

DESCRIPTION

This is EV board documentation for MP18021A. The MP18021A is a high frequency, 100V half bridge N-channel power MOSFET driver. Its low side and high side driver channels are independently controlled and matched with a time delay of less than 5ns. Under-voltage lockout on both high side and low side supplies force their outputs low in case of insufficient supply. The integrated bootstrap diode reduces external component count.

This demo board is configured to a buck converter. INH and INL are independent signals of each other. For simplicity, the user only need to supply a PWM signal to this demo board and the on-board circuitry will generate INH and INL signals with proper dead time. In a real system, the controller will have to take care of dead time adjustment.

ELECTRICAL SPECIFICATION

Parameter	Symbol	Value	Units
Driver Voltage	V_{DD}	9 – 18	V
Input Power Voltage	V_{POWER}	0-100	V
Duty		10	%
Output Current	I_{OUT}	4	A
Frequency	F_{SW}	200	KHz

FEATURES

- Drives N-Channel MOSFET Half Bridge
- 100V V_{BST} Voltage Range
- On-Chip Bootstrap Diode
- Typical 16ns Propagation Delay Time
- Less Than 5ns Gate Drive Matching
- Drives 1nF Load with 12ns/9ns Rise/Fall Times with 12V VDD
- TTL Compatible Input
- Less Than 150 μ A Quiescent Current
- UVLO for Both High Side and Low Side
- In SOIC8E and QFN8 3x3mm Packages

APPLICATIONS

- Telecom Half Bridge Power Supplies
- Avionics DC-DC Converters
- Two-Switch Forward Converters
- Active Clamp Forward Converters

EV18021AHN-00A EVALUATION BOARD

(L x W x H) 6.4cm x 6.4cm x 3cm

Board Number	MPS IC Number
EV18021A-H-00A	MP18021AHN

The schematic diagram illustrates a 5V@30mA DC-DC converter. The main components and their connections are as follows:

- Input Filter:** VIN is connected to VDD through a 100k resistor (R11) and a 1uF capacitor (C19). The input to the converter is labeled 1, and the ground connection is labeled 2.
- MP2016-DJ Converter:** The converter has a VIN pin (1), a VOUT pin (3), a GND pin (2), and a FB pin (4). The output is labeled 5V@30mA.
- Output Filter:** The output of the converter is connected to a 5V output through a 2.49k resistor (R10), a 22nF capacitor (C20), a 76.8k resistor (R12), and a 4.7uF capacitor (C21).
- Bootstrap Network:** The bootstrap network consists of a 33uH inductor (L1) connected to the SW pin (1) of the MP18021A. The SW pin is connected to the SW pin of the MP2016-DJ. The bootstrap network also includes a 10uF capacitor (C2), a 100k resistor (R2), a 100k resistor (R3), a 100k resistor (R6), a 100k resistor (R7), a 100k resistor (R11), and a 100k resistor (R12).
- PWM Control:** The PWM control section includes a PWM input, a 5V supply, a 1k resistor (R4), a 47pF capacitor (C17), and a 47pF capacitor (C18). The PWM signal is connected to the IN pin (1) of the MP18021A. The 5V supply is connected to the VCC pin (5) of the MP18021A. The 47pF capacitor (C17) is connected to the GND pin (2) of the MP18021A. The 47pF capacitor (C18) is connected to the IN pin (1) of the MP18021A.

EVB TEST RESULTS

Performance waveforms are tested on the evaluation board.

$V_{POWER} = 100V$, $V_{DD} = 12V$, $I_{LOAD} = 4A$, Duty=10%, $L = 33\mu H$, Frequency=200KHz, $T_A = 25^\circ C$, unless otherwise noted.

QUICK START GUIDE

EV18021A-N-00A is configured in a buck converter. Below is the recommended setting for users to evaluate the EV board. User must watch for inductor saturation (do not set switching frequency too low) and over temperature (do not increase duty).

1. Preset Driver Power Supply between 9V-18V.
2. Preset Input Power Supply between 0V-100V.
3. Connect Driver Power Supply terminals to:
 - a. Positive (+): VDD
 - b. Negative (–): GND
4. Connect Input Power Supply terminals to:
 - a. Positive (+): VPOWER
 - b. Negative (–): GND
5. Connect Load to:
 - a. Positive (+): LOAD
 - b. Negative (–): LOADGND
6. Function Generator setting:
 - a. Frequency: 200 KHz
 - b. Logic High: 5V
 - c. Logic Low: 0V
 - d. Duty: 10%
 - e. Rising/Falling Edge Slew Rate: As fast as possible
7. Connect Function Generator's output to PWM and GND pins. Turn on Function Generator's output.
8. Turn on Driver Power Supply.
9. Check INH, INL, DRVH and DRVL signals. Make sure there are dead time between DRVH high and DRVL high to avoid shoot through.
10. If all signals are correct, then turn on Input Power Supply.
11. User may load up to 4A of output current. Higher load current may cause overheat to the MOSFET.
12. To turn off the board, please follow these steps:
 - a. Turn off load.
 - b. Turn off Input Power Supply.
 - c. Turn off Driver Power Supply.
