

# nRF5340

## Objective Product Specification

v0.5

# nRF5340 features

## Features:

- 1.7 V to 5.5 V supply voltage range
- Single 32 MHz crystal operation
- Package: aQFN-94
- 1.8 V to 3.3 V regulated supply for external components
- Operating temperature: -40 to +105 °C

## Application core:

- Arm® Cortex®-M33 with TrustZone® technology
  - 128 MHz or 64 MHz operation
  - 510 EEMBC CoreMark score running from flash memory
  - Single-precision floating-point unit (FPU)
  - Digital signal processing (DSP) instructions
  - Data watchpoint and trace (DWT), embedded trace macrocell (ETM), instrumentation trace macrocell (ITM), and cross trigger interface (CTI)
  - Serial wire debug (SWD)
  - Trace port interface unit (TPIU)
    - 4-bit parallel trace of ITM and ETM trace data
    - Serial wire output (SWO) trace of ITM data
- 1 MB flash and 512 kB low leakage RAM
- Arm TrustZone CryptoCell™ -312 security subsystem
  - NIST 800-90B, AIS-31, and FIPS 140-2 compliant random number generator
  - AES-128 and 256: ECB, CBC, CMAC/CBC-MAC, CTR, CCM/CCM\*, GCM
  - SHA-1, SHA-2 up to 256 bits
  - Keyed-hash message authentication code (HMAC)
  - RSA public key cryptography with up to 3072-bit key size
  - ECC support for most used curves
  - Application key management using derived key model
- Two-way set associative cache towards flash and QSPI XIP code regions
- QSPI peripheral for communicating with an external flash memory device
- Near field communication (NFC-A) tag with wake-on field
  - Touch-to-pair support
- Up to 3x SPI master/slave with EasyDMA
- Up to 2x I2C compatible two-wire master/slave with EasyDMA
- Up to 2x UART (CTS/RTS) with EasyDMA
  - Optional, built-in, flow control (CTS, RTS)
- Audio peripherals: I2S, digital microphone interface (PDM)
- Up to 3x pulse width modulator (PWM) units with EasyDMA
- 12-bit, 200 ksp/s ADC with EasyDMA - eight configurable channels with programmable gain
- Up to 3x 32-bit timer with counter mode
- Up to 2x 24-bit real-time counter (RTC)
- Quadrature decoder (QDEC)
- Distributed programmable peripheral interconnect (DPPI)
- Inter-processor communication (IPC)
- Mutually exclusive peripheral (MUTEX)
- 48 general purpose I/O pins

## Network core:

- Arm Cortex-M33
  - 64 MHz operation
  - 238 EEMBC CoreMark score running from flash memory
  - Cross trigger interface (CTI)
  - Serial wire debug (SWD)
  - SWO trace port
- 256 kB flash
- 64 kB low leakage RAM
- Bluetooth® 5.1, IEEE 802.15.4-2006, 2.4 GHz transceiver
  - -97.5 dBm sensitivity in 1 Mbps Bluetooth low energy mode
  - -20 to +3 dBm configurable TX power
- On-air compatible with nRF52, nRF51, nRF24L, and nRF24AP Series
- Supported data rates:
  - Bluetooth 5.1: 2 Mbps, 1 Mbps, 500 kbps, and 125 kbps
  - IEEE 802.15.4-2006: 250 kbps
  - Proprietary 2.4 GHz: 2 Mbps, 1 Mbps
- Single-ended antenna output (on-chip balun)
- 128-bit AES/ECB/CCM/AAR co-processor (on-the-fly packet encryption)
- 3.2 mA run current in TX (0 dBm)
- 2.6 mA run current in RX
- RSSI (1 dB resolution)
- SPI master/slave with EasyDMA
- I2C compatible two-wire master/slave with EasyDMA
- UART (CTS/RTS) with EasyDMA
- Up to 3x 32-bit timer with counter mode
- Up to 2x real-time counter (RTC)
- Temperature sensor
- Distributed programmable peripheral interconnect (DPPI)
- Inter-processor communication (IPC)
- Mutually exclusive peripheral (MUTEX)

**Applications:**

- Advanced computer peripherals and I/O devices
  - Multi-touch trackpad
- Advanced wearables
  - Health/fitness sensor and monitor devices
  - Wireless payment enabled devices
- Internet of things (IoT)
  - Smart home sensors and controllers
  - Industrial IoT sensors and controllers
- Interactive entertainment devices
  - Remote controls
  - Gaming controllers

|---------------|---------|---------------|
| November 2019 | 0.5     | First release |

# 2 About this document

This document is organized into chapters that are based on the modules and peripherals available in the IC.

## 2.1 Document status

The document status reflects the level of maturity of the document.

| Document name                         | Description                                                                                                                                                                                                                                                      |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Objective Product Specification (OPS) | Applies to document versions up to 1.0.<br><br>This document contains target specifications for product development.                                                                                                                                             |
| Product Specification (PS)            | Applies to document versions 1.0 and higher.<br><br>This document contains final product specifications. Nordic Semiconductor ASA reserves the right to make changes at any time without notice in order to improve design and supply the best possible product. |

Table 1: Defined document names

## 2.2 Peripheral chapters

Every peripheral has a unique capitalized name or an abbreviation of its name, e.g. TIMER, used for identification and reference. This name is used in chapter headings and references, and it will appear in the ARM Cortex Microcontroller Software Interface Standard (CMSIS) hardware abstraction layer to identify the peripheral.

The peripheral instance name, which is different from the peripheral name, is constructed using the peripheral name followed by a numbered postfix, starting with 0, for example, TIMER0. A postfix is normally only used if a peripheral can be instantiated more than once. The peripheral instance name is also used in the CMSIS to identify the peripheral instance.

The chapters describing peripherals may include the following information:

- A detailed functional description of the peripheral
- Register configuration for the peripheral
- Electrical specification tables, containing performance data which apply for the operating conditions described in [Recommended operating conditions](#) on page 773.

## 2.3 Register tables

Individual registers are described using register tables. These tables are built up of two sections. The first three colored rows describe the position and size of the different fields in the register. The following rows describe the fields in more detail.

### 2.3.1 Fields and values

The **Id (Field Id)** row specifies the bits that belong to the different fields in the register. If a field has enumerated values, then every value will be identified with a unique value id in the **Value Id** column.

A blank space means that the field is reserved and read as undefined, and it also must be written as 0 to secure forward compatibility. If a register is divided into more than one field, a unique field name is specified for each field in the **Field** column. The **Value Id** may be omitted in the single-bit bit fields when values can be substituted with a Boolean type enumerator range, e.g. true/false, disable(d)/enable(d), on/off, and so on.

Values are usually provided as decimal or hexadecimal. Hexadecimal values have a 0x prefix, decimal values have no prefix.

The **Value** column can be populated in the following ways:

- Individual enumerated values, for example 1, 3, 9.
- Range of values, e.g. [0..4], indicating all values from and including 0 and 4.
- Implicit values. If no values are indicated in the **Value** column, all bit combinations are supported, or alternatively the field's translation and limitations are described in the text instead.

If two or more fields are closely related, the **Value Id**, **Value**, and **Description** may be omitted for all but the first field. Subsequent fields will indicate inheritance with '..'.

A feature marked **Deprecated** should not be used for new designs.

### 2.3.2 Permissions

Different fields in a register might have different access permissions enforced by hardware.

The access permission for each register field is documented in the **Access** column in the following ways:

| Access | Description     | Hardware behavior                                                                                                      |
|--------|-----------------|------------------------------------------------------------------------------------------------------------------------|
| RO     | Read-only       | Field can only be read. A write will be ignored.                                                                       |
| WO     | Write-only      | Field can only be written. A read will return an undefined value.                                                      |
| RW     | Read-write      | Field can be read and written multiple times.                                                                          |
| W1     | Write-once      | Field can only be written once per reset. Any subsequent write will be ignored. A read will return an undefined value. |
| RW1    | Read-write-once | Field can be read multiple times, but only written once per reset. Any subsequent write will be ignored.               |

Table 2: Register field permission schemes

## 2.4 Registers

| Register | Offset | Security | Description                                       |
|----------|--------|----------|---------------------------------------------------|
| DUMMY    | 0x514  |          | Example of a register controlling a dummy feature |

Table 3: Register overview

### 2.4.1 DUMMY

Address offset: 0x514

Example of a register controlling a dummy feature

|                  |      |         | ValidRange   |    | [2..7] |    | Example of allowed values for this field                        |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |            |   |
| D                | RW   | FIELD_D |              |    |        |    | Example of a read-write field with no restriction on the values |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |            |   |

# 3 Product overview

nRF5340 is a wireless ultra-low power multicore System on Chip (SoC), integrating two fully programmable Arm Cortex-M33 processors, advanced security features, a range of peripherals, and a multiprotocol 2.4 GHz transceiver. The transceiver supports Bluetooth Low Energy, ANT<sup>™</sup>, and 802.15.4 and allows the implementation of proprietary 2.4 GHz protocols.

The two Arm Cortex-M33 processors share the power, clock, and peripheral architecture with Nordic Semiconductor nRF51, nRF52, and nRF91 Series of PAN/LAN SoCs, ensuring minimal porting efforts. The application core is a full-featured Arm Cortex-M33 processor including DSP instructions and FPU and running at up to 128 MHz with 1 MB of flash and 512 kB of RAM. The option to run the application processor at 64 MHz allows the CPU to increase energy efficiency. The network core is an Arm Cortex-M33 processor with a reduced feature set, designed for ultra-low power operation. It runs at a fixed 64 MHz frequency and contains 256 kB of flash and 64 kB of RAM.

The peripheral set offers a variety of analog and digital functionality enabling single-chip implementation of a wide range of applications. Arm TrustZone technology, Arm CryptoCell-312, and supporting blocks for system protection and key management are embedded for the advanced security needed for IoT applications.

## 3.1 Block diagram

The block diagram illustrates the overall system. More detailed diagrams of the two cores, including pins and EasyDMA connectivity, can be found in [Application core overview](#) on page 92 and [Network core overview](#) on page 122.

Figure 1: Simplified block diagram

## 3.2 Memory

The nRF5340 SoC contains two processor cores each with flash and RAM that can be used for code and data storage.

| Core             | RAM                                                                                                                                              | Flash                 |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| Application core | 512 kB, arranged as follows: <ul style="list-style-type: none"> <li>• 256 kB CPU single-cycle RAM</li> <li>• 256 kB of peripheral RAM</li> </ul> | 1024 kB in 4 kB pages |
| Network core     | 64 kB total                                                                                                                                      | 256 kB in 2 kB pages  |

Table 4: nRF5340 memory configuration

All memory and registers are found in the same address space, as shown in [Figure 2: Memory map](#) on page 20. This includes the two blocks of 256 kB RAM, which are accessible in the memory map as one contiguous 512 kB block of RAM.

The application core memory is mapped to the network core memory map. This means that the network core can access and use the application core memory for shared memory communication. The application core can restrict network core access through the domain configuration (DCNF) PROTECT registers, see [DCNF — Domain configuration](#) on page 186. Access to secure memory or peripherals as defined by the [SPU — System protection unit](#) on page 568 is also prevented when the network core is marked as non-secure in an application using TrustZone technology.

Figure 2: Memory map

### 3.2.1 RAM - Random access memory

RAM can be read and written an unlimited number of times.

Each RAM AHB slave within a core is connected to one or more RAM sections that has separate power control for System ON and System OFF mode operation. For details, see [VMC — Volatile memory controller](#) on page 719.

### 3.2.2 Flash (non-volatile memory)

Flash memory can be read an unlimited number of times by the CPU, but is restricted in the number of times it can be written to or erased, and in how it can be written.

Writing to flash memory is managed by the non-volatile memory controller (NVMC), see [NVMC — Non-volatile memory controller](#) on page 318.

Flash memory is divided in pages, as listed in [Table 4: nRF5340 memory configuration](#) on page 19.

### 3.2.3 XIP - Execute in place

Execute in Place (XIP) allows the CPU to execute program code directly from the external flash memory device using the Quad serial peripheral interface (QSPI).

For details, see [QSPI — Quad serial peripheral interface](#) on page 380.

### 3.2.4 Access latency

When accessing memories or peripherals across bus bridges, additional access latency will occur. An example of such a case is network core access to application core memory or peripherals.

# 4 Power and clock management

## 4.1 Overview

The power and clock management system in nRF5340 is optimized for ultra-low power applications to ensure maximum power efficiency.

The core of the power and clock management system is the power management unit (PMU) shown in the following figure.

Figure 3: Power management unit

The PMU automatically tracks the power and clock resources required by the different components in the system at any given time. To achieve the lowest power consumption possible, the PMU optimizes the system by evaluating power and clock requests, automatically starting and stopping clock sources, and choosing regulator operation modes.

### 4.1.1 System ON mode

System ON is the default operation mode after power-on reset.

In System ON, all functional blocks, such as the CPU and peripherals, can be in an idle or run state depending on the configuration set by the software and the state of the executing application. The network core's CPU and peripherals can be in an idle state, run state, System OFF mode (see [System OFF mode](#) on page 23), or Force-off mode (see [Core Force-off mode](#) on page 24).

The PMU can switch the appropriate internal power sources on and off, depending on how much power is needed at any given time. The power requirement of a peripheral is directly related to its activity level, which increases and decreases when specific tasks are triggered or events are generated.

### Voltage and frequency scaling

nRF5340 allows frequency scaling of the application core. Changing the frequency of the application core's clock will change the internal voltage to optimize power efficiency, which is a trade off between performance and power consumption. For more information, see [Application core frequency scaling](#) on page 64.

#### 4.1.1.1 Power submodes

In System ON mode, when the CPU and all peripherals are IDLE, the system can reside in one of two power submodes.

The power submodes are:

- Constant latency
- Low-power

In Constant latency, the CPU wakeup latency and the PPI task response will be constant and kept at a minimum. This is secured by a set of resources that are always enabled. Compared to Low-power, the advantage of having a constant and predictable latency comes at a cost of increased power consumption. Constant latency is selected by triggering the [CONSTLAT](#) task.

In Low-power, the most power efficient supply option is chosen by the automatic power management system. Achieving the lowest power possible is at the expense of variations in CPU wakeup latency and PPI task response. Low-power is selected by triggering the [LOWPWR](#) task.

When the system enters System ON, it is by default in the Low-power submode.

#### 4.1.2 System OFF mode

System OFF is the deepest power-saving mode the system can enter. In this mode, the system's core functionality is powered down and all ongoing tasks are terminated.

The device can be put into System OFF mode using the register [SYSTEMOFF](#) on page 44 . The following signals/actions cause a wakeup from System OFF:

- The DETECT signal, generated by the GPIO peripheral
- The ANADETECT signal, generated by the LPCOMP peripheral
- The SENSE signal, generated by the NFCT peripheral to wake-on-field
- A valid USB voltage on the VBUS pin is detected
- A debug session is started
- Pin reset

When the device wakes up from System OFF, a system reset is performed. For more details, see [Application core reset behavior](#) on page 57.

One or more RAM sections can be retained in System OFF depending on the RAM retention settings in the peripheral [VMC — Volatile memory controller](#) on page 719.

Before entering System OFF, all on-going EasyDMA transactions should be completed. This is accomplished by making sure that the EasyDMA enabled peripheral is not active when entering System OFF. It is also recommended that the network core is in an idle state (i.e. peripherals are stopped and CPU is idle).

##### 4.1.2.1 Emulated System OFF mode

When the device is in Debug Interface mode, System OFF is emulated to ensure that all required resources needed for debugging are available during System OFF.

Required resources needed for debugging include the following key components:

- [Debug interface mode](#) on page 731
- [CLOCK — Clock control](#) on page 61
- [POWER — Power control](#) on page 36
- [OSCILLATORS — Oscillator control](#) on page 88
- [REGULATORS - Regulator control](#) on page 41
- [RESET - Reset control](#) on page 55
- [NVMC — Non-volatile memory controller](#) on page 318
- CPU

- Flash memory
- RAM

Because the CPU is kept on in an emulated System OFF mode, it is recommended to add an infinite loop directly after entering System OFF, to prevent the CPU from executing code that normally should not be executed. For more information, see [Overview](#) on page 730.

### 4.1.3 Core Force-off mode

Core Force-off is only applicable for the network core.

The register interface [RESET - Reset control](#) on page 55 is used by the application core to set the network core to Force-off mode. This stops the network core in order to achieve the lowest power consumption possible. When the network core is in Force-off mode, only the application core can release the mode, causing the network core to wake up and start the CPU again.

Before the application core sets the network core to Force-off mode, it is recommended that the network core is in an idle state (i.e. peripherals are stopped and CPU is idle).

When the network core wakes up from Force-off mode, it is reset. For more details, see [Network core reset behavior](#) on page 58.

Several RAM sections can be retained in Force-off mode depending on the RAM retention settings in the peripheral [VMC — Volatile memory controller](#) on page 719.

#### 4.1.3.1 Emulated Force-off mode

If the device is in Debug Interface mode, Force-off mode will be emulated to secure the required resources needed for debugging.

When Force-off mode is emulated, the CPU and all peripherals are reset. The CPU is prevented from running during debug access to a core's resources, including writing to RAM, flash, and/or peripherals. See [Overview](#) on page 730 for more information.

## 4.2 Current consumption

Because the Power Management Unit (PMU) is constantly adjusting the different power and clock sources, estimating an application's current consumption can be challenging when the measurements cannot be performed directly on the hardware. To facilitate the estimation process, a set of current consumption scenarios is provided to show the typical current drawn from the VDD or VDDH supply.

Each scenario specifies a set of operations and conditions applying to the given scenario. All scenarios are listed in [Electrical specification](#) on page 26. The following table shows a set of common conditions used in all scenarios, unless otherwise stated in the description of a given scenario.

| Condition               | Value                                                                                                                                                                                                                                                              | Note                                                                                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Supply                  | 3 V on VDD/VDDH (normal voltage mode)                                                                                                                                                                                                                              |                                                                                                                                                                                   |
| Temperature             | 25 °C                                                                                                                                                                                                                                                              |                                                                                                                                                                                   |
| CPU                     | WFI (wait for interrupt)/WFE (wait for event) sleep                                                                                                                                                                                                                |                                                                                                                                                                                   |

Table 5: Current consumption scenarios, common conditions

## 4.2.1 Electrical specification

### 4.2.1.1 Sleep

| Symbol                | Description                                                                                                      | Min. | Typ. | Max. | Units |
|-----------------------|------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| I <sub>ON_IDLE1</sub> | System ON, wake on any event, power-fail comparator enabled                                                      |      | 1.5  |      | uA    |
| I <sub>ON_IDLE2</sub> | System ON, wake on GPIOTE input (event mode)                                                                     | ..   | ..   | ..   | uA    |
| I <sub>ON_IDLE3</sub> | System ON, wake on GPIOTE PORT event                                                                             | ..   | ..   | ..   | uA    |
| I <sub>ON_IDLE4</sub> | System ON, 0 kB application RAM, wake on RTC (running from LFXO clock)                                           | ..   | ..   | ..   | uA    |
| I <sub>ON_IDLE5</sub> | System ON, wake on RTC (running from LFXO clock)                                                                 | ..   | ..   | ..   | uA    |
| I <sub>ON_IDLE6</sub> | System ON, 0 kB application RAM, wake on RTC (running from LFXO clock), 5 V supply on VDDH, VREGH output = 3.3 V | ..   | ..   | ..   | uA    |
| I <sub>ON_IDLE7</sub> | System ON, 0 kB network RAM, wake on network RTC (running from LFXO clock)                                       |      | 1.6  |      | uA    |
| I <sub>ON_IDLE8</sub> | System ON, 64 kB network RAM, wake on network RTC (running from LFXO clock)                                      |      | 1.8  |      | uA    |
| I <sub>ON_IDLE9</sub> | System ON, 0 kB application RAM, wake on RTC (running from LFRC clock)                                           |      | 2.3  |      | uA    |
| I <sub>OFF0</sub>     | System Off, 0 kB application RAM, wake on reset                                                                  |      | 1.1  |      | uA    |
| I <sub>OFF1</sub>     | System Off, 0 kB application RAM, wake on LPCOMP                                                                 | ..   | ..   | ..   | uA    |
| I <sub>OFF2</sub>     | System Off, wake on reset                                                                                        | ..   | ..   | ..   | uA    |
| I <sub>OFF3</sub>     | System Off, 0 kB application RAM, wake on reset, 5 V supply on VDDH, VREGH output = 3.3V                         | ..   | ..   | ..   | uA    |
| I <sub>OFF4</sub>     | System Off, 512 kB application RAM + 64 kB network RAM, wake on reset                                            | ..   | ..   | ..   | uA    |

### 4.2.1.2 Application CPU running

**Note:** Compiler: ARM version 6.12 (armclang). Compiler flags: -std=c99 --target=arm-arm-none-eabi -mcpu=cortex-m33 -mfpu=fpv5-sp-d16 -mfloat-abi=hard -fno-rtti -flto -funsigned-char -mcmse -Omax -ffunction-sections. Linker flags: -Omax. Amount of RAM in Application CPU set to 20 kB in flash cases and 44 kB in RAM cases.

| Symbol                | Description                                                         | Min. | Typ. | Max. | Units |
|-----------------------|---------------------------------------------------------------------|------|------|------|-------|
| I <sub>APPCPU0</sub>  | CPU running CoreMark from flash, regulator = LDO, clock = HFINT128M |      | 14.0 |      | mA    |
| I <sub>APPCPU1</sub>  | CPU running CoreMark from flash, regulator = LDO                    | ..   | ..   | ..   | mA    |
| I <sub>APPCPU2</sub>  | CPU running CoreMark from flash, clock = HFXO128M                   |      | 7.3  |      | mA    |
| I <sub>APPCPU3</sub>  | CPU running CoreMark from flash, clock = HFXO64M                    |      | 3.4  |      | mA    |
| I <sub>APPCPU4</sub>  | CPU running CoreMark from flash, clock = HFINT128M                  |      | 7.1  |      | mA    |
| I <sub>APPCPU5</sub>  | CPU running CoreMark from flash                                     | ..   | ..   | ..   | mA    |
| I <sub>APPCPU6</sub>  | CPU running CoreMark from RAM, regulator = LDO, clock = HFINT128M   | ..   | ..   | ..   | mA    |
| I <sub>APPCPU7</sub>  | CPU running CoreMark from RAM, regulator = LDO                      | ..   | ..   | ..   | mA    |
| I <sub>APPCPU8</sub>  | CPU running CoreMark from RAM, clock = HFINT128M                    | ..   | ..   | ..   | mA    |
| I <sub>APPCPU9</sub>  | CPU running CoreMark from RAM                                       | ..   | ..   | ..   | mA    |
| I <sub>APPCPU10</sub> | CPU running CoreMark from RAM, clock = HFXO128M                     | ..   | ..   | ..   | mA    |
| I <sub>APPCPU11</sub> | CPU running CoreMark from RAM, clock = HFXO64M                      | ..   | ..   | ..   | mA    |

#### 4.2.1.3 Network CPU running

**Note:** Compiler: ARM version 6.12 (armclang). Compiler flags: -std=c99 --target=arm-arm-none-eabi -mcpu=cortex-m33+nodsp -mfpv=none -mfloat-abi=soft -fno-rtti -flto -funsigned-char -Omax -ffunction-sections. Linker flags: -Omax. Amount of RAM in Network CPU set to 20 kB in flash cases and 40 kB in RAM cases. Clock and regulator settings only apply to Network CPU. Settings in Application CPU equal those in common conditions table above.

### 4.3 Power supply modes and regulators

nRF5340 supports two different power supply voltage ranges, each having a corresponding power supply pin. The PMU automatically activates the correct voltage regulator depending on which power supply pin is used.

The nRF5340 PMU controls three different regulators to support the following power supply modes:

- **Normal voltage mode** on page 32 - Powers the device through the VDD pin
- **High voltage mode** on page 33 - Powers the device through the VDDH pin

The three regulators and how they are connected to the supply pins are shown in the following figure.

Figure 4: Regulators used in nRF5340

#### 4.3.1 Normal voltage mode

When the device operates in normal voltage mode, only the main voltage regulator (VREGMAIN) and the radio voltage regulator (VREGRADIO) are used.

Figure 5: Regulator usage in Normal voltage mode

The external power supply is connected to the VDD pin. The VDDH pin is connected to VDD, but the VREGH regulator is deactivated.

In normal voltage mode, each regulator can operate in LDO or DC/DC mode. See [Normal voltage mode - detailed setup](#) on page 41 for details about configuration of the regulators in this mode.

### 4.3.2 High voltage mode

When the device operates in high voltage mode, the high voltage regulator (VREGH), the main voltage regulator (VREGMAIN) and the radio voltage regulator (VREGRADIO) are used.

Figure 6: Regulator usage in High voltage mode

The external power supply is connected to the VDDH pin. The VREGMAIN and VREGRADIO regulators are used to power the internal circuitry from the VDD pin. The VDD pin is supplied by the VREGH regulator.

In high voltage mode, each of the three regulators can operate in LDO or DC/DC mode. See [High voltage mode - detailed setup](#) on page 42 for details about configuring the regulators in this mode.

### 4.3.3 Power supply supervisor

Several voltage monitoring devices, enabled through the power management unit (PMU), are used to monitor the connected power supply.

The following figure illustrates the main components for power supply supervision.

Figure 7: Power supply supervision in nRF5340

The power supply mode detector determines which supply pin is used when the device is powered up. It selects the power supply mode accordingly, and generates a power-on reset (POR) which initializes the device. For an overview of the different supply modes, see [Power supply modes and regulators](#) on page 32.

The brownout detector monitors the VDD supply (input of the VREGMAIN regulator) to ensure safe operation, and generates a brownout reset (BOR) if the voltage is too low, holding the device in reset when the voltage is too low for safe operation. The brownout reset voltage is defined in parameters  $V_{BOR,OFF}$  and  $V_{BOR,ON}$ .

The optional power-fail comparator (POF) can be used to signal the application when the supply voltage drops below a configured threshold. For details on the POF, see [Power-fail comparator](#) on page 34.

#### 4.3.3.1 Power-fail comparator

The power-fail comparator (POF) can provide the CPU with an early warning of an impending power supply failure.

The POF can be used to signal the application when the supply voltage drops below a configured threshold. The POF will not reset the system, but instead give the CPU time to prepare for an orderly power-down. The following figure shows the main elements of the POF.

Figure 8: Power-fail comparator

Using the POF is optional, and must be enabled and configured through the register [POFCON \( Retained \)](#) on page 45.

Depending on the supply mode (see [Power supply modes and regulators](#) on page 32), the thresholds  $V_{POF}$  and  $V_{POFH}$  must be configured to a suitable level through the [POFCON](#) register. When the supply voltage falls below the defined threshold, the POF will generate the event [POFWARN](#) that is sent to the [POWER](#) module within both the application and network cores. Software running on the two cores can use this signal to prepare for a power failure. This event is also generated when the supply voltage is already below the threshold at the time the power-fail comparator is enabled, or if the threshold is reconfigured to a level above the supply voltage.

If the POF is enabled and the supply voltage is below the threshold, the POF will prevent the [NVMC](#) from performing write operations to the NVM.

To save power, the POF is not active in System OFF.

The POF features a hysteresis of  $V_{POFHYST}$ , as illustrated in the following figure.

Figure 9: POF hysteresis and POFWARN event (BOR = brownout reset)

The POF hysteresis voltage is defined with the  $V_{POFHYST}$  parameter in [Electrical specification](#) on page 46.

## 4.4 POWER — Power control

The POWER peripheral provides an interface for the power and clock subsystem for task, event, and interrupt related settings.

Each core has its own POWER peripheral that is responsible for requesting resources from the power and clock subsystem. The power and clock subsystem ensure that the power mode with the proper latency settings is selected when requested by an instance of the POWER peripheral. This means that the Constant latency mode is prioritized over Low-power mode. For an overview of power modes, see [Power submodes](#) on page 23.

The **POFWARN** event is a system level event that enables each core to react quickly if there is a power failure. The power-fail comparator must be configured and enabled in order to receive the event, see [Power-fail comparator](#) on page 34 for more information.

**Note:** Registers [INTEN](#) on page 40, [INTENSET](#) on page 40, and [INTENCLR](#) on page 40 are the same (at the same address) as corresponding registers in [CLOCK peripheral](#).

**Note:** Power control of the RAM blocks is controlled by the Volatile memory controller (VMC), see [VMC — Volatile memory controller](#) on page 719.

### 4.4.1 Registers

| Base address | Domain      | Peripheral | Instance   | Secure mapping | DMA security | Description   | Configuration |
|--------------|-------------|------------|------------|----------------|--------------|---------------|---------------|
| 0x50005000   | APPLICATION | POWER      | POWER : S  | US             | NA           | Power control |               |
| 0x40005000   |             |            | POWER : NS |                |              |               |               |

## 4.5 REGULATORS - Regulator control

All system components are powered from the on-chip voltage regulators. These regulators are responsible for converting the voltage supplied on the VDD or VDDH pins to adequate voltages to be used internally.

The available regulators can be configured in multiple ways to accommodate different input voltage ranges. Some modes support sourcing power to external circuitry. The voltage modes that are supported by nRF5340 are listed in the following table.

| Voltage mode        | Input voltage range | Output voltage range |
|---------------------|---------------------|----------------------|
| Normal voltage mode | 1.7 V - 3.6 V       | -                    |
| High voltage mode   | 2.5 V - 5.5 V       | 1.8 V - 3.3 V        |

Table 8: Supported voltage modes

For an overview on the available regulators, see [Power supply modes and regulators](#) on page 32.

### 4.5.1 Normal voltage mode - detailed setup

Normal voltage mode uses the main regulator (VREGMAIN) and the radio regulator (VREGRADIO).

The VREGMAIN and VREGRADIO regulators operate in LDO mode by default. DC/DC mode can be enabled independently for each regulator using [VREGMAIN.DCDCEN \( Retained \)](#) on page 45 and [VREGRADIO.DCDCEN \( Retained \)](#) on page 46 respectively.

When configured as shown in the following figure, the nRF5340 enters normal voltage mode. Here both regulators are in DC/DC mode. An external LC filter is required for each regulator in DC/DC mode. If a regulator is only to be used in LDO mode, the inductor for this regulator is not needed. In this mode, the VDDH pin must be connected to VDD, even if the high voltage regulator (VREGH) is not in use.

Figure 10: Normal voltage mode

The advantage of using a regulator in DC/DC mode is that the overall power consumption is reduced. This is because the regulator in DC/DC mode has a higher efficiency than in LDO mode. Regulator efficiency in DC/DC mode varies depending on the supply voltage and the current drawn from the regulators.

### 4.5.2 High voltage mode - detailed setup

High voltage mode uses the main regulator (VREGMAIN), the high voltage regulator (VREGH), and the radio regulator (VREGRADIO).

All regulators operate in LDO mode by default. DC/DC mode can be enabled independently for each regulator using [VREGMAIN.DCDCEN \(Retained\)](#) on page 45, [VREGH.DCDCEN \(Retained\)](#) on page 46, and [VREGRADIO.DCDCEN \(Retained\)](#) on page 46.

When configured as shown in the following figure, the nRF5340 enters high voltage mode. Here all three regulators are in DC/DC mode. An external LC filter is required for each of the regulators in DC/DC mode. If a regulator is only to be used in LDO mode, the inductor for this regulator is not needed.

Figure 11: High voltage mode

The advantage of using a regulator in DC/DC mode is that the overall power consumption is reduced. This is because the regulator in DC/DC mode has higher efficiency than when in LDO mode. Regulator efficiency in DC/DC mode varies depending on the supply voltage and the current drawn from the regulators.

#### 4.5.2.1 External circuitry supply

In high voltage mode, the output from VREGH can be used to supply external circuitry from the VDD pin.

As illustrated in [High voltage mode - detailed setup](#) on page 42, external circuitry can be powered from the VDD pin once it is enabled in the register [EXTSUPPLY](#) on page 116.

The VDD output voltage is programmed in the register [VREGHVOUT](#) on page 116.

The supported output voltage range depends on the supply voltage provided to the VDDH pin. The difference between voltage supplied on the VDDH pin and the voltage output on the VDD pin is defined by the  $V_{\text{REGH,DROP}}$  parameter in [Regulator specifications, VREGH stage](#) on page 48.

Supplying power to external circuitry is allowed in both System OFF and System ON mode.

**Note:** The maximum allowed current drawn by external circuitry is dependent on the total internal current draw. The maximum current that can be drawn externally from REGH is defined in [Regulator specifications, VREGH stage](#) on page 48).

### 4.5.3 GPIO levels

The GPIO high reference voltage depends on the regulator voltage mode.

In normal voltage mode, the GPIO high level equals the voltage supplied to the VDD pin. In high voltage mode, it equals the level specified in the **VREGHVOUT** register.

### 4.5.4 Registers

| Base address | Domain      | Peripheral | Instance     | Secure mapping | DMA security | Description             | Configuration |

### 4.5.5 Electrical specification

#### 4.5.5.1 Regulator startup times

| Symbol                | Description                                                                                                                          | Min. | Typ. | Max. | Units |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| t <sub>POR</sub>      | Time in power-on reset after VDD reaches 1.7 V for all supply voltages and temperatures. Dependent on supply rise time. <sup>1</sup> | ..   | ..   | ..   |       |
| t <sub>POR,10us</sub> | VDD rise time 10 μs                                                                                                                  | ..   | ..   | ..   | ms    |
| t <sub>POR,10ms</sub> | VDD rise time 10 ms                                                                                                                  | ..   | ..   | ..   | ms    |
| t <sub>POR,60ms</sub> | VDD rise time 60 ms                                                                                                                  | ..   | ..   | ..   | ms    |

<sup>1</sup> A step increase in supply voltage of 300 mV or more, with rise time of 300 ms or less, within the valid supply range, may result in a system reset.

| Symbol                      | Description                                                                                                                                                                                                         | Min. | Typ. | Max. | Units |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| $t_{RISE,VREGHOUT}$         | VREGH output (VDD) rise time after VDDH reaches minimum VDDH supply voltage                                                                                                                                         | ..   | ..   | ..   |       |

#### 4.5.5.2 Application core startup times

| Symbol               | Description                                                                                             | Min. | Typ. | Max. | Units   |
|----------------------|---------------------------------------------------------------------------------------------------------|------|------|------|---------|
| $t_{R2ON}$           | Time from reset to ON (CPU execute)                                                                     | ..   | ..   | ..   |         |
| $t_{R2ON,NOTCONF}$   | If reset pin not configured                                                                             | ..   | ..   | ..   | ms      |
| $t_{R2ON,CONF}$      | If reset pin configured                                                                                 | ..   | ..   | ..   | ms      |
| $t_{OFF2ON,NM}$      | Time from OFF to CPU execute when in normal voltage mode (supply on VDD)                                | ..   | ..   | ..   | $\mu s$ |
| $t_{OFF2ON,LDO,HV}$  | Time from OFF to CPU execute when in high voltage mode (supply on VDDH) and VREGH using LDO regulator   | ..   | ..   | ..   | $\mu s$ |
| $t_{OFF2ON,DCDC,HV}$ | Time from OFF to CPU execute when in high voltage mode (supply on VDDH) and VREGH using DC/DC regulator | ..   | ..   | ..   | $\mu s$ |
| $t_{IDLE2CPU}$       | Time from IDLE to CPU execute                                                                           | ..   | ..   | ..   | $\mu s$ |
| $t_{EVTSET,CL1}$     | Time from HW event to PPI event in constant latency System ON mode                                      | ..   | ..   | ..   | $\mu s$ |
| $t_{EVTSET,CL0}$     | Time from HW event to PPI event in low power System ON mode                                             | ..   | ..   | ..   | $\mu s$ |

#### 4.5.5.3 Network core startup times

| Symbol               | Description                                                                      | Min. | Typ. | Max. | Units   |
|----------------------|----------------------------------------------------------------------------------|------|------|------|---------|
| $t_{NET,EVTSET,CL1}$ | Time from HW event to PPI event in constant latency System ON mode               | ..   | ..   | ..   | $\mu s$ |
| $t_{NET,EVTSET,CL0}$ | Time from HW event to PPI event in low power System ON mode                      | ..   | ..   | ..   | $\mu s$ |
| $t_{NET,IDLE2CPU}$   | Time from IDLE to CPU execute                                                    | ..   | ..   | ..   | $\mu s$ |
| $t_{FO2ON,NET64}$    | Time for network core from OFF to CPU execute after NETWORK.FORCEOFF is released | ..   | ..   | ..   | $\mu s$ |

<sup>2</sup> To decrease maximum time a device could hold in reset, a strong external pullup resistor can be used.

#### 4.5.5.4 Power-fail comparator

| Symbol               | Description                                                                                                                                                                    | Min. | Typ. | Max. | Units |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| V <sub>POF,NV</sub>  | Nominal power level warning thresholds (falling supply voltage) in normal voltage mode (supply on VDD). Levels are configurable between min. and max. in increments of 100 mV. | ..   | ..   | ..   | V     |
| V <sub>POF,HV</sub>  | Nominal power level warning thresholds (falling supply voltage) in high voltage mode (supply on VDDH). Levels are configurable between min. and max. in increments of 100 mV.  | ..   | ..   | ..   | V     |
| V <sub>POF,LV</sub>  | Nominal power level warning thresholds (falling supply voltage) in low voltage mode (supply on VDDL). Levels are configurable between min. and max. in increments of 100 mV.   | ..   | ..   | ..   | V     |
| V <sub>POFTOL</sub>  | Threshold voltage tolerance (applies in both normal voltage mode and high voltage mode)                                                                                        | ..   | ..   | ..   | %     |
| V <sub>POFHYST</sub> | Threshold voltage hysteresis (applies in both normal voltage mode and high voltage mode)                                                                                       | ..   | ..   | ..   | mV    |
| V <sub>BOR,OFF</sub> | Brownout reset voltage range System OFF mode. Brownout only applies to the voltage on VDD.                                                                                     | ..   | ..   | ..   | V     |
| V <sub>BOR,ON</sub>  | Brownout reset voltage range System ON mode. Brownout only applies to the voltage on VDD.                                                                                      | ..   | ..   | ..   | V     |

#### 4.5.5.5 Regulator specifications, VREGH stage

| Symbol                 | Description                                                                                                                                 | Min. | Typ. | Max. | Units |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| V <sub>DDOUT</sub>     | VDD output voltage.                                                                                                                         | ..   | ..   | ..   | V     |
| I <sub>EXT,OFF</sub>   | External current draw <sup>3</sup> allowed in High voltage mode (supply on VDDH) during System OFF.                                         | ..   | ..   | ..   | mA    |
| I <sub>EXT,LOW</sub>   | External current draw <sup>3</sup> allowed in High voltage mode (supply on VDDH) when radio output power is higher than TBD dBm.            | ..   | ..   | ..   | mA    |
| I <sub>EXT,HIGH</sub>  | External current draw <sup>3</sup> allowed in High voltage mode (supply on VDDH) when radio output power is lower than or equal to TBD dBm. | ..   | ..   | ..   | mA    |
| V <sub>REGH,DROP</sub> | Minimum voltage drop in REGH (difference between voltage supplied on VDDH pin and voltage output on VDD pin).                               | ..   | ..   | ..   | V     |

### 4.6 USBREG - USB regulator control

The USB peripheral has its own voltage regulator. When using the USB peripheral, a 5 V USB supply needs to be provided on the VBUS pin.

The USB peripheral has a dedicated internal voltage regulator for converting the VBUS supply to 3.3 V to be used by the USB signalling interface (D+ and D- lines, and pull-up on D+). The rest of the USB peripheral (USBD) is supplied through the main supply like other on-chip features. As a consequence, both VBUS and combinations of VDDH and VDD are required for USB peripheral operation. For details on configuring the main supplies, see [Power supply modes and regulators](#) on page 32.

<sup>3</sup> External current draw is defined as the sum of all GPIO currents and the current being drawn from VDD.

When VBUS rises into its valid range, the software is notified through the [USBDETECTED](#) event. The [USBREMOVED](#) event is sent when VBUS goes below its valid range. Use these events to implement the USB startup sequence described in [USB power-up sequence](#) on page 678.

When VBUS rises into its valid range while the device is in System OFF, the device resets and transitions to System ON mode. The [RESETREAS](#) register will have the VBUS bit set to indicate the source of the wakeup.

See [VBUS detection specifications](#) on page 54 for the voltage level where events are sent ( $V_{BUS,DETECT}$  and  $V_{BUS,REMOVE}$ ) or where the system causes a wakeup from System OFF ( $V_{BUS,DETECT}$ ).

When the USB peripheral is enabled through the [ENABLE](#) register and VBUS is detected, the regulator is turned on. A [USBPWRRDY](#) event is sent when the regulator's worst case settling time has elapsed, indicating to the software that it can enable the USB pull-up to signal a USB connection to the host.

The software can read the state of the VBUS detection and regulator output readiness at any time through the [USBREGSTATUS](#) register.

Figure 12: USB voltage regulator

To ensure stability, the input and output of the USB regulator need to be decoupled with a suitable decoupling capacitor  $C_{VBUS}$ . See [Reference circuitry](#) on page 768 for the recommended values.

### 4.6.1 Registers

| Base address | Domain      | Peripheral | Instance             | Secure mapping | DMA security | Description           | Configuration |
|--------------|-------------|------------|----------------------|----------------|--------------|-----------------------|---------------|
| 0x50037000   | APPLICATION | USBREG     | USBREGULATOR :       |                |              |                       |               |
|              |             |            | S                    |                |              |                       |               |
| 0x40037000   |             |            | US<br>USBREGULATOR : |                | NA           | USB regulator control |               |

### 4.6.2 Electrical specification

#### 4.6.2.1 USB operating conditions

| Symbol            | Description                | Min. | Typ. | Max. | Units |
|-------------------|----------------------------|------|------|------|-------|
| V <sub>BUS</sub>  | Supply voltage on VBUS pin | ..   | ..   | ..   | V     |
| V <sub>DPDM</sub> | Voltage on D+ and D- lines | ..   | ..   | ..   | V     |

#### 4.6.2.2 USB regulator specifications

| Symbol                   | Description                                                                         | Min. | Typ. | Max. | Units |
|--------------------------|-------------------------------------------------------------------------------------|------|------|------|-------|
| I <sub>USB,QUIES</sub>   | USB regulator quiescent current drawn from VBUS (USB enabled)                       | ..   | ..   | ..   | μA    |
| t <sub>USBPWRDY</sub>    | Time from USB enabled to USBPWRDY event triggered, V <sub>BUS</sub> supply provided | ..   | ..   | ..   | ms    |
| V <sub>USB33</sub>       | On voltage at the USB regulator output (DECUSB pin)                                 | ..   | ..   | ..   | V     |
| R <sub>SOURCE,VBUS</sub> | Maximum source resistance on VBUS, including cable                                  | ..   | ..   | ..   | Ω     |
| C <sub>DECUSB</sub>      | Decoupling capacitor on the DECUSB pin                                              | ..   | ..   | ..   | μF    |

### 4.6.2.3 VBUS detection specifications

| Symbol                  | Description                                                  | Min. | Typ. | Max. | Units |
|-------------------------|--------------------------------------------------------------|------|------|------|-------|
| V <sub>BUS,DETECT</sub> | Voltage at which rising VBUS gets reported by USBDETECTED    | ..   | ..   | ..   | V     |
| V <sub>BUS,REMOVE</sub> | Voltage at which decreasing VBUS gets reported by USBREMOVED | ..   | ..   | ..   | V     |

## 4.7 VREQCTRL - Voltage request control

The VREQCTRL can request additional voltage on the VREGRADIO regulated supply to support +3 dBm TX power on RADIO.

Setting the [VREGRADIO.VREQH](#) register will request high voltage. The request is active until the register is cleared. Status register [VREGRADIO.VREQHREADY](#) indicates when the regulator has changed to high voltage.

### 4.7.1 Registers

| Base address | Domain  | Peripheral | Instance | Secure mapping | DMA security | Description             | Configuration |
|--------------|---------|------------|----------|----------------|--------------|-------------------------|---------------|
| 0x41004000   | NETWORK | VREQCTRL   | VREQCTRL | NS             | NA           | Voltage request control |               |

## 4.8 RESET - Reset control

A reset in the system is triggered by either a system-level or core-level reset source.

A system-level reset will reset all cores. Power-on reset, brownout reset, and pin reset are examples of a system-level reset. A core-level reset, such as a soft reset or a lockup, will reset either the entire core or only part of it. The different reset sources in the system are illustrated in the following figure.

Figure 13: Reset sources

After a system-level reset, the application core will start up on its own and will then start the network core as necessary.

After a reset has occurred, the register [RESETREAS](#) on page 59 can be read to determine which source generated the reset. Each core has its own [RESETREAS](#) register. System-level and application core reset sources are also available in the network core's [RESETREAS](#) register, unless otherwise noted.

### 4.8.1 Power-on reset

The power-on reset (POR) generator initializes the system when the VDD supply voltage is above the power-on threshold. This also applies in high voltage mode, where the VDD supply voltage is provided by the high voltage regulator (VREGH).

The system is held in a reset state until the supply has reached the minimum operating voltage, and the internal voltage regulators have started. After a power-on reset, the application core is started while the network core is held in reset, see [Network force off](#) on page 57.

### 4.8.2 Pin reset

A pin reset is generated when the physical reset pin on the device is asserted.

Similar to a power-on reset, the application core is started after the reset pin is deasserted. The network core is held in reset, see [Network force off](#) on page 57.

The reset pin has an internal pull-up resistor with the same resistance as GPIO pull-ups, see [GPIO — General purpose input/output](#) on page 209.

### 4.8.3 Brownout reset

The brownout reset (BOR) generator puts the system in reset state if the VDD supply voltage drops below the brownout reset threshold. This also applies in high voltage mode, where the VDD supply voltage is provided by the high voltage regulator (VREGH).

Similar to a power-on reset, the application core is started after BOR is deasserted while the network core is held in reset, see [Network force off](#) on page 57.

### 4.8.4 Wakeup from System OFF mode reset

The device is reset when it wakes up from System OFF mode.

Similar to a power-on reset, the application core is started while the network core is held in reset, see [Network force off](#) on page 57.

If the device is in debug interface mode, the debug access port (DAP) is not reset after a wakeup from System OFF. For more information, see [Overview](#) on page 730.

### 4.8.5 Soft reset

Soft reset is generated when the SYSRESETREQ bit of the application interrupt and reset control register (AIRCRR) in the Arm core of the application and network cores is set. For more information, see [ARM documentation](#).

When the application core performs a soft reset, the network core is held in reset, see [Network force off](#) on page 57. A soft reset in the network core will only cause the network core to reset.

A soft reset can also be generated using the [RESET](#) on page 742 register in the associated CTRL-AP.

### 4.8.6 Watchdog timer reset

A watchdog timer (WDT) reset is generated when the watchdog timer times out.

Each core has its own WDT instance. When the application core gets a WDT reset, the network core is held in reset, see [Network force off](#) on page 57. A WDT reset in the network core will only cause the network core to reset. The reset target depends on the core where WDT is instantiated.

**Note:** Because the network core WDT reset is local for the network core, the application core is not aware of WDT timing out in the network core. Notifying the application core is possible. One way is to check the register [RESETREAS](#) on page 59 for WDT flags and report the error through inter-processor communication (IPC).

For more information about WDT, see [WDT — Watchdog timer](#) on page 721. More information about IPC is available in [IPC — Interprocessor communication](#) on page 252.

### 4.8.7 Network force off

The application core can force off the network core, which resets it and switches off its power and clocks.

A FORCEOFF can be issued to the network core by the application core. To force off the network core, use the register [NETWORK.FORCEOFF](#) on page 61.

Application core resets implicitly result in a force off of the network core. The network core will be held in force off until the application core releases the force off signal from the [NETWORK.FORCEOFF](#) register.

### 4.8.8 Retained registers

A retained register is one that retains its value in System OFF and/or Force off mode and when reset, depending on the reset source. See individual peripheral chapters for information about which registers are retained for the various peripherals.

### 4.8.9 Application core reset behavior

Application core reset behavior depends on the reset source.

Any reset in the application core will cause a network core force off, triggering the FORCEOFF reset source in the network core. For more information, see [Network force off](#) on page 57.

In System OFF mode, the watchdog timer is not running and there is no CPU lockup possible. RAM may be fully or partially retained, depending on RAM retention settings in [VMC — Volatile memory controller](#) on page 719.

If the device is in Debug Interface mode, the debug components will not be reset. Additionally, CPU lockup will not generate a reset. See [Overview](#) on page 730 for more information about the different debug components in the system.

Application core reset targets and their reset sources are summarized in the following table.

An 'x' in the table means that the specific module is reset.

| Reset source                      | Reset target |              |       |                |     |            |
|-----------------------------------|--------------|--------------|-------|----------------|-----|------------|
|                                   | CPU          | Network core | Debug | RAM            | WDT | RESETPREAS |

Table 15: Application core reset targets and their reset sources

**Note:** RAM is never reset, but depending on the reset source, its content may be corrupted.

Some retained registers may have a different reset behavior, as shown in the following table.

<sup>4</sup> Depending on RAM retention settings.

An 'x' in the table means that the specific module is reset.

| Reset source                      | Reset target                 |     |      |                         |                |
|-----------------------------------|------------------------------|-----|------|-------------------------|----------------|
|                                   | Regular peripheral registers | SPU | GPIO | REGULATORS, OSCILLATORS | POWER.GPREGRET |
| CPU lockup                        | x                            | x   | x    |                         |                |
| Soft reset                        | x                            | x   | x    |                         |                |
| Wakeup from System OFF mode reset | x                            |     |      |                         |                |
| Watchdog timer reset              | x                            | x   | x    | x                       |                |
| Pin reset                         | x                            | x   | x    | x                       |                |
| Brownout reset                    | x                            | x   | x    | x                       | x              |
| Power-on reset                    | x                            | x   | x    | x                       | x              |

Table 16: Application core reset behavior for retained registers

#### 4.8.10 Network core reset behavior

Network core reset behavior depends on the reset source.

In System OFF mode, or when the network core is held in force-off, the watchdog timer is not running and there is no CPU lockup possible. RAM may be fully or partially retained, depending on RAM retention settings in [VMC — Volatile memory controller](#) on page 719.

If the device is in Debug Interface mode, the debug components will not be reset. Additionally, CPU lockup will not generate a reset. See [Overview](#) on page 730 for more information about the different debug components in the system.

Any reset in the application core will cause a network core force off, triggering the network FORCEOFF reset source in the following table. For more information, see [Network force off](#) on page 57.

An 'x' in the table means that the specific module is reset. Pin reset, brownout reset, and power-on reset are system level reset sources with the network core and application core having the same behavior, see [Application core reset behavior](#) on page 57.

| Reset source                     | Reset target |                |     |           |
|----------------------------------|--------------|----------------|-----|-----------|
|                                  | CPU          | RAM            | WDT | RESETREAS |
| CPU lockup                       | x            |                |     |           |
| Soft reset                       | x            |                |     |           |
| Network FORCEOFF                 | x            | x <sup>5</sup> | x   |           |
| Application Watchdog timer reset | x            | x              | x   |           |
| Local Watchdog timer reset       | x            | x              | x   |           |

Table 17: Network core reset target sources

**Note:** RAM is never reset, but its content may be corrupted depending on the reset source.

Some retained registers may have a different reset behavior, as shown in following table.

<sup>5</sup> Depending on RAM retention settings.

An 'x' in the table means that the specific module is reset. Pin reset, brownout reset, and power-on reset are system level reset sources with the network core and application core having the same behavior, see [Application core reset behavior](#) on page 57.

| Reset source                     | Reset target                 |                |                |
|----------------------------------|------------------------------|----------------|----------------|
|                                  | Regular peripheral registers | GPIO           | POWER.GPREGRET |
| CPU lockup                       | x                            | x <sup>6</sup> |                |
| Soft reset                       | x                            | x <sup>6</sup> |                |
| Network FORCEOFF                 | x                            |                |                |
| Application Watchdog timer reset | x                            | x              |                |
| Local Watchdog timer reset       | x                            | x              |                |

Table 18: Network core reset behavior for retained registers

## 4.8.11 Registers

| Base address | Domain      | Peripheral | Instance   | Secure mapping | DMA security | Description              | Configuration |
|--------------|-------------|------------|------------|----------------|--------------|--------------------------|---------------|
| 0x50005000   | APPLICATION | RESET      | RESET : S  | US             | NA           | Reset control and status |               |
| 0x40005000   |             |            | RESET : NS |                |              |                          |               |
| 0x41005000   | NETWORK     | RESET      | RESET      | NS             | NA           | Reset status             |               |

Table 19: Instances

| Register         | Offset | Security | Description                               |
|------------------|--------|----------|-------------------------------------------|
| RESETRAS         | 0x400  |          | Reset reason                              |
| NETWORK.FORCEOFF | 0x614  |          | Force off power and clock in network core |

Table 20: Register overview

### 4.8.11.1 RESETRAS

Address offset: 0x400

Reset reason

Unless cleared, the RESETRAS register will be cumulative. A field is cleared by writing '1' to it.

| Bit number       |  |  | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 ## 4.9 CLOCK — Clock control

The clock control system can source the system clocks from a range of internal or external high and low frequency oscillators, and distribute them to modules based on the module's individual requirements. Clock distribution is automated and grouped independently by module to limit current consumption in unused branches of the clock tree.

Each core subsystem has its own clock control system that is responsible for requesting resources from the power and clock subsystem.

Figure 14: Clock control

The power and clock subsystem secures glitch-free switching from one clock source to another. This applies to all clock sources.

**Note:** Registers [INTEN](#) on page 77, [INTENSET](#) on page 78, and [INTENCLR](#) on page 78 are the same registers (at the same address) as the corresponding registers in POWER.

#### 4.9.1 HFCLK controller

Each core has a number of high frequency clock (HFCLK) control instances. Each instance distributes one or more clocks to the core.

The following table lists the core clocks that are available.

| Core clock | Description                                             |
|------------|---------------------------------------------------------|
| HCLK128M   | Scalable 128 MHz CPU clock for the application core     |
| HCLK64M    | 64 MHz CPU clock for the network core                   |
| PCLK192M   | Scalable 192 MHz clock for QSPI                         |
| PCLK64M    | 64 MHz peripheral clock                                 |
| PCLK48M    | 48 MHz clock for USB                                    |
| PCLK32M    | 32 MHz peripheral clock                                 |
| PCLK16M    | 16 MHz peripheral clock                                 |
| ACLK       | 11.289 MHz or 12.288 MHz tunable audio peripheral clock |

Table 21: Core clocks

The HFCLK clocks sourced from the power and clock subsystem to the HFCLK control instances are the following:

| HFCLK clock | Description         |
|-------------|---------------------|
| HFCLK128M   | 128 MHz HFCLK clock |
| HFCLK64M    | 64 MHz HFCLK clock  |
| HFCLK192M   | 192 MHz HFCLK clock |
| HFCLKAUDIO  | Audio HFCLK clock   |

Table 22: HFCLK clocks for HFCLK control instances

In order to generate the HFCLK clocks, the following HFCLK sources are available:

- 192 MHz/128 MHz/64 MHz internal oscillator (HFINT)
- 32 MHz crystal oscillator (HFXO), optionally using built-in capacitors as described in [OSCILLATORS — Oscillator control](#) on page 88

See [Figure 14: Clock control](#) on page 62 for more information.

CPUs, peripherals, and other system components within a core will automatically request clocks from its corresponding local HFCLK control. The HFCLK control passes the request to the power and clock subsystem and, once the clocks are running, distributes them to the components within the core.

When HFCLK control requests within a core are stopped, the HFCLK control will stop requesting clock from the power and clock subsystem. For example, when the CPU enters sleep or when peripherals have completed their tasks. If there are no HFCLK control requests from any core, the power and clock subsystem will automatically stop the clock.

When the system enters System ON mode, and a HFCLK clock is requested, the relevant HFINT will be used as the HFCLK source. When requests for the clock are stopped, the HFINT will automatically stop.

HFCLK clocks are only available to the HFCLK controllers when the system is in System ON mode.

It is possible to have a HFCLK source running before being started by the relevant clock request (for instance, the HFCLK source is kept running during sleep). This gives shorter start-up time but causes increased power consumption. Starting the HFXO is needed when crystal clock accuracy is required.

The HFCLK source selected in register [HFCLKSRC](#) on page 82 is started by triggering the [HFCLKSTART](#) task.

The source for the HFCLK128M/HFCLK64M clocks can be configured at any time (for instance, when the HFCLK has already been started). The content of the [HFCLKSRC](#) register only takes effect when the [HFCLKSTART](#) task is triggered.

The event [HFCLKSTARTED](#) is generated when the [HFCLKSTART](#) task is triggered, the oscillator is started, and the frequency is stabilized.

The HFCLK source selected in register [HFCLK192MSRC](#) on page 85 is started by triggering the [HFCLK192MSTART](#) task.

The source for the HFCLK192M clock can be configured at any time (for instance, when the HFCLK has already been started). The content of the [HFCLK192MSRC](#) register only takes effect when the [HFCLK192MSTART](#) task is triggered.

The event [HFCLK192MSTARTED](#) is generated when the [HFCLK192MSTART](#) task is triggered, the oscillator is started, and the frequency stabilized.

The HFXO is started by triggering the [HFCLKAUDIOSTART](#) task.

The event [HFCLKAUDIOSTARTED](#) is generated when the [HFCLKAUDIOSTART](#) task is triggered, the oscillator is started, and the frequency stabilized.

It is possible to trigger a new START task after one has already been triggered, and before the corresponding STARTED event is generated. In this case, only one STARTED event will be generated, corresponding to the last triggered START task. Triggering a START task after the STARTED event from a previous triggered START task is generated, will generate a new STARTED event.

Time from a START task to the corresponding STARTED event may differ depending on whether the HFCLK source is already running or in the process of starting. The amount of time before a STARTED event may vary when a different HFCLK source is configured before triggering a new START task.

When the clock control system switches from HFINT source to HFXO source, the HFXO becomes active after a HFXO startup time set in register [HFXOCNT](#) on page 117. The startup time is programmable, enabling the use of different types of crystal oscillators (e.g. standard crystals that may have different startup times).

The HFXO must be selected and started in order to do the following:

- Use RADIO
  - The network domain [HFCLKSTART](#) task is used
- Enable USB D to respond to USB traffic
  - The application domain [HFCLK192MSTART](#) is used
- Set NFCT to activated state
  - The application domain [HFCLKSTART](#) task is used
- Improve SAADC performance by reducing clock jitter
  - The application domain [HFCLKSTART](#) task is used

Each HFCLK control can request the HFXO source independently from one another via the corresponding START task. This ensures that each core and peripheral will have access to a high accuracy clock when needed. Core clocks that originate from the same HFCLK clock will also have the same HFCLK source. This means that parts of the core that have not requested the HFXO may get a clock that is more accurate than expected, but not the other way around.

All cores that have requested a HFCLK source to start by triggering a START task must also request it to stop by triggering the corresponding STOP task (see [HFCLKSTOP](#), [HFCLK192MSTOP](#) and [HFCLKAUDIOSTOP](#) tasks) before the power and clock subsystem will stop it.

HFCLK source(s) will stop when all corresponding STOP tasks have been triggered and there are no requests for HFCLK clock(s) from the system.

Triggering a HFCLK STOP task is required only if the corresponding HFCLK START task has been triggered before. When a HFCLK START task is triggered, it is possible to trigger again the same HFCLK START task without triggering the corresponding HFCLK STOP task in between.

#### 4.9.1.1 Application core frequency scaling

The application core clocks can be scaled from their respective HFCLK clocks.

The application core clock HCLK128M can be scaled from the HFCLK128M clock using the [HFCLKCTRL](#) register.

The HCLK192M clock can be scaled from the HFCLK192M clock using the [HFCLK192MCTRL](#) register.

**Note:** Settings Div1 and Div2 in [HFCLK192MCTRL](#) register will result in increased power consumption.

The ACLK audio clock cannot be scaled from the HFCLKAUDIO clock. Instead, its frequency can be configured in the relevant peripherals. Refer to [Audio oscillator](#) on page 65 for more information on audio clock and related peripherals.

**Note:** It is possible to scale the application core clocks at any time. For instance, when a clock has already been started, without having to stop it first.

#### 4.9.1.2 32 MHz crystal oscillator (HFXO)

The 32 MHz crystal oscillator (HFXO) is controlled by a 32 MHz external crystal, see [OSCILLATORS — Oscillator control](#) on page 88.

#### 4.9.1.3 Audio oscillator

The audio oscillator generates clock frequencies suitable for audio applications.

The audio oscillator has the following features:

- Adjustable frequency with 3.3 ppm resolution in two frequency bands - 11.176 MHz to 11.402 MHz, and 12.165 MHz to 12.411 MHz
- Low jitter, suitable for audio applications
- Always uses the HFXO

The HFCLKAUDIO clock generated by the audio oscillator is suitable for use as the source clock in the I<sup>2</sup>S and PDM audio peripherals. In order to use this clock, it must be selected in the corresponding configuration registers in these peripherals. It is required to trigger the [HFCLKAUDIOSTART](#) task before it is used. To stop the HFCLKAUDIO clock, the [HFCLKAUDIOSTOP](#) task must be triggered. After triggering this task, the oscillator will be kept running as long as a peripheral is using it.

In applications where the audio data is arriving asynchronously to on-chip clocks, the frequency can be adjusted to stay in sync with the sender. The frequency can be configured in register [HFCLKAUDIO.FREQUENCY](#) on page 83 using one of the following equations.

$$f_{out} = \frac{32M}{12} (4 + HFCLKAUDIO.FREQUENCY \cdot 2^{-16})$$

Figure 15: Calculating audio frequency  $f_{out}$  from register value

$$HFCLKAUDIO.FREQUENCY = 2^{16} \left( \frac{12f_{out}}{32M} - 4 \right)$$

Figure 16: Calculating register value from audio frequency  $f_{out}$

The acceptable [HFCLKAUDIO.FREQUENCY](#) register value ranges for the two frequency bands are listed in the following table.

When switching between the two frequency ranges, the peripherals must be stopped.

| Frequency band           | Register value and frequency |                       |                       |
|--------------------------|------------------------------|-----------------------|-----------------------|
|                          | Min                          | Center                | Max                   |
| 11.176 MHz to 11.402 MHz | 12519<br>(11.176 MHz)        | 15298<br>(11.289 MHz) | 16068<br>(11.402 MHz) |
| 12.165 MHz to 12.411 MHz | 36834<br>(12.165 MHz)        | 39854<br>(12.288 MHz) | 42874<br>(12.411 MHz) |

Table 23: HFCLKAUDIO.FREQUENCY register ranges

#### 4.9.1.4 Overriding the automatic HFCLK control system

Overriding the automatic clock control system is possible to ensure a HFCLK clock is started and kept running, even if not requested.

This can be used to avoid associated HFCLK clock start-up times and have the highest clock accuracy after wake-up from sleep.

The register [HFCLKALWAYSRUN](#) on page 84 can override the automatic clock control system for the HFCLK128M/HFCLK64M clocks. This override is initiated by performing the following steps:

1. Set [HFCLKSRC.SRC](#) to select the HFCLK source.
2. Set [HFCLKALWAYSRUN.ALWAYSRUN](#).
3. Trigger the [HFCLKSTART](#) task.

The register [HFCLK192MALWAYSRUN](#) on page 85 can override the automatic clock control system for the HFCLK192M clock. This override is initiated by performing the following steps:

1. Set [HFCLK192MSRC.SRC](#) to select the HFCLK source.
2. Set [HFCLK192MALWAYSRUN.ALWAYSRUN](#).
3. Trigger the [HFCLK192MSTART](#) task.

Registers [HFCLKSRC/HFCLK192MSRC](#) and [HFCLKALWAYSRUN/HFCLK192MALWAYSRUN](#) can be written at any time, but are only activated by the START task.

The register [HFCLKAUDIOALWAYSRUN](#) on page 84 can override the automatic clock control system for the HFCLKAUDIO clock. The override is initiated by performing the following steps:

1. Set [HFCLKAUDIOALWAYSRUN.ALWAYSRUN](#).
2. Trigger the [HFCLKAUDIOSTART](#) task.

**Note:** In this case, the HFCLK source is always the HFXO.

Register [HFCLKAUDIOALWAYSRUN](#) can be written at any time, but is only activated by the START task.

#### 4.9.2 LFCLK controller

Each core has a number of low frequency clock (LFCLK) control instances. Each instance distributes one or more clocks to the core.

The LFCLK control instance in each core distributes the 32.768 kHz PCLK32KI peripheral clock to its corresponding core. The LFCLK clock is sourced from the power and clock subsystem to each LFCLK control instance.

In order to generate the LFCLK clock, the LFCLK controller uses the following LFCLK sources:

- 32.768 kHz RC oscillator (LFRC)
- 32.768 kHz ultra-low power RC oscillator (LFULP)
- 32.768 kHz crystal oscillator (LFXO)
- 32.768 kHz synthesized from HFCLK (LFSYNT)

To see an illustration of the clock sources, see [Figure 14: Clock control](#) on page 62.

The LFCLK controller and all LFCLK sources are switched off in System OFF mode.

When peripherals require the PCLK32KI clock, such as [RTC — Real-time counter](#) on page 488 and [WDT — Watchdog timer](#) on page 721, the LFCLK control will automatically request the LFCLK clock to the power and clock subsystem. The default LFCLK source is the LFRC.

When LFCLK control requests are stopped, LFCLK will stop requesting clock from the power and clock subsystem. If there are no LFCLK control requests from other cores, the power and clock subsystem will automatically stop the LFCLK clock and the LFRC source.

The LFCLK source may also be started by triggering the **LFCLKSTART** task. The LFCLK source is configured by selecting the preferred LFCLK source in register **LFCLKSRC** on page 83. Once selected, the LFCLK source will be started by triggering the **LFCLKSTART** task.

The LFCLK source can be configured at any time (for instance, when the LFCLK has already been started). The content of the **LFCLKSRC** register only takes effect when the **LFCLKSTART** task is triggered.

**Note:** Automatic requests of the LFCLK clock will ignore the value in **LFCLKSRC** and use **LFRC** as source, unless the LFCLK source is started by triggering the **LFCLKSTART** task. In this case, the LFCLK source will correspond to the value in **LFCLKSRC** when the **LFCLKSTART** task was last triggered.

The **LFCLKSTARTED** event will be generated after the **LFCLKSTART** task has been triggered and the LFCLK source has started. Triggering a **LFCLKSTART** task before the **LFCLKSTARTED** event from a previous **LFCLKSTART** task is generated will only generate one **LFCLKSTARTED** event. Triggering a **LFCLKSTART** task after a **LFCLKSTARTED** event is generated will generate a new **LFCLKSTARTED** event.

The LFCLK clock is stopped when nothing requests it, e.g. **RTC — Real-time counter** on page 488 and **WDT — Watchdog timer** on page 721 are stopped, and the **LFCLKSTOP** task is triggered. This must be done for all cores. Triggering the **LFCLKSTOP** task is required only if the **LFCLKSTART** task has been triggered before.

When the **LFCLKSTART** task is triggered, it is possible to trigger a new **LFCLKSTART** task without triggering a **LFCLKSTOP** task in between.

If the **LFXO** is selected as the LFCLK source, the LFCLK clock will initially start running from the **LFRC** while the **LFXO** is starting up, and then automatically switch to using the **LFXO** once this oscillator is running.

Events will be generated in the correct order, even if an LFCLK source that is already started by another LFCLK control instance is requested. The timing of events may differ, depending on whether a LFCLK source is already running or in the process of starting.

If two instances of the LFCLK control system request different LFCLK sources, the power and clock subsystem will secure that the most accurate of the requested LFCLK sources is selected.

If one LFCLK control instance requests a particular LFCLK source to stop when another LFCLK control instance (or a peripheral) requests the same source to run, but at a lower accuracy, the power and clock subsystem will switch to the less accurate source. The following table summarizes the priorities of the LFCLK sources.

| Priority | LFCLK source |
|----------|--------------|
| Highest  | LFSYNT       |
| ...      | LFXO         |
| ...      | LFRC         |
| Lowest   | LFULP        |

Table 24: LFCLK request priority

When switching the LFCLK source, such as from **LFRC** to **LFXO**, up to one LFCLK cycle may be lost.

#### 4.9.2.1 32.768 kHz RC oscillator (LFRC)

An internal 32.768 kHz RC oscillator (**LFRC**) is available as the LFCLK source.

The **LFRC** oscillator is fully embedded in nRF5340 and does not require additional external components.

##### 4.9.2.1.1 Calibrating the 32.768 kHz RC oscillator

To improve accuracy of the **LFRC** oscillator, it can be calibrated using the **HFXO** as a reference oscillator.

The **LFRC** oscillator can be calibrated while it is running. The calibration is started by triggering the **CAL** task which temporarily requests the **HFCLK** with **HFXO** as the source for calibration.

A **DONE** event will be generated when the calibration is finished.

**Note:** Any core changing the LFCLK source will abort calibration without the **DONE** event being generated in the core triggering the **CAL** task.

If **CAL** task is triggered while a calibration routine is already running (i.e. before the **DONE** event is generated), the **CAL** task has no effect and the calibration continues.

All cores can trigger the **CAL** task independently of each other. As a result, each core will receive a corresponding **DONE** event. If the calibration routine is already running (i.e. a core has triggered the **CAL** task), and the **CAL** task is triggered from another core, a **DONE** event is generated in both cores when the calibration of its corresponding LFRC oscillator is complete.

#### 4.9.2.2 32.768 kHz ultra-low power RC oscillator (LFULP)

An internal 32.768 kHz ultra-low power RC oscillator (LFULP) is available as an LFCLK source.

The LFULP oscillator is fully embedded in the SOC and does not require additional external components. Compared to the LFRC, the LFULP uses less power but has decreased accuracy. This oscillator can be used as a coarse, low-precision time reference in applications where low power is the main requirement.

Unlike the LFRC oscillator, the LFULP oscillator cannot be calibrated.

#### 4.9.2.3 32.768 kHz crystal oscillator (LFXO)

For higher LFCLK accuracy (when greater than  $\pm 250$  ppm accuracy is required), the low frequency crystal oscillator (LFXO) must be used.

This clock source requires external components, see [OSCILLATORS — Oscillator control](#) on page 88.

#### 4.9.2.4 32.768 kHz synthesized from HFCLK (LFSYNT)

LFCLK can be synthesized from the HFCLK clock source.

LFSYNTH depends on the HFCLK to run. The accuracy of the LFCLK clock with LFSYNTH as a source assumes the accuracy of the HFCLK. If high accuracy is required, the HFCLK must be generated from the HFXO.

Using the LFSYNT clock removes the requirement for an external 32.768 kHz crystal, but increases average power consumption as the HFCLK will need to be requested in the system.

#### 4.9.2.5 Overriding the automatic LFCLK control system

Overriding the automatic clock control system to ensure the LFCLK clock is started and kept running is possible, even if not requested.

This can be used to avoid associated LFCLK clock start-up times and have the highest clock accuracy after wake-up from sleep.

The register [LFCLKALWAYSRUN](#) on page 84 can override the automatic clock control system. This override is initiated by performing the following steps:

1. Set [LFCLKSRC.SRC](#) to select the LFCLK source.
2. Set [LFCLKALWAYSRUN.ALWAYSRUN](#).
3. Trigger the [LFCLKSTART](#) task.

Registers [LFCLKSRC.SRC](#) and [LFCLKALWAYSRUN.ALWAYSRUN](#) can be written at any time, but are only activated by the [LFCLKSTART](#) task.

## 4.9.3 Registers

| Base address | Domain      | Peripheral | Instance   | Secure mapping | DMA security | Description   | Configuration                |
|--------------|-------------|------------|------------|----------------|--------------|---------------|------------------------------|
| 0x50005000   | APPLICATION | CLOCK      | CLOCK : S  | US             | NA           | Clock control |                              |
| 0x40005000   |             |            | CLOCK : NS |                |              |               |                              |
| 0x41005000   | NETWORK     | CLOCK      | CLOCK      | NS             | NA           | Clock control | HFCLKCTRL reset value is 0x0 |

Table 25: Instances

| Register                  | Offset | Security | Description                                                                                                                                                                                       |
|---------------------------|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TASKS_HFCLKSTART          | 0x000  |          | Start HFCLK128M/HFCLK64M source as selected in HFCLKSRC                                                                                                                                           |
| TASKS_HFCLKSTOP           | 0x004  |          | Stop HFCLK128M/HFCLK64M source                                                                                                                                                                    |
| TASKS_LFCLKSTART          | 0x008  |          | Start LFCLK source as selected in LFCLKSRC                                                                                                                                                        |
| TASKS_LFCLKSTOP           | 0x00C  |          | Stop LFCLK source                                                                                                                                                                                 |
| TASKS_CAL                 | 0x010  |          | Start calibration of LFRC oscillator                                                                                                                                                              |
| TASKS_HFCLKAUDIOSTART     | 0x018  |          | Start HFCLKAUDIO source                                                                                                                                                                           |

   #### 4.9.3.46 HFCLKALWAYSRUN

Address offset: 0x570

Automatic or manual control of HFCLK128M/HFCLK64M

The AlwaysRun setting will ensure the clock source is always running, independent of the automatic clock request system.

This setting is activated by triggering the HFCLKSTART task.

## 4.9.4 Electrical specification

### 4.9.4.1 128 MHz clock source (HFCLK128M)

| Symbol                      | Description                                               | Min. | Typ. | Max. | Units |
|-----------------------------|-----------------------------------------------------------|------|------|------|-------|
| $f_{\text{NOM\_HFCLK128M}}$ | Nominal output frequency                                  |      | 128  |      | MHz   |
| $f_{\text{TOL\_HFINT128M}}$ | Frequency tolerance when running from internal oscillator | ..   | ..   | ..   | %     |
| $f_{\text{TOL\_HFXO128M}}$  | Frequency tolerance when running from crystal oscillator  | ..   | ..   | ..   | %     |

### 4.9.4.2 64 MHz clock source (HFCLK64M)

| Symbol                     | Description                                               | Min. | Typ. | Max. | Units |
|----------------------------|-----------------------------------------------------------|------|------|------|-------|
| $f_{\text{NOM\_HFCLK64M}}$ | Nominal output frequency                                  |      | 64   |      | MHz   |
| $f_{\text{TOL\_HFINT64M}}$ | Frequency tolerance when running from internal oscillator | ..   | ..   | ..   | %     |
| $f_{\text{TOL\_HFXO64M}}$  | Frequency tolerance when running from crystal oscillator  | ..   | ..   | ..   | %     |

### 4.9.4.3 192 MHz clock source (HFCLK192M)

| Symbol                      | Description                                               | Min. | Typ. | Max. | Units |
|-----------------------------|-----------------------------------------------------------|------|------|------|-------|
| $f_{\text{NOM\_HFCLK192M}}$ | Nominal output frequency                                  |      | 192  |      | MHz   |
| $f_{\text{TOL\_HFINT192M}}$ | Frequency tolerance when running from internal oscillator | ..   | ..   | ..   | %     |
| $f_{\text{TOL\_HFXO192M}}$  | Frequency tolerance when running from crystal oscillator  | ..   | ..   | ..   | %     |

### 4.9.4.4 Audio clock source (HFCLKAUDIO)

| Symbol                       | Description                                              | Min. | Typ.                   | Max. | Units |
|------------------------------|----------------------------------------------------------|------|------------------------|------|-------|
| $f_{\text{NOM\_HFCLKAUDIO}}$ | Nominal output frequency                                 |      | 11.289<br>or<br>12.288 |      | MHz   |
| $f_{\text{TOL\_HFXOAUDIO}}$  | Frequency tolerance when running from crystal oscillator | ..   | ..                     | ..   | %     |

### 4.9.4.5 32 MHz crystal oscillator (HFXO)

| Symbol                          | Description                                                                                        | Min. | Typ. | Max. | Units         |
|---------------------------------|----------------------------------------------------------------------------------------------------|------|------|------|---------------|
| $f_{\text{XTAL\_HFXO}}$         | External crystal frequency                                                                         | ..   | ..   | ..   | MHz           |
| $f_{\text{TOL\_HFXO}}$          | Frequency tolerance requirement for 2.4 GHz proprietary radio applications                         | ..   | ..   | ..   | ppm           |
| $f_{\text{TOL\_HFXO\_BLE}}$     | Frequency tolerance requirement, Bluetooth low energy applications, packet length $\leq 200$ bytes | ..   | ..   | ..   | ppm           |
| $f_{\text{TOL\_HFXO\_BLE\_LP}}$ | Frequency tolerance requirement, Bluetooth low energy applications, packet length $> 200$ bytes    | ..   | ..   | ..   | ppm           |
| $C_{\text{L\_HFXO}}$            | Load capacitance                                                                                   | ..   | ..   | ..   | pF            |
| $C_{\text{0\_HFXO}}$            | Shunt capacitance                                                                                  | ..   | ..   | ..   | pF            |
| $R_{\text{S\_HFXO\_7PF}}$       | Equivalent series resistance $3 \text{ pF} < C_0 \leq 7 \text{ pF}$                                | ..   | ..   | ..   | $\Omega$      |
| $R_{\text{S\_HFXO\_3PF}}$       | Equivalent series resistance $C_0 \leq 3 \text{ pF}$                                               | ..   | ..   | ..   | $\Omega$      |
| $P_{\text{D\_HFXO}}$            | Drive level                                                                                        | ..   | ..   | ..   | $\mu\text{W}$ |
| $C_{\text{PIN\_HFXO}}$          | Input capacitance XC1 and XC2                                                                      | ..   | ..   | ..   | pF            |
| $I_{\text{STBY\_X32M}}$         | Core standby current for various crystals                                                          | ..   | ..   | ..   |               |

| Symbol                     | Description                                              | Min. | Typ. | Max. | Units |
|----------------------------|----------------------------------------------------------|------|------|------|-------|
| I <sub>STBY_X32M_X0</sub>  | Epson TSX-3225                                           | ..   | ..   | ..   | μA    |
| I <sub>STBY_X32M_X1</sub>  | Epson FA-20H                                             | ..   | ..   | ..   | μA    |

#### 4.9.4.6 32.768 kHz crystal oscillator (LFXO)

| Symbol                    | Description                                    | Min. | Typ.   | Max. | Units |
|---------------------------|------------------------------------------------|------|--------|------|-------|
| f <sub>NOM_LFXO</sub>     | Crystal frequency                              |      | 32.768 |      | kHz   |
| f <sub>TOL_LFXO_BLE</sub> | Frequency tolerance requirement for BLE stack  | ..   | ..     | ..   | ppm   |
| f <sub>TOL_LFXO_ANT</sub> | Frequency tolerance requirement for ANT stack  | ..   | ..     | ..   | ppm   |
| C <sub>L_LFXO</sub>       | Load capacitance                               | ..   | ..     | ..   | pF    |
| C <sub>0_LFXO</sub>       | Shunt capacitance                              | ..   | ..     | ..   | pF    |
| R <sub>S_LFXO</sub>       | Equivalent series resistance                   | ..   | ..     | ..   | kΩ    |
| P <sub>D_LFXO</sub>       | Drive level                                    | ..   | ..     | ..   | μW    |
| C <sub>pin</sub>          | Input capacitance on XL1 and XL2 pads          | ..   | ..     | ..   | pF    |
| I <sub>LFXO</sub>         | Run current for 32.768 kHz crystal oscillator  | ..   | ..     | ..   | μA    |
| t <sub>START_LFXO</sub>   | Startup time for 32.768 kHz crystal oscillator | ..   | ..     | ..   | s     |

#### 4.9.4.7 32.768 kHz RC oscillator (LFRC)

| Symbol                    | Description                                        | Min. | Typ.   | Max. | Units |
|---------------------------|----------------------------------------------------|------|--------|------|-------|
| f <sub>NOM_LFRC</sub>     | Nominal frequency                                  |      | 32.768 |      | kHz   |
| f <sub>TOL_LFRC</sub>     | Frequency tolerance, uncalibrated                  | ..   | ..     | ..   | %     |
| f <sub>TOL_CAL_LFRC</sub> | Frequency tolerance after calibration <sup>7</sup> | ..   | ..     | ..   | ppm   |
| I <sub>LFRC</sub>         | Run current                                        | ..   | ..     | ..   | μA    |
| t <sub>START_LFRC</sub>   | Startup time                                       | ..   | ..     | ..   | μs    |

#### 4.9.4.8 32.768 kHz ultra-low power RC oscillator (LFULP)

<sup>7</sup> Constant temperature within ±0.5 °C, calibration performed at least every 8 seconds, averaging interval > 7.5 ms, defined as 3 sigma

| Symbol                    | Description         | Min. | Typ.   | Max. | Units         |

| $f_{\text{NOM\_LFSYNT}}$ | Nominal frequency |      | 32.768 |      | kHz   |

## 4.10 OSCILLATORS — Oscillator control

The system oscillators are shared between the cores in the system and automatically controlled by the clock control system, see [CLOCK — Clock control](#) on page 61.

The system has the following crystal oscillators:

- High-frequency 32 MHz crystal oscillator (HFXO)
- Low-frequency 32.768 kHz crystal oscillator (LFXO)

The crystal oscillators can be configured to use either built-in or external capacitors.

### 4.10.1 High-frequency (32 MHz) crystal oscillator (HFXO)

The high-frequency crystal oscillator (HFXO) is controlled by a 32 MHz external crystal.

The crystal oscillator is designed for use with an AT-cut quartz crystal in parallel resonant mode, connected between pins XC1 and XC2. To achieve correct oscillation frequency, the load capacitance must match the specification in the crystal data sheet. The following figure shows how the 32 MHz crystal is connected to the high frequency crystal oscillator.

Figure 17: Circuit diagram of the high-frequency crystal oscillator

The load capacitance (CL) is the total capacitance seen by the crystal across its terminals and is calculated by the following equation.

$$CL = \frac{(C1' \cdot C2')}{(C1' + C2')}$$

$$C1' = C1 + C_{pcb1} + C_{pin}$$

$$C2' = C2 + C_{pcb2} + C_{pin}$$

Figure 18: Load capacitance equation

C1 and C2 are ceramic SMD capacitors connected between each crystal terminal and ground. For more information, see [Reference circuitry](#) on page 768.  $C_{pcb1}$  and  $C_{pcb2}$  are stray capacitances on the PCB.  $C_{pin}$  is the pin input capacitance on pins XC1 and XC2. See [table 32 MHz crystal oscillator \(HFXO\)](#) on page 86. The load capacitors C1 and C2 should have the same value.

For reliable operation, the crystal load capacitance, shunt capacitance, equivalent series resistance, and drive level must comply with the specifications in [table 32 MHz crystal oscillator \(HFXO\)](#) on page 86. It is recommended to use a crystal with lower than maximum load capacitance and/or shunt capacitance. A low load capacitance will reduce both startup time and current consumption.

#### 4.10.1.1 Using internal capacitors

Optional internal capacitors ranging from 7.0 pF to 20.0 pF in 0.5 pF steps, are provided on pins XC1 and XC2.

To use these capacitors, in the following equation replace CAPACITANCE with the desired value to find the correct `XOSC32MCAPS.CAPVALUE` field. Then, set `XOSC32MCAPS.ENABLE` to Enabled.

$$CAPVALUE = (1 + FICR \rightarrow XOSC32MTRIM.SLOPE / 16) * (CAPACITANCE * 2 - 14) + FICR \rightarrow XOSC32MTRIM.OFFSET$$

#### 4.10.2 Low-frequency (32.768 kHz) crystal oscillator (LFXO)

For higher LFCLK accuracy (when greater than  $\pm 250$  ppm accuracy is required), the 32.768 kHz crystal oscillator (LFXO) must be used.

To use the LFXO, a 32.768 kHz crystal must be connected between the XL1 and XL2 pins. To achieve correct oscillation frequency, the load capacitance must match the specification in the crystal data sheet.

The LFXO circuitry is illustrated in the following diagram.

Figure 19: Circuit diagram of the low-frequency crystal oscillator

The load capacitance (CL) is the total capacitance seen by the crystal across its terminals. It is calculated by the following equation.

$$CL = \frac{(C1' \cdot C2')}{(C1' + C2')}$$

$$C1' = C1 + C_{pcb1} + C_{pin}$$

$$C2' = C2 + C_{pcb2} + C_{pin}$$

Figure 20: Load capacitance equation

C1 and C2 are ceramic SMD capacitors connected between each crystal terminal and ground.  $C_{pcb1}$  and  $C_{pcb2}$  are stray capacitances on the PCB.  $C_{pin}$  is the pin input capacitance on the XL1 and XL2 pins (see [32.768 kHz crystal oscillator \(LFXO\)](#) on page 87). The load capacitors C1 and C2 should have the same value.

For more information, see [Reference circuitry](#) on page 768.

#### 4.10.2.1 Using internal capacitors

Optional internal capacitors of 6 pF, 7 pF, and 11 pF are provided on pins XL1 and XL2.

To use these capacitors, select the capacitance in register [XOSC32KI.INTCAP](#).

#### 4.10.3 Low-frequency (32.768 kHz) external source

The 32.768 kHz crystal oscillator (LFXO) is designed to work with external sources.

The following external sources are supported:

- A low swing clock. The signal should be applied to the XL1 pin with the XL2 pin grounded. Set [OSCILLATORS.XOSC32KI.BYPASS](#)=Disabled.
- A rail-to-rail clock. The signal should be applied to the XL1 pin with the XL2 pin left unconnected. Set [OSCILLATORS.XOSC32KI.BYPASS](#)=Enabled.

In order to use an external source, configure [LFCLKSRC.SRC](#)=LFXO.

# 5.1 Application core

## 5.1.1 Application core overview

The application core contains a low-power microcontroller with embedded flash memory and a full featured Arm Cortex-M33 processor.

In addition, the application core includes a rich set of peripherals for serial communication, analog interfaces, and cryptographic acceleration. See the following figure for more information. Arrows with white heads indicate signals that share physical pins with other signals, while arrows with black heads are dedicated to one signal.

Figure 21: Application core block diagram

## 5.1.2 CPU

The Arm Cortex-M33 processor has a 32-bit instruction set (Thumb-2 technology) that implements a superset of 16- and 32-bit instructions to maximize code density and performance.

This processor implements several features that enable energy-efficient arithmetic and high-performance signal processing including:

- Digital signal processing (DSP) instructions
- Single-cycle multiply and accumulate (MAC) instructions
- Hardware divide
- 8- and 16-bit single instruction multiple data (SIMD) instructions
- Single-precision floating-point unit (FPU)
- Memory Protection Unit (MPU)
- Arm TrustZone for Armv8-M

The [Arm Cortex Microcontroller Software Interface Standard \(CMSIS\)](#) is implemented and available for the application processor.

Real-time execution is highly deterministic in thread mode, to and from sleep modes, and when handling events at configurable priority levels via the Nested Vectored Interrupt Controller (NVIC).

Executing code from internal or external flash will have a wait state penalty. The instruction cache can be enabled to minimize flash wait states when fetching instructions. For more information on cache, see [Cache](#) on page 320. CPU performance parameters including wait states for different configurations, CPU current consumption and efficiency, and processing power and efficiency based on the CoreMark benchmark can be found in .

### 5.1.2.1 Floating point interrupt

The floating point unit (FPU) may generate exceptions, for example, due to overflow or underflow. These exceptions may trigger interrupts when enabled in the FPU peripheral. For more information, see [FPU - Floating point unit \(FPU\) exceptions](#) on page 204.

### 5.1.2.2 Electrical specification

#### 5.1.2.2.1 CPU performance

| Symbol                  | Description                                                           | Min. | Typ. | Max. | Units                    |
|-------------------------|-----------------------------------------------------------------------|------|------|------|--------------------------|
| W <sub>FLASH</sub>      | CPU wait states, running from flash, cache disabled                   | ..   | ..   | ..   |                          |

### 5.1.2.3 CPU and support module configuration

The Arm Cortex-M33 processor has a number of CPU options and support modules implemented on the device.

| Option/Module                                                      | Description                         | Implemented   |
|--------------------------------------------------------------------|-------------------------------------|---------------|
| Core options                                                       |                                     |               |
| PRIORITIES                                                         | Priority bits                       | 3             |
| WIC                                                                | Wakeup Interrupt Controller         | NO            |
| Endianness                                                         | Memory system endianness            | Little endian |
| DWT                                                                | Data Watchpoint and Trace           | YES           |
| Modules                                                            |                                     |               |
| MPU_NS                                                             | Number of non-secure MPU regions    | 8             |
| MPU_S                                                              | Number of secure MPU regions        | 8             |
| SAU                                                                | Number of SAU regions               | 0             |
| See <a href="#">SPU</a> for more information about secure regions. |                                     |               |
| FPU                                                                | Floating-point unit                 | YES           |
| DSP                                                                | Digital Signal Processing Extension | YES           |
| Arm TrustZone for Armv8-M                                          | ARMv8-M Security Extensions         | YES           |
| CPIF                                                               | Coprocessor interface               | NO            |
| ETM                                                                | Embedded Trace Macrocell            | YES           |
| ITM                                                                | Instrumentation Trace Macrocell     | YES           |
| MTB                                                                | Micro Trace Buffer                  | NO            |
| CTI                                                                | Cross Trigger Interface             | YES           |
| BPU                                                                | Breakpoint Unit                     | YES           |
| HTM                                                                | AHB Trace Macrocell                 | NO            |

### 5.1.3 Memory

The application core contains flash memory and RAM that can be used for code and data storage.

The following figure shows how the CPU, network core, and peripherals with EasyDMA can access RAM via the AHB multilayer interconnect. The domain configuration (DCNF) registers can block access from external DMA masters, see [DCNF — Domain configuration](#) on page 186.

Figure 22: Memory layout

### 5.1.3.1 Peripheral instantiation

The following table describes the abbreviations used in the Instance, Secure mapping, and DMA security columns of the instantiation table.

| Abbreviation | Description                                                                                                                               |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| NS           | Non-secure - Peripheral is always accessible as a Non-Secure peripheral                                                                   |
| S            | Secure - Peripheral is always accessible as a Secure peripheral                                                                           |
| US           | User Selectable - A Secure or Non-secure attribute for the peripheral is defined in the SPU                                               |
| SPLIT        | Both Secure and Non-secure - The same resource is shared by both secure and non-secure code                                               |
| NA           | Not Applicable - Peripheral has no DMA capability                                                                                         |
| NSA          | NoSeparateAttribute - Peripheral with DMA and DMA transfer has the same security attribute as assigned to the peripheral                  |
| SA           | SeparateAttribute - Peripheral with DMA and DMA transfers can have a different security attribute than the one assigned to the peripheral |

Table 29: Instantiation table abbreviations

The Secure mapping column in the following table defines configuration capabilities for the Arm TrustZone for Armv8-M secure attribute. The DMA security column describes the DMA capabilities of the peripheral.

### 5.1.3.1.1 Instantiation

| ID | Base address             | Peripheral  | Instance                            | Secure mapping | DMA security | Description                                                |

## 5.1.4 Core components

### 5.1.4.1 CACHE — Instruction/data cache

The cache is two-way set associative with a least recently used (LRU) replacement policy. Both instruction and data accesses towards flash memory or XIP code regions are cached.

The cache has the following features:

- 128-bit cache line
- Configurable as a cache or general purpose RAM
- Hit/miss counters per NVM region and access type (instruction or data)

- Readable cache content (for profiling)
  - Data, tag, valid, and most recently used (MRU) bits
  - Can be disabled when not in use
- Manual invalidation and erase support
- Locking cache updates on cache misses

Figure 23: Cache overview

In Cache mode (**MODE**=Cache), instruction and data accesses from the CPU over the code bus towards internal or external flash, are cached. The contents of the cache, i.e. data, tag, valid, and MRU bits, are memory mapped, see [Cache content](#) on page 100. This can be used for performance profiling of code running in the system. Access to the cache content region is read-only by default, but can be blocked by enabling a lock bit in **DEBUGLOCK** on page 105. Preventing cache content updates on cache misses can be enabled through register **DEBUGLOCK** on page 105. When enabled, cache content is not replaced, but kept intact. The cache is still enabled and provides fast instruction and data fetches for cached content.

Access to internal or external flash memory will not be cached when in Ram mode (**MODE**=Ram). Instead, the cache data content, as described in [Cache content](#) on page 100, can be used as read/write RAM.

#### 5.1.4.1.1 Cache content

Cache information is divided into cache info content and cache data content.

Cache info content is organized in memory as show in the following figure.

Figure 24: Cache info content

The V field contains the bit that indicates if a cache entry is valid or not. All V fields are cleared when invalidating the cache using register [INVALIDATE](#) on page 104, when disabling the cache using register [ENABLE](#) on page 103, or when changing [MODE](#) from RAM to Cache. The MRU field indicates which way was used most recently in the set. The MRU bit is updated on each fetch from the cache and is used for the cache replacement policy. The Tag field is used to check if an entry in the cache matches the address being fetched.

The following figure shows how the cache data content is organized in memory.

Figure 25: Cache data content

Each set consists of two ways, each containing 128-bits of data. The 128-bit data is available as 4x32-bit words in sequential order. When operating in RAM mode ([MODE](#) = Ram), the data is accessible as general purpose RAM.

The cache info and cache data content are memory mapped in the [CACHEINFO](#) and [CACHEDATA](#) regions. These can be accessed in the [CACHEINFO registers](#) and [CACHEDATA registers](#) respectively.

### 5.1.4.1.2 Profiling

The cache includes profiling counters **IHIT**, **IMISS**, **DHIT**, and **DMISS** for both flash and execute-in-place (XIP).

Cache performance on executed code is indicated by these counters when enabled through **PROFILINGENABLE** on page 104. The counters can be cleared at any time using **PROFILINGCLEAR** on page 104. Writing to this register will clear all profiling counters. After being cleared, the counters will increment at the next instruction, or data fetch, according to the rules in the following table.

| Profiling counter | Description                                                                                      |
|-------------------|--------------------------------------------------------------------------------------------------|
| <b>IHIT</b>       | Increased on a cache hit for instruction fetch                                                   |
| <b>IMISS</b>      | Increased on a cache miss for instruction fetch                                                  |
| <b>DHIT</b>       | Increased on a cache hit for data fetch (i.e. LOAD type instruction targeting the cache region)  |
| <b>DMISS</b>      | Increased on a cache miss for data fetch (i.e. LOAD type instruction targeting the cache region) |

Table 31: Profiling counters

### 5.1.4.1.3 Registers

| Base address | Domain      | Peripheral | Instance | Secure mapping | DMA security | Description | Configuration |
|--------------|-------------|------------|----------|----------------|--------------|-------------|---------------|
| 0x50001000   | APPLICATION | CACHE      | CACHE    | S              | NA           | Cache       |               |

Table 32: Instances

| Register                  | Offset | Security | Description                                                                                                                                                                                       |
|---------------------------|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PROFILING[n].IHIT</b>  | 0x400  |          | Instruction fetch cache hit counter for cache region n, where n=0 means Flash and n=1 means XIP.                                                                                                  |
| <b>PROFILING[n].IMISS</b> | 0x404  |          | Instruction fetch cache miss counter for cache region n, where n=0 means Flash and n=1 means XIP.                                                                                                 |
| <b>PROFILING[n].DHIT</b>  | 0x408  |          | Data fetch cache hit counter for cache region n, where n=0 means Flash and n=1 means XIP.                                                                                                         |
| <b>PROFILING[n].DMISS</b> | 0x40C  |          | Data fetch cache miss counter for cache region n, where n=0 means Flash and n=1 means XIP.                                                                                                        |
| <b>ENABLE</b>             | 0x500  |          | Enable cache                                                                                                                                                                                      |
| <b>INVALIDATE</b>         | 0x504  |          | Invalidate the cache                                                                                                                                                                              |
| <b>ERASE</b>              | 0x508  |          | Erase the cache                                                                                                                                                                                   |
| <b>PROFILINGENABLE</b>    | 0x50C  |          | Enable the profiling counters                                                                                                                                                                     |
| <b>PROFILINGCLEAR</b>     | 0x510  |          | Clear the profiling counters                                                                                                                                                                      |

#### 5.1.4.1.3.9 PROFILINGCLEAR

Address offset: 0x510

Clear the profiling counters

The profiling counters can be cleared at any time. When cleared, all profiling counters will be set to zero, and will increment at the next instruction- or data fetch.

**Note:** Write 0 to clear.

### 5.1.4.1.3.13 WRITELOCK

Address offset: 0x520

Lock cache updates. Prevents updating of cache content on cache misses, but will continue to lookup instruction/data fetches in content already present in the cache.

Ignored in RAM mode.

### 5.1.4.2 FICR — Factory information configuration registers

Factory information configuration registers (FICR) are pre-programmed in factory and cannot be erased by the user. These registers contain chip-specific information and configuration.

#### 5.1.4.2.1 Registers

| Base address | Domain      | Peripheral | Instance | Secure mapping | DMA security | Description                                 | Configuration |
|--------------|-------------|------------|----------|----------------|--------------|---------------------------------------------|---------------|
| 0x00FF0000   | APPLICATION | FICR       | FICR     | S              | NA           | Factory information configuration registers |               |

Table 38: Instances

| Register          | Offset | Security | Description                                                                                                              |
|-------------------|--------|----------|--------------------------------------------------------------------------------------------------------------------------|
| INFO.CONFIGID     | 0x200  |          | Configuration identifier                                                                                                 |
| INFO.DEVICEID[n]  | 0x204  |          | Device identifier                                                                                                        |
| INFO.PART         | 0x20C  |          | Part code                                                                                                                |
| INFO.VARIANT      | 0x210  |          | Part Variant, Hardware version and Production configuration                                                              |
| INFO.PACKAGE      | 0x214  |          | Package option                                                                                                           |
| INFO.RAM          | 0x218  |          | RAM variant                                                                                                              |
| INFO.FLASH        | 0x21C  |          | Flash variant                                                                                                            |
| INFO.CODEPAGESIZE | 0x220  |          | Code memory page size in bytes                                                                                           |
| INFO.CODESIZE     | 0x224  |          | Code memory size                                                                                                         |
| INFO.DEVICETYPE   | 0x228  |          | Device type                                                                                                              |
| TRIMCNF[n].ADDR   | 0x300  |          | Address of the PAR register which will be written                                                                        |
| TRIMCNF[n].DATA   | 0x304  |          | Data                                                                                                                     |
| NFC.TAGHEADER0    | 0x450  |          | Default header for NFC Tag. Software can read these values to populate NFCID1_3RD_LAST, NFCID1_2ND_LAST and NFCID1_LAST. |
| NFC.TAGHEADER1    | 0x454  |          | Default header for NFC Tag. Software can read these values to populate NFCID1_3RD_LAST, NFCID1_2ND_LAST and NFCID1_LAST. |
| NFC.TAGHEADER2    | 0x458  |          | Default header for NFC Tag. Software can read these values to populate NFCID1_3RD_LAST, NFCID1_2ND_LAST and NFCID1_LAST. |

| Register         | Offset | Security | Description                                                                                                              |
|------------------|--------|----------|--------------------------------------------------------------------------------------------------------------------------|
| NFC.TAGHEADER3   | 0x45C  |          | Default header for NFC Tag. Software can read these values to populate NFCID1_3RD_LAST, NFCID1_2ND_LAST and NFCID1_LAST. |
| TRNG90B.BYTES    | 0xC00  |          | Amount of bytes for the required entropy bits                                                                            |
| TRNG90B.RCCUTOFF | 0xC04  |          | Repetition counter cutoff                                                                                                |
| TRNG90B.APCUTOFF | 0xC08  |          | Adaptive proportion cutoff                                                                                               |
| TRNG90B.STARTUP  | 0xC0C  |          | Amount of bytes for the startup tests                                                                                    |
| TRNG90B.ROSC1    | 0xC10  |          | Sample count for ring oscillator 1                                                                                       |
| TRNG90B.ROSC2    | 0xC14  |          | Sample count for ring oscillator 2                                                                                       |
| TRNG90B.ROSC3    | 0xC18  |          | Sample count for ring oscillator 3                                                                                       |
| TRNG90B.ROSC4    | 0xC1C  |          | Sample count for ring oscillator 4                                                                                       |
| XOSC32MTRIM      | 0xC20  |          | XOSC32M capacitor selection trim values                                                                                  |

### 5.1.4.3 UICR — User information configuration registers

The user information configuration registers (UICRs) are non-volatile memory (NVM) registers for configuring user specific settings and storing secure cryptographic keys or OTP values.

The cryptographic key part of the UICR (addresses starting at 0x100 and higher) is handled by the Key Management Unit (KMU), see [KMU — Key management unit](#) on page 258 for more information.

For information on writing registers, see [NVMC — Non-volatile memory controller](#) on page 318 and [Memory](#) on page 18.

#### 5.1.4.3.1 Registers

| Base address | Domain      | Peripheral | Instance | Secure mapping | DMA security | Description                              | Configuration |
|--------------|-------------|------------|----------|----------------|--------------|------------------------------------------|---------------|
| 0x00FF8000   | APPLICATION | UICR       | UICR     | S              | NA           | User information configuration registers |               |

Table 40: Instances

| Register  | Offset | Security | Description            |
|-----------|--------|----------|------------------------|
| APPROTECT | 0x000  |          | Access port protection |

| Register                | Offset | Security | Description                                                                                                                                                                                                                                                                                               |
|-------------------------|--------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXTSUPPLY               | 0x00C  |          | Enable external circuitry to be supplied from VDD pin. Applicable in 'High voltage mode' only.                                                                                                                                                                                                            |
| VREGHVOUT               | 0x010  |          | GPIO reference voltage / external output supply voltage in 'High voltage mode'.                                                                                                                                                                                                                           |
| HFXOCNT                 | 0x014  |          | HFXO startup counter                                                                                                                                                                                                                                                                                      |
| SECUREAPPROTECT         | 0x01C  |          | Secure access port protection                                                                                                                                                                                                                                                                             |
| ERASEPROTECT            | 0x020  |          | Erase protection                                                                                                                                                                                                                                                                                          |
| TINSTANCE               | 0x024  |          | SW-DP Target instance                                                                                                                                                                                                                                                                                     |
| NFCPINS                 | 0x028  |          | Setting of pins dedicated to NFC functionality: NFC antenna or GPIO                                                                                                                                                                                                                                       |
| OTP[n]                  | 0x100  |          | One time programmable memory                                                                                                                                                                                                                                                                              |
| KEYSLOT.CONFIG[n].DEST  | 0x400  |          | Destination address where content of the key value registers (KEYSLOT.KEYn.VALUE[0-3]) will be pushed by KMU. Note that this address must match that of a peripherals APB mapped write-only key registers, else the KMU can push this key value into an address range which the CPU can potentially read. |
| KEYSLOT.CONFIG[n].PERM  | 0x404  |          | Define permissions for the key slot. Bits 0-15 and 16-31 can only be written when equal to 0xFFFF.                                                                                                                                                                                                        |
| KEYSLOT.KEY[n].VALUE[o] | 0x800  |          | Define bits [31+o*32:0+o*32] of value assigned to KMU key slot.                                                                                                                                                                                                                                           |

## 5.1.4.3.1.8 NFCPINS

Address offset: 0x028

Setting of pins dedicated to NFC functionality: NFC antenna or GPIO

When used as NFC antenna pin, the corresponding pin must be controlled by the application core, and the GPIO PIN\_CNF register initialized to its reset value.

#### 5.1.4.3.1.10 KEYSLOT.CONFIG[n].DEST (n=0..127)

Address offset:  $0x400 + (n \times 0x8)$

Destination address where content of the key value registers (KEYSLOT.KEYn.VALUE[0-3]) will be pushed by KMU. Note that this address must match that of a peripherals APB mapped write-only key registers, else the KMU can push this key value into an address range which the CPU can potentially read.

Writing/reading this register requires the KMU SELECTKEYSLOT register to be set to n+1.

#### 5.1.4.3.1.11 KEYSLOT.CONFIG[n].PERM (n=0..127)

Address offset:  $0x404 + (n \times 0x8)$

Define permissions for the key slot. Bits 0-15 and 16-31 can only be written when equal to 0xFFFF.

Writing/reading this register requires the KMU SELECTKEYSLOT register to be set to n+1.

#### 5.1.4.3.1.12 KEYSLOT.KEY[n].VALUE[o] (n=0..127) (o=0..3)

Address offset:  $0x800 + (n \times 0x10) + (o \times 0x4)$

Define bits  $[31+o*32:0+o*32]$  of value assigned to KMU key slot.

Writing/reading this register requires the KMU SELECTKEYSLOT register to be set to n+1.

### 5.1.4.4 AHB multilayer

AHB multilayer enables parallel access paths between multiple masters and slaves in a system. Access is resolved using priorities.

Each bus master is connected to a slave device through one or more interconnection matrixes. The bus masters are assigned priorities that are used to resolve access when two (or more) bus masters request access to the same slave device. The following applies when assigning priorities:

- If two (or more) bus masters request access to the same slave device, the master with the highest priority is granted access first.
- Bus masters with lower priority are stalled until the higher priority master has completed its transaction.
- If the higher priority master pauses at any point during its transaction, the lower priority master in queue is temporarily granted access to the slave device until the higher priority master resumes its activity.
- Bus masters that have the same priority are mutually exclusive, and cannot be used concurrently.

Some peripherals, like I2S, do not have a safe stalling mechanism (not able to pause incoming data and no internal data buffering). Being a low priority bus master might cause loss of data for such peripherals upon bus contention. To avoid AHB bus contention when using multiple bus masters, apply one of the following guidelines:

- Avoid situations where more than one bus master is accessing the same slave.
- If more than one bus master is accessing the same slave, make sure that the bus bandwidth is not exhausted.

#### 5.1.4.4.1 AHB multilayer priorities

Each master connected to the AHB multilayer is assigned a default natural priority.

| Bus master name | Natural relative priority | In/Out | Description                                   |
|-----------------|---------------------------|--------|-----------------------------------------------|
| CPU             | Highest priority          | I/O    |                                               |
| QSPI            |                           | I/O    |                                               |
| SERIAL0         |                           | I/O    | Applies to UARTE0, SPIM0, SPIS0, TWIM0, TWIS0 |
| SERIAL1         |                           | I/O    | Applies to UARTE1, SPIM1, SPIS1, TWIM1, TWIS1 |
| SPIM2           |                           | I/O    |                                               |
| SAADC           |                           | I      |                                               |
| PWM             |                           | O      | Applies to PWM0, PWM1, PWM2                   |
| External core   | Lowest priority           | I/O    | Applies to network core                       |

Table 42: AHB bus masters

# 6.1 Network core

## 6.1.1 Network core overview

The network core contains a low-power microcontroller with embedded flash memory and an Arm Cortex-M33 processor.

The network core includes peripherals for efficient implementation of radio protocols such as Bluetooth Low Energy, 802.15.4, and proprietary 2.4 GHz. The following figure provides more information. Arrows with white heads indicate signals that share physical pins with other signals.

## 6.1.2 CPU

The Arm Cortex-M33 processor has a 32-bit instruction set (Thumb-2 technology) that implements a superset of 16- and 32-bit instructions to maximize code density and performance.

This processor implements several features that enable energy-efficient arithmetic and high-performance signal processing including:

- Hardware divide
- 8- and 16-bit single instruction multiple data (SIMD) instructions
- Memory Protection Unit (MPU)

The [Arm Cortex Microcontroller Software Interface Standard \(CMSIS\)](#) is implemented and available for the application processor.

Real-time execution is highly deterministic in thread mode, to and from sleep modes, and when handling events at configurable priority levels via the Nested Vectored Interrupt Controller (NVIC).

Executing code from internal or external flash will have a wait state penalty. The instruction cache can be enabled to minimize flash wait states when fetching instructions. For more information on cache, see [NVMC — Non-volatile memory controller](#) on page 318. CPU performance parameters including mode wait states, CPU current and efficiency, and processing power and efficiency based on the CoreMark benchmark can be found in .

### 6.1.2.1 Electrical specification

#### 6.1.2.1.1 CPU performance

| Symbol                  | Description                                                    | Min. | Typ. | Max. | Units                   |
|-------------------------|----------------------------------------------------------------|------|------|------|-------------------------|

| HTM               | AHB Trace Macrocell                           | NO                                                   |

### 6.1.3 Memory

The network core contains flash memory and RAM that can be used for code and data storage.

The following figure shows how the CPU and peripherals with EasyDMA can access RAM via the AHB multilayer interconnect.

The network core can access application core resources (flash, RAM, and peripherals) when granted permission through the application's DCNF and SPU settings. A small portion of the application core RAM is dedicated to the exchange of messages between the application and network cores.

Figure 27: Memory layout

### 6.1.3.1 Peripheral instantiation

The following table describes the abbreviations used in the Instance, Secure mapping, and DMA security columns of the instantiation table.

| Abbreviation | Description                                                                                                                               |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| NS           | Non-secure - Peripheral is always accessible as a Non-Secure peripheral                                                                   |
| S            | Secure - Peripheral is always accessible as a Secure peripheral                                                                           |
| US           | User Selectable - A Secure or Non-secure attribute for the peripheral is defined in the SPU                                               |
| SPLIT        | Both Secure and Non-secure - The same resource is shared by both secure and non-secure code                                               |
| NA           | Not Applicable - Peripheral has no DMA capability                                                                                         |
| NSA          | NoSeparateAttribute - Peripheral with DMA and DMA transfer has the same security attribute as assigned to the peripheral                  |
| SA           | SeparateAttribute - Peripheral with DMA and DMA transfers can have a different security attribute than the one assigned to the peripheral |

Table 43: Instantiation table abbreviations

The Secure mapping column in the following table defines configuration capabilities for the Arm TrustZone for Armv8-M secure attribute. The DMA security column describes the DMA capabilities of the peripheral.

### 6.1.3.2 Instantiation

| ID | Base address | Peripheral | Instance | Secure mapping | DMA security | Description                                 |
|----|--------------|------------|----------|----------------|--------------|---------------------------------------------|
| 0  | 0x41000000   | DCNF       | DCNF     | NS             | NA           | Domain configuration                        |
| 4  | 0x41004000   | VREQCTRL   | VREQCTRL | NS             | NA           | Voltage request control                     |
| 5  | 0x41005000   | CLOCK      | CLOCK    | NS             | NA           | Clock control                               |

Table 44: Instantiation table

## 6.1.4 Core components

### 6.1.4.1 FICR — Factory information configuration registers

Factory information configuration registers (FICR) are pre-programmed in factory and cannot be erased by the user. These registers contain chip-specific information and configuration.

#### 6.1.4.1.1 Registers

| Base address | Domain  | Peripheral | Instance | Secure mapping | DMA security | Description                       | Configuration |
|--------------|---------|------------|----------|----------------|--------------|-----------------------------------|---------------|
| 0x01FF0000   | NETWORK | FICR       | FICR     | NS             | NA           | Factory information configuration |               |

### 6.1.4.2 UICR — User information configuration registers

The user information configuration registers (UICRs) are non-volatile memory (NVM) registers for configuring user specific settings.

For information on writing registers, see [NVMC — Non-volatile memory controller](#) on page 318 and [Memory](#) on page 125.

#### 6.1.4.2.1 Registers

| Base address | Domain  | Peripheral | Instance | Secure mapping | DMA security | Description                    | Configuration |
|--------------|---------|------------|----------|----------------|--------------|--------------------------------|---------------|
| 0x01FF8000   | NETWORK | UICR       | UICR     | NS             | NA           | User information configuration |               |

Table 47: Instances

| Register     | Offset | Security | Description                         |

### 6.1.4.3 AHB multilayer

AHB multilayer enables parallel access paths between multiple masters and slaves in a system. Access is resolved using priorities.

Each bus master is connected to a slave device through one or more interconnection matrixes. The bus masters are assigned priorities that are used to resolve access when two (or more) bus masters request access to the same slave device. The following applies when assigning priorities:

- If two (or more) bus masters request access to the same slave device, the master with the highest priority is granted access first.
- Bus masters with lower priority are stalled until the higher priority master has completed its transaction.
- If the higher priority master pauses at any point during its transaction, the lower priority master in queue is temporarily granted access to the slave device until the higher priority master resumes its activity.
- Bus masters that have the same priority are mutually exclusive, and cannot be used concurrently.

Some peripherals, like RADIO, do not have a safe stalling mechanism (not able to pause incoming data and no internal data buffering). Being a low priority bus master might cause loss of data for such peripherals upon bus contention. To avoid AHB bus contention when using multiple bus masters, apply one of the following guidelines:

- Avoid situations where more than one bus master is accessing the same slave.
- If more than one bus master is accessing the same slave, make sure that the bus bandwidth is not exhausted.

#### 6.1.4.3.1 AHB multilayer priorities

Each master connected to the AHB multilayer is assigned a default natural priority.

| Bus master name                | Natural relative priority | In/Out | Description                          |
|--------------------------------|---------------------------|--------|--------------------------------------|
| CPU                            | Highest priority          | I/O    |                                      |
| RADIO                          |                           | I/O    |                                      |
| CCM/ECB/AAR                    |                           | I/O    | Same priority and mutually exclusive |
| UARTE0/SPIM0/SPIS0/TWIM0/TWIS0 | Lowest priority           | I/O    | Same priority and mutually exclusive |

Table 49: AHB bus masters

# 7.1 Peripherals

## 7.1.1 Instantiation

The nRF5340 has two cores. Each core has its own peripherals that are part of that core, listed in their instantiation tables: [Instantiation](#) on page 97 for the application core, and [Instantiation](#) on page 127 for the network core. As seen in the memory map [Memory](#) on page 18, the application core peripherals are accessible from the network core, but the application core cannot access the network core peripherals.

If instances of a peripheral has differing configurations, this is noted in the configuration column of the peripheral's instantiation table. E.g. some of the TIMER instances have more capture and compare channels implemented than others, as listed in [Registers](#) on page 603.

## 7.1.2 Peripheral interface

Peripherals are controlled by the CPU through configuration registers, as well as task and event registers. Task registers are inputs, enabling the CPU and other peripherals to initiate a functionality. Event registers are outputs, enabling a peripheral to trigger tasks in other peripherals and/or the CPU by tying events to CPU interrupts.

Figure 28: Peripheral interface

The distributed programmable peripheral interconnect (DPPI) feature enables peripherals to connect events to tasks without CPU intervention.

**Note:** For more information on DPPI and the DPPI channels, see [DPPI - Distributed programmable peripheral interconnect](#) on page 188.

### 7.1.2.1 Peripheral ID

Every peripheral is assigned a fixed block of 0x1000 bytes of address space, which is equal to 1024 x 32 bit registers.

See [Instantiation](#) on page 136 for more information about which peripherals are available and where they are located in the address map.

There is a direct relationship between peripheral ID and base address. For example, a peripheral with base address 0x40000000 is assigned ID=0, a peripheral with base address 0x40001000 is assigned ID=1, and a peripheral with base address 0x4001F000 is assigned ID=31.

Peripherals may share the same ID, which may impose one or more of the following limitations:

- Shared registers or common resources
- Limited availability due to mutually exclusive operation; only one peripheral in use at a time

- Enforced peripheral behavior when switching between peripherals (disable the first peripheral before enabling the second)

### 7.1.2.2 Peripherals with shared ID

In general (with the exception of ID 0), peripherals sharing an ID and base address may not be used simultaneously. Only one peripheral can be enabled at a given ID.

When switching between two peripherals sharing an ID, the following should be performed to prevent unwanted behavior:

1. Disable the previously used peripheral.
2. Disable any publish/subscribe connection to the DPPI system for the peripheral that is being disabled.
3. Clear all bits in the INTEN register, i.e. `INTENCLR = 0xFFFFFFFF`.
4. Explicitly configure the peripheral being enabled. Do not rely on inherited configuration from the disabled peripheral.
5. Enable the now configured peripheral.

For a list of which peripherals that share an ID see [Instantiation](#) on page 136.

### 7.1.2.3 Peripheral registers

Most peripherals feature an ENABLE register. Unless otherwise specified, the peripheral registers must be configured before enabling the peripheral.

PSEL registers need to be set before a peripheral is enabled or started. Updating PSEL registers while the peripheral is running has no effect. In order to connect a peripheral to a different GPIO, the peripheral must be disabled, the PSEL register updated, and the peripheral re-enabled. It takes four CPU cycles between the PSEL register update and the connection between a peripheral and a GPIO becoming effective.

**Note:** Note that the peripheral must be enabled before tasks and events can be used.

Most of the register values are lost during System OFF or when a reset is triggered. Some registers will retain their values in System OFF or for some specific reset sources. These registers are marked as retained in the register description for a given peripheral. For more information on their behavior, see chapter [RESET - Reset control](#) on page 55.

### 7.1.2.4 Bit set and clear

Registers with multiple single-bit bit fields may implement the set-and-clear pattern. This pattern enables firmware to set and clear individual bits in a register without having to perform a read-modify-write operation on the main register.

This pattern is implemented using three consecutive addresses in the register map, where the main register is followed by dedicated SET and CLR registers (in that exact order).

In the main register, the SET register sets individual bits and the CLR register clears them. Writing '1' to a bit in the SET or CLR register will set or clear the same bit in the main register respectively. Writing '0' to a bit in the SET or CLR register has no effect. Reading the SET or CLR register returns the value of the main register.

**Note:** The main register may not be visible and therefore not directly accessible in all cases.

### 7.1.2.5 Tasks

Tasks are used to trigger actions in a peripheral, such as to start a particular behavior. A peripheral can implement multiple tasks with each task having a separate register in that peripheral's task register group.

A task is triggered when firmware writes '1' to the task register, or when the peripheral itself or another peripheral toggles the corresponding task signal. See the figure [Figure 28: Peripheral interface](#) on page 137.

### 7.1.2.6 Events

Events are used to notify peripherals and the CPU about events that have happened, for example a state change in a peripheral. A peripheral may generate multiple events, where each event has a separate register in that peripheral's event register group.

An event is generated when the peripheral itself toggles the corresponding event signal, and the event register is updated to reflect that the event has been generated, see figure [Figure 28: Peripheral interface](#) on page 137. An event register is cleared when a '0' is written to it by firmware. Events can be generated by the peripheral even when the event register is set to '1'.

### 7.1.2.7 Publish and subscribe

Events and tasks from different peripherals can be connected together through the DPPI system using the PUBLISH and SUBSCRIBE registers in each peripheral. See [Figure 28: Peripheral interface](#) on page 137.

An event can be published onto a DPPI channel by configuring the event's PUBLISH register. Similarly, a task can subscribe to a DPPI channel by configuring the task's SUBSCRIBE register.

See [DPPI - Distributed programmable peripheral interconnect](#) on page 188 for details.

### 7.1.2.8 Shortcuts

A shortcut is a direct connection between an event and a task within the same peripheral. If a shortcut is enabled, the associated task is automatically triggered when its associated event is generated.

Using shortcuts is equivalent to making the connection outside the peripheral and through the DPPI. However, the propagation delay when using shortcuts is usually shorter than the propagation delay through the DPPI.

Shortcuts are predefined, which means that their connections cannot be configured by firmware. Each shortcut can be individually enabled or disabled through the shortcut register, one bit per shortcut, giving a maximum of 32 shortcuts for each peripheral.

### 7.1.2.9 Interrupts

All peripherals support interrupts which are generated by events.

A peripheral only occupies one interrupt, and the interrupt number follows the peripheral ID. For example, the peripheral with ID=4 is connected to interrupt number 4 in the nested vectored interrupt controller (NVIC).

Using registers INTEN, INTENSET, and INTENCLR, every event generated by a peripheral can be configured to generate that peripheral's interrupt. Multiple events can be enabled to generate interrupts simultaneously. To resolve the correct interrupt source, the event registers in the event group of peripheral registers will indicate the source.

Some peripherals implement only INTENSET and INTENCLR registers, and the INTEN register is not available on those peripherals. See the individual peripheral chapters for details. In all cases, reading back the INTENSET or INTENCLR register returns the same information as in INTEN.

Each event implemented in the peripheral is associated with a specific bit position in the INTEN, INTENSET, and INTENCLR registers.

The relationship between tasks, events, shortcuts, and interrupts is illustrated in figure [Figure 28: Peripheral interface](#) on page 137.

#### 7.1.2.9.1 Interrupt clearing and disabling

Interrupts should always be cleared by writing '0' to the corresponding EVENT register.

Until cleared, interrupts will immediately be re-triggered and cause software interrupt service routines to be executed repeatedly.

Because the clearing of the EVENT register may take a number of CPU clock cycles, the program should perform a read from the EVENT register that has been cleared before exiting the interrupt service routine. This will ensure that the EVENT clearing has taken place before the interrupt service routine is exited. Care should be taken to ensure that the compiler does not remove the read operation as an optimization.

Similarly, when disabling an interrupt inside an interrupt service routine, the program should perform a read from the INTEN or INTENCLR registers to ensure that the interrupt is disabled before exiting the interrupt service routine.

#### 7.1.2.10 Secure/non-secure peripherals

For some peripherals, the security configuration can change from secure to non-secure, or vice versa. Care must be taken when changing the security configuration of a peripheral, to prevent security information leakage and ensure correct operation.

The following sequence should be followed, where applicable, when configuring and changing the security settings of a peripheral in the [SPU — System protection unit](#) on page 568:

1. Stop peripheral operation
2. Disable the peripheral
3. Remove pin connections
4. Disable DPPI connections
5. Clear sensitive registers (e.g. writing back default values)
6. Change peripheral security setting in the [SPU — System protection unit](#) on page 568
7. Re-enable the peripheral

### 7.1.3 EasyDMA

EasyDMA is a module implemented by some peripherals to gain direct access to Data RAM.

EasyDMA is an AHB bus master similar to CPU and is connected to the AHB multilayer interconnect for direct access to Data RAM. EasyDMA is not able to access flash.

A peripheral can implement multiple EasyDMA instances to provide dedicated channels. For example, for reading and writing of data between the peripheral and RAM. This concept is illustrated in [Figure 29: EasyDMA example](#) on page 141.

Figure 29: EasyDMA example

An EasyDMA channel is implemented in the following way, but some variations may occur:

```

READERBUFFER_SIZE 5
WRITERBUFFER_SIZE 6

uint8_t readerBuffer[READERBUFFER_SIZE] __at__ 0x20000000;
uint8_t writerBuffer[WRITERBUFFER_SIZE] __at__ 0x20000005;

// Configuring the READER channel
MYPERIPHERAL->READER.MAXCNT = READERBUFFER_SIZE;
MYPERIPHERAL->READER.PTR = &readerBuffer;

// Configure the WRITER channel
MYPERIPHERAL->WRITER.MAXCNT = WRITERBUFFER_SIZE;
MYPERIPHERAL->WRITER.PTR = &writerBuffer;

```

This example shows a peripheral called MYPERIPHERAL that implements two EasyDMA channels - one for reading called READER, and one for writing called WRITER. When the peripheral is started, it is assumed that the peripheral will:

- Read 5 bytes from the readerBuffer located in RAM at address 0x20000000.
- Process the data.
- Write no more than 6 bytes back to the writerBuffer located in RAM at address 0x20000005.

The memory layout of these buffers is illustrated in [Figure 30: EasyDMA memory layout](#) on page 141.

|            |                 |                 |                 |                 |
|------------|-----------------|-----------------|-----------------|-----------------|
| 0x20000000 | readerBuffer[0] | readerBuffer[1] | readerBuffer[2] | readerBuffer[3] |
| 0x20000004 | readerBuffer[4] | writerBuffer[0] | writerBuffer[1] | writerBuffer[2] |
| 0x20000008 | writerBuffer[3] | writerBuffer[4] | writerBuffer[5] |                 |

Figure 30: EasyDMA memory layout

The WRITER.MAXCNT register should not be specified larger than the actual size of the buffer (writerBuffer). Otherwise, the channel would overflow the writerBuffer.

Once an EasyDMA transfer is completed, the AMOUNT register can be read by the CPU to see how many bytes were transferred. For example, CPU can read MYPERIPHERAL->WRITER.AMOUNT register to see how many bytes WRITER wrote to RAM.

Note that the PTR register of a READER or WRITER must point to a valid memory region before use. The reset value of a PTR register is not guaranteed to point to valid memory. See [Memory](#) on page 18 for more information about the different memory regions and EasyDMA connectivity.

### 7.1.3.1 EasyDMA error handling

Some errors may occur during DMA handling.

If READER.PTR or WRITER.PTR is not pointing to a valid memory region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 18 for more information about the different memory regions.

If several AHB bus masters try to access the same AHB slave at the same time, AHB bus congestion might occur. An EasyDMA channel is an AHB master. Depending on the peripheral, the peripheral may either stall and wait for access to be granted, or lose data.

### 7.1.3.2 EasyDMA array list

EasyDMA is able to operate in Array List mode.

The Array List mode is implemented in channels where the LIST register is available.

The array list does not provide a mechanism to explicitly specify where the next item in the list is located. Instead, it assumes that the list is organized as a linear array where items are located one after the other in RAM.

The EasyDMA Array List can be implemented by using the data structure ArrayList\_type as illustrated in the code example below using a READER EasyDMA channel as an example:

```
#define BUFFER_SIZE 4

typedef struct ArrayList
{
    uint8_t buffer[BUFFER_SIZE];
} ArrayList_type;

ArrayList_type ReaderList[3] __at__ 0x20000000;

MYPERIPHERAL->READER.MAXCNT = BUFFER_SIZE;
MYPERIPHERAL->READER.PTR = &ReaderList;
MYPERIPHERAL->READER.LIST = MYPERIPHERAL_READER_LIST_ArrayList;
```

The data structure only includes a buffer with size equal to the size of READER.MAXCNT register. EasyDMA uses the READER.MAXCNT register to determine when the buffer is full.

Figure 31: EasyDMA array list

### 7.1.4 ACL — Access control lists

The Access control lists (ACL) peripheral is designed to assign and enforce access permissions to different regions of the on-chip flash memory map.

Flash memory regions can be assigned individual ACL permission schemes. The following registers are involved:

- PERM register, where the permissions are configured.
- ADDR register, where the word-aligned start address for the flash page is defined.
- SIZE register, where the size of the region the permissions are applied to is determined.

**Important:** The size of the region in bytes is restricted to a multiple of the flash page size, and the maximum region size is limited to the flash size. See [Memory](#) on page 18 for more information.

Figure 32: Protected regions of on-chip flash memory

There are four defined ACL permission schemes, with different combinations of read/write permissions:

| Read | Write | Protection description                                                 |
|------|-------|------------------------------------------------------------------------|
| 0    | 0     | No protection. Entire region can be executed, read, written or erased. |
| 0    | 1     | Region can be executed and read, but not written or erased.            |
| 1    | 0     | Region can be written and erased, but not executed or read.            |
| 1    | 1     | Region is locked for all access until next reset.                      |

Table 50: Permission schemes

**Important:** If a permission violation to a protected region is detected by the ACL peripheral, the request is blocked and a Bus Fault exception is triggered.

Access control to a configured region is enforced by the hardware two CPU clock cycles after the ADDR, SIZE, and PERM registers for an ACL instance have been successfully written. The protection is only enforced if a valid start address of the flash page boundary is written into the ADDR register, and the values of the SIZE and PERM registers are not zero.

The ADDR, SIZE, and PERM registers can only be written once. All ACL configuration registers are cleared on reset (by resetting the device from any reset source), which is also the only way of clearing the configuration registers. To ensure that the desired permission schemes are always enforced by the ACL peripheral, the device boot sequence must perform the necessary configuration.

Debugger read access to a read-protected region will be Read-As-Zero (RAZ), while debugger write access to a write-protected region will be Write-Ignored (WI).

### 7.1.4.1 Registers

| Base address | Domain  | Peripheral | Instance | Secure mapping | DMA security | Description          | Configuration                                          |
|--------------|---------|------------|----------|----------------|--------------|----------------------|--------------------------------------------------------|
| 0x41080000   | NETWORK | ACL        | ACL      | NS             | NA           | Access control lists | This ACL can only protect network core's local memory. |

Table 51: Instances

| Register       | Offset | Security | Description                                                                                  |
|----------------|--------|----------|----------------------------------------------------------------------------------------------|
| ACL[n].ADDR    | 0x800  |          | Configure the word-aligned start address of region n to protect                              |
| ACL[n].SIZE    | 0x804  |          | Size of region to protect counting from address ACL[n].ADDR. Write '0' as no effect.         |
| ACL[n].PERM    | 0x808  |          | Access permissions for region n as defined by start address ACL[n].ADDR and size ACL[n].SIZE |
| ACL[n].UNUSED0 | 0x80C  |          | Reserved                                                                                     |

Table 52: Register overview

#### 7.1.4.1.1 ACL[n].ADDR (n=0..7)

Address offset:  $0x800 + (n \times 0x10)$

Configure the word-aligned start address of region n to protect

This register can only be written once.

|                  |            |  |          |       |    |    |    |                                                                                                          |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

## 7.1.5 AAR — Accelerated address resolver

Accelerated address resolver is a cryptographic support function for implementing the Resolvable Private Address Resolution Procedure described in the *Bluetooth Core specification v4.0*. Resolvable Private Address generation should be achieved using ECB and is not supported by AAR.

The procedure allows two devices that share a secret key to generate and resolve a hash based on their device address. The AAR block enables real-time address resolution on incoming packets when configured as described in this chapter. This allows real-time packet filtering (whitelisting) using a list of known shared keys (Identity Resolving Keys (IRK) in *Bluetooth*).

### 7.1.5.1 Shared resources

The AAR shares the same AES module as the ECB and CCM peripherals. The ECB will always have the lowest priority. If there is a sharing conflict during encryption, the ECB operation will be aborted and an `ERRORECB` event will be generated in the ECB peripheral.

Additionally, the AAR shares registers and other resources with the peripherals that have the same ID as the AAR. See [Peripherals with shared ID](#) on page 138 for more information.

### 7.1.5.2 EasyDMA

The AAR implements EasyDMA for reading and writing to the RAM. The EasyDMA will have finished accessing the RAM when the `END`, `RESOLVED`, and `NOTRESOLVED` events are generated.

If the `IRKPTR` on page 153, `ADDRPTR` on page 153, and the `SCRATCHPTR` on page 153 is not pointing to the Data RAM region, an EasyDMA transfer may result in a `HardFault` or RAM corruption. See [Memory](#) on page 18 for more information about the different memory regions.

### 7.1.5.3 Resolving a resolvable address

As per *Bluetooth* specification, a private resolvable address is composed of six bytes.

Figure 33: Resolvable address

To resolve an address the register [ADDRPTR](#) on page 153 must point to the start of the packet. The resolver is started by triggering the START task. A RESOLVED event is generated when the AAR manages to resolve the address using one of the Identity Resolving Keys (IRK) found in the IRK data structure. The AAR will use the IRK specified in the register IRK0 to IRK15 starting from IRK0. The register [NIRK](#) on page 152 specifies how many IRKs should be used. The AAR module will generate a NOTRESOLVED event if it is not able to resolve the address using the specified list of IRKs.

The AAR will go through the list of available IRKs in the IRK data structure and for each IRK try to resolve the address according to the Resolvable Private Address Resolution Procedure described in the *Bluetooth Core specification v4.0 [Vol 3]* chapter 10.8.2.3. The time it takes to resolve an address varies due to the location in the list of the resolvable address. The resolution time will also be affected by RAM accesses performed by other peripherals and the CPU. See the [Electrical specifications](#) for more information about resolution time.

The AAR only compares the received address to those programmed in the module without checking the address type.

The AAR will stop as soon as it has managed to resolve the address, or after trying to resolve the address using NIRK number of IRKs from the IRK data structure. The AAR will generate an END event after it has stopped.

Figure 34: Address resolution with packet preloaded into RAM

#### 7.1.5.4 Use case example for chaining RADIO packet reception with address resolution using AAR

The AAR may be started as soon as the 6 bytes required by the AAR have been received by the RADIO and stored in RAM. The ADDRPTR pointer must point to the start of packet.

Figure 35: Address resolution with packet loaded into RAM by the RADIO

#### 7.1.5.5 IRK data structure

The IRK data structure is located in RAM at the memory location specified by the IRKPTR register.

| Property | Address offset | Description               |
|----------|----------------|---------------------------|
| IRK0     | 0              | IRK number 0 (16 - byte)  |
| IRK1     | 16             | IRK number 1 (16 - byte)  |
| ..       | ..             | ..                        |
| IRK15    | 240            | IRK number 15 (16 - byte) |

  ## 7.1.5.7 Electrical specification

### 7.1.5.7.1 AAR Electrical Specification

| Symbol      | Description                                                                                                                                                                               | Min. | Typ. | Max. | Units   |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|------|------|---------|
| $t_{AAR}$   | Address resolution time per IRK. Total time for several IRKs is given as $(1 \mu s + n * t_{AAR})$ , where n is the number of IRKs. (Given priority to the actual destination RAM block). | ..   | ..   | ..   | $\mu s$ |
| $t_{AAR,8}$ | Time for address resolution of 8 IRKs. (Given priority to the actual destination RAM block).                                                                                              | ..   | ..   | ..   | $\mu s$ |

## 7.1.6 CCM — AES CCM mode encryption

Counter with cipher block chaining - message authentication code (CCM) mode is an authenticated encryption algorithm designed to provide both authentication and confidentiality during data transfer.

AES CCM combines counter (CTR) mode encryption and cipher block chaining - message authentication code (CBC-MAC) authentication. The CCM terminology message authentication code (MAC) is called message integrity check (MIC) in *Bluetooth* terminology, and also in this document.

The CCM block generates an encrypted keystream that is applied to input data using the XOR operation, and generates the 4-byte MIC field in one operation. The CCM and the radio can be configured to work synchronously. The CCM will encrypt in time for transmission, and decrypt after receiving bytes into memory from the radio. All operations can complete within the packet receive (RX) or transmit (TX) time.

The CCM on this device is implemented according to *Bluetooth* requirements and the algorithm as defined in IETF [RFC3610](#), and depends on the AES-128 block cipher. A description of the CCM algorithm can also be found in [NIST Special Publication 800-38C](#). The *Bluetooth* specification describes the configuration of the counter mode blocks and the encryption blocks to implement compliant encryption for *Bluetooth* low energy.

The CCM block uses EasyDMA to load the key and the counter mode blocks (including the nonce required), and to read/write plain text and cipher text.

Three operations are supported:

- keystream generation
- packet encryption
- packet decryption

All operations are done in compliance with the *Bluetooth* specification.<sup>11</sup>

Figure 36: Keystream generation, followed by encryption or decryption. The shortcut is optional.

### 7.1.6.1 Shared resources

The CCM shares the same AES module as the ECB and AAR peripherals. The ECB will always have the lowest priority. If there is a sharing conflict during encryption, the ECB operation will be aborted and an `ERRORECB` event will be generated in the ECB peripheral.

Additionally, the CCM shares registers and other resources with other peripherals that have the same ID as the CCM. See [Peripherals with shared ID](#) on page 138 for more information.

### 7.1.6.2 Keystream generation

A new keystream needs to be generated before a new packet encryption or packet decryption operation can be started.

A keystream is generated by triggering the KSGEN task, and an `ENDKSGEN` event will be generated when the keystream has been generated.

Keystream generation, packet encryption, and packet decryption operations utilize the configuration specified in the data structure pointed to by `CNFPTR` on page 166. It is necessary to configure this pointer and its underlying data structure, and the register `MODE` on page 165, before the KSGEN task is triggered.

The keystream will be stored in the AES CCM's temporary memory area, specified by the `SCRATCHPTR` on page 167, where it will be used in subsequent encryption and decryption operations.

<sup>11</sup> *Bluetooth* AES CCM 128-bit block encryption, see *Bluetooth Core specification* version 4.0.

For default length packets (MODE.LENGTH = Default), the size of the generated keystream is 27 bytes. When using extended length packets (MODE.LENGTH = Extended), register [MAXPACKETSIZE](#) on page 167 specifies the length of the keystream to be generated. The length of the generated keystream must be greater than or equal to the length of the subsequent packet payload to be encrypted or decrypted. The maximum length of the keystream in extended mode is 251 bytes, which means that the maximum packet payload size is 251 bytes.

If a shortcut is used between ENDKSGEN event and CRYPT task, pointers [INPTR](#) on page 166 and [OUTPTR](#) on page 166 must also be configured before the KSGEN task is triggered.

### 7.1.6.3 Encryption

During packet encryption, the AES CCM will read the unencrypted packet located in RAM at the address specified by the INPTR pointer, encrypt the packet, and append a four byte long message integrity check (MIC) field to the packet.

The packet header (S0) and payload are included in the MIC generation. Bits in the packet header can be masked away by configuring register [HEADERMASK](#) on page 168.

Encryption is started by triggering the CRYPT task, by setting the register [MODE](#) on page 165 to [Encryption](#). An ENDCRYPT event will be generated when packet encryption is completed.

The AES CCM will also modify the length field of the packet to adjust for the appended MIC field, that is, add four bytes to the length, and store the resulting packet back into RAM at the address specified by the pointer [OUTPTR](#) on page 166.

Figure 37: Encryption

Empty packets (length field is set to 0) will not be encrypted, but instead moved unmodified through the AES CCM.

The CCM supports different widths of the length field in the data structure for encrypted packets. This is configured in register [MODE](#) on page 165.

### 7.1.6.4 Decryption

During packet decryption, the AES CCM will read the encrypted packet located in RAM at the address specified by the INPTR pointer, decrypt the packet, authenticate the packet's MIC field, and generate the appropriate MIC status.

The packet header (S0) and payload are included in the MIC authentication. Bits in the packet header can be masked away by configuring register [HEADERMASK](#) on page 168.

Decryption is started by triggering the CRYPT task, by setting the register [MODE](#) on page 165 to [Decryption](#). An ENDCRYPT event will be generated when packet decryption is completed.

The AES CCM will also modify the length field of the packet to adjust for the MIC field, that is, subtract four bytes from the length, and then store the decrypted packet into RAM at the address specified by the pointer [OUTPTR](#) on page 166 pointer.

Figure 38: Decryption

The CCM is only able to decrypt packet payloads that are at least 5 bytes long, 1 byte or more encrypted payload (EPL) and 4 bytes of MIC. The CCM will therefore generate a MIC error for packets where the length field is set to 1, 2, 3 or 4. Empty packets (length field is set to 0) will not be decrypted, but instead moved unmodified through the AES CCM. These packets will always pass the MIC check.

The CCM supports different widths of the length field in the data structure for decrypted packets. This is configured in register [MODE](#) on page 165.

### 7.1.6.5 AES CCM and radio concurrent operation

The CCM module is able to encrypt/decrypt data synchronously to data being transmitted or received on the radio.

In order for the CCM module to run synchronously with the radio, the data rate setting in register [MODE](#) on page 165 needs to match the radio data rate. Settings in this register apply whenever either the KSGEN or the CRYPT task is triggered.

The data rate setting of the register [MODE](#) on page 165 can also be overridden on-the-fly, during an ongoing encrypt/decrypt operation, by the contents of the register [RATEOVERRIDE](#) on page 167. The data rate setting in this register applies whenever the RATEOVERRIDE task is triggered. This feature can be useful in cases where the radio data rate is changed during an ongoing packet transaction.

### 7.1.6.6 Encrypting packets on-the-fly in radio transmit mode

When the AES CCM is encrypting a packet on-the-fly, at the same time as the radio is transmitting it, the radio must read the encrypted packet from the same memory location the AES CCM is writing to.

The pointer [OUTPTR](#) on page 166 in the AES CCM must therefore point to the same memory location as the [PACKETPTR](#) pointer in the radio.

Figure 39: Configuration of on-the-fly encryption

In order to match the radio's timing, the KSGEN task must be triggered early enough to allow the keystream generation to complete before the encryption of the packet starts.

For short packets ([MODE.LENGTH](#) = Default), the KSGEN task must be triggered no later than when the radio START task is triggered. In addition, the shortcut between the ENDKSGEN event and the CRYPT task

must be enabled. This use case, using a programmable peripheral interconnect (PPI) connection between the READY event in the radio and the KSGEN task in the AES CCM, is illustrated in figure below.

Figure 40: On-the-fly encryption of short packets (MODE.LENGTH = Default), using a PPI connection

For long packets (MODE.LENGTH = Extended), the keystream generation will need to be started even earlier, for example at the time when the TXEN task in the radio is triggered.

**Note:** See [Timing specification](#) on page 168 for information about the time needed for generating a keystream.

### 7.1.6.7 Decrypting packets on-the-fly in radio receive mode

When the AES CCM is decrypting a packet on-the-fly, at the same time as the radio is receiving it, the AES CCM must read the encrypted packet from the same memory location that the radio is writing to.

The pointer [INPTR](#) on page 166 in the AES CCM must therefore point to the same memory location as the [PACKETPTR](#) pointer in the radio.

Figure 41: Configuration of on-the-fly decryption

In order to match the radio's timing, the KSGEN task must be triggered early enough to allow the keystream generation to complete before the decryption of the packet starts.

For short packets (MODE.LENGTH = Default), the KSGEN task must be triggered no later than when the START task in the radio is triggered. In addition, the CRYPT task must not be triggered earlier than when the ADDRESS event is generated by the radio. If the CRYPT task is triggered exactly at the same time as the ADDRESS event is generated by the radio, the AES CCM will guarantee that the decryption is completed no

later than when the END event in the radio is generated. This use case, using a PPI connection between the ADDRESS event in the radio and the CRYPT task in the AES CCM, is illustrated in figure below.

Figure 42: On-the-fly decryption of short packets (MODE.LENGTH = Default), using a PPI connection

The KSGEN task is triggered from the READY event in the radio, through a PPI connection.

For long packets (MODE.LENGTH = Extended), the keystream generation will need to be started even earlier, for example at the time when the RXEN task in the radio is triggered.

**Note:** See [Timing specification](#) on page 168 for information about the time needed for generating a keystream.

### 7.1.6.8 CCM data structure

The CCM data structure is located in data RAM, at the memory location specified by the CNFPTR pointer register.

| Property | Address offset | Description                                                                                                                   |
|----------|----------------|-------------------------------------------------------------------------------------------------------------------------------|
| KEY      | 0              | 16-byte AES key.                                                                                                              |
| PKTCTR   | 16             | Octet0 (least significant octet (LSO)) of packet. counter                                                                     |
|          | 17             | Octet1 of packet counter.                                                                                                     |
|          | 18             | Octet2 of packet counter.                                                                                                     |
|          | 19             | Octet3 of packet counter.                                                                                                     |
|          | 20             | Bit 6 – bit 0: Octet4 (7 most significant bits of packet counter, with bit 6 being the most significant bit). Bit 7: Ignored. |
|          | 21             | Ignored.                                                                                                                      |
|          | 22             | Ignored.                                                                                                                      |
|          | 23             | Ignored.                                                                                                                      |
|          | 24             | Bit 0: Direction bit. Bit 7 – bit 1: Zero padded.                                                                             |
| IV       | 25             | 8-byte initialization vector (IV). Octet0 (LSO) of IV, Octet1 of IV, ..., Octet7 (MSO) of IV.                                 |

Table 56: CCM data structure overview

The NONCE vector (as specified by the *Bluetooth* Core Specification) will be generated by hardware based on the information specified in the CCM data structure.

| Property | Address offset | Description                            |
|----------|----------------|----------------------------------------|
| HEADER   | 0              | Packet header                          |
| LENGTH   | 1              | Number of bytes in unencrypted payload |

Table 58: Data structure for encrypted packet

### 7.1.6.9 EasyDMA and ERROR event

The CCM implements an EasyDMA mechanism for reading from and writing to RAM.

In cases where the CPU and other EasyDMA enabled peripherals are accessing the same RAM block at the same time, a high level of bus collisions may cause operation that is too slow for correct on-the-fly encryption. In this case, the ERROR event will be generated.

EasyDMA will have finished accessing the RAM when the ENDKSGEN and ENDCRYPT events are generated.

If the pointers CNFPTR, SCRATCHPTR, INPTR and the OUTPTR are not pointing to the data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 18 for more information about the different memory regions.

### 7.1.6.10 Registers

| Base address | Domain  | Peripheral | Instance | Secure mapping | DMA security | Description             | Configuration |
|--------------|---------|------------|----------|----------------|--------------|-------------------------|---------------|
| 0x4100E000   | NETWORK | CCM        | CCM      | NS             | NA           | AES CCM mode encryption |               |

Table 59: Instances

| Register               | Offset | Security | Description                                                                                                                     |

When MODE.LENGTH = Extended, a space of (16 + MAXPACKETSIZE) bytes is required.</p> |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |  |  |  |  |

#### 7.1.6.10.25 MAXPACKETSIZE

Address offset: 0x518

Length of keystream generated when MODE.LENGTH = Extended

|            |  ## 7.1.7 COMP — Comparator

The comparator (COMP) compares an input voltage (VIN+) against a second input voltage (VIN-). VIN+ can be derived from an analog input pin (AIN0-AIN7). VIN- can be derived from multiple sources depending on the operation mode of the comparator.

Main features of the comparator are:

- Input range from 0 V to VDD
- Single-ended mode
  - Fully flexible hysteresis using a 64-level reference ladder
- Differential mode
  - Configurable hysteresis
- Reference inputs (VREF):
  - VDD
  - External reference from AIN0 to AIN7 (between 0 V and VDD)
  - Internal references 1.2 V, 1.8 V and 2.4 V
- Three speed/power consumption modes: low-power, normal and high-speed
- Single-pin capacitive sensor support

- Event generation on output changes
  - UP event on  $V_{IN-} > V_{IN+}$
  - DOWN event on  $V_{IN-} < V_{IN+}$
  - CROSS event on  $V_{IN+}$  and  $V_{IN-}$  crossing
  - READY event on core and internal reference (if used) ready

Figure 43: Comparator overview

Once enabled (using the [ENABLE](#) register), the comparator is started by triggering the START task and stopped by triggering the STOP task. The comparator will generate a READY event to indicate when it is ready for use and the output is correct. The delay between START and READY is  $t_{INT\_REF,START}$  if an internal reference is selected, or  $t_{COMP,START}$  if an external reference is used. When the COMP module is started, events will be generated every time  $V_{IN+}$  crosses  $V_{IN-}$ .

## Operation modes

The comparator can be configured to operate in two main operation modes, differential mode and single-ended mode. See the [MODE](#) register for more information. In both operation modes, the comparator can operate in different speed and power consumption modes (low-power, normal and high-speed). High-speed mode will consume more power compared to low-power mode, and low-power mode will result in slower response time compared to high-speed mode.

Use the [PSEL](#) register to select any of the AIN0-AIN7 pins as  $V_{IN+}$  input, regardless of the operation mode selected for the comparator. The source of  $V_{IN-}$  depends on which operation mode is used:

- Differential mode: Derived directly from AIN0 to AIN7
- Single-ended mode: Derived from VREF. VREF can be derived from VDD, AIN0-AIN7 or internal 1.2 V, 1.8 V and 2.4 V references.

The selected analog pins will be acquired by the comparator once it is enabled.

An optional hysteresis on  $V_{IN+}$  and  $V_{IN-}$  can be enabled when the module is used in differential mode through the [HYST](#) register. In single-ended mode, VUP and VDOWN thresholds can be set to implement a hysteresis using the reference ladder (see [Figure 46: Comparator in single-ended mode](#) on page 172). This hysteresis is in the order of magnitude of  $V_{DIFFHYST}$ , and shall prevent noise on the signal to create unwanted events. See [Figure 47: Hysteresis example where  \$V\_{IN+}\$  starts below VUP](#) on page 172 for illustration of the effect of an active hysteresis on a noisy input signal.

An upward crossing will generate an UP event and a downward crossing will generate a DOWN event. The CROSS event will be generated every time there is a crossing, independent of direction.

The immediate value of the comparator can be sampled to [RESULT](#) register by triggering the SAMPLE task.

## ISOURCE

A selectable current can be applied (ISOURCE register) on the currently selected AINx line. Enabling the block creates a feedback path around the comparator, forming a relaxation oscillator. The circuit will sink current from VIN+ when the comparator output is high, and source current into VIN+ when the comparator output is low. The frequency of the oscillator is dependent on the capacitance at the analog input pin, the reference voltages and the value of the current source. In this mode, only a capacitive sensor needs to be attached between the analog input pin and ground. With a selected current of 10 µA, VUP-VDOWN equal to 1 V, and an external capacity of typically 10 pF, the resulting oscillation frequency is around 500 kHz.

The frequency of the oscillator can be calculated as

$$f_{\_OSC} = I\_SOURCE / (2C \cdot (VUP - VDOWN) )$$

### 7.1.7.1 Shared resources

The COMP shares analog resources with SAADC. While it is possible to use the SAADC at the same time as the COMP, selecting the same analog input pin for both modules is not supported.

Additionally, COMP shares registers and other resources with other peripherals that have the same ID as the COMP. See [Peripherals with shared ID](#) on page 138 for more information.

The COMP peripheral shall not be disabled (by writing to the ENABLE register) before the peripheral has been stopped. Failing to do so may result in unpredictable behavior.

### 7.1.7.2 Differential mode

In differential mode, the reference input VIN- is derived directly from one of the AINx pins.

Before enabling the comparator via the [ENABLE](#) register, the following registers must be configured for the differential mode:

- [PSEL](#)
- [MODE](#)
- [EXTREFSEL](#)

Figure 44: Comparator in differential mode

**Note:** Depending on the device, not all the analog inputs may be available for each MUX. See definitions for [PSEL](#) and [EXTREFSEL](#) for more information about which analog pins are available on a particular device.

When [HYST](#) register is turned on while in this mode, the output of the comparator (and associated events) will change from ABOVE to BELOW whenever  $V_{IN+}$  becomes lower than  $V_{IN-} - (V_{DIFFHYST} / 2)$ . It will also change from BELOW to ABOVE whenever  $V_{IN+}$  becomes higher than  $V_{IN-} + (V_{DIFFHYST} / 2)$ . This behavior is illustrated in [Figure 45: Hysteresis enabled in differential mode](#) on page 171.

Figure 45: Hysteresis enabled in differential mode

### 7.1.7.3 Single-ended mode

In single-ended mode,  $V_{IN-}$  is derived from the reference ladder.

Before enabling the comparator via the [ENABLE](#) register, the following registers must be configured for the single-ended mode:

- [PSEL](#)
- [MODE](#)
- [REFSEL](#)
- [EXTREFSEL](#)
- [TH](#)

The reference ladder uses the reference voltage ( $V_{REF}$ ) to derive two new voltage references,  $V_{UP}$  and  $V_{DOWN}$ .  $V_{UP}$  and  $V_{DOWN}$  are configured using  $TH_{UP}$  and  $TH_{DOWN}$  respectively in the [TH](#) register.  $V_{REF}$

can be derived from any of the available reference sources, configured using the [EXTREFSEL](#) and [REFSEL](#) registers as illustrated in [Figure 46: Comparator in single-ended mode](#) on page 172. When AREF is selected in the [REFSEL](#) register, the [EXTREFSEL](#) register is used to select one of the AIN0-AIN7 analog input pins as reference input. The selected analog pins will be acquired by the comparator once it is enabled.

Figure 46: Comparator in single-ended mode

**Note:** Depending on the device, not all the analog inputs may be available for each MUX. See definitions for [PSEL](#) and [EXTREFSEL](#) for more information about which analog pins are available on a particular device.

When the comparator core detects that  $VIN+ > VIN-$ , i.e. ABOVE as per the [RESULT](#) register,  $VIN-$  will switch to  $VDOWN$ . When  $VIN+$  falls below  $VIN-$  again,  $VIN-$  will be switched back to  $VUP$ . By specifying  $VUP$  larger than  $VDOWN$ , a hysteresis can be generated as illustrated in [Figure 47: Hysteresis example where  \$VIN+\$  starts below  \$VUP\$](#)  on page 172 and [Figure 48: Hysteresis example where  \$VIN+\$  starts above  \$VUP\$](#)  on page 173.

Writing to [HYST](#) has no effect in single-ended mode, and the content of this register is ignored.

Figure 47: Hysteresis example where  $VIN+$  starts below  $VUP$

Figure 48: Hysteresis example where VIN+ starts above VUP

## 7.1.8 CRYPTOCELL — ARM TrustZone CryptoCell 312

ARM TrustZone CryptoCell 312 (CRYPTOCELL) is a security subsystem which provides root of trust (RoT) and cryptographic services for a device.

Figure 49: Block diagram for CRYPTOCELL

The following cryptographic features are provided:

- True random number generator (TRNG) compliant with NIST 800-90B, AIS-31, and FIPS 140-2
- Pseudorandom number generator (PRNG) using underlying AES engine compliant with NIST 800-90A
- RSA public key cryptography
  - Up to 3072-bit key size
  - PKCS#1 v2.1/v1.5
  - Optional CRT support
- Elliptic curve cryptography (ECC)
  - NIST FIPS 186-4 recommended curves using pseudorandom parameters, up to 521 bits:
    - Prime field: P-192, P-224, P-256, P-384, P-521
  - SEC 2 recommended curves using pseudorandom parameters, up to 521 bits:
    - Prime field: secp160r1, secp192r1, secp224r1, secp256r1, secp384r1, secp521r1
  - Koblitz curves using fixed parameters, up to 256 bits:

- Prime field: secp160k1, secp192k1, secp224k1, secp256k1
- Edwards/Montgomery curves:
  - Ed25519, Curve25519
- ECDH/ECDSA support
- Secure remote password protocol (SRP)
  - Up to 3072-bit operations
- Hashing functions
  - SHA-1, SHA-2 up to 256 bits
  - Keyed-hash message authentication code (HMAC)
- AES symmetric encryption
  - General purpose AES engine (encrypt/decrypt, sign/verify)
  - Supported key size: 128 and 256 bits
  - Supported encryption modes: ECB, CBC, CMAC/CBC-MAC, CTR, CCM/CCM\*, GCM
- ChaCha20/Poly1305 symmetric encryption
  - Supported key size: 128 and 256 bits
  - Authenticated encryption with associated data (AEAD) mode

### 7.1.8.1 Usage

The CRYPTOCELL state is controlled via a register interface. The cryptographic functions of CRYPTOCELL are accessible by using a software library provided in the device SDK, not directly via a register interface.

To enable CRYPTOCELL, use register [ENABLE](#) on page 186.

**WARNING:** Keeping the CRYPTOCELL subsystem enabled will prevent the device from reaching the System ON, All Idle state.

### 7.1.8.2 Direct memory access (DMA)

The CRYPTOCELL features a direct access memory (DMA) to allow cryptographic operations on memory mapped regions without involving the CPU.

The maximum DMA transaction size is limited to  $2^{16}-1$  bytes. See [Memory](#) on page 18 for information about what memories are accessible through the CRYPTOCELL DMA.

The CRYPTOCELL DMA can configure the security setting used for bus transactions.

Any data stored in memory type(s) not accessible by the CRYPTOCELL DMA engine must be copied to a memory type accessible by the direct memory before it can be processed by the CRYPTOCELL subsystem.

### 7.1.8.3 Standards

ARM TrustZone CryptoCell 312 (CRYPTOCELL) is compliant with the following protocol specifications and standards.

| Algorithm family | Identification code    | Document title                                                                                                                                                                                     |
|------------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TRNG             | NIST SP 800-90B        | <i>Recommendation for the Entropy Sources Used for Random Bit Generation</i>                                                                                                                       |

## 7.1.9 DCNF — Domain configuration

The domain configuration (DCNF) module provides a way to identify the CPU by its CPU ID in the device (CPUID). It also provides protection of the AHB multilayer interconnect (AMLI).

To provide for the AMLI protection, the DCNF contains configuration registers that can be used to block some paths from the AHB masters to their respective AHB slaves in the AMLI.

For an illustration of how the AHB masters and slaves are connected through the AMLI, see [Memory](#) on page 18.

### 7.1.9.1 Protection

The DCNF protection involves blocking of paths from AHB masters in an external core to the AHB slaves in the local core's AMLI. This way, the local core's internal resources can be blocked from masters in an external core. A set of configuration registers is used to control this behavior.

See [Memory](#) on page 18 to get an overview of the AMLI.

The DCNF configuration registers that are enabling the DCNF protection are listed below.

- [EXTPERI\[n\].PROTECT](#)
- [EXTRAM\[n\].PROTECT](#)
- [EXTCODE\[n\].PROTECT](#)

An attempt to access the blocked resources will trigger a BusFault or a HardFault exception, depending on the value of the BUSFAULTENA bit in the ARM Cortex-M33 SHCSR (system handler control and state register), described in the *ARM Cortex-M33 Devices Generic User Guide*.

### RAM protection

The protection of RAM regions is configured through the SLAVE-bits of the corresponding master ports' register [EXTRAM\[n\].PROTECT](#).

### Peripheral protection

The protection of peripheral memory regions is configured through the SLAVE-bits of the corresponding master ports' register [EXTPERI\[n\].PROTECT](#).

## Code protection

The protection of code memory regions is configured through the SLAVE-bits of the corresponding master ports' register `EXTCODE[0].PROTECT`.

### 7.1.9.2 Registers

## 7.1.10 DPPI - Distributed programmable peripheral interconnect

The distributed programmable peripheral interconnect (DPPI) enables peripherals to interact autonomously with each other by using tasks and events, without any intervention from the CPU. DPPI allows precise synchronization between peripherals when real-time application constraints exist, and eliminates the need for CPU involvement to implement behavior which can be predefined using the DPPI.

**Note:** Read [Peripheral interface](#) on page 136 to get familiarized with tasks, events, publish/subscribe, interrupts and other concepts.

The DPPI has the following features:

- Peripheral tasks can subscribe to channels
- Peripheral events can be published on channels
- Publish/subscribe pattern enabling multiple connection options that include the following:
  - One-to-one
  - One-to-many
  - Many-to-one
  - Many-to-many

The DPPI consists of several PPIBus modules, which are connected to a fixed number of DPPI channels and a DPPI configuration (DPPIC).

Figure 50: DPPI overview

### 7.1.10.1 Subscribing to and publishing on channels

The PPIBus can route peripheral events onto the channels (publishing), or route events from the channels into peripheral tasks (subscribing).

All peripherals include:

- One subscribe register per task
- One publish register per event

Publish and subscribe registers use a channel index field to determine the channel to which the event is published or tasks subscribed. In addition, there is an enable bit for the subscribe and publish registers that needs to be enabled before the subscription or publishing takes effect.

Writing non-existing channel index (CHIDX) numbers into a peripheral's publish or subscribe registers will yield unexpected results.

One event can trigger multiple tasks by subscribing different tasks to the same channel. Similarly, one task can be triggered by multiple events by publishing different events to the same channel. For advanced use cases, multiple events and multiple tasks can connect to the same channel forming a many-to-many connection. If multiple events are published on the same channel at the same time, the events are merged and only one event is routed through the DPPI.

How peripheral events are routed onto different channels based on publish registers is illustrated in the following figure.

Figure 51: DPPI events flow

How peripheral tasks are triggered from different channels based on subscribe registers is illustrated in the following figure.

Figure 52: DPPI tasks flow

### 7.1.10.2 DPPI configuration (DPPIC)

Enabling and disabling of channels globally is handled through the DPPI configuration (DPPIC). Connection (connect/disconnect) between a channel and a peripheral is handled locally by the PPIBus.

There are two ways of enabling and disabling global channels using the DPPI configuration:

- Enable or disable channels individually using registers CHEN, CHENSET, and CHENCLR
- Enable or disable channels in channel groups using the groups' tasks ENABLE and DISABLE. It needs to be defined which channels belong to which channel groups before these tasks are triggered.

**Note:** ENABLE tasks are prioritized over DISABLE tasks. When a channel belongs to two or more groups, for example group m and n, and the tasks CHG[m].EN and CHG[n].DIS occur simultaneously (m and n can be equal or different), the CHG[m].EN task on that channel is prioritized.

The DPPI configuration tasks (for example CHG[0].EN) can be triggered through DPPI like any other task, which means they can be linked to a DPPI channel through the subscribe registers.

In order to write to CHG[x], the corresponding CHG[x].EN and CHG[x].DIS subscribe registers must be disabled. Writes to CHG[x] are ignored if any of the two subscribe registers are enabled.

### 7.1.10.3 Connection examples

DPPI offers several connection options. Examples are given for how to create one-to-one and many-to-many connections.

## One-to-one connection

This example shows how to create a one-to-one connection between TIMER compare register and SAADC start task.

The channel configuration is set up first. TIMER0 will publish its COMPARE0 event on channel 0, and SAADC will subscribe its START task to events on the same channel. After that, the channel is enabled through the DPPIC.

```
NRF_TIMER0->PUBLISH_COMPARE0 = (DPPI_PUB_CHIDX_Ch0) |
                                (DPPI_PUB_EN_Msk);
NRF_SAADC->SUBSCRIBE_START    = (DPPI_SUB_CHIDX_Ch0) |
                                (DPPI_SUB_EN_Msk);

NRF_DPPIC->CHENSET = (DPPI_CHENSET_CH0_Set << DPPI_CHENSET_CH0_Pos);
```

## Many-to-many connection

The example shows how to create a many-to-many connection, showcasing the DPPIC's channel group functionality.

A channel group that includes only channel 0 is set up first. Then the GPIOTE and TIMER0 configure their IN0 and COMPARE0 events respectively to be published on channel 0, while the SAADC configures its START task to subscribe to events on channel 0. Through DPPIC, the CHG0 DISABLE task is configured to subscribe to events on channel 0. After an event is received on channel 0 it will be disabled. Finally, channel 0 is enabled using the DPPIC task to enable a channel group.

```
NRF_DPPIC->CHG[0] = (DPPI_CHG_CH0_Included << PPI_CHG_CH0_Pos);

NRF_GPIOTE->PUBLISH_IN0      = (DPPI_PUB_CHIDX_Ch0) |
                                (DPPI_PUB_EN_Msk);
NRF_TIMER0->PUBLISH_COMPARE0 = (DPPI_PUB_CHIDX_Ch0) |
                                (DPPI_PUB_EN_Msk);
NRF_SAADC->SUBSCRIBE_START    = (DPPI_SUB_CHIDX_Ch0) |
                                (DPPI_SUB_EN_Msk);
NRF_DPPIC->SUBSCRIBE_CHG[0].DIS = (DPPI_SUB_CHIDX_Ch0) |
                                (DPPI_SUB_EN_Msk);

NRF_DPPIC->TASK_CHG[0].EN = 1;
```

### 7.1.10.4 Special considerations for a system implementing TrustZone for Cortex-M processors

DPPI is implemented with split security, meaning it handles both secure and non-secure accesses. In a system implementing the TrustZone for Cortex-M technology, DPPI channels can be defined as secure or non-secure using the SPU.

A peripheral configured as non-secure will only be able to subscribe to or publish on non-secure DPPI channels. A peripheral configured as secure will be able to access all DPPI channels. DPPI handles both secure and non-secure accesses, but behaves differently depending on the access type:

- A non-secure peripheral access can only configure and control the DPPI channels defined as non-secure in the SPU.DPPI.PERM[] register(s)

- A secure peripheral access can control all the DPPI channels, independently of the SPU.DPPI.PERM[] register(s)

A group of channels can be created, making it possible to simultaneously enable or disable all channels within the group. The security attribute of a group of channels (secure or non-secure) is defined as follows:

- If all channels (enabled or not) within a group are non-secure, then the group is considered non-secure
- If at least one of the channels (enabled or not) within the group is secure, then the group is considered secure

A non-secure access to a DPPI register, or a bit field, controlling a channel marked as secure in SPU.DPPI[].PERM register(s) will be ignored. Write accesses will have no effect, and read accesses will always return a zero value.

No exceptions are triggered when non-secure accesses target a register or a bit field controlling a secure channel. For example, if the bit  $i$  is set in the SPU.DPPI[0].PERM register (declaring DPPI channel  $i$  as secure), then:

- Non-secure write accesses to registers CHEN, CHENSET, and CHENCLR cannot write bit  $i$  of these registers
- Non-secure write accesses to TASK\_CHG[j].EN and TASK\_CHG[j].DIS registers are ignored if the channel group  $j$  contains at least one channel defined as secure (it can be the channel  $i$  itself or any channel declared as secure)
- Non-secure read accesses to registers CHEN, CHENSET, and CHENCLR always read 0 for the bit at position  $i$

For the channel configuration registers (CHG[]), access from non-secure code is only possible if the included channels are all non-secure, whether the channels are enabled or not. If a CHG[g] register included one or more secure channel(s), then the group  $g$  is considered as secure, and only secure transfers can read to or write from CHG[g]. A non-secure write access is ignored, and a non-secure read access returns 0.

The DPPI can subscribe to secure and non-secure channels through the SUBSCRIBE\_CHG[] registers, in order to trigger the task for enabling or disabling groups of channels. An event from a non-secure channel will be ignored if the group subscribing to this channel is secure. An event from a secure channel can trigger both secure and non-secure tasks.

### 7.1.10.5 Registers

| Base address | Domain      | Peripheral | Instance   | Secure mapping | DMA security | Description     | Configuration                            |

### 7.1.11 ECB — AES electronic codebook mode encryption

The AES electronic codebook mode encryption (ECB) can be used for a range of cryptographic functions like hash generation, digital signatures, and keystream generation for data encryption/decryption. The ECB encryption block supports 128 bit AES encryption (encryption only, not decryption).

AES ECB operates with EasyDMA access to system Data RAM for in-place operations on cleartext and ciphertext during encryption. ECB uses the same AES core as the CCM and AAR blocks and is an asynchronous operation which may not complete if the AES core is busy.

AES ECB features:

- 128 bit AES encryption
- Supports standard AES ECB block encryption
- Memory pointer support
- DMA data transfer

AES ECB performs a 128 bit AES block encrypt. At the STARTECB task, data and key is loaded into the algorithm by EasyDMA. When output data has been written back to memory, the ENDECB event is triggered.

AES ECB can be stopped by triggering the STOPECB task.

#### 7.1.11.1 Shared resources

The ECB, CCM, and AAR share the same AES module. The ECB will always have lowest priority and if there is a sharing conflict during encryption, the ECB operation will be aborted and an ERRORECB event will be generated.

### 7.1.11.2 EasyDMA

The ECB implements an EasyDMA mechanism for reading and writing to the Data RAM. This DMA cannot access the program memory or any other parts of the memory area except RAM.

If the ECBDATAPTR is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 18 for more information about the different memory regions.

The EasyDMA will have finished accessing the Data RAM when the ENDECB or ERRORECB is generated.

### 7.1.11.3 ECB data structure

Input to the block encrypt and output from the block encrypt are stored in the same data structure. ECBDATAPTR should point to this data structure before STARTECB is initiated.

| Property   | Address offset | Description                         |
|------------|----------------|-------------------------------------|
| KEY        | 0              | 16 byte AES key                     |
| CLEARTEXT  | 16             | 16 byte AES cleartext input block   |
| CIPHERTEXT | 32             | 16 byte AES ciphertext output block |

Table 70: ECB data structure overview

## 7.1.11.5 Electrical specification

### 7.1.11.5.1 ECB Electrical Specification

| Symbol           | Description                             | Min. | Typ. | Max. | Units |
|------------------|-----------------------------------------|------|------|------|-------|
| t <sub>ECB</sub> | Run time per 16 byte block in all modes | ..   | ..   | ..   | µs    |

## 7.1.12 EGU — Event generator unit

Event generator unit (EGU) provides support for interlayer signaling. This means providing support for atomic triggering of both CPU execution and hardware tasks, from both firmware (by CPU) and hardware (by PPI). This feature can, for instance, be used for triggering CPU execution at a lower priority execution from a higher priority execution, or to handle a peripheral's interrupt service routine (ISR) execution at a lower priority for some of its events. However, triggering any priority from any priority is possible.

Listed here are the main EGU features:

- Software-enabled interrupt triggering
- Separate interrupt vectors for every EGU instance
- Up to 16 separate event flags per interrupt for multiplexing

Each instance of EGU implements a set of tasks which can individually be triggered to generate the corresponding event, for example, the corresponding event for TASKS\_TRIGGER[n] is EVENTS\_TRIGGERED[n]. See [Table 73: Instances](#) on page 202 for a list of EGU instances.

|----------------------|-------------------------------------------------------------------------------|------|------|------|--------|
| t <sub>EGU,EVT</sub> | Latency between setting an EGU event flag and the system setting an interrupt | ..   | ..   | ..   | cycles |

## 7.1.13 FPU - Floating point unit (FPU) exceptions

The ARM Cortex-M33 has FPU signals that indicate mathematical errors that cause floating-point exceptions.

The FPU signals are routed to the following event registers:

- FPUIOC: INVALIDOPERATION
- FPUIDC: DENORMALINPUT
- FPUOFC: OVERFLOW
- FPUUFC: UNDERFLOW
- FPUDZC: DIVIDEBYZERO
- FPUIXC: INEXACT

To clear the FPU exception source, write a 0 to the ARM Cortex-M33 FPSCR (floating-point status control register), as described in the *ARM Cortex-M33 Devices Generic User Guide*.

### 7.1.13.1 Registers

| Base address | Domain      | Peripheral | Instance | Secure mapping | DMA security | Description         | Configuration |
|--------------|-------------|------------|----------|----------------|--------------|---------------------|---------------|
| 0x50000000   | APPLICATION | FPU        | FPU : S  | US             | NA           | Floating Point unit |               |
| 0x40000000   |             |            | FPU : NS |                |              | interrupt control   |               |

Table 75: Instances

| Register                | Offset | Security | Description                                                                                        |
|-------------------------|--------|----------|----------------------------------------------------------------------------------------------------|
| EVENTS_INVALIDOPERATION | 0x100  |          | An FPUIOC exception triggered by an invalid operation has occurred in the FPU                      |
| EVENTS_DIVIDEBYZERO     | 0x104  |          | An FPUDZC exception triggered by a floating-point divide-by-zero operation has occurred in the FPU |
| EVENTS_OVERFLOW         | 0x108  |          | An FPUOFC exception triggered by a floating-point overflow has occurred in the FPU                 |
| EVENTS_UNDERFLOW        | 0x10C  |          | An FPUUFC exception triggered by a floating-point underflow has occurred in the FPU                |
| EVENTS_INEXACT          | 0x110  |          | An FPUIXC exception triggered by an inexact floating-point operation has occurred in the FPU       |
| EVENTS_DENORMALINPUT    | 0x114  |          | An FPUIDC exception triggered by a denormal floating-point input has occurred in the FPU           |
| INTEN                   | 0x300  |          | Enable or disable interrupt                                                                        |
| INTENSET                | 0x304  |          | Enable interrupt                                                                                   |
| INTENCLR                | 0x308  |          | Disable interrupt                                                                                  |

## 7.1.14 GPIO — General purpose input/output

The general purpose input/output pins (GPIOs) are grouped as one or more ports with each port having up to 32 GPIOs.

The number of ports and GPIOs per port may vary with product variant and package. Refer to [Registers](#) on page 215 and [Pin assignments](#) on page 764 for more information about the number of GPIOs that are supported.

GPIO has the following user-configurable features:

- Up to 32 GPIO pins per GPIO port
- Configurable output drive strength
- Internal pull-up and pull-down resistors
- Wake-up from high or low level triggers on all pins
- Trigger interrupt on state changes on any pin
- All pins can be used by the PPI task/event system
- One or more GPIO outputs can be controlled through PPI and GPIOTE channels
- All pins can be individually mapped to interface blocks for layout flexibility
- GPIO state changes captured on SENSE signal can be stored by LATCH register
- Pin sharing in multi-MCU system
- Support for secure and non-secure attributes for pins in conjunction with the system protection unit ([SPU — System protection unit](#) on page 568)

[Figure 53: GPIO port and the GPIO pin details](#) on page 210 illustrates the GPIO port containing 32 individual pins, where `PIN0` is illustrated in more detail as a reference. All signals on the left side in the illustration are used by other peripherals in the system and therefore not directly available to the CPU.

Figure 53: GPIO port and the GPIO pin details

#### 7.1.14.1 Assigning pins to MCUs and Subsystems

In a system implementing multiple MCUs, some pins of the system can be allocated among other MCUs and Subsystems than the Application MCU.

The pins accessible by each MCU are listed in [Table 77: Instances](#) on page 215.

Pins can be assigned to the following MCUs and Subsystems:

- Application MCU
- Network MCU
- Peripheral with dedicated pins
- Trace and Debug Subsystem

**Note:** Unless specified otherwise, the term Subsystem is used as a generic term for referring to a MCU, Peripheral or Subsystem.

The GPIO peripheral instantiated in the Application MCU will control which pin(s) another Subsystem can access. By default, all pins are assigned to the Application MCU. Pins can be assigned to a different Subsystem than the Application MCU by using the MCUSEL bitfield in the `PIN_CNF[]` register as shown in [Figure 54: Pin allocation in multiple-MCU systems](#) on page 211. If a pin is allocated to a Subsystem that can not access it, the pin stays under control of the Application MCU GPIO peripheral.

When a pin  $p$  is assigned to another Subsystem,

- for the GPIO peripheral instantiated in the Application MCU:
  - all write operations to bitfields or registers related to this pin will be ignored, except for the LATCH register and the `PIN_CNF[p].MCUSEL`, `PIN_CNF[p].SENSE` bitfields.
  - read operation will return 0 for the bitfields or the registers associated to this pin, except for LATCH, `PIN_CNF[p].MCUSEL` and `PIN_CNF[p].SENSE` bitfields.
- if the Subsystem is another MCU, for the GPIO peripherals instantiated in this MCU:
  - write operations will update the internal registers of the GPIO peripheral independently of the content of the `PIN_CNF[p].MCUSEL` bitfield of the Application MCU's GPIO peripheral.
  - the pin state will only be affected if this pin has been assigned to this MCU. Pins not assigned to this MCU will be read as zero in this MCU.
- if the Subsystem is a Peripheral with dedicated pins or the Trace and Debug Subsystem, for the pins assigned to this Subsystem:
  - the pin state will only be affected if this pin has been assigned to this Subsystem

Figure 54: Pin allocation in multiple-MCU systems

As explained before, only the Application MCU can assign pins. GPIO peripherals instantiated in other MCUs than the Application MCU don't have the `PIN_CNF[]`.MCUSEL bitfield.

Changing the MCUSEL bitfield for a pin may induce glitches, therefore it is recommended that peripherals using this pin are disabled before updating MCUSEL.

#### 7.1.14.2 Pin configuration

The GPIO port peripheral implements up to 32 pins, `PIN0` through `PIN31`. Each of these pins can be individually configured in the `PIN_CNF[n]` registers ( $n=0..31$ ).

**Note:** Refer to [Assigning pins to MCUs and Subsystems](#) on page 210 for pin assignment and corresponding effect of read and write operations of GPIO registers

The following parameters can be configured through these registers:

- Direction
- Drive strength
- Enabling of pull-up and pull-down resistors
- Pin sensing
- Input buffer disconnect
- Analog input (for selected pins)

**Note:** All write-capable registers are retained registers. See [POWER — Power control](#) on page 36 chapter for more information about retained registers.

The input buffer of a GPIO pin can be disconnected from the pin to enable power savings when the pin is not used as an input, see [Figure 53: GPIO port and the GPIO pin details](#) on page 210. Inputs must be

connected to get a valid input value in the [IN](#) register, and for the sense mechanism to get access to the pin.

Other peripherals in the system can connect to GPIO pins and override their output value and configuration, or read their analog or digital input value. See [Figure 53: GPIO port and the GPIO pin details](#) on page 210.

Selected pins also support analog input signals, see ANAIN in [Figure 53: GPIO port and the GPIO pin details](#) on page 210. The assignment of the analog pins can be found in [Pin assignments](#) on page 764.

The following delays should be taken into considerations:

- There is 2 CPU clock cycles delay from the GPIO pad to the [IN](#) register
- The GPIO pad must be low (or high depending on the SENSE polarity) for 3 CPU clock cycles after DETECT has gone high in order to generate a new DETECT signal

**Note:** When a pin is configured as digital input, care has been taken to minimize increased current consumption when the input voltage is between  $V_{IL}$  and  $V_{IH}$ . However, it is a good practice to ensure that the external circuitry does not drive that pin to levels between  $V_{IL}$  and  $V_{IH}$  for a long period of time.

### 7.1.14.3 Pin sense mechanism

Pins sensitivity can be individually configured, through the SENSE field in the PIN\_CNF[n] register, to detect either a high level or a low level on their input.

**Note:** Refer to [Assigning pins to MCUs and Subsystems](#) on page 210 for pin assignment and corresponding effect of read and write operations of GPIO registers

When the correct level is detected on any such configured pin, the sense mechanism will set the DETECT signal high. Each pin has a separate DETECT signal. Default behavior, defined by the DETECTMODE register, is that the DETECT signals from all pins in the GPIO port are combined into one common DETECT signal that is routed throughout the system, which then can be utilized by other peripherals. This mechanism is functional in both System ON and System OFF modes.

DETECTMODE and DETECTMODE\_SEC are provided to handle secure and non-secure pins. DETECTMODE\_SEC register is available to control the behavior associated to pin marked as secure, while the DETECTMODE register is restricted to pin marked as non-secure. Please refer to [GPIO security](#) on page 213 for more details.

Make sure that a pin is in a level that cannot trigger the sense mechanism before enabling it. The DETECT signal will go high immediately if the SENSE condition configured in the PIN\_CNF registers is met when the sense mechanism is enabled. This will trigger a PORT event if the DETECT signal was low before enabling the sense mechanism.

The DETECT signal is also used by power and clock management system to exit from System OFF mode, and by GPIOTE to generate the PORT event. In addition GPIOTE\_SEC is used for PORT event related to secure pins). See [POWER — Power control](#) on page 36 and [GPIOTE — GPIO tasks and events](#) on page 220 for more information about how the DETECT signal is used.

When a pin's PINx.DETECT signal goes high, a flag will be set in the [LATCH](#) register. For example, when the PIN0.DETECT signal goes high, bit 0 in the [LATCH](#) register will be set to '1'. If the CPU performs a clear operation on a bit in the [LATCH](#) register when the associated PINx.DETECT signal is high, the bit in the [LATCH](#) register will not be cleared. The [LATCH](#) register will only be cleared if the CPU explicitly clears it by writing a '1' to the bit that shall be cleared, i.e. the [LATCH](#) register will not be affected by a PINx.DETECT signal being set low.

The LDETECT signal will be set high when one or more bits in the [LATCH](#) register are '1'. The LDETECT signal will be set low when all bits in the [LATCH](#) register are successfully cleared to '0'.

If one or more bits in the **LATCH** register are '1' after the CPU has performed a clear operation on the **LATCH** registers, a rising edge will be generated on the LDETECT signal. This is illustrated in [Figure 55: DETECT signal behavior](#) on page 213.

**Note:** The CPU can read the **LATCH** register at any time to check if a SENSE condition has been met on one or more of the the GPIO pins, even if that condition is no longer met at the time the CPU queries the **LATCH** register. This mechanism will work even if the LDETECT signal is not used as the DETECT signal.

The LDETECT signal is by default not connected to the GPIO port's DETECT signal, but via the DETECTMODE register it is possible to change from default behavior to DETECT signal being derived directly from the LDETECT signal instead. See [Figure 53: GPIO port and the GPIO pin details](#) on page 210. [Figure 55: DETECT signal behavior](#) on page 213 illustrates the DETECT signal behavior for these two alternatives.

Figure 55: DETECT signal behavior

#### 7.1.14.4 GPIO security

The general purpose input/output peripheral (GPIO) is implemented as a "split-security" peripheral. If marked as non-secure, it can be access by both secure and non-secure accesses but will behave differently depending of the access type.

**Note:** Refer to [Assigning pins to MCUs and Subsystems](#) on page 210 for pin assignment and corresponding effect of read and write operations of GPIO registers

A non-secure peripheral access will only be able to configure and control pins defined as non-secure in the system protection unit (SPU) GPIOPORT.PERM[] register(s).

A non-secure access to a register or a bitfield controlling a pin marked as secure in GPIO.PERM[] register(s) will be ignored:

- write accesses will have no effect
- read accesses will always return a zero value

No exception is triggered when a non-secure access targets a register or bitfield controlling a secure pin.

For example, if the bit  $i$  is set in the SPU.GPIO.PERM[0] register (declaring Pin P0. $i$  as secure), then

- non-secure write accesses to OUT, OUTSET, OUTCLR, DIR, DIRSET, DIRCLR and LATCH registers will not be able to write to bit  $i$  of those registers
- non-secure write accesses to registers PIN[ $i$ ].OUT and PIN\_CNF[ $i$ ] will be ignored
- non-secure read accesses to registers OUT, OUTSET, OUTCLR, IN, DIR, DIRSET, DIRCLR and LATCH will always read a 0 for the bit at position  $i$
- non-secure read accesses to registers PIN[ $i$ ].OUT, PIN[ $i$ ].IN and PIN\_CNF[ $i$ ] will always return 0

The GPIO.DETECTMODE and GPIO.DETECTMODE\_SEC registers are handled differently than the other registers mentioned before. When accessed by a secure access, the DETECTMODE\_SEC register controls the source for the DETECT\_SEC signal for the pins marked as secure. When accessed by a non-secure access, the DETECTMODE\_SEC is read as zero and write accesses are ignored. The GPIO.DETECTMODE register controls the source for the DETECT\_NSEC signal for the pins defined as non-secure.

The DETECT\_NSEC signal is routed to the GPIOTE peripheral, allowing generation of events and interrupts from pins marked as non-secure. The DETECT\_SEC signal is routed to the GPIOTESEC peripheral, allowing generation of events and interrupts from pins marked as secure. [Figure 56: Principle of direct pin access](#) on page 214 illustrates how the DETECT\_NSEC and DETECT\_SEC signals are generated from the GPIO PIN[ $i$ ].DETECT signals.

Figure 56: Principle of direct pin access

### 7.1.14.5 Registers

| Base address | Domain      | Peripheral | Instance | Secure mapping | DMA security | Description                              | Configuration              |
|--------------|-------------|------------|----------|----------------|--------------|------------------------------------------|----------------------------|
| 0x50842500   | APPLICATION | GPIO       | P0 : S   | SPLIT          | NA           | General purpose input and output, port 0 | P0.00 to P0.31 implemented |
| 0x40842500   |             |            | P0 : NS  |                |              |                                          |                            |
| 0x50842800   | APPLICATION | GPIO       | P1 : S   | SPLIT          | NA           | General purpose input and output, port 1 | P1.00 to P1.16 implemented |

### 7.1.15 GPIOTE — GPIO tasks and events

The GPIO tasks and events (GPIOTE) module provides functionality for accessing GPIO pins using tasks and events. Each GPIOTE channel can be assigned to one pin.

A GPIOTE block enables GPIOs to generate events on pin state change which can be used to carry out tasks through the PPI system. A GPIO can also be driven to change state on system events using the PPI system. Tasks and events are briefly introduced in [Peripheral interface](#) on page 136, and GPIO is described in more detail in [GPIO — General purpose input/output](#) on page 209.

Low power detection of pin state changes is possible when in System ON or System OFF.

| Instance | Number of GPIOTE channels |
|----------|---------------------------|
| GPIOTE   | 8                         |

Table 79: GPIOTE properties

Up to three tasks can be used in each GPIOTE channel for performing write operations to a pin. Two tasks are fixed (SET and CLR), and one (OUT) is configurable to perform following operations:

- Set
- Clear

<sup>1</sup> Rise and fall times based on simulations

- Toggle

An event can be generated in each GPIOTE channel from one of the following input conditions:

- Rising edge
- Falling edge
- Any change

### 7.1.15.1 Pin events and tasks

The GPIOTE module has a number of tasks and events that can be configured to operate on individual GPIO pins.

The secure instance of the GPIOTE peripheral is able to operate on all GPIO pins configured in `GPIOTE.CONFIG[n].PSEL`.

The non-secure instance of the GPIOTE peripheral is able to operate only on non-secure GPIO pins. The field `GPIOTE.CONFIG[n].PSEL` can only select a non-secure pin.

The tasks `SET[n]`, `CLR[n]`, and `OUT[n]` can write to individual pins, and events `IN[n]` can be generated from input changes of individual pins.

The SET task will set the pin selected in `GPIOTE.CONFIG[n].PSEL` to high. The CLR task will set the pin low.

The effect of the OUT task on the pin is configurable in `CONFIG[n].POLARITY`. It can set the pin high, set it low, or toggle it.

Tasks and events are configured using the `CONFIG[n]` registers. One `CONFIG[n]` register is associated with a set of `SET[n]`, `CLR[n]`, and `OUT[n]` tasks and `IN[n]` events.

As long as a `SET[n]`, `CLR[n]`, and `OUT[n]` task or an `IN[n]` event is configured to control pin `n`, the pin's output value will only be updated by the GPIOTE module. The pin's output value, as specified in the GPIO, will therefore be ignored as long as the pin is controlled by GPIOTE. Attempting to write to the pin as a normal GPIO pin will have no effect. When the GPIOTE is disconnected from a pin, the associated pin gets the output and configuration values specified in the GPIO module, see `MODE` field in `CONFIG[n]` register.

When conflicting tasks are triggered simultaneously (i.e. during the same clock cycle) in one channel, the priority of the tasks is as described in the following table.

| Priority | Task |
|----------|------|
| 1        | OUT  |
| 2        | CLR  |
| 3        | SET  |

Table 80: Task priorities

When setting the `CONFIG[n]` registers, `MODE=Disabled` does not have the same effect as `MODE=Task` and `POLARITY=None`. In the latter case, a CLR or SET task occurring at the exact same time as OUT will end up with no change on the pin, based on the priorities described in the table above.

When a GPIOTE channel is configured to operate on a pin as a task, the initial value of that pin is configured in the `OUTINIT` field of `CONFIG[n]`.

### 7.1.15.2 Port event

PORT is an event that can be generated from multiple input pins using the GPIO DETECT signal.

The event will be generated on the rising edge of the DETECT signal. See [GPIO — General purpose input/output](#) on page 209 for more information about the DETECT signal.

There are two DETECT signals that come from the [GPIO](#) peripheral. The secure DETECT\_SEC, for the secure instance of the GPIOTE peripheral, and the non-secure DETECT\_NONSEC, for the non-secure instance of the GPIOTE peripheral.

The GPIO DETECT signal will not wake the system up again if the system is put into System ON IDLE while the DETECT signal is high. Make sure to clear all DETECT sources before entering sleep. If the LATCH register is used as a source, a new rising edge will be generated on DETECT if any bit in LATCH is still high after clearing all or part of the register. This could occur if one of the PINx.DETECT signals is still high, for example. See [Pin sense mechanism](#) on page 212 for more information.

Setting the system to System OFF while DETECT is high will cause a wakeup from System OFF reset.

This feature is always enabled even if the peripheral itself appears to be IDLE, meaning no clocks or other power intensive infrastructure have to be requested to keep this feature enabled. This feature can therefore be used to wake up the CPU from a WFI or WFE type sleep in System ON when all peripherals and the CPU are idle, meaning the lowest power consumption in System ON mode.

In order to prevent spurious interrupts from the PORT event while configuring the sources, the following must be performed:

1. Disable interrupts on the PORT event (through INTENCLR.PORT).
2. Configure the sources (PIN\_CNF[n].SENSE).
3. Clear any potential event that could have occurred during configuration (write '0' to EVENTS\_PORT).
4. Enable interrupts (through INTENSET.PORT).

### 7.1.15.3 Tasks and events pin configuration

Each GPIOTE channel is associated with one physical GPIO pin through the CONFIG.PSEL field.

When Event mode is selected in CONFIG.MODE, the pin specified by CONFIG.PSEL will be configured as an input, overriding the DIR setting in GPIO. Similarly, when Task mode is selected in CONFIG.MODE, the pin specified by CONFIG.PSEL will be configured as an output overriding the DIR setting and OUT value in GPIO. When Disabled is selected in CONFIG.MODE, the pin specified by CONFIG.PSEL will use its configuration from the PIN[n].CNF registers in GPIO. CONFIG.MODE must be disabled in order to be able to change the value of the PSEL field.

**Note:** A pin can only be assigned to one GPIOTE channel at a time. Failing to do so may result in unpredictable behavior.

### 7.1.15.4 Registers

| Base address | Domain      | Peripheral | Instance | Secure mapping | DMA security | Description           | Configuration |
|--------------|-------------|------------|----------|----------------|--------------|-----------------------|---------------|

### 7.1.15.5 Electrical specification

## 7.1.16 I<sup>2</sup>S — Inter-IC sound interface

The I<sup>2</sup>S (Inter-IC Sound) module, supports the original two-channel I<sup>2</sup>S format, and left- or right-aligned formats. It implements EasyDMA for sample transfer directly to and from RAM without CPU intervention.

The I<sup>2</sup>S peripheral has the following main features:

- Master and Slave mode
- Simultaneous bidirectional (TX and RX) audio streaming
- Original I<sup>2</sup>S and left- or right-aligned format
- 32, 24, 16 and 8-bit sample widths
- Separate sample and word widths
- Low-jitter master clock generator
- Various sample rates

Figure 57: I<sup>2</sup>S master

### 7.1.16.1 Mode

The I<sup>2</sup>S protocol specification defines two modes of operation, Master and Slave.

The I<sup>2</sup>S mode decides which of the two sides (master or slave) shall provide the clock signals LRCK and SCK, and these signals are always supplied by the master to the slave.

### 7.1.16.2 Transmitting and receiving

The I<sup>2</sup>S module supports both transmission (TX) and reception (RX) of serial data. In both cases the serial data is shifted synchronously to the clock signals SCK and LRCK.

TX data is written to the SDOUT pin on the falling edge of SCK, and RX data is read from the SDIN pin on the rising edge of SCK. The most significant bit (MSB) is always transmitted first.

TX and RX are available in both Master and Slave modes and can be enabled/disabled independently in the [CONFIG.TXEN](#) on page 245 and [CONFIG.RXEN](#) on page 245.

Transmission and/or reception is started by triggering the [START](#) task. With transmission enabled in [CONFIG.TXEN](#), the [TXPTRUPD](#) event will be generated for every number of transmitted data words given by [RXTXD.MAXCNT](#) on page 250. Each data word contains one or more samples. The [TXPTRUPD](#) event is generated just before [MAXCNT](#) number of data words have been transmitted. Similarly, with reception enabled in [CONFIG.RXEN](#), the [RXPTRUPD](#) event will be generated for every received data word given by [RXTXD.MAXCNT](#) on page 250. The [RXPTRUPD](#) event is generated just after [MAXCNT](#) number of data bytes have been received.

The **FRAMESTART** event is generated synchronously to the active LRCK edge at the beginning of a frame after transmitting **RXTXD.MAXCNT** data words. The initial **FRAMESTART** event is generated at the first active edge of LRCK after the **START** task has been triggered.

Figure 58: Transmitting and receiving. *CONFIG.FORMAT = Aligned, CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Stereo, RXTXD.MAXCNT = 1*

### 7.1.16.3 Left right clock (LRCK)

The left right clock (LRCK), often referred to as word clock, sample clock, or word select in I<sup>2</sup>S context, is the clock defining the frames in serial bitstreams sent and received on SDOUT and SDIN, respectively.

In I2S format, each frame contains one left and/or right sample pair. The left sample is transferred during the low half period of LRCK, followed by the right sample being transferred during the high half period of LRCK.

In Aligned format, each frame contains one left and/or right sample pair. The left sample is transferred during the high half period of LRCK, followed by the right sample being transferred during the low half period of LRCK.

For mono, the frame will contain only zeros for the unused half period of LRCK.

Consequently, the LRCK frequency is equivalent to the audio sample rate.

When operating in Master mode, the LRCK is generated from the MCK, and the frequency of LRCK is then given as:

$$\text{LRCK} = \text{MCK} / \text{CONFIG.RATIO}$$

LRCK always toggles around the falling edge of the serial clock SCK.

### 7.1.16.4 Serial clock (SCK)

The serial clock (SCK), often referred to as the serial bit clock, pulses once for each data bit being transferred on the serial data lines SDIN and SDOUT.

When operating in Master mode, the SCK is generated from the MCK, and the frequency of SCK is then given as:

$$\text{SCK} = 2 * \text{LRCK} * \text{CONFIG.SWIDTH}$$

The falling edge of the SCK falls on the toggling edge of LRCK.

When operating in Slave mode, SCK is provided by the external I<sup>2</sup>S master.

### 7.1.16.5 Master clock (MCK)

The master clock (MCK) is the clock from which LRCK and SCK are derived when operating in Master mode.

The master clock generator always needs to be enabled when in Master mode, but the generator can also be enabled when in Slave mode. Enabling the generator when in Slave mode can be useful in the case where the external master is not able to generate its own master clock.

MCK is generated from the clock source selected in the [CONFIG.CLKCONFIG](#) and [CONFIG.MCKFREQ](#) registers.

The following equation can be used to calculate the value of [CONFIG.MCKFREQ](#) for given MCK and clock source frequency:

$$MCKFREQ = 4096 \cdot \left\lceil \frac{f_{MCK} \cdot 1048576}{f_{source} + \frac{f_{MCK}}{2}} \right\rceil$$

Figure 59: MCK clock frequency equation

The parameter  $f_{MCK}$  is the requested MCK clock frequency in Hz, and  $f_{source}$  is the frequency of the selected clock source in Hz. Because of rounding errors, an accurate MCK clock may not be achievable. The equation does not take into account the maximum register value of [CONFIG.MCKFREQ](#) on page 246.

The actual MCK frequency can be calculated using the equation below.

$$f_{actual} = \frac{f_{source}}{\left\lceil \frac{1048576 \cdot 4096}{MCKFREQ} \right\rceil}$$

Figure 60: Actual MCK clock frequency

The clock error can be calculated using the equation below. The error  $e$  is the percentage difference from the requested  $f_{MCK}$  frequency.

$$e = 100 \cdot \frac{f_{actual} - f_{MCK}}{f_{MCK}} = 100 \cdot \frac{\frac{f_{source}}{\left\lceil \frac{1048576 \cdot 4096}{MCKFREQ} \right\rceil} - f_{MCK}}{f_{MCK}}$$

Figure 61: MCK frequency error equation

The master clock generator does not add any jitter to the clock source chosen.

The master clock generator is enabled/disabled using [CONFIG.MCKEN](#) on page 246, and the generator is started or stopped by the [START](#) or [STOP](#) tasks respectively.

The MCK frequency can be adjusted on-the-fly:

- For PCLK32M, by using [MCKFREQ](#)
- For ACLK, by adjusting the audio clock source, see [CLOCK — Clock control](#) on page 61.

In Master mode, the LRCK and the SCK frequencies are closely related as both are derived from MCK and set indirectly through [CONFIG.RATIO](#) on page 247 and [CONFIG.SWIDTH](#) on page 248.

When configuring these registers, the user is responsible for fulfilling the following requirements:

1. The SCK frequency can never exceed the MCK frequency.
2. The MCK/LRCK ratio shall be a multiple of  $2 \cdot \text{CONFIG.SWIDTH}$ .

The MCK signal can be routed to an output pin (specified in [PSEL.MCK](#)) to supply external I<sup>2</sup>S devices that require the MCK to be supplied from the outside.

When operating in Slave mode, the I<sup>2</sup>S module does not use the MCK and the MCK generator does not need to be enabled.

Figure 62: Relation between *RATIO*, *MCK* and *LRCK*

#### 7.1.16.5.1 Clock source selection

The clock source for the master clock generator can be selected in the register [CONFIG.CLKCONFIG](#) on page 249. Choose one of the following clocks as the clock source:

- 32 MHz peripheral clock (PCLK32M), synchronous to HFCLK.
- Audio PLL clock (ACLK) with configurable frequency.

To improve the master clock accuracy and jitter performance, it is recommended (but not mandatory) that the source is running off the HFXO instead of the HFINT oscillator. See [CLOCK — Clock control](#) on page 61 for more information about starting HFXO for the relevant clock source.

The master clock generator can be bypassed so the MCK clock is derived directly from the input source. This can be configured in the BYPASS field of register [CONFIG.CLKCONFIG](#) on page 249.

#### 7.1.16.5.2 Configuration examples

Table 83: Configuration examples for [CLKCONFIG = PCLK32M](#) on page 231 and Table 84: Configuration examples for [CLKCONFIG = ACLK](#) on page 232 show some configuration examples for popular sample rates, using both the 32 MHz master clock and the Audio PLL clock source.

| Source frequency [Hz] | Requested LRCK [Hz] | Requested RATIO | Requested MCK [Hz] | MCKFREQ   | MCK [Hz] | LRCK [Hz] | LRCK error [%] |
|-----------------------|---------------------|-----------------|--------------------|-----------|----------|-----------|----------------|
| 32000000              | 16000               | 32              | 512000             | 68173824  | 507936   | 15873     | -0.8           |

Table 84: Configuration examples for CLKCONFIG = ACLK

### 7.1.16.6 Width, alignment and format

The register `CONFIG.SWIDTH` on page 248 defines the sample width of the data read and written to memory, as well as the number of SCK clock cycles per half-frame. Figure [Figure 63: Aligned format, with CONFIG.SWIDTH configured to 16 bit samples in a 16 bit half-frame](#) on page 232 illustrates a configuration with identical sample and half-frame widths. The number of SCK pulses matches the number of sample bits. Figure [Figure 64: Aligned format, with CONFIG.SWIDTH configured to 16-bit samples in a 24-bit half-frame](#) on page 232 illustrates a configuration with greater half-frame width than sample width. The number of SCK pulses are greater than the number of sample bits, with the sample being left-aligned in the half-frame.

Figure 63: Aligned format, with CONFIG.SWIDTH configured to 16 bit samples in a 16 bit half-frame

Figure 64: Aligned format, with CONFIG.SWIDTH configured to 16-bit samples in a 24-bit half-frame

The register `CONFIG.FORMAT` on page 248 is used to choose whether a word shall be aligned on the LRCK edge, or be delayed one bit period after this edge:

- When using Aligned format, the first bit in a half-frame gets sampled on the first rising edge of SCK following a LRCK edge, as illustrated in [Figure 65: Aligned format. Identical sample width and half-frame width. Left sample on high level of LRCK](#) on page 233. The left sample is transferred during the high half period of LRCK.
- When using I<sup>2</sup>S format, the first bit in a half-frame (containing one left or right sample) gets sampled on the second rising edge of the SCK after a LRCK edge, as illustrated in [Figure 66: I<sup>2</sup>S format. Identical](#)

sample width and half-frame width. Left sample on low level of LRCK on page 233. The left sample is transferred during the low half period of LRCK.

Figure 65: Aligned format. Identical sample width and half-frame width. Left sample on high level of LRCK

Figure 66: I<sup>2</sup>S format. Identical sample width and half-frame width. Left sample on low level of LRCK

If the half-frame width differs from the sample width, the sample value can be either right or left-aligned inside a half-frame, as specified in [CONFIG.ALIGN](#) on page 248

- When using left-alignment, each half-frame starts with the MSB of the sample value, as illustrated by [Figure 67: CONFIG.ALIGN set to left justified](#) on page 233.
- When using right-alignment, each half-frame ends with the LSB of the sample value. This is illustrated in [Figure 68: CONFIG.ALIGN set to right justified](#) on page 233.

Figure 67: CONFIG.ALIGN set to left justified

Figure 68: CONFIG.ALIGN set to right justified

## Slave mode considerations

In Slave mode, the sample width does not need to equal the half-frame width, or even frame size. This means that there can be extra or fewer SCK pulses per half-frame than what the sample and half-frame widths specified in [CONFIG.SWIDTH](#) on page 248 require.

In cases where **left-alignment** is used, and the number of SCK pulses per half-frame is **higher** than the configured width, the following will apply:

- For data received on SDIN, all bits after the least significant bit (LSB) of the word value will be discarded.
- For data sent on SDOUT, all bits after the LSB of the word value will be 0.

In cases where **left-alignment** is used, and the number of SCK pulses per frame is **lower** than the word width, the following will apply:

- Data sent and received on SDOUT and SDIN will be truncated with the LSBs being removed first.

In cases where **right-alignment** is used, and the number of SCK pulses per frame is **higher** than the configured width, the following will apply:

- For data received on SDIN, all bits before the MSB of the word value will be discarded.

- For data sent on SDOUT, all bits after the LSB of the word value will be 0 (same behavior as for left-alignment).

In cases where **right-alignment** is used, and the number of SCK pulses per frame is **lower** than the configured width, the following will apply:

- Data received on SDIN will be sign-extended to the same number of bits as the sample width before being written to memory.
- Data sent on SDOUT will be truncated with the LSBs being removed first (same behavior as for left-alignment).

### 7.1.16.7 EasyDMA

The I<sup>2</sup>S module implements EasyDMA for accessing internal Data RAM without CPU intervention.

The source and destination pointers for the TX and RX data are configured in [TXD.PTR](#) on page 249 and [RXD.PTR](#) on page 249. The memory pointed to by these pointers will only be read or written when TX or RX are enabled in [CONFIG.TXEN](#) on page 245, and [CONFIG.RXEN](#) on page 245.

The addresses written to the pointer registers [TXD.PTR](#) on page 249 and [RXD.PTR](#) on page 249 are double-buffered in hardware. These double buffers are updated for every number of transmitted data words given by [RXTXD.MAXCNT](#) on page 250 read from/written to memory. The events TXPTRUPD and RXPTRUPD are generated whenever the TXD.PTR and RXD.PTR are transferred to these double buffers.

If [TXD.PTR](#) on page 249 is not pointing to the Data RAM region when transmission is enabled, or [RXD.PTR](#) on page 249 is not pointing to the Data RAM region when reception is enabled, an EasyDMA transfer may result in a HardFault and/or memory corruption. See [Memory](#) on page 18 for more information about the different memory regions.

Due to the nature of I<sup>2</sup>S, where the number of transmitted samples always equals the number of received samples (at least when both TX and RX are enabled), one common register [RXTXD.MAXCNT](#) on page 250 is used for specifying the sizes of these two memory buffers. The size of the buffers is specified in a number of 32-bit words. Such a 32-bit memory word can either contain one 32-bit sample, one right-aligned 24-bit sample sign extended to 32-bit, two 16-bit samples or four 8-bit samples.

In Stereo mode ([CONFIG.CHANNELS](#) on page 248=Stereo), the samples are stored as left and right sample pairs in memory. [Figure 69: Memory mapping for 8-bit stereo](#). [CONFIG.SWIDTH = 8Bit](#), [CONFIG.CHANNELS = Stereo](#). on page 235, [Figure 71: Memory mapping for 16-bit stereo](#). [CONFIG.SWIDTH = 16Bit](#), [CONFIG.CHANNELS = Stereo](#). on page 235 and [Figure 73: Memory mapping for 24-bit stereo](#). [CONFIG.SWIDTH = 24Bit](#), [CONFIG.CHANNELS = Stereo](#). on page 236 show how the samples are mapped to memory in this mode. The mapping is valid for both RX and TX.

In Mono mode ([CONFIG.CHANNELS](#) on page 248=Left or Right), RX sample from only one channel in the frame is stored in memory, the other channel sample is ignored. [Figure 70: Memory mapping for 8-bit mono](#). [CONFIG.SWIDTH = 8Bit](#), [CONFIG.CHANNELS = Left](#). on page 235, [Figure 72: Memory mapping for 16-bit mono, left channel only](#). [CONFIG.SWIDTH = 16Bit](#), [CONFIG.CHANNELS = Left](#). on page 235 and [Figure 74: Memory mapping for 24-bit mono, left channel only](#). [CONFIG.SWIDTH = 24Bit](#), [CONFIG.CHANNELS = Left](#). on page 236 show how RX samples are mapped to memory in this mode. For TX, the same outgoing sample read from memory is transmitted on both left and right in a frame, resulting in a mono output stream.

Figure 69: Memory mapping for 8-bit stereo. CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Stereo.

Figure 70: Memory mapping for 8-bit mono. CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Left.

Figure 71: Memory mapping for 16-bit stereo. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Stereo.

Figure 72: Memory mapping for 16-bit mono, left channel only. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Left.

Figure 74: Memory mapping for 24-bit mono, left channel only. *CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Left.*

Figure 75: Memory mapping for 32-bit stereo. *CONFIG.SWIDTH = 32Bit, CONFIG.CHANNELS = Stereo.*

Figure 76: Memory mapping for 32-bit mono, left channel only. *CONFIG.SWIDTH = 32Bit, CONFIG.CHANNELS = Left.*

### 7.1.16.8 Module operation

Described here is a typical operating procedure for the I<sup>2</sup>S module.

## 1. Configure the I<sup>2</sup>S module using the CONFIG registers

```
// Enable reception
NRF_I2S->CONFIG.RXEN = (I2S_CONFIG_RXEN_RXEN_Enabled <<
                        I2S_CONFIG_RXEN_RXEN_Pos);

// Enable transmission
NRF_I2S->CONFIG.TXEN = (I2S_CONFIG_TXEN_TXEN_Enabled <<
                        I2S_CONFIG_TXEN_TXEN_Pos);

// Enable MCK generator
NRF_I2S->CONFIG.MCKEN = (I2S_CONFIG_MCKEN_MCKEN_Enabled <<
                        I2S_CONFIG_MCKEN_MCKEN_Pos);

// MCKFREQ = 4 MHz
NRF_I2S->CONFIG.MCKFREQ = I2S_CONFIG_MCKFREQ_MCKFREQ_32MDIV8 <<
                        I2S_CONFIG_MCKFREQ_MCKFREQ_Pos;

// Ratio = 256
NRF_I2S->CONFIG.RATIO = I2S_CONFIG_RATIO_RATIO_256X <<
                        I2S_CONFIG_RATIO_RATIO_Pos;

// MCKFREQ = 4 MHz and Ratio = 256 gives sample rate = 15.625 ks/s
// Sample width = 16 bit
NRF_I2S->CONFIG.SWIDTH = I2S_CONFIG_SWIDTH_SWIDTH_16Bit <<
                        I2S_CONFIG_SWIDTH_SWIDTH_Pos;

// Alignment = Left
NRF_I2S->CONFIG.ALIGN = I2S_CONFIG_ALIGN_ALIGN_Left <<
                        I2S_CONFIG_ALIGN_ALIGN_Pos;

// Format = I2S
NRF_I2S->CONFIG.FORMAT = I2S_CONFIG_FORMAT_FORMAT_I2S <<
                        I2S_CONFIG_FORMAT_FORMAT_Pos;

// Use stereo
NRF_I2S->CONFIG.CHANNELS = I2S_CONFIG_CHANNELS_CHANNELS_Stereo <<
                        I2S_CONFIG_CHANNELS_CHANNELS_Pos;
```

## 2. Map IO pins using the PINSEL registers

```
// MCK routed to pin 0
NRF_I2S->PSEL.MCK = (0 << I2S_PSEL_MCK_PIN_Pos) |
                    (I2S_PSEL_MCK_CONNECT_Connected <<
                     I2S_PSEL_MCK_CONNECT_Pos);

// SCK routed to pin 1
NRF_I2S->PSEL.SCK = (1 << I2S_PSEL_SCK_PIN_Pos) |
                    (I2S_PSEL_SCK_CONNECT_Connected <<
                     I2S_PSEL_SCK_CONNECT_Pos);

// LRCK routed to pin 2
NRF_I2S->PSEL.LRCK = (2 << I2S_PSEL_LRCK_PIN_Pos) |
                     (I2S_PSEL_LRCK_CONNECT_Connected <<
                      I2S_PSEL_LRCK_CONNECT_Pos);

// SDOUT routed to pin 3
NRF_I2S->PSEL.SDOUT = (3 << I2S_PSEL_SDOUT_PIN_Pos) |
                      (I2S_PSEL_SDOUT_CONNECT_Connected <<
                       I2S_PSEL_SDOUT_CONNECT_Pos);

// SDIN routed on pin 4
NRF_I2S->PSEL.SDIN = (4 << I2S_PSEL_SDIN_PIN_Pos) |
                     (I2S_PSEL_SDIN_CONNECT_Connected <<
                      I2S_PSEL_SDIN_CONNECT_Pos);
```

### 3. Configure TX and RX data pointers using the TXD, RXD and RXTXD registers

```
NRF_I2S->TXD.PTR = my_tx_buf;
NRF_I2S->RXD.PTR = my_rx_buf;
NRF_I2S->TXD.MAXCNT = MY_BUF_SIZE;
```

### 4. Enable the I<sup>2</sup>S module using the ENABLE register

```
NRF_I2S->ENABLE = 1;
```

### 5. Start audio streaming using the START task

```
NRF_I2S->TASKS_START = 1;
```

### 6. Handle received and transmitted data when receiving the TXPTRUPD and RXPTRUPD events

```
if (NRF_I2S->EVENTS_TXPTRUPD != 0)
{
    NRF_I2S->TXD.PTR = my_next_tx_buf;
    NRF_I2S->EVENTS_TXPTRUPD = 0;
}

if (NRF_I2S->EVENTS_RXPTRUPD != 0)
{
    NRF_I2S->RXD.PTR = my_next_rx_buf;
    NRF_I2S->EVENTS_RXPTRUPD = 0;
}
```

#### 7.1.16.9 Pin configuration

The MCK, SCK, LRCK, SDIN and SDOUT signals associated with the I<sup>2</sup>S module are mapped to physical pins according to the pin numbers specified in the PSEL.x registers.

These pins are acquired whenever the I<sup>2</sup>S module is enabled through the register [ENABLE](#) on page 245.

When a pin is acquired by the I<sup>2</sup>S module, the direction of the pin (input or output) will be configured automatically, and any pin direction setting done in the GPIO module will be overridden. The directions for the various I<sup>2</sup>S pins are shown below in [Table 85: GPIO configuration before enabling peripheral \(Master mode\)](#) on page 238 and [Table 86: GPIO configuration before enabling peripheral \(Slave mode\)](#) on page 239.

To secure correct signal levels on the pins in System OFF mode, and when the I<sup>2</sup>S module is disabled, these pins must be configured in the GPIO peripheral directly.

| I <sup>2</sup> S signal | I <sup>2</sup> S pin       | Direction | Output value   | Comment |
|-------------------------|----------------------------|-----------|----------------|---------|
| MCK                     | As specified in PSEL.MCK   | Output    | 0              |         |
| LRCK                    | As specified in PSEL.LRCK  | Output    | 0              |         |
| SCK                     | As specified in PSEL.SCK   | Output    | 0              |         |
| SDIN                    | As specified in PSEL.SDIN  | Input     | Not applicable |         |
| SDOUT                   | As specified in PSEL.SDOUT | Output    | 0              |         |

Table 85: GPIO configuration before enabling peripheral (Master mode)

| I <sup>2</sup> S signal | I <sup>2</sup> S pin       | Direction | Output value   | Comment |
|-------------------------|----------------------------|-----------|----------------|---------|
| MCK                     | As specified in PSEL.MCK   | Output    | 0              |         |
| LRCK                    | As specified in PSEL.LRCK  | Input     | Not applicable |         |
| SCK                     | As specified in PSEL.SCK   | Input     | Not applicable |         |
| SDIN                    | As specified in PSEL.SDIN  | Input     | Not applicable |         |
| SDOUT                   | As specified in PSEL.SDOUT | Output    | 0              |         |

Table 86: GPIO configuration before enabling peripheral (Slave mode)

### 7.1.16.10 Registers

| Base address | Domain      | Peripheral | Instance  | Secure mapping | DMA security | Description              | Configuration |
|--------------|-------------|------------|-----------|----------------|--------------|--------------------------|---------------|
| 0x50028000   | APPLICATION | I2S        | I2S0 : S  | US             | SA           | Inter-IC sound interface |               |

| $DC_{CK}$       | Clock duty cycle (MCK, LRCK, SCK)  | ..   | ..   | ..   | %     |

Figure 77: I2S timing diagram

## 7.1.17 IPC — Interprocessor communication

The interprocessor communication (IPC) peripheral is used to send and receive events between MCUs in the system.

Figure 78: IPC block diagram

## Functional description

Figure 78: IPC block diagram on page 253 illustrates the interprocessor communication (IPC) peripheral. In a multi-MCU system, each MCU has one dedicated IPC peripheral. The IPC peripheral can be used to send and receive events to and from other IPC peripherals. An instance of the IPC peripheral can have multiple SEND tasks and RECEIVE events. A single SEND task can be configured to signal an event on one or more IPC channels, and a RECEIVE event can be configured to listen on one or more IPC channels. The IPC channels that are triggered in a SEND task can be configured through the `SEND_CNF` registers, and the IPC channels that trigger a RECEIVE event are configured through the `RECEIVE_CNF` registers. The figure below illustrates how the `SEND_CNF` and `RECEIVE_CNF` registers work. Both the SEND task and the RECEIVE event can be connected to all IPC channels.

Figure 79: IPC registers *SEND\_CNF* and *RECEIVE\_CNF*

A SEND task can be viewed as broadcasting events onto one or more IPC channels, and a RECEIVE event can be seen as subscribing to a subset of IPC channels. It is possible for multiple IPCs to trigger events onto the same channel at the same time. When two or more events on the same channel occur within  $t_{IPC}$ , the events may be merged into a single event seen from the IPC receiver. One of the events can therefore be lost. To prevent this, the user must ensure that events on the same IPC channel do not occur within  $t_{IPC}$  of each other. When implementing firmware data structures, such as queues or mailboxes, this can be done by using one channel for acknowledgements.

An IPC event often does not contain any data itself, it is used to signal other MCUs that something has occurred. Data can be shared through shared memory, for example in the form of a software implemented mailbox, or command/event queues. It is up to software to assign a logical functionality to an IPC channel. For instance, one IPC channel can be used to signal that a command is ready to be executed, and any processor in the system can subscribe to that particular channel and decode/execute the command.

## General purpose memory

The **GP**MEM registers can be used freely to store information. These registers are accessed like any other of the IPC peripheral's registers.

### 7.1.17.1 IPC and PPI connections

The IPC SEND tasks and RECEIVE events can be connected through PPI channels. This makes it possible to relay events from peripherals in one MCU to another, without CPU involvement.

Figure below illustrates a timer COMPARE event that is relayed from one MCU to IPC using PPI, then back into a timer CAPTURE event in another MCU.

Figure 80: Example of PPI and IPC connections

### 7.1.17.2 Registers

| Base address | Domain      | Peripheral | Instance | Secure mapping | DMA security | Description                  | Configuration |

## 7.1.18 KMU — Key management unit

The key management unit (KMU) enforces access policies to a subset region of user information configuration register (UICR). This subset region is used for storing cryptographic key values inside the key slots, which the CPU has no access to.

In total there are 128 key slots available, where each key slot can store one 128-bit key value together with an access policy and a destination address for the key value. Multiple key slots can be combined in order

to support key sizes larger than 128 bits. The access policy of a key slot governs if and how a key value can be used, while the destination address determines where in the memory map the KMU pushes the key value upon a request from the CPU.

Key slots can be configured to be pushed directly into write-only key registers in cryptographic accelerators, like e.g. CryptoCell, without exposing the key value itself to the CPU. This enables the CPU to use the key values stored inside the key slots for cryptographic operations without being exposed to the key value.

Access to the KMU, and the key slots in the UICR, is only allowed from secure mode.

### 7.1.18.1 Functional view

From a functional view the UICR is divided into two different regions, one-time programmable (OTP) memory and key storage.

Figure 81: Memory map overview

## OTP

One-time programmable (OTP) memory is typically used for holding values that are written once, and then never to be changed again throughout the product lifetime. The OTP region of UICR is emulated by placing a write-once per halfword limitation on registers defined here.

## Key storage

The key storage region contains multiple key slots, where each slot consists of a key header and an associated key value. The key value is limited to 128 bits. Any key size greater than 128 bits must be divided and distributed over multiple key slot instances.

Key headers are allocated an address range of 0x400 in the UICR memory map, allowing a total of 128 keys to be addressable inside the key storage region.

**Note:** The use of the key storage region in UICR should be limited to keys with a certain life span, and not per-session derived keys where the CPU is involved in the key exchange.

### 7.1.18.2 Access control

Access control to the underlying UICR infopage in flash is enforced by a hardware finite-state machine (FSM). The FSM can allow or block transactions, depending both on the security of the transaction (secure or non-secure) and on the type of register being written and/or read.

| Access type | Key headers | Key values |
|-------------|-------------|------------|
| Read        | Allowed     | Restricted |
| Write       | Restricted  | Restricted |

Table 91: Access control

Any restricted access requires an explicit key slot selection through the KMU register interface. Any illegal access to restricted key slot registers will be blocked and word `0xDEADDEAD` will be returned on the AHB.

The OTP region has individual access control behavior, while access control to the key storage region is configured on a per key slot basis. The KMU FSM operates on only one key slot instance at a time, and the permissions and the usage restriction for a key value associated with a key slot can be configured individually.

**Note:** Even if the KMU can be configured as non-secure, all non-secure transactions will be blocked.

### 7.1.18.3 Protecting the UICR content

The UICR content can be protected against device-internal NVMC.ERASEALL requests, in addition to device-external ERASEALL requests, through the CTRL-AP interface. This feature is useful if the firmware designers want to prevent the OTP region from being erased.

Since enabling this step will permanently disable erase for the UICR, the procedure requires an implementation defined 32-bit word to be written into the UICR's ERASEPROTECT register.

In case of a field return handling, it is still possible to erase the UICR even if the ERASEPROTECT is set. If this functionality is desired, the secure boot code must implement a secure communication channel over the CTRL-AP mailbox interface. Upon successful authentication of the external party, the secure boot code can temporarily re-enable the CTRL-AP ERASEALL functionality.

### 7.1.18.4 Usage

This section describes the specific KMU and UICR behavior in more detail, to help the reader get a better overview of KMU's features and the intended usage.

#### 7.1.18.4.1 OTP

The OTP region of the UICR contains a user-defined static configuration of the device. The KMU emulates the OTP functionality by placing a write-once per halfword limitation of registers defined in this region, i.e. only halfwords containing all '1's can be written.

An OTP write transaction must consist of a full 32-bit word. Both halfwords can either be written simultaneously or one at a time. The KMU FSM will block any write to a halfword in the OTP region, if the initial value of this halfword is not `0xFFFF`. When writing halfwords one at a time, the non-active halfword must be masked as `0xFFFF`, otherwise the request will be blocked. For example, writing `0x1234XXXX` to an OTP destination address which already contains the value `0xFFFFAABB`, must be configured as `0x1234FFFF`. The OTP destination address will contain the value `0x1234AABB` after both write transactions have been processed.

The KMU will also only allow secure AHB write transactions into the OTP region of the UICR. Any AHB write transaction to this region that does not satisfy the above requirements will be ignored, and the `STATUS.BLOCKED` register will be set to '1'.

#### 7.1.18.4.2 Key storage

The key storage region of the UICR can contain multiple keys of different type, including symmetrical keys, hashes, public/private key pairs and other device secrets. One of the key features of the KMU, is that these

device secrets can be installed and made available for use in cryptographic operations without revealing the actual secret values.

Keys in this region will typically have a certain life span. The region is not designed to be used for per-session derived keys where the non-secure side (i.e. application) is participating in the key exchange.

All key storage is done through the concept of multiple key slots, where each key slot instance consists of one key header and an associated key value. Each key header supports the configuration of usage permissions and an optional secure destination address.

The key header secure destination address option enables the KMU to push the associated key value over a dedicated secure APB to a pre-configured secure location within the memory map. Such locations typically include a write-only key register of the hardware cryptographic accelerator, allowing the KMU to distribute keys within the system without compromising the key values.

One key slot instance can store a key value of maximum 128 bits. If a key size exceeds this limit, the key value itself must be split over multiple key slot instances.

The following usage and read permissions scheme is applicable for each key slot:

| State          | Push            | Read            | Write           | Description                                                                                                                       |
|----------------|-----------------|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Active (1)     | Enabled<br>(1)  | Enabled<br>(1)  | Enabled<br>(1)  | Default flash erase value. Key slot cannot be pushed, write is enabled.                                                           |
| Active (1)     | Enabled<br>(1)  | Enabled<br>(1)  | Disabled<br>(0) | Key slot is active, push is enabled. Key slot VALUE registers can be read, but write is disabled.                                 |
| Active (1)     | Enabled<br>(1)  | Disabled<br>(0) | Disabled<br>(0) | Key slot is active, push is enabled. Read and write to key slot VALUE registers are disabled.                                     |
| Active (1)     | Disabled<br>(0) | Enabled<br>(1)  | Disabled<br>(0) | Key slot is active, push is disabled. Key slot VALUE registers can be read, but write is disabled.                                |
| Revoked<br>(0) | -               | -               | -               | Key slot is revoked and key value is set to zero. Cannot be read or pushed over secure APB regardless of the permission settings. |

Table 92: Valid key slot permission schemes

#### 7.1.18.4.2.1 Selecting a key slot

The KMU FSM is designed to process only one key slot at a time, effectively operating as a memory protection unit for the key storage region. Whenever a key slot is selected, the KMU will allow access to writing, reading, and/or pushing the associated key value according to the selected slot configuration.

A key slot must be selected prior to use, by writing the key slot ID into the KMU SELECTKEYSLOT register. Because the reset value of this register is 0x00000000, there is no key slot associated with ID=0 and no slot is selected by default. All key slots are addressed using IDs from 1 to 128.

SELECTED status is set when a key slot is selected, and a read or write access to that keyslot occurs.

BLOCKED status is set when any illegal access to key slot registers is detected.

When the use of the particular key slot is stopped, the key slot selection in SELECTKEYSLOT must be set back to '0'.

By default, all KMU key slots will consist of a 128-bit key value of '1's, where the key headers have no secure destination address, or any usage and read restrictions.

#### 7.1.18.4.2.2 Writing to a key slot

Writing a key slot into UICR is a five-step process.

1. Select which key slot the KMU shall operate on by writing the desired key slot ID into KMU->SELECTKEYSLOT. The selected key slot must be empty in order to add a new entry to UICR.
2. If the key value shall be pushable over secure APB, the destination address of the recipient must be configured in register KEYSLOT.CONFIG[ID-1].DEST.

3. Write the 128-bit key value into KEYSLOT.KEY[ID-1].VALUE[0-3].
4. Write the desired key slot permissions into KEYSLOT.CONFIG[ID-1].PERM, including any applicable usage restrictions.
5. Select key slot 0.

In case the total key size is greater than 128 bits, the key value itself must be split into 128-bit segments and written to multiple key slot instances. Steps 1 through 5 above must be repeated for the entire key size.

**Note:** If a key slot is configured as readable, and KEYSLOT.CONFIG[ID-1].DEST is not to be used, it is recommended to disable the push bit in KEYSLOT.CONFIG[ID-1].PERM when configuring key slot permissions.

**Note:** A key value distributed over multiple key slots should use the same key slot configuration in its key headers, but the secure destination address for each key slot instance must be incremented by 4 words (128 bits) for each key slot instance spanned.

**Note:** Write to flash must be enabled in NVMC->CONFIG prior to writing keys to flash, and subsequently disabled once writing is complete.

Steps 1 through 5 above will be blocked if any of the following violations are detected:

- No key slot selected
- Non-empty key slot selected
- NVM destination address not empty
- AHB write to KEYSLOT.KEY[ID-1].VALUE[0-3] registers not belonging to selected key slot

#### 7.1.18.4.2.3 Reading a key value

Key slots that are configured as readable can have their key value read directly from the UICR memory map by the CPU.

Readable keys are typically used during the secure boot sequence, where the CPU is involved in falsifying or verifying the integrity of the system. Since the CPU is involved in this decision process, it makes little sense not to trust the CPU having access to the actual key value but ultimately trust the decision of the integrity check. Another use-case for readable keys is if the key type in question does not have a HW peripheral in the platform that is able to accept such keys over secure APB.

Reading a key value from the UICR is a three-step process:

1. Select the key slot which the KMU shall operate on by writing the desired key slot ID into KMU->SELECTKEYSLOT.
2. If STATE and READ permission requirements are fulfilled as defined in KEYSLOT.CONFIG[ID-1].PERM, the key value can be read from region KEYSLOT.KEY[ID-1].VALUE[0-3] for selected key slot.
3. Select key slot 0.

Step 2 will be blocked and word 0xDEADDEAD will be returned on AHB if any of the following violations are detected:

- No key slot selected
- Key slot not configured as readable
- Key slot is revoked
- AHB read to KEYSLOT.KEY[ID-1].VALUE[0-3] registers not belonging to selected key slot

#### 7.1.18.4.2.4 Push over secure APB

Key slots that are configured as non-readable cannot be read by the CPU regardless of the mode the system is in, and must be pushed over secure APB in order to use the key value for cryptographic operations.

The secure APB destination address is set in the key slot configuration DEST register. Such destination addresses are typically write-only key registers in a hardware cryptographic accelerators memory map. The secure APB allows key slots to be utilized by the software side, without exposing the key value itself.

Figure 82: Tasks and events pattern for key slots

Pushing a key slot over secure APB is a four-step process:

1. Select the key slot on which the KMU shall operate by writing the desired key slot ID into KMU->SELECTKEYSLOT.
2. Start TASKS\_PUSH\_KEYSLLOT to initiate a secure APB transaction, writing the 128-bit key value associated with the selected key slot into address defined in KEYSLOT.CONFIG[ID-1].DEST.
3. After completing the secure APB transaction, the 128-bit key value is ready for use by the peripheral and EVENTS\_KEYSLLOT\_PUSHED is triggered.
4. Select key slot 0.

**Note:** If a key value is distributed over multiple key slots due to its key size, exceeding the maximum 128-bit key value limitation, then each distributed key slot must be pushed individually in order to transfer the entire key value over secure APB.

Step 3 will trigger other events than EVENTS\_KEYSLLOT\_PUSHED if the following violations are detected:

- EVENTS\_KEYSLLOT\_ERROR:
  - If no key slot is selected
  - If a key slot has no destination address configured
  - If when pushing a key slot, flash or peripheral returns an error
  - If pushing a key slot when push permissions are disabled
  - If attempting to push a key slot with default permissions
- EVENTS\_KEYSLLOT\_REVOKED if a key slot is marked as revoked in its key header configuration

#### 7.1.18.4.2.5 Revoking the key slots

All key slots within the key storage area can be marked as revoked.

To revoke any key slots, write to the STATE field in the KEYSLOT.CONFIG[ID-1].PERM register. The following rules apply to keys that have been revoked:

1. Key slots that have the PUSH field enabled in PERM register can no longer be pushed. If a revoked key slot is selected and task TASKS\_PUSH\_KEYSLLOT is started, the event EVENTS\_KEYSLLOT\_REVOKED is triggered.
2. Key slots that have the READ field enabled in PERM register can no longer be read. Any read operation to a revoked key value will return word 0xDEADDEAD.
3. Previously pushed key values stored in a peripheral write-only key register are not affected by key revocation. If secure code wants to enforce that a revoked key is no longer usable by a peripheral for cryptographic operations, the secure code should disable or reset the peripheral in question.

**Note:** If a key slot is revoked, the KMU will automatically zeroize the associated VALUE registers.

#### 7.1.18.4.3 STATUS register

The KMU uses a STATUS register to indicate its status of operation. The SELECTED bit will be asserted whenever the currently selected key slot is successfully read from or written to.

All read or write operations to other key slots than what is currently selected in KMU->SELECTKEYSLOT will assert the BLOCKED bit. The BLOCKED bit will also be asserted if the KMU fails to select a key slot, or if a request has been blocked due to an access violation. Normal operation using the KMU should never trigger the BLOCKED bit. If this bit is triggered during the development phase, it indicates that the code is using the KMU incorrectly.

The STATUS register is reset every time register SELECTKEYSLOT is written.

#### 7.1.18.5 Registers

| Base address | Domain      | Peripheral | Instance | Secure mapping | DMA security | Description         | Configuration |
|--------------|-------------|------------|----------|----------------|--------------|---------------------|---------------|
| 0x50039000   | APPLICATION | KMU        | KMU : S  | SPLIT          | NA           | Key management unit |               |
| 0x40039000   |             |            | KMU : NS |                |              |                     |               |

Table 93: Instances

| Register                | Offset | Security | Description                                                                                       |
|-------------------------|--------|----------|---------------------------------------------------------------------------------------------------|

## 7.1.19 LPCOMP — Low-power comparator

Low-power comparator (LPCOMP) compares an input voltage against a reference voltage.

Listed here are the main features of LPCOMP:

- 0 - VDD input range
- Ultra-low power
- Eight input options (**AIN0** to **AIN7**)
- Reference voltage options:
  - Two external analog reference inputs, or
  - 15-level internal reference ladder (VDD/16)
- Optional hysteresis enable on input
- Can be used as a wakeup source from System OFF mode

In System ON, the LPCOMP can generate separate events on rising and falling edges of a signal, or sample the current state of the pin as being above or below the selected reference. The block can be configured to use any of the analog inputs on the device. Additionally, the low-power comparator can be used as an analog wakeup source from System OFF or System ON. The comparator threshold can be programmed to a range of fractions of the supply voltage.

**Note:** LPCOMP cannot be used (STARTed) at the same time as COMP. Only one comparator can be used at a time.

Figure 83: Low-power comparator

The wakeup comparator (LPCOMP) compares an input voltage ( $V_{IN+}$ ), which comes from an analog input pin selected via the PSEL register, against a reference voltage ( $V_{IN-}$ ) selected via registers REFSEL on page 277 and EXTREFSEL.

The PSEL, REFSEL, and EXTREFSEL registers must be configured before the LPCOMP is enabled through the ENABLE register.

The HYST register allows enabling an optional hysteresis in the comparator core. This hysteresis shall prevent noise on the signal to create unwanted events. Figure below illustrates the effect of an active hysteresis on a noisy input signal. It is disabled by default, and shall be configured before enabling LPCOMP as well.

Figure 84: Effect of hysteresis on a noisy input signal

The LPCOMP is started by triggering the START task. After a startup time of  $t_{LPCOMP,STARTUP}$ , the LPCOMP will generate a READY event to indicate that the comparator is ready to use and the output of the LPCOMP is correct. The LPCOMP will generate events every time  $V_{IN+}$  crosses  $V_{IN-}$ . More specifically, every time  $V_{IN+}$  rises above  $V_{IN-}$  (upward crossing) an UP event is generated along with a CROSS event. Every time  $V_{IN+}$  falls below  $V_{IN-}$  (downward crossing), a DOWN event is generated along with a CROSS event. When hysteresis is enabled, the upward crossing level becomes  $(V_{IN-} + VHYST/2)$ , and the downward crossing level becomes  $(V_{IN-} - VHYST/2)$ .

The LPCOMP is stopped by triggering the STOP task.

LPCOMP will be operational in both System ON and System OFF mode when it is enabled through the ENABLE register. See [POWER — Power control](#) on page 36 for more information about power modes. Note that it is not allowed to go to System OFF when a READY event is pending to be generated.

All LPCOMP registers, including ENABLE, are classified as retained registers when the LPCOMP is enabled. However, when the device wakes up from System OFF, all LPCOMP registers will be reset.

The LPCOMP can wake up the system from System OFF by asserting the ANADETECT signal. The ANADETECT signal can be derived from any of the event sources that generate the UP, DOWN and CROSS events. In case of wakeup from System OFF, no events will be generated, only the ANADETECT signal. See the ANADETECT register ([ANADETECT](#) on page 278) for more information on how to configure the ANADETECT signal.

The immediate value of the LPCOMP can be sampled to [RESULT](#) on page 276 by triggering the SAMPLE task.

See [RESETREAS](#) on page 59 for more information on how to detect a wakeup from LPCOMP.

### 7.1.19.1 Shared resources

The LPCOMP shares analog resources with SAADC. While it is possible to use the SAADC at the same time as the LPCOMP, selecting the same analog input pin for both modules is not supported.

Additionally, LPCOMP shares registers and other resources with other peripherals that have the same ID as the LPCOMP. See [Peripherals with shared ID](#) on page 138 for more information.

The LPCOMP peripheral shall not be disabled (by writing to the ENABLE register) before the peripheral has been stopped. Failing to do so may result in unpredictable behavior.

### 7.1.19.2 Pin configuration

You can use the LPCOMP.PSEL register to select one of the analog input pins, **AIN0** through **AIN7**, as the analog input pin for the LPCOMP.

See [GPIO — General purpose input/output](#) on page 209 for more information about the pins. Similarly, you can use [EXTREFSEL](#) on page 277 to select one of the analog reference input pins, **AIN0** and **AIN1**, as input for AREF in case AREF is selected in [EXTREFSEL](#) on page 277. The selected analog pins will be acquired by the LPCOMP when it is enabled through [ENABLE](#) on page 276.

## 7.1.20 MUTEX — Mutual exclusive peripheral

The MUTEX peripheral uses mutual exclusion to support locking a resource that is shared between different CPUs in the system. The shared resource can only be used by one of these cores during the duration that it is locked.

The MUTEX peripheral includes several mutex registers. Each mutex register contains one bit which indicates if it is in a locked or unlocked state. Reading or writing to a mutex register may impact its state.

When a mutex is read, the following conditions apply:

- If the state is locked, the MUTEX[i] state is unchanged (remains in a locked state) and returns a value equal to 1.
- If the state is unlocked, the MUTEX[i] state changes to the locked state and returns a value equal to 0.

When writing '0' to a mutex, the following occurs:

- If the state is unlocked, the MUTEX[i] state is unchanged (remains in unlocked state) and the store is ignored.
- If the state is locked, the MUTEX[i] state changes to the unlocked state.

**Note:** Faults are not managed by the peripheral. If a mutex is locked and a fault occurs, it is the responsibility of the fault handler to release the mutex. If a fault handler is not managing the mutex release, the mutex will stay locked.

The following figure illustrates the mutex state transitions.

Figure 85: MUTEX - state transitions

The following code is an example of how a mutex can be used by two different CPUs:

```
// CPU0 Polling the MUX[0] register
while (NRF_MUX->MUX[0]){ // Read MUX[0]
    // If a 0 is read, the mutex will lock
    // If a 1 is read, polling will continue
}
// CPU0 working on shared data related to the mutex
...
NRF_MUX->MUX[0] = 0; // Release the mutex
```

```
// CPU1 Polling the MUX[0] register
while (NRF_MUX->MUX[0]){ // Read MUX[0]
    // If a 0 is read, the mutex will lock
    // If a 1 is read, polling will continue
}
// CPU1 working on shared data related to the mutex
...
NRF_MUX->MUX[0] = 0; // Release the mutex
```

Only one CPU can access the mutex at a time, meaning the mutex must be released before being accessed by the another CPU. If the load operation occurs at the same time, a bus arbitration mechanism will ensure only one CPU gets the mutex.

### 7.1.20.1 Registers

## 7.1.21 NFCT — Near field communication tag

The NFCT peripheral is an implementation of an NFC Forum compliant listening device NFC-A.

With appropriate software, the NFCT peripheral can be used as the listening device NFC-A as specified by the [NFC Forum](#).

Listed here are the main features for the NFCT peripheral:

- NFC-A listen mode operation
  - 13.56 MHz input frequency
  - Bit rate 106 kbps
- Wake-on-field low power field detection (SENSE) mode
- Frame assemble and disassemble for the NFC-A frames specified by the NFC Forum
- Programmable frame timing controller
- Integrated automatic collision resolution, cyclic redundancy check (CRC), and parity functions

Figure 86: NFCT block diagram

#### 7.1.21.1 Overview

The NFCT peripheral contains a 13.56 MHz AM receiver and a 13.56 MHz load modulator with 106 kbps data rate as defined by the NFC Forum.

Figure 87: NFCT overview

When transmitting, the frame data will be transferred directly from RAM and transmitted with configurable frame type and delay timing. The system will be notified by an event whenever a complete frame is received or sent. The received frames will be automatically disassembled and the data part of the frame transferred to RAM.

The NFCT peripheral also supports the collision detection and resolution ("anticollision") as defined by the NFC Forum.

Wake-on-field is supported in SENSE mode while the device is either in System OFF or System ON mode. When the antenna enters an NFC field, an event will be triggered notifying the system to activate the NFCT functionality for incoming frames. In System ON, if the energy detected at the antenna increases beyond a threshold value, the module will generate a **FIELDDETECTED** event. When the strength of the field no longer supports NFC communication, the module will generate a **FIELDLOST** event. For the Low Power Field Detect threshold values, refer to **NFCT Electrical Specification** on page 317.

In System OFF, the NFCT Low Power Field Detect function can wake the system up through a reset. See **RESETREAS** on page 59 for more information on how to detect a wakeup from NFCT.

If the system is put into System OFF mode while a field is already present, the NFCT Low Power Field Detect function will wake the system up right away and generate a reset.

**Important:** As a consequence of a reset, NFCT is disabled, and therefore the reset handler will have to activate NFCT again and set it up properly.

The HFXO must be running before the NFCT peripheral goes into ACTIVATED state. Note that the NFCT peripheral calibration is automatically done on **ACTIVATE** task. The HFXO can be turned off when the NFCT peripheral goes into SENSE mode. The shortcut **FIELDDETECTED\_ACTIVATE** can be used when the HFXO is already running while in SENSE mode.

Outgoing data will be collected from RAM with the EasyDMA function and assembled according to the **TXD.FRAMECONFIG** on page 313 register. Incoming data will be disassembled according to the **RXD.FRAMECONFIG** register and the data section in the frame will be written to RAM via the EasyDMA function.

The NFCT peripheral includes a frame timing controller that can be used to accurately control the inter-frame delay between the incoming frame and a corresponding outgoing frame. It also includes optional CRC functionality.

### 7.1.21.2 Operating states

Tasks and events are used to control the operating state of the peripheral. The module can change state by triggering a task, or when specific operations are finalized. Events and tasks allow software to keep track of and change the current state.

See [Figure 86: NFCT block diagram](#) on page 282 and [Figure 88: NFCT state diagram, automatic collision resolution enabled](#) on page 284 for more information. See *NFC Forum, NFC Activity Technical Specification* for description on NFCT operating states.

Figure 88: NFCT state diagram, automatic collision resolution enabled

Figure 89: NFCT state diagram, automatic collision resolution disabled

**Important:**

- FIELDLOST event is not generated in SENSE mode.
- Sending SENSE task while field is still present does not generate **FIELDDETECTED** event.
- If the FIELDDETECTED event is cleared before sending the **ACTIVATE** task, then the FIELDDETECTED event shows up again after sending the ACTIVATE task. The shortcut FIELDDETECTED\_ACTIVATE can be used to avoid this condition.

### 7.1.21.3 Pin configuration

NFCT uses two pins to connect the antenna and these pins are shared with GPIOs.

The PROTECT field in the NFCPINS register in UICR defines the usage of these pins and their protection level against excessive voltages. The content of the NFCPINS register is reloaded at every reset. See [Pin assignments](#) on page 764 for the pins used by the NFCT peripheral.

When NFCPINS.PROTECT=NFC, a protection circuit will be enabled on the dedicated pins, preventing the chip from being damaged in the presence of a strong NFC field. The protection circuit will short the two pins together if voltage difference exceeds approximately 2V. The GPIO function on those pins will also be disabled.

When NFCPINS.PROTECT=Disabled, the device will not be protected against strong NFC field damages caught by a connected NFCT antenna, and the NFCT peripheral will not operate as expected, as it will never leave the DISABLE state.

The pins dedicated to the NFCT antenna function will have some limitation when the pins are configured for normal GPIO operation. The pin capacitance will be higher on those (refer to  $C_{PAD\_NFC}$  in the Electrical Specification of [GPIO — General purpose input/output](#) on page 209), and some increased leakage current between the two pins is to be expected if they are used in GPIO mode, and are driven to different logical values. To save power, the two pins should always be set to the same logical value whenever entering one of the device power saving modes. For details, refer to  $I_{NFC\_LEAK}$  in the Electrical Specification of [GPIO — General purpose input/output](#) on page 209.

### 7.1.21.4 EasyDMA

The NFCT peripheral implements EasyDMA for reading and writing of data packets from and to the Data RAM.

The NFCT EasyDMA utilizes a pointer called [PACKETPTR](#) on page 312 for receiving and transmitting packets.

The NFCT peripheral uses EasyDMA to read or write RAM, but not both at the same time. The event **RXFRAMESTART** indicates that the EasyDMA has started writing to the RAM for a receive frame and the event **RXFRAMEEND** indicates that the EasyDMA has completed writing to the RAM. Similarly, the event **TXFRAMESTART** indicates that the EasyDMA has started reading from the RAM for a transmit frame and the event **TXFRAMEEND** indicates that the EasyDMA has completed reading from the RAM. If a transmit and a receive operation is issued at the same time, the transmit operation would be prioritized.

Starting a transmit operation while the EasyDMA is writing a receive frame to the RAM will result in unpredictable behavior. Starting an EasyDMA operation when there is an ongoing EasyDMA operation may result in unpredictable behavior. It is recommended to wait for the TXFRAMEEND or RXFRAMEEND event for the ongoing transmit or receive before starting a new receive or transmit operation.

The **MAXLEN** on page 313 register determines the maximum number of bytes that can be read from or written to the RAM. This feature can be used to ensure that the NFCT peripheral does not overwrite, or read beyond, the RAM assigned to a packet. Note that if the **RXD.AMOUNT** or **TXD.AMOUNT** register indicates longer data packets than set in MAXLEN, the frames sent to or received from the physical layer

will be incomplete. In that situation, in RX, the **OVERRUN** bit in the **FRAMESTATUS.RX** register will be set and an **RXERROR** event will be triggered.

**Important:** The **RXD.AMOUNT** and **TXD.AMOUNT** define a frame length in bytes and bits excluding start of frame (SoF), end of frame (EoF), and parity, but including CRC for **RXD.AMOUNT** only. Make sure to take potential additional bits into account when setting **MAXLEN**.

Only sending task **ENABLERXDATA** ensures that a new value in **PACKETPTR** pointing to the RX buffer in Data RAM is taken into account.

If **PACKETPTR** is not pointing to the Data RAM region, an EasyDMA transfer may result in a hard fault or RAM corruption. For more information about the different memory regions, see Chapter **Memory** on page 18.

The NFCT peripherals normally do alternative receive and transmit frames. Therefore, to prepare for the next frame, the **PACKETPTR**, **MAXLEN**, **TXD.FRAMECONFIG** and **TXD.AMOUNT** can be updated while the receive is in progress, and, similarly, the **PACKETPTR**, **MAXLEN** and **RXD.FRAMECONFIG** can be updated while the transmit is in progress. They can be updated and prepared for the next NFC frame immediately after the **STARTED** event of the current frame has been received. Updating the **TXD.FRAMECONFIG** and **TXD.AMOUNT** during the current transmit frame or updating **RXD.FRAMECONFIG** during current receive frame may cause unpredictable behaviour.

In accordance with *NFC Forum, NFC Digital Protocol Technical Specification*, the least significant bit (LSB) from the least significant byte (LSByte) is sent on air first. The bytes are stored in increasing order, starting at the lowest address in the EasyDMA buffer in RAM.

### 7.1.21.5 Frame assembler

The NFCT peripheral implements a frame assembler in hardware.

When the NFCT peripheral is in the **ACTIVE\_A** state, the software can decide to enter RX or TX mode. For RX, see **Frame disassembler** on page 287. For TX, the software must indicate the address of the source buffer in Data RAM and its size through programming the **PACKETPTR** and **MAXLEN** registers respectively, then issuing a **STARTTX** task.

**MAXLEN** must be set so that it matches the size of the frame to be sent.

The **STARTED** event indicates that the **PACKETPTR** and **MAXLEN** registers have been captured by the frame assembler EasyDMA.

When asserting the **STARTTX** task, the frame assembler module will start reading **TXD.AMOUNT.TXDATABYTES** bytes (plus one additional byte if **TXD.AMOUNT.TXDATABITS** > 0) from the RAM position set by the **PACKETPTR**.

The NFCT peripheral transmits the data as read from RAM, adding framing and the CRC calculated on the fly if set in **TXD.FRAMECONFIG**. The NFCT peripheral will take  $(8 * \text{TXD.AMOUNT.TXDATABYTES} + \text{TXD.AMOUNT.TXDATABITS})$  bits and assemble a frame according to the settings in **TXD.FRAMECONFIG**. Both short frames, standard frames, and bit-oriented SDD frames as specified in the *NFC Forum, NFC Digital Protocol Technical Specification* can be assembled by the correct setting of the **TXD.FRAMECONFIG** register.

The bytes will be transmitted on air in the same order as they are read from RAM with a rising bit order within each byte, least significant bit (LSB) first. That is, b0 will be transmitted on air before b1, and so on. The bits read from RAM will be coded into symbols as defined in the *NFC Forum, NFC Digital Protocol Technical Specification*.

**Important:** Some NFC Forum documents, such as *NFC Forum*, *NFC Digital Protocol Technical Specification*, define bit numbering in a byte from b1 (LSB) to b8 (most significant bit (MSB)), while most other technical documents from the NFC Forum, and also the Nordic Semiconductor documentation, traditionally number them from b0 to b7. The present document uses the b0–b7 numbering scheme. Be aware of this when comparing the *NFC Forum*, *NFC Digital Protocol Technical Specification* to others.

The frame assembler can be configured in TXD.FRAMECONFIG to add SoF symbol, calculate and add parity bits, and calculate and add CRC to the data read from RAM when assembling the frame. The total frame will then be longer than what is defined by TXD.AMOUNT.TXDATABYTES. TXDATABITS. DISCARDMODE will select if the first bits in the first byte read from RAM or the last bits in the last byte read from RAM will be discarded if TXD.AMOUNT.TXDATABITS are not equal to zero. Note that if TXD.FRAMECONFIG.PARITY = Parity and TXD.FRAMECONFIG.DISCARDMODE=DiscardStart, a parity bit will be included after the non-complete first byte. No parity will be added after a non-complete last byte.

The frame assemble operation is illustrated in [Figure 90: Frame assemble illustration](#) on page 287 for different settings in TXD.FRAMECONFIG. All shaded bit fields are added by the frame assembler. Some of these bits are optional and appearances are configured in TXD.FRAMECONFIG. Note that the frames illustrated do not necessarily comply with the NFC specification. The figure is only to illustrate the behavior of the NFCT peripheral.

#### Data from RAM

#### Frame on air

PARITY = Parity  
TXDATABITS = 0  
CRCMODETX = CRC16TX

PARITY = Parity  
TXDATABITS = 4  
CRCMODETX = NoCRCTX  
DISCARDMODE = DiscardStart

PARITY = Parity  
TXDATABITS = 0  
CRCMODETX = NoCRCTX

Figure 90: Frame assemble illustration

The accurate timing for transmitting the frame on air is set using the frame timing controller settings.

### 7.1.21.6 Frame disassembler

The NFCT peripheral implements a frame disassembler in hardware.

When the NFCT peripheral is in the ACTIVE\_A state, the software can decide to enter RX or TX mode. For TX, see [Frame assembler](#) on page 286. For RX, the software must indicate the address and size of the destination buffer in Data RAM through programming the [PACKETPTR](#) and [MAXLEN](#) registers before issuing an [ENABLERXDATA](#) task.

The [STARTED](#) event indicates that the [PACKETPTR](#) and [MAXLEN](#) registers have been captured by the frame disassembler EasyDMA.

When an incoming frame starts, the [RXFRAMESTART](#) event will get issued and data will be written to the buffer in Data RAM. The frame disassembler will verify and remove any parity bits, start of frame (SoF) and

end of frame (EoF) symbols on the fly based on [RXD.FRAMECONFIG](#) register configuration. It will, however, verify and transfer the CRC bytes into RAM, if the CRC is enabled through [RXD.FRAMECONFIG](#).

When an EoF symbol is detected, the NFCT peripheral will assert the [RXFRAMEEND](#) event and write the [RXD.AMOUNT](#) register to indicate numbers of received bytes and bits in the data packet. The module does not interpret the content of the data received from the remote NFC device, except for SoF, EoF, parity, and CRC checking, as described above. The frame disassemble operation is illustrated below.

#### Frame on air

PARITY = Parity  
RXDATABITS = 0  
CRCMODERX = CRC16RX

PARITY = Parity  
CRCMODERX = NoCRCTR  
RXDATABITS = 4

PARITY = NoParity  
CRCMODERX = NoCRCRX  
RXDATABITS = 0

#### Data to RAM

Figure 91: Frame disassemble illustration

Per NFC specification, the time between EoF to the next SoF can be as short as 86  $\mu$ s, and therefore care must be taken that PACKETPTR and MAXLEN are ready and ENABLERXDATA is issued on time after the end of previous frame. The use of a PPI shortcut from [TXFRAMEEND](#) to ENABLERXDATA is recommended.

### 7.1.21.7 Frame timing controller

The NFCT peripheral includes a frame timing controller that continuously keeps track of the number of the 13.56 MHz RF carrier clock periods since the end of the EoF of the last received frame.

The NFCT peripheral can be programmed to send a responding frame within a time window or at an exact count of RF carrier periods. In case of [FRAMEDELAYMODE](#) = Window, a [STARTTX](#) task triggered before the frame timing controller counter is equal to [FRAMEDELAYMIN](#) will force the transmission to halt until the counter is equal to [FRAMEDELAYMIN](#). If the counter is within [FRAMEDELAYMIN](#) and [FRAMEDELAYMAX](#) when the [STARTTX](#) task is triggered, the NFCT peripheral will start the transmission straight away. In case of [FRAMEDELAYMODE](#) = ExactVal, a [STARTTX](#) task triggered before the frame delay counter is equal to [FRAMEDELAYMAX](#) will halt the actual transmission start until the counter is equal to [FRAMEDELAYMAX](#).

In case of [FRAMEDELAYMODE](#) = WindowGrid, the behaviour is similar to the [FRAMEDELAYMODE](#) = Window, but the actual transmission between [FRAMEDELAYMIN](#) and [FRAMEDELAYMAX](#) starts on a bit grid as defined for NFC-A Listen frames (slot duration of 128 RF carrier periods).

An [ERROR](#) event (with [FRAMEDELAYTIMEOUT](#) cause in [ERRORSTATUS](#)) will be asserted if the frame timing controller counter reaches [FRAMEDELAYMAX](#) without any [STARTTX](#) task triggered. This may happen even when the response is not required as per *NFC Forum, NFC Digital Protocol Technical Specification*. Any commands handled by the automatic collision resolution that don't involve a response being generated may also result in an [ERROR](#) event (with [FRAMEDELAYTIMEOUT](#) cause in [ERRORSTATUS](#)). The [FRAMEDELAYMIN](#) and [FRAMEDELAYMAX](#) values shall only be updated before the [STARTTX](#) task is triggered. Failing to do so may cause unpredictable behaviour.

The frame timing controller operation is illustrated in [Figure 92: Frame timing controller \(FRAMEDELAYMODE=Window\)](#) on page 289. The frame timing controller automatically adjusts the frame timing counter based on the last received data bit according to NFC-A technology in the *NFC Forum, NFC Digital Protocol Technical Specification*.

Figure 92: Frame timing controller (FRAMEDELAYMODE=Window)

### 7.1.21.8 Collision resolution

The NFCT peripheral implements an automatic collision resolution function as defined by the NFC Forum.

Automatic collision resolution is enabled by default, and it is recommended that the feature is used since it is power efficient and reduces the complexity of software handling the collision resolution sequence. This feature can be disabled through the MODE field in the [AUTOCOLRESCONFIG](#) register. When the automatic collision resolution is disabled, all commands will be sent over EasyDMA as defined in frame disassembler.

The [SENSRES](#) and [SELRES](#) registers need to be programmed upfront in order for the collision resolution to behave correctly. Depending on the NFCIDSIZE field in SENSRES, the following registers also need to be programmed upfront:

- NFCID1\_LAST if NFCID1SIZE=NFCID1Single (ID = 4 bytes);
- NFCID1\_2ND\_LAST and NFCID1\_LAST if NFCID1SIZE=NFCID1Double (ID = 7 bytes);
- NFCID1\_3RD\_LAST, NFCID1\_2ND\_LAST and NFCID1\_LAST if NFCID1SIZE=NFCID1Triple (ID = 10 bytes);

A pre-defined set of registers, NFC.TAGHEADER0..3, containing a valid NFCID1 value, is available in FICR and can be used by software to populate the NFCID1\_3RD\_LAST, NFCID1\_2ND\_LAST, and NFCID1\_LAST registers.

[Table 99: NFCID1 byte allocation \(top sent first on air\)](#) on page 290 explains the position of the ID bytes in NFCID1\_3RD\_LAST, NFCID1\_2ND\_LAST, and NFCID1\_LAST, depending on the ID size, and as compared to the definition used in the *NFC Forum, NFC Digital Protocol Technical Specification*.

| ID = 4 bytes | ID = 7 bytes        | ID = 10 bytes       |
|--------------|---------------------|---------------------|
| NFCID1_Q     |                     | nfcid1 <sub>0</sub> |
| NFCID1_R     |                     | nfcid1 <sub>1</sub> |
| NFCID1_S     |                     | nfcid1 <sub>2</sub> |
| NFCID1_T     | nfcid1 <sub>0</sub> | nfcid1 <sub>3</sub> |
| NFCID1_U     | nfcid1 <sub>1</sub> | nfcid1 <sub>4</sub> |
| NFCID1_V     | nfcid1 <sub>2</sub> | nfcid1 <sub>5</sub> |
| NFCID1_W     | nfcid1 <sub>0</sub> | nfcid1 <sub>6</sub> |
| NFCID1_X     | nfcid1 <sub>1</sub> | nfcid1 <sub>7</sub> |
| NFCID1_Y     | nfcid1 <sub>2</sub> | nfcid1 <sub>8</sub> |
| NFCID1_Z     | nfcid1 <sub>3</sub> | nfcid1 <sub>9</sub> |

Table 99: NFCID1 byte allocation (top sent first on air)

The hardware implementation can handle the states from IDLE to ACTIVE\_A automatically as defined in the *NFC Forum, NFC Activity Technical Specification*, and the other states are to be handled by software. The software keeps track of the state through events. The collision resolution will trigger an **AUTOCOLRESSTARTED** event when it has started. Reaching the ACTIVE\_A state is indicated by the **SELECTED** event.

If collision resolution fails, a **COLLISION** event is triggered. Note that errors occurring during automatic collision resolution may also cause **ERROR** and/or **RXERROR** events to be generated. Other events may also get generated. It is recommended that the software ignores any event except COLLISION, SELECTED and FIELDLOST during automatic collision resolution. Software shall also make sure that any unwanted SHORT or PPI shortcut is disabled during automatic collision resolution.

The automatic collision resolution will be restarted, if the packets are received with CRC or parity errors while in ACTIVE\_A state. The automatic collision resolution feature can be disabled while in ACTIVE\_A state to avoid this.

The SLP\_REQ is automatically handled by the NFCT peripheral when the automatic collision resolution is enabled. However, this results in an ERROR event (with FRAMEDELAYTIMEOUT cause in ERRORSTATUS) since the SLP\_REQ has no response. This error must be ignored until the SELECTED event is triggered and this error should be cleared by the software when the SELECTED event is triggered.

### 7.1.21.9 Antenna interface

In ACTIVATED state, an amplitude regulator will adjust the voltage swing on the antenna pins to a value that is within the  $V_{\text{swing}}$  limit.

Refer to **NFCT Electrical Specification** on page 317.

### 7.1.21.10 NFCT antenna recommendations

The NFCT antenna coil must be connected differential between **NFC1** and **NFC2** pins of the device.

Two external capacitors should be used to tune the resonance of the antenna circuit to 13.56 MHz.

Figure 93: NFCT antenna recommendations

The required tuning capacitor value is given by the below equations:

$$C'_{tune} = \frac{1}{(2\pi \cdot 13.56 \text{ MHz})^2 \cdot L_{ant}} \quad \text{where } C'_{tune} = \frac{1}{2} \cdot (C_p + C_{int} + C_{tune})$$

$$\text{and } C_{tune1} = C_{tune2} = C_{tune} \quad C_{p1} = C_{p2} = C_p \quad C_{int1} = C_{int2} = C_{int}$$

$$C_{tune} = \frac{2}{(2\pi \cdot 13.56 \text{ MHz})^2 \cdot L_{ant}} - C_p - C_{int}$$

An antenna inductance of  $L_{ant} = 2 \mu\text{H}$  will give tuning capacitors in the range of 130 pF on each pin. The total capacitance on **NFC1** and **NFC2** must be matched.

#### 7.1.21.11 Battery protection

If the antenna is exposed to a strong NFC field, current may flow in the opposite direction on the supply due to parasitic diodes and ESD structures.

If the battery used does not tolerate return current, a series diode must be placed between the battery and the device in order to protect the battery.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 30 | 29 |
