11. OVER CURRENT PROTECTION

To provide protection in a fault output overload condition, the module is equipped with internal current-limiting circuitry which can endure current limiting for a few milliseconds. If the over current condition persists beyond a few milliseconds, the module will shut down into hiccup mode and restart once every 400 ms. The module operates normally when the output current goes into specified range. The typical average output current is 1.77 A during hiccup.

The OTP is achieved by temperature sensor and it is in non-latch mode when the hottest point on base plate reaches 105°C. It will restart automatically when the temperature falls to 90°C. The protecting point will be varied a little under different conditions (airflow, ambient temperature, input voltage, load...)
