## 7.1.40 USB — Universal serial bus device

The USB device (USB\_D) controller implements a full speed USB device function that meets 2.0 revision of the USB specification.

<sup>27</sup> High baud rates may require GPIOs to be set as High Drive, see GPIO chapter for more details.

Figure 226: USB device block diagram

Listed here are the main features for USB:

- Implements full-speed (12 Mbps) device fully compliant to [Universal Serial Bus Specification Revision 2.0](#), including following engineering change notices (ECNs) issued by USB Implementers Forum:
  - *Pull-up/pull-down Resistors ECN*
  - *5V Short Circuit Withstand Requirement Change ECN*
- USB device stack available in the Nordic SDK
- Integrated (on-chip) USB transceiver (PHY)
- Software controlled on-chip pull-up on D+
- Endpoints:
  - 2 control (1 IN, 1 OUT)
  - 14 bulk/interrupt (7 IN, 7 OUT)
  - 2 isochronous (1 IN, 1 OUT)
- Supports double buffering for isochronous (ISO) endpoints (IN/OUT)
- Supports USB suspend, resume, and remote wake-up
- 64 bytes buffer size for each bulk/interrupt endpoint
- Up to 1023 bytes buffer size for ISO endpoints
- EasyDMA for all data transfers

#### 7.1.40.1 USB device states

The behavior of a USB device can be modelled through a state diagram.

The USB specification revision 2.0 (see *Chapter 9 USB Device Framework*) defines a number of states for a USB device, as illustrated below.

Figure 227: Device state diagram

The device must change state according to host-initiated traffic and USB bus states. It is up to the software to implement a state machine that matches the above definition. To detect the presence or absence of USB supply (VBUS), the **POWER** chapter defines two events, USBDETECTED and USBREMOVED, which can be used to implement the state machine.

As a general rule when implementing the software, the host behavior shall never be assumed to be predictable. In particular the sequence of commands received during an enumeration. The software shall always react to the current bus conditions or commands sent by the host.

#### 7.1.40.2 USB terminology

The USB specification defines bus states, rather than logic levels on the D+ and D- lines.

For a full speed device, the bus state where the D+ line is high and the D- line is low is defined as the J state. The bus state where D+ is low and D- high is called the K state.

An idle bus, where D+ and D- lines are only polarized through the pull-up on D+ and pull-downs on the host side, will be in J state.

Both lines low are called SE0 (single-ended 0), and both lines high SE1 (single-ended 1).

### 7.1.40.3 USB pins

The USB peripheral features a number of dedicated pins.

The dedicated USB pins can be grouped in two categories, signal and power. The signal pins consist of the D+ and D- pins, which are to be connected to the USB host. They are dedicated pins, and not available as standard GPIOs. The USB implements the *5V Short Circuit Withstand ECU* meaning that these two pins are not 5 V tolerant.

The signal pins and the pull-up will operate only while VBUS is in its valid voltage range, and USB is enabled through the **ENABLE** register. For details on the USB power supply and VBUS detection, see **POWER**.

See **Pin assignments** on page 764 for more information about the pinout.

### 7.1.40.4 USB power-up sequence

The physical layer interface (PHY)/USB transceiver is powered separately from the rest of the device (VBUS pin), which has some implications on the USB power-up sequence.

The device is not able to properly signal its presence to the USB host and handle traffic from the host, unless the PHY's power supply is enabled and stable. Turning the PHY's power supply on/off is directly linked to register **ENABLE**. The device provides events that help synchronizing software to the various steps during the power-up sequence.

To make sure that all resources in USB are available and the dedicated USB voltage regulator stabilized, the following is recommended:

- Enable USB after VBUS has been detected only
- Turn the USB pull-up on after:
  - USBPWRDY event has occurred
  - USBEVENT has occurred, with the READY condition flagged in **EVENTCAUSE**

The following sequence chart illustrates a typical handling of VBUS power-up:

Figure 228: VBUS power-up sequence

Upon VBUS removal detection, signalled by the USBREMOVED event described in **POWER**, it is recommended to let on-going EasyDMA transfers finish (wait for the relevant ENDEPIN[n], ENDISOIN, ENDEPOUT[n] or ENDISOOUT event, see **EasyDMA** on page 681), before disabling USB (by writing **ENABLE=Disabled**). Reading the **ENABLE** register will return Enabled until USB is completely disabled.

### 7.1.40.5 USB pull-up

The USB pull-up serves two purposes - it indicates to the host that the device is connected to the USB bus, and it indicates the device's speed capability.

When no pull-up is connected to the USB bus, the host sees both D+ and D- lines low, as they are pulled down on the host side by 15 k $\Omega$  resistors. The device is not seen by the host and hence in detached state, even though it could be physically connected to the host. USB specification does not allow to draw any current on VBUS in that situation.

When a full-speed device connects its 1.5 k $\Omega$  pull-up to D+, the host sees the corresponding line high. The device is then in the attached state. During the enumeration process, the host attempts to determine if the full-speed device also supports higher speeds and initiates communication with the device to further identify it. The USB peripheral implemented in this device supports only full-speed (12 Mbps), and thus ignores the negotiation for higher speeds in accordance with the USB specification revision 2.0.

Register [USBPULLUP](#) provides means to connect or disconnect the pull-up on D+ under software control. This allows the software to control when USB enumeration takes place. It also allows to emulate a physical disconnect from the USB bus, for instance when re-enumeration is required. [USBPULLUP](#) has to be enabled to allow the USB peripheral to handle USB traffic and generate appropriate events. This forbids the use of an external pull-up.

Note that disconnecting the pull-up through register [USBPULLUP](#) while connected to a host, will result in both D+ and D- lines to be pulled low by the host's pull-down resistors. However, as mentioned above, this will also inhibit the generation of the USBRESET event. The pull-up is disabled by default after a chip reset.

The pull-up shall only get connected after USB peripheral has been enabled through register [ENABLE](#). The USB pull-up value is automatically changed depending on the bus activity, as specified in *Resistor ECN* which amends the original USB specification version 2.0. The user does not have access to this function, it is handled in hardware.

While they should never be used in normal traffic activity, lines D+ and D- may at any time be forced into state specified in register [DPDMVALUE](#) by the task DPDMDRIVE. The DPDMNODRIVE task stops driving them, and PHY returns to normal operation.

### 7.1.40.6 USB reset

The USB specification defines a USB reset, which is not to be confused with a chip reset. The USB reset is a normal USB bus condition, and is used as part of the enumeration sequence, it does not reset the chip.

The USB reset results from a single-ended low state (SE0) on lines D+/D- for a  $t_{\text{USB,DETRST}}$  amount of time. Only the host is allowed to drive a USB reset condition on the bus. The USB peripheral automatically interprets a SE0 longer than  $t_{\text{USB,DETRST}}$  as a USB reset. When the device detects a USB reset and generates a USBRESET event, the device USB stack and related parts of the application shall re-initialize themselves, and go back to the default state.

Some of the registers in the USB peripheral get automatically reset to a known state, in particular all data endpoints are disabled and the [USBADDR](#) reset to 0.

After the device has connected to the USB bus (i.e. after VBUS is applied), the device shall not respond to any traffic from the time the pull-up is enabled until it has seen a USB reset condition. This is automatically ensured by the USB peripheral.

After a USB reset, the device shall be fully responsive after at most  $T_{\text{RSTRCY}}$  (according to chapter 7 in the USB specification). Software shall take into account this time that takes the hardware to recover from a USB reset condition.

### 7.1.40.7 USB suspend and resume

Normally, the host will maintain activity on the USB at least every millisecond according to USB specification. A USB device will enter suspend when there is no activity on the bus (idle) for a given time. The device will resume operation when it receives any non idle signalling.

To signal that the device shall go into low power mode (suspend), the host stops activity on the USB bus, which becomes idle. Only the device pull-up and host pull-downs act on D+ and D-, and the bus is thus kept at a constant J state. It is up to the device to detect this lack of activity, and enter the low power mode (suspend) within a specified time.

The USB host can decide to suspend or resume USB activity at any time. If remote wake-up is enabled, the device may signal to the host to resume from suspend.

#### 7.1.40.7.1 Entering suspend

The USB peripheral automatically detects lack of activity for more than a defined amount of time, and performs steps needed to enter suspend.

When no activity has been detected for longer than  $t_{\text{USB,SUSPEND}}$ , the USB peripheral generates the USBEVENT event with SUSPEND bit set in register **EVENTCAUSE**. The software shall ensure that the current drawn from the USB supply line VBUS is within the specified limits before  $T_{2\text{SUSP}}$ , as defined in chapter 7 of the USB specification. In order to reduce idle current of USB peripheral, the software must explicitly place the USB peripheral in low power mode through writing **LowPower** to register **LOWPOWER**.

In order to save power, and provided that no other peripheral needs it, the crystal oscillator (HFXO) in **CLOCK** may be disabled by software during the USB suspend, while the USB pull-up is disconnected, or when VBUS is not present. Software must explicitly enable it at any other time. The USB peripheral will not be able to respond to USB traffic unless HFXO is enabled and stable.

#### 7.1.40.7.2 Host-initiated resume

Once the host resumes the bus activity, it has to be responsive to incoming requests on the USB bus within the time  $T_{\text{RSMRCY}}$  (as defined in chapter 7 of the USB specification) and revert to normal power consumption mode.

If the host resumes bus activity with or without a RESUME condition (in other words: bus activity is defined as any non-J state), the USB peripheral will generate a USBEVENT event, with RESUME bit set in register **EVENTCAUSE**. If the host resumes bus activity simply by restarting sending frames, the USB peripheral will generate SOF events.

#### 7.1.40.7.3 Device-initiated remote wake-up

Assuming the remote wake-up is supported by the device and enabled by the host, the device can request the host to resume from suspend if wake-up condition is met.

To do so, the HFXO needs to be enabled first. After waking up the HFXO, the software must bring USB peripheral out of the low power mode and into the normal power consumption mode through writing **ForceNormal** in register **LOWPOWER**. It can then instruct the USB peripheral to drive a RESUME condition (K state) on the USB bus by triggering the **DPDMDRIVE** task, and hence attempt to wake up the host. By choosing **Resume** in **DPDMVALUE**, the duration of the RESUME state is under hardware control ( $t_{\text{USB,DRIVEK}}$ ). By choosing **J** or **K**, the duration of that state is under software control (the J or K state is maintained until a **DPDMNODRIVE** task is triggered) and has to meet  $T_{\text{DRSMUP}}$  as specified in USB specification chapter 7.

Upon writing the **ForceNormal** in register **LOWPOWER**, a USBEVENT event is generated with the **USBWUALLOWED** bit set in register **EVENTCAUSE**.

The value in register **DPDMVALUE** on page 713 will only be captured and used when the **DPDMDRIVE** task is triggered. This value defines the state the bus will be forced into after the **DPDMDRIVE** task.

Note that the device shall ensure that it does not initiate a remote wake-up request before  $T_{\text{WTRSM}}$  (according to USB specification chapter 7) after the bus has entered idle state. Using the recommended

resume value in [DPDMVALUE](#) (rather than K) takes care of this, and postpones the RESUME state accordingly.

### 7.1.40.8 EasyDMA

The USB peripheral implements EasyDMA for accessing memory without CPU involvement.

Each endpoint has an associated set of registers, tasks and events. EasyDMA and traffic on USB are tightly related. A number of events provide insight of what is happening on the USB bus, and a number of tasks allow to somewhat automate response to the traffic.

**Note:** Endpoint 0 (IN and OUT) are implemented as control endpoint. For more information, see [Control transfers](#) on page 682.

## Registers

Enabling endpoints is controlled through the [EPINEN](#) and [EPOUTEN](#) registers.

The following registers define the memory address of the buffer for a specific IN or OUT endpoint:

- [EPIN\[n\].PTR](#), (n=0..7)
- [EPOUT\[n\].PTR](#), (n=0..7)
- [ISOIN.PTR](#)
- [ISOOUT.PTR](#)

The following registers define the amount of bytes to be sent on USB for next transaction:

- [EPIN\[n\].MAXCNT](#), (n=0..7)
- [ISOIN.MAXCNT](#)

The following registers define the length of the buffer (in bytes) for next transfer of incoming data:

- [EPOUT\[n\].MAXCNT](#), (n=1..7)
- [ISOOUT.MAXCNT](#)

Since the host decides how many bytes are sent over USB, the MAXCNT value can be copied from register [SIZE.EPOUT\[n\]](#) (n=1..7) or register [SIZE.ISOOUT](#).

Register [EPOUT\[0\].MAXCNT](#) defines the length of the OUT buffer (in bytes) for the control endpoint 0. If the USB host does not misbehave, register [SIZE.EPOUT\[0\]](#) will indicate the same value as `MaxPacketSize` from the device descriptor or `wLength` from the SETUP command, whichever the smallest.

The [.AMOUNT](#) registers indicate how many bytes actually have been transferred over EasyDMA during the last transfer.

Stalling bulk/interrupt endpoints is controlled through the [EPSTALL](#) register.

**Note:** Due to USB specification requirements, the effect of the stalling control endpoint 0 may be overridden by hardware, in particular when a new SETUP token is received.

EasyDMA will not copy the SETUP data to memory (it will only transfer data from the data stage). Setup data is available as separate registers in the USB peripheral:

- [BMREQUESTTYPE](#)
- [BREQUEST](#)
- [WVALUEL](#)
- [WVALUEH](#)
- [WINDEXL](#)
- [WINDEXH](#)

- [WLENGTHL](#)
- [WLENGTHH](#)

[EVENTCAUSE](#) register provides details on what caused a given USBEVENT event, for instance if a CRC error is detected during a transaction, or if bus activity stops or resumes.

## Tasks

Tasks [STARTEPIN\[n\]](#), [STARTEPOUT\[n\]](#) (n=0..7), [STARTISOIN](#) and [STARTISOOUT](#) capture the values for .PTR and .MAXCNT registers. For IN endpoints, a transaction over USB gets automatically triggered when the EasyDMA transfer is complete. For OUT endpoints, it is up to software to allow the next transaction over USB. See the examples in [Control transfers](#) on page 682, [Bulk and interrupt transactions](#) on page 685 and [Isochronous transactions](#) on page 688.

For the control endpoint 0, OUT transactions are allowed through the EPORCVOUT task. The EPOSTATUS task allows a status stage to be initiated, and the EPOSTALL task allows stalling further traffic (data or status stage) on the control endpoint.

## Events

The [STARTED](#) event confirms that the values of the .PTR and .MAXCNT registers of the endpoints flagged in register [EPSTATUS](#) have been captured. Those can then be modified by software for the next transfer.

Events [ENDEPIN\[n\]](#), [ENDEPOUT\[n\]](#) (n=0..7), [ENDISOIN](#) and [ENDISOOUT](#) events indicate that the whole buffer has been consumed. The buffer can be accessed safely by the software.

Only a single EasyDMA transfer can take place in USB0 at any time. Software must ensure that tasks [STARTEPIN\[n\]](#) (n=0..7), [STARTISOIN](#), [STARTEPOUT\[n\]](#) (n=0..7) or [STARTISOOUT](#) are not triggered before events [ENDEPIN\[n\]](#) (n=0..7), [ENDISOIN](#), [ENDEPOUT\[n\]](#) (n=0..7) or [ENDISOOUT](#) are received from an on-going transfer.

The [EPDATA](#) event indicates that a successful (acknowledged) data transaction has occurred on the data endpoint(s) flagged in register [EPDATASTATUS](#). A successful (acknowledged) data transaction on endpoint 0 is signalled by the [EPODATADONE](#) event.

At any time a [USBEVENT](#) event may be sent, with details provided in [EVENTCAUSE](#) register.

[EPOSETUP](#) event indicates that a SETUP token has been received on the control endpoint 0, and that the setup data is available in [registers](#).

### 7.1.40.9 Control transfers

The USB specification mandates every USB device to implement endpoint 0 IN and OUT as control endpoints.

A control transfer consists of two or three stages:

- Setup stage
- Data stage (optional)
- Status stage

Each control transfer can be one of following types:

- Control read
- Control read no data
- Control write
- Control write no data

An EPOSETUP event indicates that the data in the setup stage (following the SETUP token) is available in [registers](#).

The data in the data stage (following the IN or OUT token) is transferred from or to the desired location using EasyDMA.

The control endpoint buffer can be of any size.

After receiving the SETUP token, the USB controller will not accept (NAK) any incoming IN or OUT tokens until the software has finished decoding the command, determining the type of transfer, and preparing for the next stage (data or status) appropriately.

The software can choose to stall a command (in both data and status stages) through the EPOSTALL task, for instance if the command is not supported, or its wValue, wIndex or wLength parameters are wrong. A stalled control read transfer is illustrated below, but the same mechanism (same tasks) applies to stalling a control write transfer (not illustrated):

Figure 229: Control read gets stalled

See chapter 9 of the USB specification and relevant class specifications for rules on when to stall a command.

**Note:** The USB peripheral handles the SetAddress transfer by itself. As a consequence, the software shall not process this command other than updating its state machine (see [Device state diagram](#)), nor initiate a status stage. If necessary, the address assigned by the host can be read out from the USBADDR register after the command has been processed.

#### 7.1.40.9.1 Control read transfer

This section describes how the software behaves to respond to a control read transfer.

As mentioned earlier, the USB controller will not accept (NAK) any incoming IN tokens until software has finished decoding the command, determining the type of transfer, and preparing for the next stage (data or status) appropriately.

For a control read, transferring the data from memory into USB will trigger a valid, acknowledged (ACK) IN transaction on USB.

The software has to prepare EasyDMA by pointing to the buffer containing the data to be transferred. If no other EasyDMA transfers are on-going with USB, the software can send the STARTEPIN0 task, which will initiate the data transfer and transaction on USB.

A STARTED event (with EPIN0 bit set in the [EPSTATUS](#) register) will be generated as soon as the EPIN[0].PTR and .MAXCNT registers have been captured. Software may then prepare them for the next data transaction.

An ENDEPIN[0] event will be generated when the data has been transferred from memory to the USBD peripheral.

Finally, an EP0DATADONE event will be generated when the data has been transmitted over USB and acknowledged by the host.

The software can then either prepare and transmit the next data transaction by repeating the above sequence, or initiate the status stage through the EPOSTATUS task.

Figure 230: Control read transfer

Note the possibility to enable a shortcut from the EP0DATADONE event to the EPOSTATUS task, typically if the data stage is expected to take a single transfer. If there is no data stage, the software can initiate the status stage through the EPOSTATUS task right away, as illustrated below:

Figure 231: Control read no data transfer

#### 7.1.40.9.2 Control write transfer

This section describes how the software responds to a control write transfer.

The software has to prepare EasyDMA by pointing to the buffer in memory that shall contain the incoming data. If no other EasyDMA transfers are on-going with USB, the software can then send the EP0RCVOUT task, which will make USB acknowledge (ACK) the first OUT+DATA transaction from the host.

An EP0DATADONE event will be generated when a new OUT+DATA has been transmitted over USB, and is about to get acknowledged by the device.

A STARTED event (with EPOUT0 bit set in the EPSTATUS register) will be generated as soon as the EPOUT[0].PTR and .MAXCNT registers have been captured, after receiving the first transaction. Software may then prepare them for the next data transaction.

An ENDEPOUT[0] event will be generated when the data has been transferred from the USB peripheral to memory. The software can then either prepare to receive the next data transaction by repeating the above sequence, or initiate the status stage through the EPOSTATUS task. Until then, further incoming OUT +DATA transactions get a NAK response by the device.

Figure 232: Control write transfer

Figure 233: Control write no data transfer

#### 7.1.40.10 Bulk and interrupt transactions

The USB peripheral implements seven pairs of bulk/interrupt endpoints.

The bulk/interrupt endpoints have a fixed USB endpoint number, summarized in the table below.

| Bulk endpoint # | USB IN endpoint | USB OUT endpoint |
|-----------------|-----------------|------------------|
| [1]             | 0x81            | 0x01             |
| [2]             | 0x82            | 0x02             |
| [3]             | 0x83            | 0x03             |
| [4]             | 0x84            | 0x04             |
| [5]             | 0x85            | 0x05             |
| [6]             | 0x86            | 0x06             |
| [7]             | 0x87            | 0x07             |

Table 176: Bulk/interrupt endpoint numbering

A bulk/interrupt transaction consists of a single data stage. Two consecutive, successful transactions are distinguished through alternating leading process ID (PID): DATA0 follows DATA1, DATA1 follows DATA0,

etc. A repeated transaction is detected by re-using the same PID as previous transaction, i.e DATA0 follows DATA0, or DATA1 follows DATA1.

The USB controller automatically toggles DATA0/DATA1 PIDs for every bulk/interrupt transaction, and in general software does not need to care about it.

If an incoming data is corrupted (CRC does not match), the USB controller automatically prevents DATA0/DATA1 from toggling, to request the host to resend the data.

In some specific cases, the software may want to force a data toggle (usually reset) on a specific IN endpoint, or force the expected toggle on an OUT endpoint, for instance as a consequence of the host issuing **ClearFeature**, **SetInterface** or selecting an alternate setting. Controlling the data toggle of data IN or OUT endpoint  $n$  ( $n=1..7$ ) is done through register **DTOGGLE**.

The bulk/interrupt transaction in USB full-speed can be of any size up to 64 bytes, and it has to be a multiple of 4 bytes and 32-bit aligned in memory.

When the transaction is done over USB, an EPDATA event is generated. The hardware will then automatically respond with NAK to all incoming IN tokens until the software is ready to send more data and has finished configuring the EasyDMA, started it, and the whole buffer content has been moved to USB controller (signalled by the ENDEPIN[n] event).

Each IN or OUT data endpoint has to be explicitly enabled by software through register **EPINEN** or **EPOUTEN**, according to the configuration declared by the device and selected by the host through the **SetConfig** command.

A disabled data endpoint will not respond to any traffic from the host. An enabled data endpoint will normally respond NAK or ACK (depending on the readiness of the buffers), or STALL (if configured in register **EPSTALL**), in which case the endpoint is asked to halt). The halted (or not) state of a given endpoint can be read back from register **HALTED.EPIN[n]** or **HALTED.EPOUT[n]**. The format of the returned 16-bit value can be copied as is as response to a **GetStatusEndpoint** request from the host.

Note that enabling or disabling an endpoint will not change its halted state. However, a USB reset will disable and clear the halted state of all data endpoints.

The control endpoint 0 IN and OUT can also be enabled and/or halted using the same mechanisms, but due to USB specification, receiving a SETUP will override its state.

#### 7.1.40.10.1 Bulk and interrupt IN transaction

The host issues IN tokens to receive bulk/interrupt data. In order to send data, the software has to enable the endpoint and prepare an EasyDMA transfer on the desired endpoint.

Bulk/interrupt IN endpoints are enabled or disabled through their respective INN bit ( $n=1..7$ ) in **EPINEN** register.

It is also possible to stall or un-stall an endpoint through the **EPSTALL** register.

Figure 234: Bulk/interrupt IN transaction

It is possible (and in some situations it is required) to respond to an IN token with a zero-length data packet.

**Note:** On many USB hosts, not responding (DATA+ACK or NAK) to three IN tokens on an interrupt endpoint would have the host disable that endpoint as a consequence. Re-enumerating the device (unplug-replug) may be required to restore functionality. Make sure that the relevant data endpoints are enabled for normal operation as soon as the device gets configured through a **SetConfig** request.

#### 7.1.40.10.2 Bulk and interrupt OUT transaction

When the host wants to transmit bulk/interrupt data, it issues an OUT token (packet) followed by a DATA packet on a given endpoint  $n$  ( $n=1..7$ ).

A NAK is returned until the software writes any value to register [SIZE.EPOUT\[n\]](#), indicating that the content of the local buffer can be overwritten. Upon receiving the next OUT+DATA transaction, an ACK is returned to the host while an EPDATA event is generated (and the [EPDATASTATUS](#) register flags are set to indicate on which endpoint this happened). Once the EasyDMA is prepared and enabled, by writing the [EPOUT\[n\]](#) registers and triggering the [STARTEPOUT\[n\]](#) task, the incoming data will be transferred to memory. Until that transfer is finished, the hardware will automatically NAK any other incoming OUT+DATA packets. Only when the EasyDMA transfer is done (signalled by the [ENDEPOUT\[n\]](#) event), or as soon as any values are written by the software in register [SIZE.EPOUT\[n\]](#), the endpoint  $n$  will accept incoming OUT+DATA again.

It is allowed for the host to send zero-length data packets.

Bulk/interrupt OUT endpoints are enabled or disabled through their respective OUTn bit ( $n=1..7$ ) in the [EPOUTEN](#) register. It is also possible to stall or un-stall an endpoint through the [EPSTALL](#) register.

Figure 235: Bulk/interrupt OUT transaction

### 7.1.40.11 Isochronous transactions

The USB peripheral implements isochronous (ISO) endpoints.

The ISO endpoints have a fixed USB endpoint number, summarized in the table below.

| ISO endpoint # | USB IN endpoint | USB OUT endpoint |
|----------------|-----------------|------------------|
| [0]            | 0x88            | 0x08             |

Table 177: Isochronous endpoint numbering

An isochronous transaction consists of a single, non-acknowledged data stage. The host sends out a start of frame at a regular interval (1 ms), and data follows IN or OUT tokens within each frame.

EasyDMA allows transferring ISO data directly from and to memory. EasyDMA transfers must be initiated by the software, which can synchronize with the SOF (start of frame) events.

Because the timing of the start of frame is very accurate, the SOF event can be used for instance to synchronize a local timer through the SOF event and PPI. The SOF event gets synchronized to the 16 MHz clock prior to being made available to the PPI.

Every start of frame increments a free-running counter, which can be read by software through the [FRAMECNT](#) register.

Each IN or OUT ISO data endpoint has to be explicitly enabled by software through register [EPINEN](#) or [EPOUTEN](#), according to the configuration declared by the device and selected by the host through the **SetConfig** command. A disabled ISO IN data endpoint will not respond to any traffic from the host. A disabled ISO OUT data endpoint will ignore any incoming traffic from the host.

The USB peripheral has an internal 1 kB buffer associated with ISO endpoints. The user can either allocate the full amount to the IN or the OUT endpoint, or split the buffer allocation between the two using register [ISOSPLIT](#).

The internal buffer also sets the maximum size of the ISO OUT and ISO IN transfers: 1023 bytes when the full buffer is dedicated to either ISO OUT or ISO IN, and half when the buffer is split between the two.

#### 7.1.40.11.1 Isochronous IN transaction

When the host wants to receive isochronous (ISO) data, it issues an IN token on the isochronous endpoint.

After the data has been transferred using the EasyDMA, the USB controller on the isochronous IN endpoint responds to the IN token with the transferred data using the [ISOIN.MAXCNT](#) for the size of the packet.

The ISO IN data endpoint has to be explicitly enabled by software through the ISOIN0 bit in register [EPINEN](#).

When an ISO IN endpoint is enabled and no data transferred with EasyDMA, the response of the USB device depends on the setting of the RESPONSE field in register [ISOINCONFIG](#) - it can either provide no response to an IN token or respond with a zero-length data.

If the EasyDMA transfer on the isochronous endpoint is not completed before the next SOF event, the result of the transfer is undefined.

The maximum size of an ISO IN transfer in USB full-speed is 1023 bytes, and the data buffer has to be a multiple of 4 bytes 32-bit aligned in memory. However, the amount of bytes transferred on the USB data endpoint can be of any size (up to 1023 bytes, if not shared with an OUT ISO endpoint).

Figure 236: Isochronous IN transfer

#### 7.1.40.11.2 Isochronous OUT transaction

When the host wants to send isochronous (ISO) data, it issues an OUT token on the isochronous endpoint, followed by data.

The ISO OUT data endpoint has to be explicitly enabled by software through the ISOOUT0 bit in register [EPOUTEN](#).

The amount of last received ISO OUT data is provided in the [SIZE.ISOOUT](#) register. Software shall interpret the ZERO and SIZE fields as follows:

| ZERO     | SIZE              | Last received data size          |
|----------|-------------------|----------------------------------|
| Normal   | 0                 | No data received at all          |
| Normal   | 1..1023           | 1..1023 bytes of data received   |
| ZeroData | (not of interest) | Zero-length data packet received |

Table 178: ISO OUT incoming data size

When EasyDMA is prepared and started, triggering a STARTISOOUT task initiates an EasyDMA transfer to memory. Software shall synchronize ISO OUT transfers with the SOF events. EasyDMA uses the address in [ISOOUT.PTR](#) and size in [ISOOUT.MAXCNT](#) for every new transfer.

If the EasyDMA transfer on the isochronous endpoint is not completed before the next SOF event, the result of the transfer is undefined.

The maximum size of an isochronous OUT transfer in USB full-speed is 1023 bytes, and the data buffer has to be a multiple of 4 bytes and 32-bit aligned in Data RAM. However, the amount of bytes transferred on the USB data endpoint can be of any size (up to 1023 bytes if not shared with an IN ISO endpoint).

If the last received ISO data packet is corrupted (wrong CRC), the USB controller generates an USBEVENT event (at the same time as SOF) and indicates a CRC error on ISOOUTCRC in register [EVENTCAUSE](#). EasyDMA will transfer the data anyway if it has been set up properly.

Figure 237: Isochronous OUT transfer

#### 7.1.40.12 USB register access limitations

Some of the registers in USBBD cannot be accessed in specific conditions.

This may be the case when USBBD is not enabled (using the [ENABLE](#) register) and ready (signalled by the READY bit in [EVENTCAUSE](#) after a USBEVENT event), or when USBBD is in low power mode while the USB bus is suspended.

Triggering any tasks, including the tasks triggered through the PPI, is affected by this behavior. In addition, the following registers are affected:

- HALTED.EPIN[0..7]
- HALTED.EPOUT[0..7]
- USBADDR
- BMREQUESTTYPE
- BREQUEST
- WVALUEL
- WVALUEH
- WINDEXL
- WINDEXH
- WLENGTHL
- WLENGTHH
- SIZE.EPOUT[0..7]
- SIZE.ISOOUT
- USBPULLUP
- DTOGGLE

- EPINEN
- EPOUTEN
- EPSTALL
- ISOSPLIT
- FRAMECNTR

### 7.1.40.13 Registers

| Base address | Domain      | Peripheral | Instance  | Secure mapping | DMA security | Description                 | Configuration |
|--------------|-------------|------------|-----------|----------------|--------------|-----------------------------|---------------|
| 0x50036000   | APPLICATION | USB0       | USB0 : S  | US             | SA           | Universal serial bus device |               |
| 0x40036000   |             |            | USB0 : NS |                |              |                             |               |

Table 179: Instances

| Register                | Offset | Security | Description                                                                                                                                                           |
|-------------------------|--------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TASKS_STARTEPIN[n]      | 0x004  |          | Captures the EPIN[n].PTR and EPIN[n].MAXCNT registers values, and enables endpoint IN n to respond to traffic from host                                               |
| TASKS_STARTISOIN        | 0x024  |          | Captures the ISOIN.PTR and ISOIN.MAXCNT registers values, and enables sending data on ISO endpoint                                                                    |
| TASKS_STARTEPOUT[n]     | 0x028  |          | Captures the EPOUT[n].PTR and EPOUT[n].MAXCNT registers values, and enables endpoint n to respond to traffic from host                                                |
| TASKS_STARTISOOOUT      | 0x048  |          | Captures the ISOOOUT.PTR and ISOOOUT.MAXCNT registers values, and enables receiving of data on ISO endpoint                                                           |
| TASKS_EPORCVOUT         | 0x04C  |          | Allows OUT data stage on control endpoint 0                                                                                                                           |
| TASKS_EPOSTATUS         | 0x050  |          | Allows status stage on control endpoint 0                                                                                                                             |
| TASKS_EPOSTALL          | 0x054  |          | Stalls data and status stage on control endpoint 0                                                                                                                    |
| TASKS_DPDMDRIVE         | 0x058  |          | Forces D+ and D- lines into the state defined in the DPDMVALUE register                                                                                               |
| TASKS_DPDMNODRIVE       | 0x05C  |          | Stops forcing D+ and D- lines into any state (USB engine takes control)                                                                                               |

| ISOIN.MAXCNT    | 0x6A4  |          | Maximum number of bytes to transfer                 |
| ISOIN.AMOUNT    | 0x6A8  |          | Number of bytes transferred in the last transaction |
| EPOUT[n].PTR    | 0x700  |          | Data pointer                                        |
| EPOUT[n].MAXCNT | 0x704  |          | Maximum number of bytes to transfer                 |
| EPOUT[n].AMOUNT | 0x708  |          | Number of bytes transferred in the last transaction |
| ISOOUT.PTR      | 0x7A0  |          | Data pointer                                        |
| ISOOUT.MAXCNT   | 0x7A4  |          | Maximum number of bytes to transfer                 |
| ISOOUT.AMOUNT   | 0x7A8  |          | Number of bytes transferred in the last transaction |

Table 180: Register overview

### 7.1.40.13.1 TASKS\_STARTEPIN[n] (n=0..7)

Address offset:  $0x004 + (n \times 0x4)$

Captures the EPIN[n].PTR and EPIN[n].MAXCNT registers values, and enables endpoint IN n to respond to traffic from host

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |    ## 7.1.40.14 Electrical specification

### 7.1.40.14.1 USB Electrical Specification

| Symbol              | Description                                                              | Min. | Typ. | Max. | Units    |
|---------------------|--------------------------------------------------------------------------|------|------|------|----------|
| $R_{USB,PU,ACTIVE}$ | Value of pull-up on D+, bus active (upstream device transmitting)        | ..   | ..   | ..   | $\Omega$ |
| $R_{USB,PU,IDLE}$   | Value of pull-up on D+, bus idle                                         | ..   | ..   | ..   | $\Omega$ |
| $t_{USB,DETRST}$    | Minimum duration of an SE0 state to be detected as a USB reset condition | ..   | ..   | ..   | $\mu s$  |
| $f_{USB,CLK}$       | Frequency of local clock, USB active                                     | ..   | ..   | ..   | MHz      |
| $f_{USB,TOL}$       | Accuracy of local clock, USB active <sup>28</sup>                        | ..   | ..   | ..   | ppm      |
| $T_{USB,JITTER}$    | Jitter on USB local clock, USB active                                    | ..   | ..   | ..   | ns       |

## 7.1.41 VMC — Volatile memory controller

The VMC provides power control of RAM blocks.

Each of the available RAM blocks, which each may contain multiple RAM sections, can power up and down independently in both System ON and System OFF mode, using the RAM[n] registers. See [Memory](#) chapter for more information about RAM blocks and sections.

### 7.1.41.1 RAM power states

In System OFF, retention of a RAM section is configured in the RETENTION field of the corresponding register [RAM\[n\].POWER \(n=0..7\)](#) on page 720.

In System ON, retention and accessibility for a RAM section is configured in the RETENTION and POWER fields of the corresponding register [RAM\[n\].POWER \(n=0..7\)](#) on page 720.

The following table summarizes the behavior of these registers.

<sup>28</sup> The local clock can be stopped during USB suspend

| Configuration |                    |                        | RAM section status |          |
|---------------|--------------------|------------------------|--------------------|----------|
| System on/off | RAM[n].POWER.POWER | RAM[n].POWER.RETENTION | Accessible         | Retained |
| Off           | x                  | Off                    | No                 | No       |
| Off           | x                  | On                     | No                 | Yes      |
| On            | Off                | Off                    | No                 | No       |
| On            | Off <sup>1</sup>   | On                     | No                 | Yes      |
| On            | On                 | x                      | Yes                | Yes      |

Table 181: RAM section configuration. x = don't care.

The advantage of not retaining RAM contents is that the overall current consumption is reduced.

See chapter [Memory](#) on page 18 for more information on RAM sections.

### 7.1.41.2 Registers

| Base address | Domain      | Peripheral | Instance | Secure mapping | DMA security | Description                | Configuration            |
|--------------|-------------|------------|----------|----------------|--------------|----------------------------|--------------------------|
| 0x50081000   | APPLICATION | VMC        | VMC : S  | US             | NA           | Volatile memory controller |                          |
| 0x40081000   |             |            | VMC : NS |                |              |                            |                          |

|                  |            | On                                                                                    |  | 1     |  | On                                                                          |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Q-f              | RW         | S[i]RETENTION (i=0..15)                                                               |  |       |  | Keep retention on RAM section Si of RAM[n] when RAM section is switched off |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|                  |            | Off                                                                                   |  | 0     |  | Off                                                                         |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|                  |            | On                                                                                    |  | 1     |  | On                                                                          |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

<sup>1</sup> Not useful setting. RAM section power off gives negligible reduction in current consumption when retention is on.

### 7.1.41.2.2 RAM[n].POWERSET (n=0..7)

Address offset:  $0x604 + (n \times 0x10)$

RAM[n] power control set register

When read, this register will return the value of the RAM[n].POWER register.

|                  |      |                         |       |    |       |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |  |  |  |                                                                             |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## 7.1.42 WDT — Watchdog timer

A countdown watchdog timer using the low-frequency clock source (LFCLK) offers configurable and robust protection against application lock-up.

The watchdog must be configured before it is started.

After configuration, the watchdog is started by triggering the START task.

After it is started, the watchdog's configuration registers, which comprise registers CRV, RREN, and CONFIG, will be blocked for further configuration.

The watchdog can be paused during long CPU sleep periods for low power applications and when the debugger has halted the CPU. The watchdog is implemented as a down-counter that generates a TIMEOUT event when it wraps over after counting down to 0. When the watchdog timer is started through the START task, the watchdog counter is loaded with the value specified in the CRV register. This counter is also reloaded with the value specified in the CRV register when a reload request is granted.

The watchdog's timeout period is given by:

$$\text{timeout [s]} = ( \text{CRV} + 1 ) / 32768$$

When started, the watchdog will automatically force the 32.768 kHz RC oscillator on as long as no other 32.768 kHz clock source is running and generating the 32.768 kHz system clock, see chapter [CLOCK — Clock control](#) on page 61.

#### 7.1.42.1 Reload criteria

The watchdog has eight separate reload request registers, which shall be used to request the watchdog to reload its counter with the value specified in the CRV register. To reload the watchdog counter, the special value 0x6E524635 needs to be written to all enabled reload registers.

One or more RR registers can be individually enabled through the RREN register.

#### 7.1.42.2 Temporarily pausing the watchdog

By default, the watchdog will be active counting down the down-counter while the CPU is sleeping. It is however possible to configure the watchdog to automatically pause while the CPU is sleeping as well as when it is halted by the debugger.

Going to system OFF-mode will stop and disable the watchdog.

#### 7.1.42.3 Watchdog reset

A TIMEOUT event will automatically lead to a watchdog reset.

See [RESET - Reset control](#) on page 55 for more information about reset sources. If the watchdog is configured to generate an interrupt on the TIMEOUT event, the watchdog reset will be postponed with two 32.768 kHz clock cycles after the TIMEOUT event has been generated. Once the TIMEOUT event has been generated, and unless the watchdog is stopped, the impending watchdog reset will be effectuated.

The watchdog can be reset from several reset sources, see [Application core reset behavior](#) on page 57. After being reset from these sources, the watchdog configuration registers will be available for configuration again.

#### 7.1.42.4 Stopping the watchdog

By default, the watchdog cannot be stopped. It is however possible to configure the watchdog to allow the STOP task.

To allow stopping the watchdog, the STOPEN field of the [CONFIG](#) register must be set to Enable when configuring the watchdog.

Then, to stop the watchdog,

- the special value 0x6E524635 must be written to the [TSEN](#) register
- the STOP task must be invoked

When all of these conditions are met, the watchdog is stopped. The STOPPED event indicates a successful stopping of the watchdog.

When the watchdog is stopped, the watchdog's configuration registers [CRV](#), [RREN](#) and [CONFIG](#) are no longer blocked.

**Note:** It is recommended to write zeros to [TSEN](#) on page 728 after the watchdog has stopped, to avoid un-intended invocation of the STOP task.

## 7.1.42.5 Registers

| Base address | Domain      | Peripheral | Instance  | Secure mapping | DMA security | Description      | Configuration |

## 8 Debug and trace

## 8.1 Overview

The debug and trace system offers a flexible and powerful mechanism for non-intrusive debugging.

Figure 238: Debug and trace overview

The main features of the debug and trace system are:

- Access port connection to application core ARM Cortex-M33
  - Eight breakpoints
  - Four watchpoint comparators
  - Instrumentation trace macrocell (ITM)
  - Embedded trace macrocell (ETM)
  - Access protection through APPROTECT, ERASEPROTECT and SECUREAPPROTECT
- Access port connection to network core ARM Cortex-M33
  - Eight breakpoints
  - Four watchpoints
  - Access protection through APPROTECT and ERASEPROTECT
- Serial wire debug (SWD) interface, protocol version 2 with multidrop support
- Trace port interface unit (TPIU)

- 4-bit parallel trace of ITM and ETM trace data
- Serial wire output (SWO) trace of ITM data

### 8.1.1 DAP - Debug access port

An external debugger can access the device via the debug access port (DAP).

The DAP implements a standard ARM CoreSight serial wire debug port (SW-DP). The SW-DP implements the serial wire debug (SWD) protocol that is a two-pin serial interface, see SWDCLK and SWDIO in figure [Figure 238: Debug and trace overview](#) on page 730.

**Note:**

- The SWDIO line has an internal pull-up resistor.
- The SWDCLK line has an internal pull-down resistor.

There are several access ports that connect to different parts of the system. An overview is given in the table below.

| AP ID | Type    | Description                               |
|-------|---------|-------------------------------------------|
| 0     | AHB-AP  | Application subsystem access port         |
| 1     | AHB-AP  | Network subsystem access port             |
| 2     | CTRL-AP | Application subsystem control access port |
| 3     | CTRL-AP | Network subsystem control access port     |

Table 186: Access port overview

The AHB-AP and APB-AP are standard ARM components, and documented in *ARM CoreSight SoC-400 Technical Reference Manual*, revision r3p2. The control access port (CTRL-AP) is proprietary, and described in more detail in [CTRL-AP - Control access port](#) on page 739.

### 8.1.2 Access port protection

Debugger transactions through an access port can be protected in different ways.

An overview of the access port protection schemes is given in the table below.

| Register                         | Description                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Application UICR.APPROTECT       | Blocks all access through the application AHB-AP. This can be used to provide read-back protection of the application. Note that the network core may be able to access non-secure memory of the application core as defined in <a href="#">SPU — System protection unit</a> on page 568. This can be prevented by using the network core's APPROTECT. |
| Application UICR.SECUREAPPROTECT | Blocks all secure transfers through the application AHB-AP. This means that only the non-secure code can be debugged and accessed.                                                                                                                                                                                                                     |
| Application UICR.ERASEPROTECT    | Disables the application core CTRL-AP.ERASEALL and NVMC ERASEALL functionality. This can be used together with APPROTECT to provide read-back and re-purposing protection.                                                                                                                                                                             |
| Network UICR.APPROTECT           | Blocks all access through the network AHB-AP.                                                                                                                                                                                                                                                                                                          |
| Network UICR.ERASEPROTECT        | Disables the network core CTRL-AP.ERASEALL and NVMC ERASEALL functionality. This can be used together with APPROTECT to provide read-back and re-purposing protection.                                                                                                                                                                                 |

Table 187: Access port protection overview

### 8.1.3 Debug interface mode

Before the external debugger can access any of the access ports, the debugger must first request the device to power up via CxxxPWRUPREQ in the SWJ-DP.

As long as the debugger is requesting power via CxxxPWRUPREQ, the device will be in debug interface mode. Otherwise, the device is in normal mode. When a debug session is over, the external debugger must make sure to put the device back into normal mode and then a pin reset should be performed. The reason is that the overall power consumption is higher in debug interface mode compared to normal mode.

Some peripherals behave differently in debug interface mode compared to normal mode. These differences are described in more detail in the chapters of the peripherals that are affected.

For details on how to use the debug capabilities, read the debug documentation of your IDE.

If the device is in System OFF when power is requested via CxxxPWRUPREQ, the system will wake up and the DIF flag in [RESETREAS](#) on page 59 will be set.

### 8.1.4 Real-time debug

The device supports real-time debugging, which allows interrupts to execute to completion in real time when breakpoints are set in thread mode or lower priority interrupts.

Real-time debugging enables the developer to set a breakpoint and single-step through their code without a failure of the real-time event-driven threads running at higher priority. For example, this enables the device to continue to service the high-priority interrupts of an external controller or sensor without failure or loss of state synchronization while the developer steps through code in a low-priority thread.

### 8.1.5 ROM tables

Figure 239: Application core ROM table overview

| Address    | Component | Value                                                           |

Table 191: Network ARM Cortex-M33 ROM table entries

### 8.1.6 Cross-trigger network

The debug system features a cross-trigger network that can be used for simultaneous starting and halting of the cores in the system. An overview of the cross-trigger connections is given in figure below.

Figure 241: Cross-trigger network overview

Both the application and network core have a cross-trigger interface (CTI) peripheral that can trigger, or get triggered, by signals in the processor or debug blocks. The CTI can be configured to route trigger in-signals to trigger out-signals within the CTI or the cross-trigger matrix. The cross-trigger matrix has four channels in total that can be used to communicate trigger signals between cores.

It is possible to halt the network core when the application is halted (either because of a breakpoint or a stopped debug session). This can be done in the following way:

1. Configure application CTI to generate an event on channel 0 for CTITRIGIN[0] (processor halted) using CTIINEN[0].
2. Configure network CTI to trigger CTITRIGOUT[0] (processor debug request) on channel 0 using CTIOUTEN[0].

### Configuring the cross-trigger interface

In this example, the following CTI channels are used:

- Channel 0 is used to relay debug requests from the application to the network domain.
- Channel 1 is used to relay debug requests from the network to the application domain.
- Channel 2 is used by the debugger to send a common trigger for restarting both domains after a breakpoint.

For the application core, add the following code:

```
#define CTI_TRIGIN_CPUHALTED    0
#define CTI_TRIGOUT_DEBUGREQ    0
#define CTI_TRIGOUT_CPURESTART  1
...
// Enable global CTI routing
NRF_CTI_S->CTICONTROL = CTI_CTICONTROL_GLBEN_Enabled;
// Connect the CPU halted trigger of this domain to debug request of the other domain
NRF_CTI_S->CTIINEN[CTI_TRIGIN_CPUHALTED]    = CTI_CTIINEN_TRIGINEN_0_Msk;
NRF_CTI_S->CTIOUTEN[CTI_TRIGOUT_DEBUGREQ]    = CTI_CTIOUTEN_TRIGOUTEN_1_Msk;
NRF_CTI_S->CTIOUTEN[CTI_TRIGOUT_CPURESTART] = CTI_CTIOUTEN_TRIGOUTEN_2_Msk;
```

For the network core, add the following code:

```
#define CTI_TRIGIN_CPUHALTED    0
#define CTI_TRIGOUT_DEBUGREQ    0
#define CTI_TRIGOUT_CPURESTART  1
...
// Enable global CTI routing
NRF_CTI_NS->CTICONTROL = CTI_CTICONTROL_GLBEN_Enabled;
// Connect the CPU halted trigger of this domain to debug request of the other domain
NRF_CTI_NS->CTIINEN[CTI_TRIGIN_CPUHALTED]    = CTI_CTIINEN_TRIGINEN_1_Msk;
NRF_CTI_NS->CTIOUTEN[CTI_TRIGOUT_DEBUGREQ]    = CTI_CTIOUTEN_TRIGOUTEN_0_Msk;
NRF_CTI_NS->CTIOUTEN[CTI_TRIGOUT_CPURESTART] = CTI_CTIOUTEN_TRIGOUTEN_2_Msk;
```

For more information about the trigger connections to and from the CTI, see the tables below.

| Signal       | Description             |
|--------------|-------------------------|
| CTITRIGIN[0] | Processor halted        |
| CTITRIGIN[1] | DWT comparator output 0 |

## 8.1.7 Multidrop SWD

Multidrop SWD allows simultaneous access to an unlimited number of devices through a single connection. This is useful for connectivity-constrained products that contain multiple chips with multidrop support.

In order to select a target in a multidrop capable product, the debugger must write the correct TINSTANCE, TPARTNO and TDESIGNER fields into the SW-DP TARGETSEL register. Values for these fields are located in and fetched from two registers, [TARGETID](#) on page 738 and [DLPIDR](#) on page 738.

For more information about multidrop SWD, see *ARM Debug Interface Architecture Specification*, ADIv5.0 to ADIv5.2.

## 8.1.8 Trace

The device supports ETM and ITM trace.

Trace data from the ETM and the ITM is sent to an external debugger via a 4-bit wide parallel trace port (TPIU), see TRACEDATA[0] through TRACEDATA[3], and TRACECLK in figure [Figure 238: Debug and trace overview](#) on page 730.

In addition to parallel trace, the TPIU supports serial trace via the serial wire output (SWO) trace protocol. Parallel and serial trace cannot be used at the same time. ETM trace is supported in parallel trace mode only, while both parallel and serial trace modes support the ITM trace. For details on how to use the trace capabilities, please read the debug documentation of your IDE.

TPIU's trace pins are multiplexed with GPIOs. SWO and TRACEDATA[0] use the same GPIO. See [Pin assignments](#) on page 764 for more information.

Trace speed is configured in the [TRACEPORTSPEED](#) on page 763 register. The speed of the trace pins depends on the drive setting of the GPIOs that the trace pins are multiplexed with. See [GPIO — General purpose input/output](#) on page 209 for information about how to set drive settings. Only S0S1 and H0H1 drives are suitable for debugging. S0S1 is the default drive at reset. If parallel or serial trace port signals are not fast enough in the debugging conditions, all GPIOs in use for tracing should be set to high drive (H0H1). The user shall make sure that these GPIOs' drive setting is not overwritten by software during the debugging session.

### 8.1.9 Enabling the trace port

A specific sequence of operations must be performed to enable the trace port.

1. Enable the debug master by using the code below.

```
NRF_TAD_S->ENABLE = TAD_ENABLE_ENABLE_Msk;
```

2. Request clock startup.

```
NRF_TAD_S->CLOCKSTART = TAD_CLOCKSTART_START_Msk;
```

3. Configure TPIU port to pads.

```
NRF_TAD_S->PSEL.TRACECLK = TAD_PSEL_TRACECLK_PIN_Traceclk;
NRF_TAD_S->PSEL.TRACEDATA0 = TAD_PSEL_TRACEDATA0_PIN_Tracedata0;
NRF_TAD_S->PSEL.TRACEDATA1 = TAD_PSEL_TRACEDATA1_PIN_Tracedata1;
NRF_TAD_S->PSEL.TRACEDATA2 = TAD_PSEL_TRACEDATA2_PIN_Tracedata2;
NRF_TAD_S->PSEL.TRACEDATA3 = TAD_PSEL_TRACEDATA3_PIN_Tracedata3;
```

4. Hand over control of the GPIO pads to the trace and debug subsystem, and set high drive strength to ensure sufficiently fast operation. Do this for all trace pins that should be used.

```
// Clear the bitfields before configuring to make sure the correct value is written
NRF_P0_S->PIN_CNF[TAD_PSEL_TRACECLK_PIN_Traceclk]
    &= ~(GPIO_PIN_CNF_MCUSEL_Msk | GPIO_PIN_CNF_DRIVE_Msk);
NRF_P0_S->PIN_CNF[TAD_PSEL_TRACECLK_PIN_Traceclk]
    |= (GPIO_PIN_CNF_MCUSEL_TND << GPIO_PIN_CNF_MCUSEL_Pos)
    | (GPIO_PIN_CNF_DRIVE_H0H1 << GPIO_PIN_CNF_DRIVE_Pos);
```

5. Set trace port speed to 64 MHz.

```
NRF_TAD_S->TRACEPORTSPEED = TAD_TRACEPORTSPEED_TRACEPORTSPEED_64MHz;
```

**Note:** Although possible, it is not recommended to run the trace port at less than half the CPU frequency, as it risks dropping some trace packets.

6. Configure ARM CoreSight components (see ARM CoreSight documents for more information).

## 8.1.10 Registers

| Register | Offset | Security | Description                                                                                                                                                                                                                                          |

Table 196: Register overview

### 8.1.10.1 TARGETID

Address offset: 0x042

The TARGETID register provides information about the target when the host is connected to a single device.

The TARGETID register is accessed by a read of DP register 0x4 when the DPBANKSEL bit in the SELECT register is set to 0x2.

### 8.1.10.2 DLPIDR

Address offset: 0x043

The DLPIDR register provides information about the serial wire debug protocol version.

Accessed by a read of DP register 0x4 when the DPBANKSEL bit in the SELECT register is set to 0x3.

|                  |            |           |          |    |    |    |       |    |                        |    |                                                   |                   |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

## 8.2 CTRL-AP - Control access port

The control access port (CTRL-AP) is a custom access port that enables control of the device when other debug access ports (DAP) have been disabled by the access port protection.

For an overview of the other debug access ports, see [DAP - Debug access port](#) on page 731.

Figure 242: Control access port details

Access port protection (APPROTECT) blocks the debugger access to the AHB-AP, and prevents read and write access to all CPU registers and memory-mapped addresses. It is possible to enable access port protection for both secure and non-secure mode, using registers UICR.SECUREAPPROTECT and UICR.APPROTECT respectively. The debugger can use register [APPROTECT.STATUS](#) on page 743 to read the status of secure and non-secure access port protection.

CTRL-AP has the following features:

- Soft reset
- Erase all

- Mailbox interface
- Debug of protected devices

### 8.2.1 Reset request

The debugger can request the device to perform a soft reset.

Register [RESET](#) on page 742 is used to request the soft reset. Once the soft reset is performed, the reset reason is accessible to on-chip firmware through register [RESETREAS](#). For more information about the soft reset, see [RESET - Reset control](#) on page 55.

### 8.2.2 Erase all

Erase all function gives debugger the possibility of triggering an erase of flash, user information configuration registers (UICR), RAM, including all peripheral settings, as well as removing the access port protection.

To trigger an erase all function, the debugger can write to register [ERASEALL](#) on page 743. Register [ERASEALLSTATUS](#) on page 743 will read as busy for the duration of the operation. After the next reset, the access port protection is removed.

If the debugger performs an erase all function on a slave MCU, the erase sequence will always erase the application MCU first, independently of how the application is protected, before erasing the slave MCU.

#### Erase all protection

It is possible to prevent debugger from performing an erase all operation by writing to the [UICR.ERASEPROTECT](#) register. Once the register is configured and the device reset, the CTRL-AP [ERASEALL](#) operation is disabled, and all flash write and erase operations are restricted to firmware. In addition, it is still possible to write/erase from debugger as long as [UICR.APPROTECT](#) is not set.

**Note:** Setting [UICR.ERASEPROTECT](#) has no effect on debugger access, only on erase all operation.

Register [ERASEPROTECT.STATUS](#) on page 744 holds the status for erase protection.

### 8.2.3 Mailbox interface

CTRL-AP implements a mailbox interface which enables the CPU to communicate with a debugger over the SWD interface.

The mailbox interface consists of a transmit register [MAILBOX.TXDATA](#) on page 745 with its corresponding status register [MAILBOX.TXSTATUS](#) on page 745, and a receive register [MAILBOX.RXDATA](#) on page 746 with its corresponding status register [MAILBOX.RXSTATUS](#) on page 746. Status bits in registers [TXSTATUS](#)/[RXSTATUS](#) will be set and cleared automatically when registers [TXDATA](#)/[RXDATA](#) are written to and read from, independently of the direction.

Figure 243: Mailbox register interface

### Mailbox transfer sequence

1. Sender writes TXDATA
2. Hardware sets sender's TXSTATUS to DataPending
3. Hardware sets receiver's RXSTATUS to DataPending
4. Receiver reads RXDATA
5. Hardware sets receiver's RXSTATUS to NoDataPending
6. Hardware sets sender's TXSTATUS to NoDataPending

### 8.2.4 Disabling erase protection

The erase protection mechanism can be disabled in order to return a device to factory default settings upon next reset.

The debugger can read the erase protection status in register [ERASEPROTECT.STATUS](#) on page 744.

If ERASEPROTECT has been enabled, both the debugger and on-chip firmware must write the same non-zero 32-bit KEY value into their respective ERASEPROTECT.DISABLE registers in order to disable the erase protection. As soon as both registers have been written with the same non-zero 32-bit KEY value, the device is automatically erased as described in [Erase all](#) on page 740. The access ports will be re-enabled on next reset once the secure erase sequence has completed.

Write-once register [ERASEPROTECT.LOCK](#) on page 748 should be set to 'Locked' as early as possible in the start-up sequence, preferably as soon as on-chip firmware has determined it does not need to communicate with a debugger over the CTRL-AP mailbox interface. Once written, it will not be possible to remove the erase protection until next reset.

### 8.2.5 Disabling access port protection

The access port protection mechanisms can be temporarily disabled to erase or debug the device.

The debugger can read the access port protection status in register [APPROTECT.STATUS](#) on page 743.

### Disabling non-secure access port protection

If APPROTECT has been enabled from UICR, both the debugger and on-chip firmware must write the same 32-bit KEY value into their respective APPROTECT.DISABLE registers in order to disable the access port protection to non-secure mode. The access port protection remain disabled until a non-equal KEY value is written or until a pin reset is performed, allowing non-secure mode to be debugged through a reset.

Write-once register [APPROTECT.LOCK](#) on page 748 should be set to 'Locked' as early as possible in the start-up sequence, preferably as soon as on-chip firmware has determined it does not need to

communicate with a debugger over the CTRL-AP mailbox interface. Once written, it will not be possible to remove the non-secure mode access port protection until next reset.

## Disabling secure access port protection

If SECUREAPPROTECT has been enabled from UICR, both the debugger and on-chip firmware must write the same 32-bit KEY value into their respective SECUREAPPROTECT.DISABLE registers in order to disable the access port protection to secure mode. The access port protection remain disabled until a non-equal KEY value is written or until a pin reset is performed, allowing secure mode to be debugged through a reset.

Write-once register [SECUREAPPROTECT.LOCK](#) on page 749 should be set to 'Locked' as early as possible in the start-up sequence, preferably as soon as on-chip firmware has determined it does not need to communicate with a debugger over the CTRL-AP mailbox interface. Once written, it will not be possible to remove the secure mode access port protection until next reset.

**Note:** If secure mode debug is enabled, an ERASEALL sequence can also be initiated by writing the same 32-bit KEY value into the respective ERASEPROTECT.DISABLE registers

## 8.2.6 Debugger registers

The CTRL-AP has a set of registers that can only be accessed from the debugger over the SWD interface. These are not accessible from the CPU.

### 8.2.6.1 Registers

| Register                | Offset | Security | Description                                                                                                                                                           |
|-------------------------|--------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RESET                   | 0x000  |          | System reset request.                                                                                                                                                 |
| ERASEALL                | 0x004  |          | Perform a secure erase of the device, where flash, SRAM and UICR will be erased in sequence. The device will be returned to factory default settings upon next reset. |
| ERASEALLSTATUS          | 0x008  |          | Status register for the ERASEALL operation                                                                                                                            |
| APPROTECT.STATUS        | 0x00C  |          | Status register for UICR APPROTECT and SECUREAPPROTECT configuration                                                                                                  |
| APPROTECT.DISABLE       | 0x010  |          | Disable APPROTECT and enable debug access to non-secure mode                                                                                                          |
| SECUREAPPROTECT.DISABLE | 0x014  |          | Disable SECUREAPPROTECT and enable debug access to secure mode                                                                                                        |
| ERASEPROTECT.STATUS     | 0x018  |          | Status register for UICR ERASEPROTECT configuration                                                                                                                   |
| ERASEPROTECT.DISABLE    | 0x01C  |          | Disable ERASEPROTECT and perform ERASEALL                                                                                                                             |
| MAILBOX.TXDATA          | 0x020  |          | Data sent from the debugger to the CPU                                                                                                                                |
| MAILBOX.TXSTATUS        | 0x024  |          | Status to indicate if data sent from the debugger to the CPU has been read                                                                                            |
| MAILBOX.RXDATA          | 0x028  |          | Data sent from the CPU to the debugger                                                                                                                                |
| MAILBOX.RXSTATUS        | 0x02C  |          | Status to indicate if data sent from the CPU to the debugger has been read                                                                                            |
| IDR                     | 0x0FC  |          | CTRL-AP Identification Register, IDR                                                                                                                                  |

Table 197: Register overview

#### 8.2.6.1.1 RESET

Address offset: 0x000

System reset request.

This register is automatically deactivated during ERASEALL operation.

Table 201: Register overview

### 8.3.1.1 CTICONTROL

Address offset: 0x000

CTI Control register

The CTICONTROL register enables the CTI.

### 8.3.1.2 CTIINTACK

Address offset: 0x010

CTI Interrupt Acknowledge register

The CTIINTACK register is a software acknowledge for a trigger output. This register is used when **ctitrigout** is used as a sticky output. That is, no hardware acknowledge is available and software acknowledge is required.

### 8.3.1.5 CTIAPPPULSE

Address offset: 0x01C

CTI Application Pulse register

A write to this register causes a channel event pulse, one ctick period, to be generated, corresponding to the bit written to. The pulse external to the CTI can be extended to multi-cycle by the handshaking interface circuits. This register clears itself immediately, so it can be repeatedly written to without software having to clear it.

### 8.3.1.6 CTIINEN[n] (n=0..7)

Address offset: 0x020 + (n × 0x4)

CTI Trigger to Channel Enable register

The CTIINENn register enables the signaling of an event on CTM channels when a trigger event is received by the CTI. There is a bit for each of the four channels implemented. This register does not affect the application trigger operations.

### 8.3.1.7 CTIOUTEN[n] (n=0..7)

Address offset: 0x0A0 + (n × 0x4)

CTI Channel to Trigger Enable register

The CTIOUTENn register defines which channels can generate a ctitrigin[n] output. There is a bit for each of the four channels implemented. This register affects the mapping from application trigger to trigger outputs.

|                  |            |                       |       |                                                                                          |                                                                                 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

  ### 8.3.1.11 CTIGATE

Address offset: 0x140

Enable CTI Channel Gate register

The CTIGATE register prevents the channels from propagating through the CTM to other CTIs. This enables local cross-triggering, for example for causing an interrupt when the ETM trigger occurs. It can be used effectively with CTIAPPSET, CTIAPPCLEAR, and CTIAPPULSE for asserting trigger outputs by asserting channels, without affecting the rest of the system. On reset, this register is 0xF, and channel propagation is enabled.

### 8.3.1.14 DEVTYPE

Address offset: 0xFCC

Device Type Identifier register

The DEVTYPE register provides a debugger with information about the component when the Part Number field is not recognized. The debugger can then report this information.

### 8.3.1.15 PIDR4

Address offset: 0xFD0

Peripheral ID4 Register

The PIDR4 register is part of the set of peripheral identification registers. Contains part of the designer identity and the memory size.

### 8.3.1.19 PIDR0

Address offset: 0xFE0

Peripheral ID0 Register

The PIDR0 register is part of the set of peripheral identification registers. Contains part of the designer-specific part number.

### 8.3.1.24 CIDR1

Address offset: 0xFF4

Component ID1 Register

The CIDR1 register is a component identification register that indicates the presence of identification registers. This register also indicates the component class.

### 8.3.1.25 CIDR2

Address offset: 0xFF8

Component ID2 Register

The CIDR2 register is a component identification register that indicates the presence of identification registers.

## 8.4 TAD - Trace and debug control

Configuration interface for trace and debug

Please refer to the [Trace](#) section for more information about how to configure the trace and debug interface.

**Note:** Although there are [PSEL](#) registers for the trace port, each function can only be mapped to a single pin due to pin speed requirements. Setting the PIN field to anything else will not have any effect. See [Pin assignment chapter](#) for more information

### 8.4.1 Registers

| Base address | Domain      | Peripheral | Instance | Secure mapping | DMA security | Description             | Configuration |
|--------------|-------------|------------|----------|----------------|--------------|-------------------------|---------------|
| 0xE0080000   | APPLICATION | TAD        | TAD      | S              | NA           | Trace and debug control |               |

Table 202: Instances

| Register        | Offset | Security | Description                                          |
|-----------------|--------|----------|------------------------------------------------------|
| CLOCKSTART      | 0x004  |          | Start all trace and debug clocks.                    |
| CLOCKSTOP       | 0x008  |          | Stop all trace and debug clocks.                     |
| ENABLE          | 0x500  |          | Enable debug domain and aquire selected GPIOs        |
| PSEL.TRACECLK   | 0x504  |          | Pin configuration for TRACECLK                       |
| PSEL.TRACEDATA0 | 0x508  |          | Pin configuration for TRACEDATA[0] and SWO           |
| PSEL.TRACEDATA1 | 0x50C  |          | Pin configuration for TRACEDATA[1]                   |
| PSEL.TRACEDATA2 | 0x510  |          | Pin configuration for TRACEDATA[2]                   |
| PSEL.TRACEDATA3 | 0x514  |          | Pin configuration for TRACEDATA[3]                   |
| TRACEPORTSPEED  | 0x518  |          | Clocking options for the Trace Port debug interface. |

Table 203: Register overview

#### 8.4.1.1 CLOCKSTART

Address offset: 0x004

Start all trace and debug clocks.

# 9 Hardware and layout

## 9.1 Pin assignments

This section describes the pin assignment and the pin functions.

This device provides flexibility when it comes to routing and configuration of the GPIO pins. However, some pins have recommendations for how the pin should be configured or what it should be used for.

In addition to the information in the pin-out tables for the respective packages, the following peripherals have dedicated pins that should be used for proper operation:

- TWI - In 1 Mbps mode, the two high-speed TWI pins must be configured in the TWI peripheral's PSEL registers
- QSPI - For the fastest QSPI mode, the special purpose GPIO pins are enabled using the PIN\_CNF[p].MCUSEL register
- SPIM2 - For the fastest SPI mode, the special purpose GPIO pins are enabled using the PIN\_CNF[p].MCUSEL register

For all high-speed signals, printed circuit board (PCB) layout must ensure that connections are made using short PCB traces. Refer to the manufacturer's PCB design recommendations for additional information.

### 9.1.1 aQFN94 pin assignments

Figure 244: aQFN94 pin assignments, top view

| Pin  | Name   | Function     | Description                                             |
|------|--------|--------------|---------------------------------------------------------|
| A5   | VBUS   | Power        | 5 V input for USB 3.3 V regulator                       |
| A13  | DECA   | Power        | Analog regulator supply decoupling                      |
| A15  | DECD   | Power        | Digital regulator supply decoupling                     |
| A17  | P1.13  | Digital I/O  | General purpose I/O                                     |
| A19  | VDD    | Power        | Power supply                                            |
| A21  | DCCR   | Power        | DC/DC converter output                                  |
| A23  | DECN   | Power        | Regulator supply decoupling                             |
| A27  | DECR   | Power        | Regulator supply decoupling                             |
| B2   | D+     | Digital I/O  | USB D+                                                  |
| B4   | D-     | Digital I/O  | USB D-                                                  |
| B6   | DECUSB | Power        | USB 3.3 V regulator supply decoupling                   |
| B8   | VDD    | Power        | Power supply                                            |
| B10  | DCCD   | Power        | DC/DC converter output                                  |
| B14  | P1.15  | Digital I/O  | General purpose I/O                                     |
| B16  | P1.14  | Digital I/O  | General purpose I/O                                     |
| B18  | P1.12  | Digital I/O  | General purpose I/O                                     |
| B20  | P1.11  | Digital I/O  | General purpose I/O                                     |
| B22  | P0.31  | Digital I/O  | General purpose I/O                                     |
| B24  | P0.30  | Digital I/O  | General purpose I/O                                     |
| B28  | VDD    | Power        | Power supply                                            |
| B30  | XC2    | Analog input | Connection for 32 MHz crystal                           |
| C1   | VDD    | Power        | Power supply                                            |
| C31  | XC1    | Analog input | Connection for 32 MHz crystal                           |
| E1   | VDDH   | Power        | Power supply                                            |
| E31  | VDD    | Power        | Power supply                                            |
| G31  | DECRF  | Power        | RADIO power supply decoupling                           |
| J1   | DCCH   | Power        | DC/DC converter output                                  |
| L1   | VDD    | Power        | Power supply                                            |
| L31  | ANT    | RF           | Single-ended antenna connection                         |
| M2   | P1.00  | Digital I/O  | General purpose I/O                                     |
| N1   | P0.00  | Digital I/O  | General purpose I/O                                     |
|      | XL1    | Analog input | Connection for 32 kHz crystal                           |
| N31  | VDD    | Power        | Power supply                                            |
| P2   | P1.01  | Digital I/O  | General purpose I/O                                     |
| R1   | P0.01  | Digital I/O  | General purpose I/O                                     |
|      | XL2    | Analog input | Connection for 32 kHz crystal                           |
| R31  | P1.10  | Digital I/O  | General purpose I/O                                     |
| U1   | VDD    | Power        | Power supply                                            |
| U31  | P0.29  | Digital I/O  | General purpose I/O                                     |
| V2   | P0.04  | Digital I/O  | General purpose I/O                                     |
|      | AIN0   | Analog input | Analog input                                            |
| W1   | P0.02  | Digital I/O  | General purpose I/O                                     |
|      | NFC1   | NFC input    | NFC antenna connection                                  |
| W31  | SWDCLK | Debug        | Serial wire debug clock input for debug and programming |
| Y2   | P0.05  | Digital I/O  | General purpose I/O                                     |
|      | AIN1   | Analog input | Analog input                                            |
| AA1  | P0.03  | Digital I/O  | General purpose I/O                                     |
|      | NFC2   | NFC input    | NFC antenna connection                                  |
| AA31 | SWDIO  | Debug        | Serial wire debug I/O for debug and programming         |
| AB2  | P0.06  | Digital I/O  | General purpose I/O                                     |
|      | AIN2   | Analog input | Analog input                                            |
| AC1  | VDD    | Power        | Power supply                                            |
| AC31 | nRESET | Reset        | Pin RESET with internal pull-up resistor                |

| Pin  | Name       | Function       | Description                      |
|------|------------|----------------|----------------------------------|
| AD2  | P0.07      | Digital I/O    | General purpose I/O              |
|      | AIN3       | Analog input   | Analog input                     |
| AE1  | P1.02      | Digital I/O    | General purpose I/O              |
|      | TWI        | TWI 1 Mbps     | High-speed pin for 1 Mbps TWI    |
| AE31 | P0.28      | Digital I/O    | General purpose I/O              |
|      | AIN7       | Analog input   | Analog input                     |
| AF2  | P1.03      | Digital I/O    | General purpose I/O              |
|      | TWI        | TWI 1 Mbps     | High-speed pin for 1 Mbps TWI    |
| AG1  | VDD        | Power          | Power supply                     |
| AG31 | DECF       | Power          | Regulator supply decoupling      |
| AH2  | P0.08      | Digital I/O    | General purpose I/O              |

## 9.3 Reference circuitry

To ensure good RF performance when designing PCBs, it is highly recommended to use the PCB layouts and component values provided by Nordic Semiconductor.

Documentation for the different package reference circuits, including Altium Designer files, PCB layout files, and PCB production files can be downloaded from [www.nordicsemi.com](http://www.nordicsemi.com).

In this section, there is a reference circuit for QKAA aQFN94, showing the components and component values to support on-chip features in a design.

Some general guidance is summarized here:

- When supplying power from a USB source only, VBUS must be connected to VDDH if USB is to be used.
- Components required for DC/DC function are only needed if DC/DC mode is enabled for that regulator.
- NFC can be used in any configuration.
- USB can be used in any configuration as long as VBUS is supplied by the USB host.
- The schematics include an optional, but recommended, series resistor on the USB supply for improved immunity to transient over-voltage during VBUS connection.

### 9.3.1 Circuit configuration no. 1

Circuit configuration number 1 for QKAA aQFN94, showing the schematic and the bill of materials table.

| Config no. | Supply configuration |     | Enabled features |     |
|------------|----------------------|-----|------------------|-----|
|            | VDDH                 | VDD | USB              | NFC |
| Config. 1  | USB                  | N/A | Yes              | No  |

Table 206: Configuration summary for circuit configuration no. 1

Figure 246: Circuit configuration no. 1 schematic

**Note:** For PCB reference layouts, see the product page for the nRF5340 on [www.nordicsemi.com](http://www.nordicsemi.com).

| L2, L4                                     | 15 nH        | Inductor, 250 mA, $\pm 5\%$                                                                   | 0201      |
| L6                                         | 2.2 nH       | High frequency chip inductor, $\pm 5\%$                                                       | 0201      |
| R1                                         | 4.7 $\Omega$ | Resistor, $\pm 1\%$ , 0.05 W                                                                  | 0201      |
| U1                                         | nRF5340-QKAA | Multi-protocol Bluetooth Low Energy, IEEE 802.15.4, ANT and 2.4GHz proprietary system-on-chip | AQFN-94   |
| X1                                         | 32 MHz       | XTAL SMD 2016, 32 MHz, CI=8 pF, $\pm 40$ ppm                                                  | XTAL_2016 |
| X2                                         | 32.768 kHz   | XTAL SMD 2012, 32.768 kHz, CI=9 pF, Total Tol: $\pm 50$ ppm                                   | XTAL_2012 |

Table 207: Bill of material for circuit configuration no. 1

### 9.3.2 PCB layout example

The PCB layout shown below is a reference layout for the aQFN package with internal LDO setup and VBUS supply.

**Note:** Pay attention to how the capacitor C12 is grounded. It is not directly connected to the ground plane, but grounded via pin J31 and to the VSS die pad. This is done to create additional filtering of harmonic components.

For all available reference layouts, see the product page for the nRF5340 on [www.nordicsemi.com](http://www.nordicsemi.com).

# 10 Recommended operating conditions

The operating conditions are the physical parameters that the chip can operate within.

| Symbol              | Parameter                                       | Notes | Min. | Nom. | Max. | Units |
|---------------------|-------------------------------------------------|-------|------|------|------|-------|
| VDD                 | VDD supply voltage, independent of DCDC enable  |       | 1.7  | 3.0  | 3.6  | V     |
| VDDH                | VDDH supply voltage, independent of DCDC enable |       | 2.5  | 3.7  | 5.5  | V     |
| t <sub>R_VDD</sub>  | Supply rise time (0 V to 1.7 V)                 |       |      |      | tbd  | ms    |
| t <sub>R_VDDH</sub> | Supply rise time (0 V to 3.7 V)                 |       |      |      | tbd  | ms    |
| TA                  | Operating temperature                           |       | -40  | 25   | 105  | °C    |

Table 208: Recommended operating conditions

**Important:** The on-chip power-on reset circuitry may not function properly for rise times longer than the specified maximum.

# 11 Absolute maximum ratings

Maximum ratings are the extreme limits to which the chip can be exposed for a limited amount of time without permanently damaging it. Exposure to absolute maximum ratings for prolonged periods of time may affect the reliability of the device.

|                                   | Note                       | Min.             | Max.        | Unit               |
|-----------------------------------|----------------------------|------------------|-------------|--------------------|

| Retention                         |                            | 10 years at 40°C |             |                    |

Table 209: Absolute maximum ratings

# 12 Ordering information

This chapter contains information on IC marking, ordering codes, and container sizes.

## 12.1 IC marking

The nRF5340 SoC package is marked as shown in the following figure.

|     |    |    |    |     |     |
|-----|----|----|----|-----|-----|
| N   | 5  | 3  | 4  | 0   |     |
| <P> | P> | <V | V> | <H> | <P> |
| <Y  | Y> | <W | W> | <L  | L>  |

Figure 252: IC marking

## 12.2 Box labels

Table 210: Abbreviations

## 12.4 Code ranges and values

The following tables define the nRF5340 code ranges and values.

| <PP> | Package | Size (mm) | Pin/Ball count | Pitch (mm) |
|------|---------|-----------|----------------|------------|
| QK   | AQFN    | 7 x 7     | 94             | 0.4        |

Table 211: Package variant codes

| <VV> | Flash (kB) | RAM (kB) |
|------|------------|----------|
| AA   | 1024       | 512      |

Table 212: Function variant codes

| <H>       | Description                                        |
|-----------|----------------------------------------------------|
| [A . . Z] | Hardware version/revision identifier (incremental) |

Table 213: Hardware version codes

| <P>       | Description                                 |
|-----------|---------------------------------------------|
| [0 . . 9] | Production device identifier (incremental)  |
| [A . . Z] | Engineering device identifier (incremental) |

Table 214: Production configuration codes

| <F>                | Description                              |
|--------------------|------------------------------------------|
| [A . . N, P . . Z] | Version of preprogrammed firmware        |
| [0]                | Delivered without preprogrammed firmware |

Table 215: Production version codes

| <YY>        | Description                   |
|-------------|-------------------------------|
| [16 . . 99] | Production year: 2016 to 2099 |

Table 216: Year codes

| <WW>       | Description        |
|------------|--------------------|
| [1 . . 52] | Week of production |

Table 217: Week codes

| <LL>        | Description                     |
|-------------|---------------------------------|
| [AA . . ZZ] | Wafer production lot identifier |

Table 218: Lot codes

| <CC> | Description |
|------|-------------|
| R7   | 7" Reel     |
| R    | 13" Reel    |
| T    | Tray        |

Table 219: Container codes

## 12.5 Product options

The following tables define the nRF5340 product options.

| Order code      | MOQ <sup>29</sup> | Comment                       |
|-----------------|-------------------|-------------------------------|
| nRF5340-QKAA-R7 | 800               | Availability to be announced. |
| nRF5340-QKAA-R  | 3000              |                               |
| nRF5340-QKAA-T  | 260               |                               |

*Table 220: nRF5340 order codes*

| Order code         | Description                     |
|--------------------|---------------------------------|
| nRF5340-PREVIEW-DK | nRF5340 Preview Development Kit |

# 13 Legal notices

By using this documentation you agree to our terms and conditions of use. Nordic Semiconductor may change these terms and conditions at any time without notice.

## Liability disclaimer

Nordic Semiconductor ASA reserves the right to make changes without further notice to the product to improve reliability, function, or design. Nordic Semiconductor ASA does not assume any liability arising out of the application or use of any product or circuits described herein.

Nordic Semiconductor ASA does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. If there are any discrepancies, ambiguities or conflicts in Nordic Semiconductor's documentation, the Product Specification prevails.

Nordic Semiconductor ASA reserves the right to make corrections, enhancements, and other changes to this document without notice.

## Life support applications

Nordic Semiconductor products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury.

Nordic Semiconductor ASA customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Nordic Semiconductor ASA for any damages resulting from such improper use or sale.

## RoHS and REACH statement

Refer to [www.nordicsemi.com](http://www.nordicsemi.com) for complete hazardous substance reports, material composition reports, and latest version of Nordic's RoHS and REACH statements.

## Trademarks
