

Low-Voltage SPDT Analog Switch or 2:1 Multiplexer/De-multiplexer Bus Switch

NC7SBU3157, FSAU3157

General Description

The NC7SBU3157 / FSAU3157 is a high-performance, single-pole / double-throw (SPDT) analog switch or 2:1 multiplexer / de-multiplexer bus switch.

The device is fabricated with advanced sub-micron CMOS technology to achieve high-speed enable and disable times and low on resistance. The break-before-make select circuitry prevents disruption of signals on the B port due to both switches temporarily being enabled during select pin switching. The device is specified to operate over the 1.65 to 5.5 V V_{CC} operating range. The control input tolerates voltages up to 5.5V, independent of the V_{CC} operating range.

ON Semiconductor integrated Undershoot Hardened Circuit senses undershoot at the I/Os, and responds by preventing voltage differentials from developing and turning the switch on.
