  ### 7.1.21.13.68 AUTOCOLRESCONFIG

Address offset: 0x59C

Controls the auto collision resolution function. This setting must be done before the NFCT peripheral is activated.

When modifying this register bit 1 must be written to '1'.

## 7.1.21.14 Electrical specification

### 7.1.21.14.1 NFCT Electrical Specification

| Symbol      | Description                                                               | Min. | Typ. | Max. | Units |
|-------------|---------------------------------------------------------------------------|------|------|------|-------|
| $f_c$       | Frequency of operation                                                    | ..   | ..   | ..   | MHz   |
| $C_{MI}$    | Carrier modulation index                                                  | ..   | ..   | ..   | %     |
| DR          | Data Rate                                                                 | ..   | ..   | ..   | kbps  |
| $V_{sense}$ | Peak differential Field detect threshold level on NFC1-NFC2 <sup>12</sup> | ..   | ..   | ..   | Vp    |
| $I_{max}$   | Maximum input current on NFCT pins                                        | ..   | ..   | ..   | mA    |

### 7.1.21.14.2 NFCT Timing Parameters

| Symbol         | Description                                                                                 | Min. | Typ. | Max. | Units |
|----------------|---------------------------------------------------------------------------------------------|------|------|------|-------|
| $t_{activate}$ | Time from task_ACTIVATE in SENSE or DISABLE state to ACTIVATE_A or IDLE state <sup>13</sup> | ..   | ..   | ..   | μs    |
| $t_{sense}$    | Time from remote field is present in SENSE mode to FIELDDETECTED event is asserted          | ..   | ..   | ..   | μs    |

<sup>12</sup> Input is high impedance in sense mode

<sup>13</sup> Does not account for voltage supply and oscillator startup times

Figure 94: NFCT timing parameters (Shortcuts for FIELDDETECTED and FIELDLOST are disabled)

## 7.1.22 NVMC — Non-volatile memory controller

The non-volatile memory controller (NVMC) is used for writing and erasing of the internal flash memory and the user information configuration register (UICR).

The NVMC is a split security peripheral. This means that when the NVMC is configured as non-secure, only a subset of the registers is available from the non-secure code. See [SPU — System protection unit](#) on page 568 and [Registers](#) on page 321 for more details.

When the NVMC is configured to be a secure peripheral, only secure code has access.

Before a write can be performed, the NVMC must be enabled for writing in CONFIG.WEN. Similarly, before an erase can be performed, the NVMC must be enabled for erasing in CONFIG.EEN, see [CONFIG](#) on page 322. The user must make sure that writing and erasing are not enabled at the same time. Failing to do so may result in unpredictable behavior.

### 7.1.22.1 Writing to flash

When writing is enabled, in CONFIG register for secure region, or in CONFIGNS register for non-secure region, flash is written by writing a full 32-bit word to a word-aligned address in flash.

Secure code has access to both secure and non-secure regions, by using the appropriate configuration of CONFIG and CONFIGNS registers. Non-secure code, in contrast, has access to non-secure regions only. Thus, non-secure code only needs CONFIGNS.

The NVMC is only able to write '0' to erased bits in flash, that is bits set to '1'. It cannot write a bit back to '1'.

As illustrated in [Memory](#) on page 18, flash is divided into multiple pages. The same address in flash can only be written  $n_{\text{WRITE}}$  number of times before a page erase must be performed.

Only full 32-bit words can be written to flash using the NVMC interface. To write less than 32 bits to flash, write the data as a word, and set all the bits that should remain unchanged in the word to '1'. Note that the restriction about the number of writes (see above) still applies in this case.

The time it takes to write a word to flash is specified by  $t_{\text{WRITE}}$ . If CPU executes code from flash while the NVMC is writing to flash, the CPU will be stalled.

Only word-aligned writes are allowed. Byte or half-word-aligned writes will result in a bus fault.

### 7.1.22.2 Erasing a secure page in flash

When secure region erase is enabled (in CONFIG register), a flash page can be erased by writing 0xFFFFFFFF into the first 32-bit word in a flash page.

Page erase is only applicable to the code area in the flash and does not work with UICR.

After erasing a flash page, all bits in the page are set to '1'. The time it takes to erase a page is specified by  $t_{\text{ERASEPAGE}}$ . The CPU is stalled if the CPU executes code from the flash while the NVMC performs the erase operation.

See [Partial erase of a page in flash](#) for information on splitting the erase time in smaller chunks.

### 7.1.22.3 Erasing a non-secure page in flash

When non-secure region erase is enabled, a non-secure flash page can be erased by writing 0xFFFFFFFF into the first 32-bit word of the flash page.

Page erase is only applicable to the code area in the flash and does not work with UICR.

After erasing a flash page, all bits in the page are set to '1'. The time it takes to erase a page is specified by  $t_{\text{ERASEPAGE}}$ . The CPU is stalled if the CPU executes code from the flash while the NVMC performs the erase operation.

### 7.1.22.4 Writing to user information configuration registers (UICR)

User information configuration registers (UICR) are written in the same way as flash. After UICR has been written, the new UICR configuration will only take effect after a reset.

UICR is only accessible by secure code. Any write from non-secure code will be faulted. In order to lock the chip after uploading non-secure code, non-secure debugger needs to use the WRITEUICRNS register inside the NVMC in order to set APPROTECT (APPROTECT will be written to 0x00000000).

UICR can only be written  $n_{\text{WRITE}}$  number of times before an erase must be performed using [ERASEALL](#).

The time it takes to write a word to the UICR is specified by  $t_{\text{WRITE}}$ . The CPU is stalled if the CPU executes code from the flash while the NVMC is writing to the UICR.

### 7.1.22.5 Erase all

When erase is enabled, the whole flash and UICR can be erased in one operation by using the [ERASEALL](#) register. [ERASEALL](#) will not erase the factory information configuration registers (FICR).

This functionality can be blocked by some configuration of the UICR protection bits, see the table [Table 102: NVMC protection \(1 - Enabled, 0 - Disabled, X - Don't care\)](#) on page 320.

The time it takes to perform an [ERASEALL](#) on page 322 command is specified by  $t_{\text{ERASEALL}}$ . The CPU is stalled if the CPU executes code from the flash while the NVMC performs the erase operation.

### 7.1.22.6 NVMC protection mechanisms

This chapter describes the different protection mechanisms for the non-volatile memory.

#### 7.1.22.6.1 NVMC blocking

UICR integrity is assured through use of multiple levels of protection. UICR protection bits can be configured to allow or block certain operations.

The table below shows the different status of UICR protection bits, and which operations are allowed or blocked.

| UICR protection bit status |           |              | NVMC protection     |                  |
|----------------------------|-----------|--------------|---------------------|------------------|
| SECUREAPPROTECT            | APPROTECT | ERASEPROTECT | CTRL-AP<br>ERASEALL | NVMC<br>ERASEALL |
| 0                          | 0         | 0            | Available           | Available        |
| 1                          | X         | 0            | Available           | Blocked          |
| X                          | 1         | 0            | Available           | Blocked          |
| X                          | X         | 1            | Blocked             | Blocked          |

Table 102: NVMC protection (1 - Enabled, 0 - Disabled, X - Don't care)

**Note:** Erase can still be performed through CTRL-AP, regardless of the above settings. See [CTRL-AP - Control access port](#) on page 739 for more information.

## Uploading code with secure debugging blocked

Non-secure code can program non-secure flash regions. In order to perform these operations, the NVMC has the following non-secure registers: CONFIGS, READY and READYNEXT.

Register [CONFIGS](#) on page 323 works as the CONFIG register but it is used only for non-secure transactions. Both page erase and writing inside the flash require a write transaction (see [Erasing a secure page in flash](#) on page 318 or [Erasing a non-secure page in flash](#) on page 319). Because of this, the [SPU — System protection unit](#) on page 568 will guarantee that the non-secure code cannot write inside a secure page, since the transaction will never reach the NVMC controller.

### 7.1.22.6.2 NVMC power failure protection

NVMC power failure protection is possible through use of power-fail comparator that is monitoring power supply.

If the power-fail comparator is enabled, and the power supply voltage is below  $V_{POF}$  threshold, the power-fail comparator will prevent the NVMC from performing erase or write operations in non-volatile memory (NVM).

If a power failure warning is present at the start of an NVM write or erase operation, the NVMC will block the operation and a bus error will be signalled. If a power failure warning occurs during an ongoing NVM write operation, the NVMC will try to finish the operation. And if the power failure warning persists, consecutive NVM write operations will be blocked by the NVMC, and a bus error will be signalled.

### 7.1.22.7 Cache

An instruction cache (I-Cache) can be enabled for the ICODE bus in the NVMC.

See [Memory](#) on page 18 for the location of flash.

A cache hit is an instruction fetch from the cache, and it has a 0 wait-state delay. The number of wait-states for a cache miss, where the instruction is not available in the cache and needs to be fetched from flash, depends on the processor frequency, see CPU parameter `W_FLASHCACHE`.

Enabling the cache can increase the CPU performance, and reduce power consumption by reducing the number of wait cycles and the number of flash accesses. This will depend on the cache hit rate. Cache draws current when enabled. If the reduction in average current due to reduced flash accesses is larger than the cache power requirement, the average current to execute the program code will be reduced.

When disabled, the cache does not draw current and its content is not retained.

It is possible to enable cache profiling to analyze the performance of the cache for your program using the register `ICACHECNF`. When profiling is enabled, registers `IHIT` and `IMISS` are incremented for every instruction cache hit or miss respectively.

## 7.1.22.8 Registers

## 7.1.23 PDM — Pulse density modulation interface

The pulse density modulation (PDM) module enables input of pulse density modulated signals from external audio frontends, for example, digital microphones. The PDM module generates the PDM clock and supports single-channel or dual-channel (left and right) data input. Data is transferred directly to RAM buffers using EasyDMA.

Listed here are the main features for PDM:

- Up to two PDM microphones configured as a left/right pair using the same data input
- 16 kHz output sample rate, 16-bit samples
- EasyDMA support for sample buffering
- HW decimation filters
- Selectable ratio of 64 or 80 between PDM\_CLK and output sample rate

The PDM module illustrated below is interfacing up to two digital microphones with the PDM interface. EasyDMA is implemented to relieve the real-time requirements associated with controlling of the PDM slave from a low priority CPU execution context. It also includes all the necessary digital filter elements to produce pulse code modulation (PCM) samples. The PDM module allows continuous audio streaming.

Figure 95: PDM module

### 7.1.23.1 Master clock source selection

The master clock source can be configured in register [MCLKCONFIG](#) on page 337. Choose one of the following as the master clock source:

- 32 MHz peripheral clock (PCLK32M), synchronous to HFCLK.
- Audio PLL clock (ACLK) with configurable frequency.

The peripheral must be stopped before selecting the master clock source. The use of the STOP task and the STOPPED event is described in [Module operation](#) on page 326.

To improve the master clock accuracy and jitter performance, it is recommended (but not mandatory) that the source is running off the HFXO instead of the HFINT oscillator. See [CLOCK — Clock control](#) on page 61 for more information about starting HFXO for the relevant clock source.

### 7.1.23.2 Master clock generator

The master clock generator's PDMCLKCTRL register allows adjusting the PDM clock's frequency.

The master clock generator does not add any jitter to the HFCLK source chosen. It is recommended (but not mandatory) to use the Xtal as HFCLK source.

The following equation can be used to calculate the value of the PDMCLKCTRL register for a given PDM clock- and master clock source frequency:

$$PDMCLKCTRL = 4096 \cdot \left\lfloor \frac{f_{pdm} \cdot 1048576}{f_{source} + \frac{f_{pdm}}{2}} \right\rfloor$$

Figure 96: PDM clock frequency equation

Where  $f_{\text{pdm}}$  is the requested PDM clock frequency in Hz, and  $f_{\text{source}}$  is the master clock generator source in Hz. Because of rounding errors, an accurate PDM clock may not be achievable. The actual PDM frequency can be calculated using the equation below.

$$f_{\text{actual}} = \frac{f_{\text{source}}}{\left\lfloor \frac{1048576 \cdot 4096}{\text{PDMCLKCTRL}} \right\rfloor}$$

Figure 97: Actual PDM frequency

The clock error can be calculated using the equation below. The error  $e$  is the percentage difference from the requested  $f_{\text{pdm}}$  frequency.

$$e = 100 \cdot \frac{f_{\text{actual}} - f_{\text{pdm}}}{f_{\text{pdm}}} = 100 \cdot \frac{\frac{f_{\text{source}}}{\left\lfloor \frac{1048576 \cdot 4096}{\text{PDMCLKCTRL}} \right\rfloor} - f_{\text{pdm}}}{f_{\text{pdm}}}$$

Figure 98: PDM frequency error equation

The PDM frequency can be adjusted on-the-fly:

- For PCLK32M, by using PDMCLKCTRL
- For ACLK, by adjusting the audio clock source, see [CLOCK — Clock control](#) on page 61.

| Requested PDM frequency $f_{\text{pdm}}$ [Hz] | $f_{\text{source}}$ [Hz] | RATIO | PDMCLKCTRL | Actual PDM frequency $f_{\text{actual}}$ [Hz] | Sample frequency [Hz] | Error [%] |
|-----------------------------------------------|--------------------------|-------|------------|-----------------------------------------------|-----------------------|-----------|
| 1024000                                       | 32000000 (PCLK32M)       | 64    | 135274496  | 1032258.1                                     | 16129.0               | 0.81      |
| 1280000                                       | 32000000 (PCLK32M)       | 80    | 168427520  | 1280000                                       | 16000                 | 0         |
| 1024000                                       | 12288000 (ACLK)          | 64    | 343597056  | 1024000                                       | 16000                 | 0         |

Table 105: Configuration examples

### 7.1.23.3 Module operation

By default, bits from the left PDM microphone are sampled on PDM\_CLK falling edge, and bits for the right are sampled on the rising edge of PDM\_CLK, resulting in two bitstreams. Each bitstream is fed into a digital filter which converts the PDM stream into 16-bit PCM samples, then filters and down-samples them to reach the appropriate sample rate.

The EDGE field in the MODE register allows swapping left and right, so that left will be sampled on rising edge, and right on falling.

The PDM module uses EasyDMA to store the samples coming out from the filters into one buffer in RAM. Depending on the mode chosen in the OPERATION field in the MODE register, memory either contains alternating left and right 16-bit samples (Stereo), or only left 16-bit samples (Mono). To ensure continuous PDM sampling, it is up to the application to update the EasyDMA destination address pointer as the previous buffer is filled.

The continuous transfer can be started or stopped by sending the START and STOP tasks. STOP becomes effective after the current frame has finished transferring, which will generate the STOPPED event. The STOPPED event indicates that all activity in the module is finished, and that the data is available in RAM (EasyDMA has finished transferring as well). Attempting to restart before receiving the STOPPED event may result in unpredictable behavior.

### 7.1.23.4 Decimation filter

In order to convert the incoming data stream into PCM audio samples, a decimation filter is included in the PDM interface module.

The input of the filter is the two-channel PDM serial stream (with left channel on clock high, right channel on clock low). Depending on the **RATIO** selected, its output is  $2 \times 16$ -bit PCM samples at a sample rate either 64 times or 80 times (depending on the **RATIO** register) lower than the PDM clock rate.

The filter stage of each channel is followed by a digital volume control, to attenuate or amplify the output samples in a range of -20 dB to +20 dB around the default (reset) setting, defined by  $G_{PDM, default}$ . The gain is controlled by the **GAINL** and **GAINR** registers.

As an example, if the goal is to achieve 2500 RMS output samples (16-bit) with a 1 kHz 90 dBA signal into a -26 dBFS sensitivity PDM microphone, do the following:

- Sum the PDM module's default gain ( $G_{PDM, default}$ ) and the gain introduced by the microphone and acoustic path of his implementation (an attenuation would translate into a negative gain)
- Adjust **GAINL** and **GAINR** by the above summed amount. Assuming that only the PDM module influences the gain, **GAINL** and **GAINR** must be set to  $-G_{PDM, default}$  dB to achieve the requirement.

With  $G_{PDM, default}=3.2$  dB, and as **GAINL** and **GAINR** are expressed in 0.5 dB steps, the closest value to program would be 3.0 dB, which can be calculated as:

```
GAINL = GAINR = (DefaultGain - (2 * 3))
```

Remember to check that the resulting values programmed into **GAINL** and **GAINR** fall within **MinGain** and **MaxGain**.

### 7.1.23.5 EasyDMA

Samples will be written directly to RAM, and EasyDMA must be configured accordingly.

The address pointer for the EasyDMA channel is set in **SAMPLE.PTR** register. If the destination address set in **SAMPLE.PTR** is not pointing to the Data RAM region, an EasyDMA transfer may result in a **HardFault** or RAM corruption. See [Memory](#) on page 18 for more information about the different memory regions.

DMA supports Stereo (Left+Right 16-bit samples) and Mono (Left only) data transfer, depending on the setting in the **OPERATION** field in the **MODE** register. The samples are stored little endian.

| MODE.OPERATION | Bits per sample | Result stored per RAM word | Physical RAM allocated (32-bit words) | Result boundary indexes in RAM | Note    |
|----------------|-----------------|----------------------------|---------------------------------------|--------------------------------|---------|
| Stereo         | 32 (2x16)       | L+R                        | $\text{ceil}(\text{SAMPLE.MAXCNT}/2)$ | $R0=[31:16]; L0=[15:0]$        | Default |
| Mono           | 16              | 2xL                        | $\text{ceil}(\text{SAMPLE.MAXCNT}/2)$ | $L1=[31:16]; L0=[15:0]$        |         |

Table 106: DMA sample storage

The destination buffer in RAM consists of one block, the size of which is set in **SAMPLE.MAXCNT** register. Format is number of 16-bit samples. The physical RAM allocated is always:

```
(RAM allocation, in bytes) = SAMPLE.MAXCNT * 2;
```

(but the mapping of the samples depends on **MODE.OPERATION**).

If **OPERATION**=Stereo, RAM will contain a succession of left and right samples.

If **OPERATION**=Mono, RAM will contain a succession of left only samples.

For a given value of `SAMPLE.MAXCNT`, the buffer in RAM can contain half the stereo sampling time as compared to the mono sampling time.

The PDM acquisition can be started by the `START` task, after the `SAMPLE.PTR` and `SAMPLE.MAXCNT` registers have been written. When starting the module, it will take some time for the filters to start outputting valid data. Transients from the PDM microphone itself may also occur. The first few samples (typically around 50) might hence contain invalid values or transients. It is therefore advised to discard the first few samples after a PDM start.

As soon as the `STARTED` event is received, the firmware can write the next `SAMPLE.PTR` value (this register is double-buffered), to ensure continuous operation.

When the buffer in RAM is filled with samples, an `END` event is triggered. The firmware can start processing the data in the buffer. Meanwhile, the PDM module starts acquiring data into the new buffer pointed to by `SAMPLE.PTR`, and sends a new `STARTED` event, so that the firmware can update `SAMPLE.PTR` to the next buffer address.

### 7.1.23.6 Hardware example

PDM can be configured with a single microphone (mono), or with two microphones.

When a single microphone is used, connect the microphone clock to `CLK`, and data to `DIN`.

Figure 99: Example of a single PDM microphone, wired as left

Figure 100: Example of a single PDM microphone, wired as right

Note that in a single-microphone (mono) configuration, depending on the microphone's implementation, either the left or the right channel (sampled at falling or rising CLK edge respectively) will contain reliable data.

If two microphones are used, one of them has to be set as left, the other as right (L/R pin tied high or to GND on the respective microphone). It is strongly recommended to use two microphones of exactly the same brand and type so that their timings in left and right operation match.

Figure 101: Example of two PDM microphones

### 7.1.23.7 Pin configuration

The CLK and DIN signals associated to the PDM module are mapped to physical pins according to the configuration specified in the PSEL.CLK and PSEL.DIN registers respectively. If the CONNECT field in any PSEL register is set to Disconnected, the associated PDM module signal will not be connected to the required physical pins, and will not operate properly.

The PSEL.CLK and PSEL.DIN registers and their configurations are only used as long as the PDM module is enabled, and retained only as long as the device is in System ON mode. See [POWER — Power control](#) on page 36 for more information about power modes. When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN\_CNF[n] register.

To ensure correct behavior in the PDM module, the pins used by the PDM module must be configured in the GPIO peripheral as described in [Table 107: GPIO configuration before enabling peripheral](#) on page 329 before enabling the PDM module. This is to ensure that the pins used by the PDM module are driven correctly if the PDM module itself is temporarily disabled or the device temporarily enters System OFF. This configuration must be retained in the GPIO for the selected I/Os as long as the PDM module is supposed to be connected to an external PDM circuit.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| PDM signal | PDM pin                  | Direction | Output value   | Comment |
|------------|--------------------------|-----------|----------------|---------|
| CLK        | As specified in PSEL.CLK | Output    | 0              |         |
| DIN        | As specified in PSEL.DIN | Input     | Not applicable |         |

Table 107: GPIO configuration before enabling peripheral

### 7.1.23.8 Registers

| Base address | Domain      | Peripheral | Instance  | Secure mapping | DMA security | Description                    | Configuration |

 ### 7.1.23.8.19 RATIO

Address offset: 0x520

Selects the ratio between PDM\_CLK and output sample rate. Change PDMCLKCTRL accordingly.

  ## 7.1.23.9 Electrical specification

### 7.1.23.9.1 PDM Electrical Specification

| Symbol                  | Description                                                                                          | Min. | Typ. | Max. | Units |
|-------------------------|------------------------------------------------------------------------------------------------------|------|------|------|-------|
| $f_{\text{PDM,CLK},64}$ | PDM clock speed. PDMCLKCTRL = Default (Setting needed for 16 MHz sample frequency @ RATIO = Ratio64) | ..   | ..   | ..   | MHz   |
| $f_{\text{PDM,CLK},80}$ | PDM clock speed. PDMCLKCTRL = 1280K (Setting needed for 16 MHz sample frequency @ RATIO = Ratio80)   | ..   | ..   | ..   | MHz   |
| $t_{\text{PDM,JITTER}}$ | Jitter in PDM clock output                                                                           | ..   | ..   | ..   | ns    |
| $T_{\text{dPDM,CLK}}$   | PDM clock duty cycle                                                                                 | ..   | ..   | ..   | %     |
| $t_{\text{PDM,DATA}}$   | Decimation filter delay                                                                              | ..   | ..   | ..   | ms    |

| Symbol            | Description                                             | Min. | Typ. | Max. | Units |
|-------------------|---------------------------------------------------------|------|------|------|-------|
| $t_{PDM,cv}$      | Allowed clock edge to data valid                        | ..   | ..   | ..   | ns    |
| $t_{PDM,ci}$      | Allowed (other) clock edge to data invalid              | ..   | ..   | ..   | ns    |
| $t_{PDM,s}$       | Data setup time at $f_{PDM,CLK}=1.024$ MHz or 1.280 MHz | ..   | ..   | ..   | ns    |
| $t_{PDM,h}$       | Data hold time at $f_{PDM,CLK}=1.024$ MHz or 1.280 MHz  | ..   | ..   | ..   | ns    |
| $G_{PDM,default}$ | Default (reset) absolute gain of the PDM module         | ..   | ..   | ..   | dB    |

Figure 102: PDM timing diagram

## 7.1.24 PWM — Pulse width modulation

The pulse with modulation (PWM) module enables the generation of pulse width modulated signals on GPIO. The module implements an up or up-and-down counter with four PWM channels that drive assigned GPIOs.

The following are the main features of a PWM module:

- Programmable PWM frequency
- Up to four PWM channels with individual polarity and duty cycle values
- Edge or center-aligned pulses across PWM channels
- Multiple duty cycle arrays (sequences) defined in RAM
- Autonomous and glitch-free update of duty cycle values directly from memory through EasyDMA (no CPU involvement)
- Change of polarity, duty cycle, and base frequency possibly on every PWM period
- RAM sequences can be repeated or connected into loops

Figure 103: PWM module

### 7.1.24.1 Wave counter

The wave counter is responsible for generating the pulses at a duty cycle that depends on the compare values, and at a frequency that depends on COUNTERTOP.

There is one common 15-bit counter with four compare channels. Thus, all four channels will share the same period (PWM frequency), but can have individual duty cycle and polarity. The polarity is set by a value read from RAM (see figure [Figure 106: Decoder memory access modes](#) on page 342). Whether the counter counts up, or up and down, is controlled by the MODE register.

The timer top value is controlled by the COUNTERTOP register. This register value, in conjunction with the selected PRESCALER of the PWM\_CLK, will result in a given PWM period. A COUNTERTOP value smaller than the compare setting will result in a state where no PWM edges are generated. OUT[n] is held high, given that the polarity is set to FallingEdge. All compare registers are internal and can only be configured through decoder presented later. COUNTERTOP can be safely written at any time.

Sampling follows the START task. If DECODER.LOAD=WaveForm, the register value is ignored and taken from RAM instead (see section [Decoder with EasyDMA](#) on page 342 for more details). If DECODER.LOAD is anything else than the WaveForm, it is sampled following a STARTSEQ[n] task and when loading a new value from RAM during a sequence playback.

The following figure shows the counter operating in up mode (MODE=PWM\_MODE\_Up), with three PWM channels with the same frequency but different duty cycle:

Figure 104: PWM counter in up mode example - FallingEdge polarity

The counter is automatically reset to zero when COUNTERTOP is reached and OUT[n] will invert. OUT[n] is held low if the compare value is 0 and held high if set to COUNTERTOP, given that the polarity is set to

**FallingEdge.** Counter running in up mode results in pulse widths that are edge-aligned. The following is the code for the counter in up mode example:

```
uint16_t pwm_seq[4] = {PWM_CH0_DUTY, PWM_CH1_DUTY, PWM_CH2_DUTY, PWM_CH3_DUTY};
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                         PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->PSEL.OUT[1] = (second_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                         PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE      = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE        = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER   = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                         PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP  = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP        = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER     = (PWM_DECODER_LOAD_Individual << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR  = ((uint32_t)(pwm_seq) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT  = ((sizeof(pwm_seq) / sizeof(uint16_t)) <<
                         PWM_SEQ_CNT_CNT_Pos);
NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;
```

When the counter is running in up mode, the following formula can be used to compute the PWM period and the step size:

PWM period:  $T_{PWM(Up)} = T_{PWM\_CLK} * COUNTERTOP$

Step width/Resolution:  $T_{steps} = T_{PWM\_CLK}$

The following figure shows the counter operating in up-and-down mode (MODE=PWM\_MODE\_UpAndDown), with two PWM channels with the same frequency but different duty cycle and output polarity:

Figure 105: PWM counter in up-and-down mode example

The counter starts decrementing to zero when COUNTERTOP is reached and will invert the OUT[n] when compare value is hit for the second time. This results in a set of pulses that are center-aligned. The following is the code for the counter in up-and-down mode example:

```
uint16_t pwm_seq[4] = {PWM_CH0_DUTY, PWM_CH1_DUTY, PWM_CH2_DUTY, PWM_CH3_DUTY};
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);

```

When the counter is running in up-and-down mode, the following formula can be used to compute the PWM period and the step size:

$$T_{\text{PWM(Up And Down)}} = T_{\text{PWM\_CLK}} * 2 * \text{COUNTERTOP}$$

$$\text{Step width/Resolution: } T_{\text{steps}} = T_{\text{PWM\_CLK}} * 2$$

PWM parameters are organized into a sequence containing at least one half word (16 bit). Its most significant bit[15] denotes the polarity of the OUT[n] while bit[14:0] is the 15-bit compare value.

The diagram illustrates three different decoder load configurations, each showing a vertical stack of components (P, O, L) and their connections to comparators (COMP0, COMP1, COMP2, COMP3) or a counter (COUNTERTOP).

**DECODER.LOAD=Common**

SEQ[n].PTR

Increasing Data RAM address

Each component (P, O, L) is connected to a single output line, which is then connected to a single output line (COMP0, COMP1, COMP2, COMP3). This configuration is labeled "Common".

**DECODER.LOAD=Grouped**

Each component (P, O, L) is connected to a single output line, which is then connected to a single output line (COMP0, COMP1, COMP2, COMP3). This configuration is labeled "Grouped".

**DECODER.LOAD=Single**

Each component (P, O, L) is connected to a single output line, which is then connected to a single output line (COMP0, COMP1, COMP2, COMP3). This configuration is labeled "Single".

**DECODER.LOAD=WaveForm**

Each component (P, O, L) is connected to a single output line, which is then connected to a single output line (COMP0, COMP1, COMP2, COUNTERTOP). This configuration is labeled "WaveForm".

A special mode of operation is available when `DECODER.LOAD` is set to `WaveForm`. In this mode, up to three PWM channels can be enabled - `OUT[0]` to `OUT[2]`. In RAM, four values are loaded at a time: the first, second and third location are used to load the values, and the fourth RAM location is used to load the `COUNTERTOP` register. This way one can have up to three PWM channels with a frequency base that changes on a per PWM period basis. This mode of operation is useful for arbitrary wave form generation in applications, such as LED lighting.

The register `SEQ[n].REFRESH=N` (one per sequence  $n=0$  or  $1$ ) will instruct a new RAM stored pulse width value on every  $(N+1)^{\text{th}}$  PWM period. Setting the register to zero will result in a new duty cycle update every PWM period, as long as the minimum PWM period is observed.

Note that registers `SEQ[n].REFRESH` and `SEQ[n].ENDDELAY` are ignored when `DECODER.MODE=NextStep`. The next value is loaded upon every received `NEXTSTEP` task.

`SEQ[n].PTR` is the pointer used to fetch `COMPARE` values from RAM. If the `SEQ[n].PTR` is not pointing to a RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 18 for more information about the different memory regions. After the `SEQ[n].PTR` is set to the desired RAM location, the `SEQ[n].CNT` register must be set to number of 16-bit half words in the sequence. It is important to observe that the Grouped mode requires one half word per group, while the Single mode requires one half word per channel, thus increasing the RAM size occupation. If PWM generation is not running when the `SEQSTART[n]` task is triggered, the task will load the first value from RAM and then start the PWM generation. A `SEQSTARTED[n]` event is generated as soon as the EasyDMA has read the first PWM parameter from RAM and the wave counter has started executing it. When `LOOP.CNT=0`, sequence  $n=0$  or  $1$  is played back once. After the last value in the sequence has been loaded and started executing, a `SEQEND[n]` event is generated. The PWM generation will then continue with the last loaded value. The following figure illustrates an example of such simple playback:

Figure 107: Simple sequence example

Figure depicts the source code used for configuration and timing details in a sequence where only sequence 0 is used and only run once with a new PWM duty cycle for each period.

```

NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                          PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE       = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE         = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER    = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                          PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP   = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP         = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER      = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR   = ((uint32_t)(seq0_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT   = ((sizeof(seq0_ram) / sizeof(uint16_t)) <<
                          PWM_SEQ_CNT_CNT_Pos);
NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;

```

To completely stop the PWM generation and force the associated pins to a defined state, a STOP task can be triggered at any time. A STOPPED event is generated when the PWM generation has stopped at the end of currently running PWM period, and the pins go into their idle state as defined in GPIO OUT register. PWM generation can then only be restarted through a SEQSTART[n] task. SEQSTART[n] will resume PWM generation after having loaded the first value from the RAM buffer defined in the SEQ[n].PTR register.

The table below indicates when specific registers get sampled by the hardware. Care should be taken when updating these registers to avoid that values are applied earlier than expected.

| Register        | Taken into account by hardware                                                                                                               | Recommended (safe) update                                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SEQ[n].PTR      | When sending the SEQSTART[n] task                                                                                                            | After having received the SEQSTARTED[n] event                                                                                                                                                |

| PSEL.OUT[n]     | Immediately                                                                                                                                  | Before enabling the PWM instance through the ENABLE register                                                                                                                                 |

Table 110: When to safely update PWM registers

**Note:** SEQ[n].REFRESH and SEQ[n].ENDDELAY are ignored at the end of a complex sequence, indicated by a LOOPSDONE event. The reason for this is that the last value loaded from RAM is maintained until further action from software (restarting a new sequence, or stopping PWM generation).

A more complex example, where LOOP.CNT>0, is shown in the following figure:

Figure 108: Example using two sequences

In this case, an automated playback takes place, consisting of SEQ[0], delay 0, SEQ[1], delay 1, then again SEQ[0], etc. The user can choose to start a complex playback with SEQ[0] or SEQ[1] through sending the SEQSTART[0] or SEQSTART[1] task. The complex playback always ends with delay 1.

The two sequences 0 and 1 are defined by the addresses of value tables in RAM (pointed to by SEQ[n].PTR) and the buffer size (SEQ[n].CNT). The rate at which a new value is loaded is defined individually for each sequence by SEQ[n].REFRESH. The chaining of sequence 1 following the sequence 0 is implicit, the LOOP.CNT register allows the chaining of sequence 1 to sequence 0 for a determined number of times. In other words, it allows to repeat a complex sequence a number of times in a fully automated way.

In the following code example, sequence 0 is defined with SEQ[0].REFRESH set to 1, meaning that a new PWM duty cycle is pushed every second PWM period. This complex sequence is started with the SEQSTART[0] task, so SEQ[0] is played first. Since SEQ[0].ENDDelay=1 there will be one PWM period delay between last period on sequence 0 and the first period on sequence 1. Since SEQ[1].ENDDelay=0 there is no delay 1, so SEQ[0] would be started immediately after the end of SEQ[1]. However, as LOOP.CNT is

1, the playback stops after having played SEQ[1] only once, and both SEQEND[1] and LOOPSDONE are generated (their order is not guaranteed in this case).

```

NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                         PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE      = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE        = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER   = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                         PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP  = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP        = (1 << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER     = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR   = ((uint32_t)(seq0_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT   = ((sizeof(seq0_ram) / sizeof(uint16_t)) <<
                         PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[0].REFRESH = 1;
NRF_PWM0->SEQ[0].ENDDELAY = 1;
NRF_PWM0->SEQ[1].PTR   = ((uint32_t)(seq1_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[1].CNT   = ((sizeof(seq1_ram) / sizeof(uint16_t)) <<
                         PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[1].REFRESH = 0;
NRF_PWM0->SEQ[1].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;

```

The decoder can also be configured to asynchronously load new PWM duty cycle. If the DECODER.MODE register is set to NextStep, then the NEXTSTEP task will cause an update of internal compare registers on the next PWM period.

The following figures provide an overview of each part of an arbitrary sequence, in various modes (LOOP.CNT=0 and LOOP.CNT>0). In particular, the following are represented:

- Initial and final duty cycle on the PWM output(s)
- Chaining of SEQ[0] and SEQ[1] if LOOP.CNT>0
- Influence of registers on the sequence
- Events generated during a sequence
- DMA activity (loading of next value and applying it to the output(s))

Figure 109: Single shot (LOOP.CNT=0)

**Note:** The single-shot example also applies to SEQ[1]. Only SEQ[0] is represented for simplicity.

Figure 110: Complex sequence (LOOP.CNT&gt;0) starting with SEQ[0]

Figure 111: Complex sequence ( $LOOP.CNT > 0$ ) starting with  $SEQ[1]$

**Note:** If a sequence is in use in a simple or complex sequence, it must have a length of  $SEQ[n].CNT > 0$ .

This example shows how the PWM module can be configured to repeat a single sequence until stopped.

```
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                          PWM_PSEL_OUT_CONNECT_Pos);

NRF_PWM0->ENABLE       = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE         = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER    = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                          PWM_PRESCALER_PRESCALER_Pos);

NRF_PWM0->COUNTERTOP   = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
// Enable the shortcut from LOOPSDONE event to SEQSTART1 task for infinite loop
NRF_PWM0->SHORTS       = (PWM_SHORTS_LOOPSDONE_SEQSTART1_Enabled <<
                          PWM_SHORTS_LOOPSDONE_SEQSTART1_Pos);

// LOOP_CNT must be greater than 0 for the LOOPSDONE event to trigger and enable looping
NRF_PWM0->LOOP         = (1 << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER      = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);

// To repeat a single sequence until stopped, it must be configured in SEQ[1]
NRF_PWM0->SEQ[1].PTR   = ((uint32_t)(seq0_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[1].CNT   = ((sizeof(seq0_ram) / sizeof(uint16_t)) <<
                          PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[1].REFRESH = 0;
NRF_PWM0->SEQ[1].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[1] = 1;
```

### 7.1.24.3 Limitations

Previous compare value is repeated if the PWM period is shorter than the time it takes for the EasyDMA to retrieve from RAM and update the internal compare registers. This is to ensure a glitch-free operation even for very short PWM periods.

Only SEQ[1] can trigger the **LOOPSDONE** event upon completion, not SEQ[0]. This requires looping to be enabled (**LOOP** > 0) and **SEQ[1].CNT** > 0 when sequence playback starts.

### 7.1.24.4 Pin configuration

The OUT[n] (n=0..3) signals associated with each PWM channel are mapped to physical pins according to the configuration of PSEL.OUT[n] registers. If PSEL.OUT[n].CONNECT is set to Disconnected, the associated PWM module signal will not be connected to any physical pins.

The PSEL.OUT[n] registers and their configurations are used as long as the PWM module is enabled and the PWM generation active (wave counter started). They are retained only as long as the device is in System ON mode (see section **POWER** for more information about power modes).

To ensure correct behavior in the PWM module, the pins that are used must be configured in the GPIO peripheral in the following way before the PWM module is enabled:

| PWM signal | PWM pin                                 | Direction | Output value | Comment                                 |
|------------|-----------------------------------------|-----------|--------------|-----------------------------------------|
| OUT[n]     | As specified in PSEL.OUT[n]<br>(n=0..3) | Output    | 0            | Idle state defined in GPIO OUT register |

Table 111: Recommended GPIO configuration before starting PWM generation

The idle state of a pin is defined by the OUT register in the GPIO module, to ensure that the pins used by the PWM module are driven correctly. If PWM generation is stopped by triggering a STOP task, the PWM module itself is temporarily disabled or the device temporarily enters System OFF. This configuration must be retained in the GPIO for the selected pins (I/Os) for as long as the PWM module is supposed to be connected to an external PWM circuit.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

### 7.1.24.5 Registers

| Base address | Domain      | Peripheral | Instance  | Secure mapping | DMA security | Description                   | Configuration |
|--------------|-------------|------------|-----------|----------------|--------------|-------------------------------|---------------|
| 0x50021000   | APPLICATION | PWM        | PWM0 : S  | US             | SA           | Pulse width modulation unit 0 |               |
| 0x40021000   |             |            | PWM0 : NS |                |              |                               |               |
| 0x50022000   | APPLICATION | PWM        | PWM1 : S  | US             | SA           | Pulse width modulation unit 1 |               |
| 0x40022000   |             |            | PWM1 : NS |                |              |                               |               |
| 0x50023000   | APPLICATION | PWM        | PWM2 : S  | US             | SA           | Pulse width modulation unit 2 |               |
| 0x40023000   |             |            | PWM2 : NS |                |              |                               |               |

Table 112: Instances

| Register          | Offset | Security | Description                                                                                                                                                                                                   |
|-------------------|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TASKS_STOP        | 0x004  |          | Stops PWM pulse generation on all channels at the end of current PWM period, and stops sequence playback                                                                                                      |
| TASKS_SEQSTART[n] | 0x008  |          | Loads the first PWM value on all enabled channels from sequence n, and starts playing that sequence at the rate defined in SEQ[n].REFRESH and/or DECODER.MODE. Causes PWM generation to start if not running. |

| Register              | Offset | Security | Description                                                                                                                                         |
|-----------------------|--------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| TASKS_NEXTSTEP        | 0x010  |          | Steps by one value in the current sequence on all enabled channels if DECODER.MODE=NextStep. Does not cause PWM generation to start if not running. |
| SUBSCRIBE_STOP        | 0x084  |          | Subscribe configuration for task STOP                                                                                                               |
| SUBSCRIBE_SEQSTART[n] | 0x088  |          | Subscribe configuration for task SEQSTART[n]                                                                                                        |
| SUBSCRIBE_NEXTSTEP    | 0x090  |          | Subscribe configuration for task NEXTSTEP                                                                                                           |
| EVENTS_STOPPED        | 0x104  |          | Response to STOP task, emitted when PWM pulses are no longer generated                                                                              |
| EVENTS_SEQSTARTED[n]  | 0x108  |          | First PWM period started on sequence n                                                                                                              |
| EVENTS_SEQEND[n]      | 0x110  |          | Emitted at end of every sequence n, when last value from RAM has been applied to wave counter                                                       |

### 7.1.24.5.2 TASKS\_SEQSTART[n] (n=0..1)

Address offset: 0x008 + (n × 0x4)

Loads the first PWM value on all enabled channels from sequence n, and starts playing that sequence at the rate defined in SEQ[n]REFRESH and/or DECODER.MODE. Causes PWM generation to start if not running.

### 7.1.24.5.3 TASKS\_NEXTSTEP

Address offset: 0x010

Steps by one value in the current sequence on all enabled channels if DECODER.MODE=NextStep. Does not cause PWM generation to start if not running.

### 7.1.24.5.11 EVENTS\_LOOPSDONE

Address offset: 0x11C

Concatenated sequences have been played the amount of times defined in LOOP.CNT

This event triggers after the last SEQ[1] completion of the loop, and only if looping was enabled (LOOP > 0) when the sequence playback was started.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |  |  |  |  |  |  |  |  | ### 7.1.25 QDEC — Quadrature decoder

The Quadrature decoder (QDEC) provides buffered decoding of quadrature-encoded sensor signals. It is suitable for mechanical and optical sensors.

The sample period and accumulation are configurable to match application requirements. The QDEC provides the following:

- Decoding of digital waveform from off-chip quadrature encoder.
- Sample accumulation eliminating hard real-time requirements to be enforced on application.
- Optional input de-bounce filters.
- Optional LED output signal for optical encoders.

Figure 112: Quadrature decoder configuration

### 7.1.25.1 Sampling and decoding

The QDEC decodes the output from an incremental motion encoder by sampling the QDEC phase input pins (A and B).

The off-chip quadrature encoder is an incremental motion encoder outputting two waveforms, phase A and phase B. The two output waveforms are always 90 degrees out of phase, meaning that one always changes level before the other. The direction of movement is indicated by which of these two waveforms that changes level first. Invalid transitions may occur, that is when the two waveforms switch simultaneously. This may occur if the wheel rotates too fast relative to the sample rate set for the decoder.

The QDEC decodes the output from the off-chip encoder by sampling the QDEC phase input pins (A and B) at a fixed rate as specified in the SAMPLEPER register.

If the SAMPLEPER value needs to be changed, the QDEC shall be stopped using the STOP task. SAMPLEPER can be then changed upon receiving the STOPPED event, and QDEC can be restarted using the START task. Failing to do so may result in unpredictable behaviour.

It is good practice to change other registers (LEDPOL, REPORTPER, DBFEN and LEDPRE) only when the QDEC is stopped.

When started, the decoder continuously samples the two input waveforms and decodes these by comparing the current sample pair (n) with the previous sample pair (n-1).

The decoding of the sample pairs is described in the table below.

| Previous sample pair(n-1) |   | Current samples pair(n) |   | SAMPLE register | ACC operation | ACCDBL operation | Description                    |
|---------------------------|---|-------------------------|---|-----------------|---------------|------------------|--------------------------------|
| A                         | B | A                       | B |                 |               |                  |                                |
| 0                         | 0 | 0                       | 0 | 0               | No change     | No change        | No movement                    |

Table 114: Sampled value encoding

### 7.1.25.2 LED output

The LED output follows the sample period, and the LED is switched on a given period before sampling and switched off immediately after the inputs are sampled. The period the LED is switched on before sampling is given in the LEDPRE register.

The LED output pin polarity is specified in the LEDPOL register.

For using off-chip mechanical encoders not requiring a LED, the LED output can be disabled by writing value 'Disconnected' to the CONNECT field of the PSEL.LED register. In this case the QDEC will not acquire access to a LED output pin and the pin can be used for other purposes by the CPU.

### 7.1.25.3 Debounce filters

Each of the two-phase inputs have digital debounce filters.

When enabled through the DBFEN register, the filter inputs are sampled at a fixed 1 MHz frequency during the entire sample period (which is specified in the SAMPLEPER register), and the filters require all of the samples within this sample period to equal before the input signal is accepted and transferred to the output of the filter.

As a result, only input signal with a steady state longer than twice the period specified in SAMPLEPER are guaranteed to pass through the filter, and any signal with a steady state shorter than SAMPLEPER will always be suppressed by the filter. (This is assumed that the frequency during the debounce period never exceeds 500 kHz (as required by the Nyquist theorem when using a 1 MHz sample frequency).

The LED will always be ON when the debounce filters are enabled, as the inputs in this case will be sampled continuously.

Note that when the debounce filters are enabled, displacements reported by the QDEC peripheral are delayed by one SAMPLEPER period.

### 7.1.25.4 Accumulators

The quadrature decoder contains two accumulator registers, ACC and ACCDBL, that accumulate respectively valid motion sample values and the number of detected invalid samples (double transitions).

The ACC register will accumulate all valid values (1/-1) written to the SAMPLE register. This can be useful for preventing hard real-time requirements from being enforced on the application. When using the ACC register the application does not need to read every single sample from the SAMPLE register, but can instead fetch the ACC register whenever it fits the application. The ACC register will always hold the relative movement of the external mechanical device since the previous clearing of the ACC register. Sample values indicating a double transition (2) will not be accumulated in the ACC register.

An ACCOF event will be generated if the ACC receives a SAMPLE value that would cause the register to overflow or underflow. Any SAMPLE value that would cause an ACC overflow or underflow will be discarded, but any samples not causing the ACC to overflow or underflow will still be accepted.

The accumulator ACCDBL accumulates the number of detected double transitions since the previous clearing of the ACCDBL register.

The ACC and ACCDBL registers can be cleared by the READCLRACC and subsequently read using the ACCREAD and ACCDBLREAD registers.

The ACC register can be separately cleared by the RDCLRACC and subsequently read using the ACCREAD registers.

The ACCDBL register can be separately cleared by the RDCLRDBL and subsequently read using the ACCDBLREAD registers.

The REPORTPER register allows automating the capture of several samples before it can send out a REPORTRDY event in case a non-null displacement has been captured and accumulated, and a DBLRDY event in case one or more double-displacements have been captured and accumulated. The REPORTPER field in this register selects after how many samples the accumulators contents are evaluated to send (or not) REPORTRDY and DBLRDY events.

Using the RDCLRACC task (manually sent upon receiving the event, or using the DBLRDY\_RDCLRACC shortcut), ACCREAD can then be read.

In case at least one double transition has been captured and accumulated, a DBLRDY event is sent. Using the RDCLRDBL task (manually sent upon receiving the event, or using the DBLRDY\_RDCLRDBL shortcut), ACCDBLREAD can then be read.

### 7.1.25.5 Output/input pins

The QDEC uses a three-pin interface to the off-chip quadrature encoder.

These pins will be acquired when the QDEC is enabled in the ENABLE register. The pins acquired by the QDEC cannot be written by the CPU, but they can still be read by the CPU.

The pin numbers to be used for the QDEC are selected using the PSEL.n registers.

### 7.1.25.6 Pin configuration

The Phase A, Phase B, and LED signals are mapped to physical pins according to the configuration specified in the PSEL.A, PSEL.B, and PSEL.LED registers respectively.

If the CONNECT field value 'Disconnected' is specified in any of these registers, the associated signal will not be connected to any physical pin. The PSEL.A, PSEL.B, and PSEL.LED registers and their configurations are only used as long as the QDEC is enabled, and retained only as long as the device is in ON mode.

When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN\_CNF[n] register.

To secure correct behavior in the QDEC, the pins used by the QDEC must be configured in the GPIO peripheral as described in [Table 115: GPIO configuration before enabling peripheral](#) on page 365 before enabling the QDEC. This configuration must be retained in the GPIO for the selected IOs as long as the QDEC is enabled.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| QDEC signal | QDEC pin                 | Direction | Output value   | Comment |
|-------------|--------------------------|-----------|----------------|---------|
| Phase A     | As specified in PSEL.A   | Input     | Not applicable |         |
| Phase B     | As specified in PSEL.B   | Input     | Not applicable |         |
| LED         | As specified in PSEL.LED | Input     | Not applicable |         |

|-----------|--------|----------|-----------------------------------------------------------------------------------|
| REPORTPER | 0x510  |          | Number of samples to be taken before REPORTRDY and DBLRDY events can be generated |
| ACC       | 0x514  |          | Register accumulating the valid transitions                                       |
| ACCREAD   | 0x518  |          | Snapshot of the ACC register, updated by the READCLRACC or RDCLRACC task          |
| PSEL.LED  | 0x51C  |          | Pin select for LED signal                                                         |
| PSEL.A    | 0x520  |          | Pin select for A signal                                                           |
| PSEL.B    | 0x524  |          | Pin select for B signal                                                           |
| DBFEN     | 0x528  |          | Enable input debounce filters                                                     |
| LEDPRE    | 0x540  |          | Time period the LED is switched ON prior to sampling                              |
| ACCDL     | 0x544  |          | Register accumulating the number of detected double transitions                   |
| ACCDLREAD | 0x548  |          | Snapshot of the ACCDL, updated by the READCLRACC or RDCLRDL task                  |

Table 117: Register overview

### 7.1.25.7.1 TASKS\_START

Address offset: 0x000

Task starting the quadrature decoder

When started, the SAMPLE register will be continuously updated at the rate given in the SAMPLEPER register.

### 7.1.25.7.3 TASKS\_READCLRACC

Address offset: 0x008

Read and clear ACC and ACCDL

Task transferring the content of ACC to ACCREAD and the content of ACCDL to ACCDLREAD, and then clearing the ACC and ACCDL registers. These read-and-clear operations will be done atomically.

### 7.1.25.7.14 EVENTS\_DBLRDY

Address offset: 0x10C

Double displacement(s) detected

Event generated when REPORTPER number of samples has been accumulated and the content of the ACCDBL register is not equal to 0. (Thus, this event is only generated if a double transition is detected since the previous clearing of the ACCDBL register).

The value is a 2's complement value, and the sign gives the direction of the motion. The value '2' indicates a double transition.

### 7.1.25.7.28 REPORTPER

Address offset: 0x510

Number of samples to be taken before REPORTRDY and DBLRDY events can be generated

## 7.1.25.8 Electrical specification

### 7.1.25.8.1 QDEC Electrical Specification

| Symbol              | Description                                           | Min. | Typ. | Max. | Units         |
|---------------------|-------------------------------------------------------|------|------|------|---------------|
| $t_{\text{SAMPLE}}$ | Time between sampling signals from quadrature decoder | ..   | ..   | ..   | $\mu\text{s}$ |
| $t_{\text{LED}}$    | Time from LED is turned on to signals are sampled     | ..   | ..   | ..   | $\mu\text{s}$ |

## 7.1.26 QSPI — Quad serial peripheral interface

The QSPI peripheral provides support for communicating with an external flash memory device using SPI.

Listed here are the main features for the QSPI peripheral:

- Single/dual/quad SPI input/output
- 6–96 MHz configurable clock frequency
- Single-word read/write access from/to external flash
- EasyDMA for block read and write transfers
- Up to 48 MB/sec EasyDMA read rate
- Execute in place (XIP) for executing program directly from external flash
- XIP access can optionally be disabled
- On-the-fly encryption and decryption, including EasyDMA and XIP

Figure 113: Block diagram

### 7.1.26.1 Configuring peripheral

Before any data can be transferred to or from the external flash memory, the peripheral needs to be configured.

1. Select input/output pins in [PSEL.SCK](#) on page 398, [PSEL.CSN](#) on page 398, [PSEL.IO0](#) on page 399, [PSEL.IO1](#) on page 399, [PSEL.IO2](#) on page 399, and [PSEL.IO3](#) on page 399. See [Reference circuitry](#) on page 768 for the recommended pins.
2. To ensure stable operation, set the GPIO drive strength to “high drive”. See the [GPIO — General purpose input/output](#) on page 209 chapter for details on how to configure GPIO drive strength.
3. Configure the interface towards the external flash memory using [IFCONFIG0](#) on page 400, [IFCONFIG1](#) on page 405, and [ADDRCONF](#) on page 406.
4. Enable the QSPI peripheral and acquire I/O pins using [ENABLE](#) on page 396.
5. Activate the external flash memory interface using the ACTIVATE task. The READY event will be generated when the interface has been activated and the external flash memory is ready for access.

**Important:**

If the [IFCONFIG0](#) on page 400 register is configured to use the quad mode, the external flash device also needs to be set in the quad mode before any data transfers can take place.

This can be done by sending custom instructions to the external flash device, as described in [Sending custom instructions](#) on page 383.

### 7.1.26.2 Write operation

A write operation to the external flash is configured using the [WRITE.DST](#) on page 397, [WRITE.SRC](#) on page 397, and [WRITE.CNT](#) on page 397 registers and started using the WRITESTART task.

The READY event is generated when the transfer is complete.

The QSPI peripheral automatically takes care of splitting DMA transfers into page writes.

### 7.1.26.3 Read operation

A read operation from the external flash is configured using the [READ.SRC](#) on page 396, [READ.DST](#) on page 396, and [READ.CNT](#) on page 397 registers and started using the READSTART task.

The READY event is generated when the transfer is complete.

### 7.1.26.4 Erase operation

Erase of pages/blocks of the external flash is configured using the [ERASE.PTR](#) on page 397 and [ERASE.LEN](#) on page 398 registers and started using the ERASESTART task.

The READY event is generated when the erase operation has been started.

Note that in this case the READY event will not indicate that the erase operation of the flash has been completed, but it only signals that the erase operation has been started. The actual status of the erase operation can normally be read from the external flash using a custom instruction, see [Sending custom instructions](#) on page 383.

### 7.1.26.5 Execute in place

Execute in place (XIP) allows the CPU to execute program code directly from the external flash.

After the external flash has been configured, the CPU can execute code from the external flash by accessing the XIP memory region. See the figure below and [Memory](#) on page 18 for details.

Note that the XIP memory region is read-only, writing to it will result in a bus error.

When accessing the XIP memory region, the start address of this XIP memory region will map to the address [XIPOFFSET](#) on page 400 of the external flash.

Figure 114: XIP memory map

### 7.1.26.6 Encryption

The contents of an external flash memory can be protected using stream cipher encryption. Encryption can be configured and enabled independently for XIP and EasyDMA, with separate keys and nonce.

Once configured and enabled, the stream cipher operates between the AHB bus and the external flash, encrypting and decrypting data passing through.

Figure [Figure 115: Stream cipher](#) on page 382 shows the stream cipher block with the three configuration registers. The stream cipher uses an AES 128 encryption operation to form the keystream from key, nonce and external memory address. The keystream then combines each 32-bit plaintext digit one at a time with the corresponding digit of the keystream.

Figure 115: Stream cipher

**Note:** The same nonce and key must be used for both encryption and decryption of the same memory address.

The memory address used for encryption is the external flash memory address and thus independent of [XIPOFFSET](#) on page 400. This means a second firmware image can be encrypted and written using EasyDMA, then [XIPOFFSET](#) on page 400 set to point to the new firmware image before executing from it.

**Note:** Stream ciphers are symmetric. They do not differentiate between encrypting or decrypting, reading or writing. Thus, if the contents of a plain text external flash is read when stream cipher is enabled, the data provided to the MCU are encrypted.

## Execute in place (XIP)

Stream cipher for QSPI XIP is enabled by

1. Configuring keys using [XIP\\_ENC.KEY0](#) on page 401 through [XIP\\_ENC.KEY3](#) on page 402
2. Configuring nonce using [XIP\\_ENC.NONCE0](#) on page 402 through [XIP\\_ENC.NONCE2](#) on page 402
3. Setting [XIP\\_ENC.ENABLE](#) on page 403

Any instructions or data read from the XIP interface will now pass through the stream cipher.

## EasyDMA

Stream cipher for QSPI EasyDMA is enabled by

1. Configuring keys using [DMA\\_ENC.KEY0](#) on page 403 through [DMA\\_ENC.KEY3](#) on page 403
2. Configuring nonce using [DMA\\_ENC.NONCE0](#) on page 404 through [DMA\\_ENC.NONCE2](#) on page 404
3. Setting [DMA\\_ENC.ENABLE](#) on page 404

Any data read from, or written to, the external flash over the EasyDMA interface will now pass through the stream cipher.

### 7.1.26.7 Sending custom instructions

Custom instructions can be sent to the external flash using the [CINSTRCONF](#) on page 407, [CINSTRDAT0](#) on page 407, and [CINSTRDAT1](#) on page 408 registers. It is possible to send an instruction consisting of a one-byte opcode and up to 8 bytes of additional data and to read its response.

A custom instruction is prepared by first writing the data to be sent to [CINSTRDAT0](#) on page 407 and [CINSTRDAT1](#) on page 408 before writing the opcode and other configurations to the [CINSTRCONF](#) on page 407 register.

The custom instruction is sent when the [CINSTRCONF](#) on page 407 register is written and it is always sent on a single data line SPI interface.

The READY event will be generated when the custom instruction has been sent.

After a custom instruction has been sent, the [CINSTRDAT0](#) on page 407 and [CINSTRDAT1](#) on page 408 will contain the response bytes from the custom instruction.

Data of custom instructions are not part of the stream cipher encryption.

Figure 116: Sending custom instruction

### 7.1.26.7.1 Long frame mode

The LFEN and LFSTOP fields in the [CINSTRCONF](#) on page 407 control the operation of the custom instruction long frame mode. The long frame mode is a mechanism that permits arbitrary byte length custom instructions. While in long frame mode a long custom instruction sequence is split in multiple writes to the [CINSTRDAT0](#) on page 407 and [CINSTRDAT1](#) on page 408 registers.

To enable the long frame mode every write to the [CINSTRCONF](#) on page 407 register must have the LFEN field set to 1. The contents of the OP\_CODE field will be transmitted after the first write to [CINSTRCONF](#) on page 407 and will be omitted in every subsequent write to this register. For subsequent writes the number of data bytes as specified in the LENGTH field are transferred (that is the value of LENGTH - 1 data bytes). The values of the LIO2 and LIO3 fields are set in the first write to [CINSTRCONF](#) on page 407 and will apply for the entire custom instruction transmission until the long frame is finalized.

To finalize a long frame transmission, the LFSTOP field in [CINSTRCONF](#) on page 407 must be set to 1 in the last write to this register.

### 7.1.26.8 Deep power-down mode

The external flash memory can be put in deep power-down mode (DPM) to minimize its current consumption when there is no need to access the memory.

DPM is enabled in the [IFCONFIG0](#) on page 400 register and configured in the [DPM DUR](#) on page 406 register. The DPM status of the external memory can be read in the [STATUS](#) on page 405 register. The DPM DUR register has to be configured according to the external flash specification to get the information in the STATUS register and the timing of the READY event correct.

Entering/exiting DPM is controlled using the [IFCONFIG1](#) on page 405 register.

### 7.1.26.9 Instruction set

The table below shows the instruction set being used by the QSPI peripheral when communicating with an external flash device.

| Instruction | Opcode                                                         | Description                    |
|-------------|----------------------------------------------------------------|--------------------------------|
| WREN        | 0x06                                                           | Write enable                   |
| RDSR        | 0x05                                                           | Read status register           |
| WRSR        | 0x01                                                           | Write status register          |
| FASTREAD    | 0x0B                                                           | Read bytes at higher speed     |
| READ2O      | 0x3B                                                           | Dual-read output               |
| READ2IO     | 0xBB                                                           | Dual-read input/output         |
| READ4O      | 0x6B                                                           | Quad-read output               |
| READ4IO     | 0xEB                                                           | Quad-read input/output         |
| PP          | 0x02                                                           | Page program                   |
| PP2O        | 0xA2                                                           | Dual-page program output       |
| PP4O        | 0x32                                                           | Quad-page program output       |

| XIP_ENC.NONCE2       | 0x578  |          | Bits 95:64 of XIP NONCE                                                                |
| XIP_ENC.ENABLE       | 0x57C  |          | Enable stream cipher for XIP                                                           |
| DMA_ENC.KEY0         | 0x580  |          | Bits 31:0 of DMA AES KEY                                                               |
| DMA_ENC.KEY1         | 0x584  |          | Bits 63:32 of DMA AES KEY                                                              |

| Register       | Offset | Security | Description                                                         |
|----------------|--------|----------|---------------------------------------------------------------------|
| DMA_ENC.KEY2   | 0x588  |          | Bits 95:64 of DMA AES KEY                                           |
| DMA_ENC.KEY3   | 0x58C  |          | Bits 127:96 of DMA AES KEY                                          |
| DMA_ENC.NONCE0 | 0x590  |          | Bits 31:0 of DMA NONCE                                              |
| DMA_ENC.NONCE1 | 0x594  |          | Bits 63:32 of DMA NONCE                                             |
| DMA_ENC.NONCE2 | 0x598  |          | Bits 95:64 of DMA NONCE                                             |
| DMA_ENC.ENABLE | 0x59C  |          | Enable stream cipher for XIP                                        |
| IFCONFIG1      | 0x600  |          | Interface configuration.                                            |
| STATUS         | 0x604  |          | Status register.                                                    |
| DPMDUR         | 0x614  |          | Set the duration required to enter/exit deep power-down mode (DPM). |
| ADDRCONF       | 0x624  |          | Extended address configuration.                                     |
| CINSTRCONF     | 0x634  |          | Custom instruction configuration register.                          |
| CINSTRDAT0     | 0x638  |          | Custom instruction data register 0.                                 |
| CINSTRDAT1     | 0x63C  |          | Custom instruction data register 1.                                 |
| IFTIMING       | 0x640  |          | SPI interface timing.                                               |

Table 120: Register overview

### 7.1.26.11.1 TASKS\_ACTIVATE

Address offset: 0x000

Activate QSPI interface

Triggering this task activates the external flash memory interface and initiates communication with the external memory. The READY event is generated when the activation has been completed.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |   Address offset: 0x634

Custom instruction configuration register.

A new custom instruction is sent every time this register is written. The READY event will be generated when the custom instruction has been sent.

## 7.1.27 RADIO — 2.4 GHz radio

The 2.4 GHz radio transceiver is compatible with multiple radio standards such as 1 Mbps and 2 Mbps *Bluetooth* Low Energy modes, Long Range (125 kbps and 500 kbps) *Bluetooth* Low Energy modes, IEEE 802.15.4 250 kbps mode, as well as Nordic's proprietary 1 Mbps and 2 Mbps modes.

Listed here are main features for the RADIO:

- Multidomain 2.4 GHz radio transceiver
  - 1 Mbps and 2 Mbps *Bluetooth* Low Energy modes
  - Long Range (125 kbps and 500 kbps) *Bluetooth* Low Energy modes
  - Angle-of-arrival (AoA) and angle-of-departure (AoD) direction finding using *Bluetooth* Low Energy
  - IEEE 802.15.4 250 kbps mode
  - 1 Mbps and 2 Mbps Nordic proprietary modes
- Best in class link budget and low power operation
- Efficient data interface with EasyDMA support
- Automatic address filtering and pattern matching

EasyDMA, in combination with an automated packet assembler, packet disassembler, automated CRC generator and CRC checker, makes it easy to configure and use the RADIO. See the following figure for details.

Figure 135: RADIO block diagram

The RADIO includes a device address match unit and an interframe spacing control unit that can be utilized to simplify address whitelisting and interframe spacing respectively in *Bluetooth* low energy and similar applications.

The RADIO also includes a received signal strength indicator (RSSI) and a bit counter. The bit counter generates events when a preconfigured number of bits are sent or received by the RADIO.

### 7.1.27.1 Packet configuration

A RADIO packet contains the fields PREAMBLE, ADDRESS, S0, LENGTH, S1, PAYLOAD, and CRC. For Long Range (125 kbps and 500 kbps) *Bluetooth* Low Energy modes, fields CI, TERM1 and TERM2 are also included.

The content of a RADIO packet is illustrated in the figures below. The RADIO sends the fields in the packet according to the order illustrated in the figures, starting on the left.

Figure 136: On-air packet layout

Figure 137: On-air packet layout for Long Range (125 kbps and 500 kbps) Bluetooth Low Energy modes

Not shown in the figures is the static payload add-on (the length of which is defined in [PCNF1.STATLEN](#), and which is 0 bytes in a standard BLE packet). The static payload add-on is sent between PAYLOAD and CRC fields. The RADIO sends the different fields in the packet in the order they are illustrated above, from left to right.

PREAMBLE is sent with least significant bit first on air. The size of the PREAMBLE depends on the mode selected in the [MODE](#) register:

- The PREAMBLE is one byte for [MODE](#) = Ble\_1Mbit as well as all Nordic proprietary operating modes ([MODE](#) = Nrf\_1Mbit and [MODE](#) = Nrf\_2Mbit), and [PCNF0.PLEN](#) has to be set accordingly. If the first bit of the ADDRESS is 0, the preamble will be set to 0xAA. Otherwise the PREAMBLE will be set to 0x55.
- For [MODE](#) = Ble\_2Mbit, the PREAMBLE must be set to 2 byte through [PCNF0.PLEN](#). If the first bit of the ADDRESS is 0, the preamble will be set to 0xAAAA. Otherwise the PREAMBLE will be set to 0x5555.
- For [MODE](#) = Ble\_LR125Kbit and [MODE](#) = Ble\_LR500Kbit, the PREAMBLE is 10 repetitions of 0x3C.
- For [MODE](#) = leee802154\_250Kbit, the PREAMBLE is 4 bytes and set to all zeros.

Radio packets are stored in memory inside instances of a RADIO packet data structure as illustrated below. The PREAMBLE, ADDRESS, CI, TERM1, TERM2, and CRC fields are omitted in this data structure. Fields S0, LENGTH, and S1 are optional.

Figure 138: In-RAM representation of RADIO packet

The byte ordering on air is always least significant byte first for the ADDRESS and PAYLOAD fields, and most significant byte first for the CRC field. The ADDRESS fields are always transmitted and received least significant bit first. The CRC field is always transmitted and received most significant bit first. The endianness, i.e. the order in which the bits are sent and received, of the S0, LENGTH, S1, and PAYLOAD fields can be configured via [PCNF1.ENDIAN](#).

The sizes of the S0, LENGTH and S1 fields can be individually configured via SOLEN, LFLEN, and S1LEN in [PCNF0](#) respectively. If any of these fields are configured to be less than 8 bits, the least significant bits of the fields are used.

If S0, LENGTH, or S1 are specified with zero length, their fields will be omitted in memory. Otherwise each field will be represented as a separate byte, regardless of the number of bits in their on-air counterpart.

Independent of the configuration of [PCNF1.MAXLEN](#), the combined length of S0, LENGTH, S1, and PAYLOAD cannot exceed 258 bytes.

### 7.1.27.2 Address configuration

The on-air radio ADDRESS field is composed of two parts, the base address field and the address prefix field.

The size of the base address field is configurable via **PCNF1.BALEN**. The base address is truncated from the least significant byte if the **PCNF1.BALEN** is less than 4. See [Table 121: Definition of logical addresses](#) on page 411.

| Logical address | Base address | Prefix byte |
|-----------------|--------------|-------------|
| 0               | BASE0        | PREFIX0.AP0 |
| 1               | BASE1        | PREFIX0.AP1 |
| 2               | BASE1        | PREFIX0.AP2 |
| 3               | BASE1        | PREFIX0.AP3 |
| 4               | BASE1        | PREFIX1.AP4 |
| 5               | BASE1        | PREFIX1.AP5 |
| 6               | BASE1        | PREFIX1.AP6 |
| 7               | BASE1        | PREFIX1.AP7 |

Table 121: Definition of logical addresses

The on-air addresses are defined in the **BASE0/BASE1** and **PREFIX0/PREFIX1** registers. It is only when writing these registers that the user must relate to the actual on-air addresses. For other radio address registers, such as the **TXADDRESS**, **RXADDRESSES**, and **RXMATCH** registers, logical radio addresses ranging from 0 to 7 are being used. The relationship between the on-air radio addresses and the logical addresses is described in [Table 121: Definition of logical addresses](#) on page 411.

### 7.1.27.3 Data whitening

The RADIO is able to do packet whitening and de-whitening, enabled in **PCNF1.WHITEEN**. When enabled, whitening and de-whitening will be handled by the RADIO automatically as packets are sent and received.

The whitening word is generated using polynomial  $g(D) = D^7 + D^4 + 1$ , which then is XORed with the data packet that is to be whitened, or de-whitened. See the figure below.

Figure 139: Data whitening and de-whitening

Whitening and de-whitening will be performed over the whole packet except for the preamble and the address fields.

Including the address field in CRC check (**CRCNF.SKIPADDR=Include**) is not supported for whitened packets.

The linear feedback shift register in the figure above is initialized via **DATAWHITEIV**.

### 7.1.27.4 CRC

The CRC generator in the RADIO calculates the CRC over the whole packet excluding the preamble. If desirable, the address field can be excluded from the CRC calculation as well.

See [CRCCNF](#) register for more information.

The CRC polynomial is configurable as illustrated in the following figure, where bit 0 in the [CRCPOLY](#) register corresponds to  $X^0$  and bit 1 corresponds to  $X^1$  etc. See [CRCPOLY](#) on page 467 for more information.

Figure 140: CRC generation of an  $n$  bit CRC

The figure shows that the CRC is calculated by feeding the packet serially through the CRC generator. Before the packet is clocked through the CRC generator, the CRC generator's latches  $b_0$  through  $b_n$  will be initialized with a predefined value specified in the [CRCINIT](#) register. After the whole packet has been clocked through the CRC generator,  $b_0$  through  $b_n$  will hold the resulting CRC. This value will be used by the RADIO during both transmission and reception. Latches  $b_0$  through  $b_n$  are not available to be read by the CPU at any time. However, a received CRC can be read by the CPU via the [RXCRC](#) register.

The length ( $n$ ) of the CRC is configurable, see [CRCCNF](#) for more information.

Once the entire packet, including the CRC, has been received and no errors were detected, the RADIO generates a [CRCOK](#) event. If CRC errors were detected, a [CRCERROR](#) event is generated.

The status of the CRC check can be read from the [CRCSTATUS](#) register after a packet has been received.

### 7.1.27.5 Radio states

Tasks and events are used to control the operating state of the RADIO.

The RADIO can enter the states described the table below.

| State     | Description                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------|
| DISABLED  | No operations are going on inside the RADIO and the power consumption is at a minimum                |
| RXRU      | The RADIO is ramping up and preparing for reception                                                  |
| RXIDLE    | The RADIO is ready for reception to start                                                            |
| RX        | Reception has been started and the addresses enabled in the RXADDRESSES register are being monitored |
| TXRU      | The RADIO is ramping up and preparing for transmission                                               |
| TXIDLE    | The RADIO is ready for transmission to start                                                         |
| TX        | The RADIO is transmitting a packet                                                                   |
| RXDISABLE | The RADIO is disabling the receiver                                                                  |
| TXDISABLE | The RADIO is disabling the transmitter                                                               |

Table 122: RADIO state diagram

A state diagram showing an overview of the RADIO is shown in the following figure.

Figure 141: Radio states

This figure shows how the tasks and events relate to the RADIO's operation. The RADIO does not prevent a task from being triggered from the wrong state. If a task is triggered from the wrong state, for example if the **RXEN** task is triggered from the **RXDISABLE** state, this may lead to incorrect behavior. The **PAYLOAD** event is always generated even if the payload is zero.

The END to START shortcut should not be used with IEEE 802.15.4 250 kbps mode. Use the PHYEND to START shortcut instead.

The END to START shortcut should not be used with Long Range (125 kbps and 500 kbps) *Bluetooth* Low Energy modes. Use the PHYEND to START shortcut instead.

### 7.1.27.6 Transmit sequence

Before the RADIO is able to transmit a packet, it must first ramp-up in TX mode. See TXRU in [Figure 141: Radio states](#) on page 413 and [Figure 142: Transmit sequence](#) on page 414. A TXRU ramp-up sequence is initiated when the **TXEN** task is triggered. After the RADIO has successfully ramped up it will generate the **READY** event indicating that a packet transmission can be initiated. A packet transmission is initiated by triggering the **START** task. The **START** task can first be triggered after the RADIO has entered into the TXIDLE state.

The following figure illustrates a single packet transmission where the CPU manually triggers the different tasks needed to control the flow of the RADIO, i.e. no shortcuts are used. If shortcuts are not used, a certain amount of delay caused by CPU execution is expected between **READY** and **START**, and between **END** and **DISABLE**. As illustrated in [Figure 142: Transmit sequence](#) on page 414 the RADIO will by default transmit '1's between **READY** and **START**, and between **END** and **DISABLE**. What is transmitted can be programmed through the DTX field in the **MODECNFO** register.

Figure 142: Transmit sequence

The following figure shows a slightly modified version of the transmit sequence where the RADIO is configured to use shortcuts between **READY** and **START**, and between **END** and **DISABLE**, which means that no delay is introduced.

Figure 143: Transmit sequence using shortcuts to avoid delays

The RADIO is able to send multiple packets one after the other without having to disable and re-enable the RADIO between packets, as illustrated in the following figure.

Figure 144: Transmission of multiple packets

### 7.1.27.7 Receive sequence

Before the RADIO is able to receive a packet, it must first ramp up in RX mode, see RXRU in [Figure 141: Radio states](#) on page 413 and [Figure 145: Receive sequence](#) on page 415.

An RXRU ramp up sequence is initiated when the **RXEN** task is triggered. After the RADIO has successfully ramped up it will generate the **READY** event indicating that a packet reception can be initiated. A packet reception is initiated by triggering the **START** task. As illustrated in [Figure 141: Radio states](#) on page 413, the **START** task can first be triggered after the RADIO has entered into the RXIDLE state.

The following figure shows a single packet reception where the CPU manually triggers the different tasks needed to control the flow of the RADIO, i.e. no shortcuts are used. If shortcuts are not used, a certain amount of delay caused by CPU execution is expected between **READY** and **START**, and between **END** and **DISABLE**. The RADIO will be listening and possibly receiving undefined data, represented with an 'X', from **START** and until a packet with valid preamble (P) is received.

Figure 145: Receive sequence

The following figure shows a slightly modified version of the receive sequence, where the RADIO is configured to use shortcuts between **READY** and **START**, and between **END** and **DISABLE**, which means that no delay is introduced.

Figure 146: Receive sequence using shortcuts to avoid delays

The RADIO is able to receive consecutive packets without having to disable and re-enable the RADIO between packets, as illustrated in the figure below.

Figure 147: Reception of multiple packets

#### 7.1.27.8 Received signal strength indicator (RSSI)

The RADIO implements a mechanism for measuring the power in the received signal. This feature is called received signal strength indicator (RSSI).

The RSSI is measured continuously and the value filtered using a single-pole IIR filter. After a signal level change, the RSSI will settle after approximately `RSSISETTLE`.

Sampling of the received signal strength is started by using the `RSSISTART` task. The sample can be read from the `RSSISAMPLE` register.

The sample period of the RSSI is defined by `RSSIPERIOD`. The `RSSISAMPLE` will hold the filtered received signal strength after this sample period.

For the RSSI sample to be valid, the RADIO has to be enabled in receive mode (`RXEN` task) and the reception has to be started (`READY` event followed by `START` task).

#### 7.1.27.9 Interframe spacing (IFS)

Interframe spacing (IFS) is defined as the time, in microseconds, between two consecutive packets, starting from when the end of the last bit of the previous packet is received, to the beginning of the first bit of the subsequent packet that is transmitted. The RADIO is able to enforce this interval, as specified in the `TIFS` register, as long as the `TIFS` is not specified to be shorter than the RADIO's turnaround time, i.e. the time needed to switch off the receiver, and then switch the transmitter back on. The `TIFS` register can be written any time before the last bit on air is received.

This timing is illustrated in the figure below.

Figure 148: IFS timing detail

The TIFS duration starts after the last bit on air (just before the **END** event), and elapses with first bit being transmitted on air (just after **READY** event).

TIFS is only enforced if the shortcuts **END** to **DISABLE** and **DISABLED** to **TXEN** or **END** to **DISABLE** and **DISABLED** to **RXEN** are enabled.

TIFS is qualified for use in IEEE 802.15.4 250kbps mode, Long Range (125 kbps and 500 kbps) *Bluetooth* Low Energy modes, 1 Mbps and 2 Mbps *Bluetooth* Low Energy modes, using the default ramp-up mode.

**SHORTS** and **TIFS** registers are not double-buffered, and can be updated at any point before the last bit on air is received. The **MODE** register is double-buffered and sampled at the **TXEN** or **RXEN** task.

#### 7.1.27.10 Device address match

The device address match feature is tailored for address whitelisting in *Bluetooth* low energy and similar implementations.

This feature enables on-the-fly device address matching while receiving a packet on air. This feature only works in receive mode and when the RADIO is configured for little endian, see **PCNF1.ENDIAN**.

The device address match unit assumes that the first 48 bits of the payload are the device address and that bit number 6 in S0 is the TxAdd bit. See the *Bluetooth* Core Specification for more information about device addresses, TxAdd, and whitelisting.

The RADIO is able to listen for eight different device addresses at the same time. These addresses are specified in a DAB/DAP register pair, one pair per address, in addition to a TxAdd bit configured in the DACNF register. The DAB register specifies the 32 least significant bits of the device address, while the DAP register specifies the 16 most significant bits of the device address.

Each of the device addresses can be individually included or excluded from the matching mechanism. This is configured in the **DACNF** register.

#### 7.1.27.11 Bit counter

The RADIO implements a simple counter that can be configured to generate an event after a specific number of bits have been transmitted or received.

By using shortcuts, this counter can be started from different events generated by the RADIO and count relative to these.

The bit counter is started by triggering the **BCSTART** task, and stopped by triggering the **BCSTOP** task. A **BCMATCH** event will be generated when the bit counter has counted the number of bits specified in the **BCC** register. The bit counter will continue to count bits until the **DISABLED** event is generated or until the **BCSTOP** task is triggered. The CPU can therefore, after a **BCMATCH** event, reconfigure the **BCC** value for new **BCMATCH** events within the same packet.

The bit counter can only be started after the RADIO has received the **ADDRESS** event.

The bit counter will stop and reset on either the **BCSTOP**, **STOP**, or **DISABLE** task, or the **END** event.

The figure below illustrates how the bit counter can be used to generate a **BCMATCH** event in the beginning of the packet payload, and again generate a second **BCMATCH** event after sending 2 bytes (16 bits) of the payload.

Figure 149: Bit counter example

### 7.1.27.12 Direction finding

The RADIO implements the Angle-of-Arrival (AoA) and Angle-of-Departure (AoD) Bluetooth Low Energy feature, which can be used to determine the direction of a peer device. The feature is available for the BLE 1 Mbps and BLE 2 Mbps modes.

When using this feature, the transmitter sends a packet with a continuous tone extension (CTE) appended to the packet, after the CRC. During the CTE, the receiver can take IQ samples of the incoming signal.

An antenna array is employed at the transmitter (AoD) or at the receiver (AoA). The AoD transmitter, or AoA receiver, switches between the antennas, in order to collect IQ samples from the different antenna pairs. The IQ samples can be used to calculate the relative path lengths between the antenna pairs, which can be used to estimate the direction of the transmitter.

#### 7.1.27.12.1 CTE format

The CTE is from 16  $\mu$ s to 160  $\mu$ s and consists of an unwhitened sequence of 1's, equivalent to a continuous tone nominally offset from the carrier by +250 kHz for the 1 Mbps PHY and +500 kHz for the 2 Mbps BLE PHYs. The format of the CTE, when switching and/or sampling, is shown below.

Figure 150: Constant tone extension (CTE) structure

Antenna switching is performed during switch slots and the guard period. The AoA/AoD feature requires that one IQ sample is taken for each microsecond within the reference period, and once for each sample slot. Oversampling is possible by changing the sample spacing as described in [IQ sampling](#) on page 422. The switch slot and sample slot durations are either 1 or 2  $\mu$ s, but must be equal. The format of the CTE and switching and sampling procedures may be configured prior to, or during, packet transmission and reception. Alternatively, during packet reception, these operations can be configured by reading specific fields of the packet contents.

### 7.1.27.12.2 Mode

Depending on the [DFEMODE](#), the device performs the following procedures:

|                   |                                           | DFEMODE |    |     |    |
|-------------------|-------------------------------------------|---------|----|-----|----|
|                   |                                           | AOA     |    | AOD |    |
|                   |                                           | TX      | RX | TX  | RX |
| AoA/AoD Procedure | Generating and transmitting CTE           | x       |    | x   |    |
|                   | Receiving, interpreting, and sampling CTE |         | x  |     | x  |
|                   | Antenna switching                         |         | x  | x   |    |

Table 123: AoA/AoD Procedures performed as a function of DFEMODE and TX/RX mode

### 7.1.27.12.3 Inline configuration

When inline configuration is enabled during RX, further configuration of the AoA/AoD procedures is performed based on the values of the CP bit and the CTEInfo octet within the packet. This is enabled by setting [CTEINLINECONF.CTEINLINCTRLIN](#). The CTEInfo octet is present only if the CP bit is set. The position of the CP bit and CTEInfo octet depends on whether the packet has a *Data Channel PDU* ([CTEINLINECONF.CTEINFOINS1=InS1](#)), or an *Advertising Channel PDU* ([CTEINLINECONF.CTEINFOINS1=NotInS1](#)).

#### Data channel PDU

For Data Channel PDUs, [PCNF0.SOLEN](#) must be 1 byte, and [PCNF0.LFLEN](#) must be 8 bits. To determine if S1 is present, the registers [CTEINLINECONF.SOMASK](#) and [CTEINLINECONF.SOCONF](#) forms a bitwise mask-and-test for the S0 field. If the bitwise AND between S0 and SOMASK equals SOCONF, then S1 is determined to be present. When present, the value of [PCNF0.S1LEN](#) will be ignored, as this is decided by the CP bit in the the following figure.

Figure 151: Data channel PDU header

When encrypting and decrypting BLE packets using the [CCM](#) peripheral, it is also required to set [PCNF0.S1INCL=1](#). The CCM mode must be configured to use an 8-bit length field. The value of the CP bit is included in the calculation of the MIC, while the S1 field is ignored by the CCM calculation.

#### Advertising channel PDU

For advertising channel PDUs, the CTEInfo Flag replaces the CP bit. The CTEInfo Flag is within the extended header flag field in some of the advertising PDUs that employ the common extended advertising payload format (i.e. [AUX\\_SYNC\\_IND](#), [AUX\\_CHAIN\\_IND](#)). The format of such packets is shown in the following figure.

The `CTEINLINECONF.S0CONF` and `CTEINLINECONF.S0MASK` fields can be configured to accept only certain advertising PDU Types. If the extended header length is non-zero, the CTEInfo extended header flag is checked to determine whether CTEInfo is present. If a bit before the CTEInfo flag within the extended header flags is set, then the CTEInfo position is postponed 6 octets.

The CTEInfo field is shown in the following figure.

The CTETIME field defines the length of the CTE in 8  $\mu$ s units. The valid upper bound of values can be adjusted using [CTEINLINECONF.CTETIMEVALIDRANGE](#), including allowing use of the RFU bit within this field. If the CTETIME field is an invalid value of either 0 or 1, the CTE is assumed to be the minimum valid length of 16  $\mu$ s. The slot duration is determined by the CTEType field. In RX this determines whether the sample spacing as defined in [CTEINLINECONF.CTEINLINERXMODE1US](#) or [CTEINLINECONF.CTEINLINERXMODE2US](#) is used.

| CTEType | Description             | TX switch spacing | RX sample spacing during reference period | Sample spacing RX during reference period |
|---------|-------------------------|-------------------|-------------------------------------------|-------------------------------------------|
| 0       | AoA, no switching       | -                 | TSAMPLESPACING1                           | TSAMPLESPACING2                           |
| 1       | AoD, 1 $\mu$ s slots    | 2 $\mu$ s         | TSAMPLESPACING1                           | CTEINLINERXMODE1US                        |
| 2       | AoD, 2 $\mu$ s slots    | 4 $\mu$ s         | TSAMPLESPACING1                           | CTEINLINERXMODE2US                        |
| 3       | Reserved for future use |                   |                                           |                                           |

Table 124: Switching and sampling spacing based on CTEType

If [CTEINLINECONF.CTEINLINERLEN](#) is not set, then the packet is not parsed to determine the CTE parameters, and the antenna switching and sampling is controlled by other registers, see [Antenna switching](#) on page 421. The length of the CTE is given in 8  $\mu$ s units by [DFECTRL1.NUMBEROF8US](#). The start of the antenna switching and/or sampling (denoted as an AoA/AoD procedure), can be configured to start at some trigger with an additional offset. Using [DFECTRL1.DFEINEXTENSION](#), the trigger can be configured to be the end of the CRC, or alternatively, the ADDRESS event. The additional offset for antenna switching is configured using [DFECTRL2.TSWITCHOFFSET](#). Similarly, the additional offset for antenna sampling is configured using [DFECTRL2.TSAMPLEOFFSET](#).

The addition of the CTE to the transmitted packet is illustrated in the following figure.

Figure 154: Transmit sequence with DFE

The presence of CTE within a received packet is signalled by the **CTEPRESENT** and **CTEWARNING** events illustrated in the figure below.

Figure 155: Receive sequence with DFE

### 7.1.27.12.6 Antenna switching

The RADIO can control up to 8 GPIO pins in order to control external antenna switches used in direction finding.

#### Pin configuration

The eight antenna selection signals are mapped to physical pins according to the pin numbers specified in the **PSEL.DFEGPIO[n]** registers. Only pins that have the **PSEL.DFEGPIO[n].CONNECTED** field set to *Connected* will be controlled by the RADIO. Pins that are *Disconnected* will be controlled by GPIO.

During transmission in AoD TX mode or reception in AoA RX mode, the RADIO automatically acquires the pins as needed. At times when the RADIO does not use the pin, the pin is released to its default state and controlled by the **GPIO** configuration. Thus, the pin must be configured using the **GPIO** peripheral.

| Pin acquired by RADIO | Direction                | Value                             | Comment                                                                                |
|-----------------------|--------------------------|-----------------------------------|----------------------------------------------------------------------------------------|
| Yes                   | Output                   | Specified in <b>SWITCHPATTERN</b> | Pin acquired by RADIO, and in use for DFE.                                             |
| No                    | Specified by <b>GPIO</b> | Specified by <b>GPIO</b>          | DFE not in progress. Pin has not been acquired by RADIO, but is available for DFE use. |

Table 125: Pin configuration matrix for a connected and enabled pin [n]

## Switch pattern configuration

The values of the GPIOs while switching during the CTE are configured by writing successively to the **SWITCHPATTERN** register. The first write to **SWITCHPATTERN** is the GPIO pattern applied from the call of **TASKS\_TXEN** or **TASKS\_RXEN** until the first antenna switch is triggered. The second write sets the pattern for the reference period and is applied at the start of the guard period. The following writes set the pattern for the remaining switch slots and are applied at the start of each switch slot. If writing beyond the total number of antenna slots, the pattern will wrap to **SWITCHPATTERN[2]** and start over again. During operation, when the end of the **SWITCHPATTERN** buffer is reached, the RADIO cycles back to **SWITCHPATTERN[2]**. At the end of the AoA/AoD procedure, **SWITCHPATTERN[0]** is applied to **DFECTRL1.TSWITCHSPACING** after the previous antenna switch. The **SWITCHPATTERN** buffer can be erased/cleared using **CLEARPATTERN**.

A minimum number of three patterns must be written to the **SWITCHPATTERN** register.

If **CTEINLINECONF.CTEINLINECTRLLEN** is not set, then the antenna switch spacing is determined by **DFECTRL1.TSWITCHSPACING** (otherwise described by [Table 124: Switching and sampling spacing based on CTEType](#) on page 420). **DFECTRL2.TSWITCHOFFSET** determines the position of the first switch compared to the configurable start of CTE (see **DFECTRL1.DFEINEXTENSION**).

### 7.1.27.12.7 IQ sampling

The RADIO uses DMA to write IQ samples recorded during the CTE to RAM. Alternatively, the magnitude and phase of the samples can be recorded using the **DFECTRL1.SAMPLETYPE** field. The samples are written to the location in RAM specified by **DFEPACKET.PTR**. The maximum number of samples to transfer are specified by **DFEPACKET.MAXCNT** and the number of samples transferred are given in **DFEPACKET.AMOUNT**. The IQ samples are recorded with respect to the RX carrier frequency. The format of the samples is provided in the following table.

| SAMPLETYPE       | Field     | Bits  | Description                                                                                           |
|------------------|-----------|-------|-------------------------------------------------------------------------------------------------------|
| 0: I_Q (default) | Q         | 31:16 | 12 bits signed, sign extended to 16 bits                                                              |
|                  | I         | 15:0  |                                                                                                       |
| 1: MagPhase      | reserved  | 31:29 | Always zero                                                                                           |
|                  | magnitude | 28:16 | 13 bits unsigned. Equals $1.646756 \cdot \sqrt{I^2 + Q^2}$                                            |
|                  | phase     | 15:0  | 9 bits signed, sign extended to 16 bits. Equals $64 \cdot \text{atan2}(Q, I)$ in the range [-201,201] |

Table 126: Format of samples

Oversampling is configured separately for the reference period and for the time after the reference period. During the reference period, the sample spacing is determined by **DFECTRL1.TSAMPLESPACINGREF**. **DFECTRL2.TSAMPLEOFFSET** determines the position of the first sample relative to the end of the last bit of the CRC.

For the time after the reference period, if **CTEINLINECONF.CTEINLINECTRLLEN** is disabled, the sample spacing is set in **DFECTRL1.TSAMPLESPACING**. However, when **CTEINLINECONF.CTEINLINECTRLLEN** is enabled, the sample spacing are determined by two different registers, depending on whether the device is in AoA or AoD RX-mode, as follows.

For AoD RX mode, the sample spacing after the reference period is determined by the CTEType in the packet, as listed in the table below.

| CTEType             | Sample spacing                          |
|---------------------|-----------------------------------------|
| AoD 1 $\mu$ s slots | <b>CTEINLINECONF.CTEINLINERXMODE1US</b> |
| AoD 2 $\mu$ s slots | <b>CTEINLINECONF.CTEINLINERXMODE2US</b> |
| Other               | <b>DFECTRL1.TSAMPLESPACING</b>          |

Table 127: Sample spacing when **CTEINLINECONF.CTEINLINECTRLLEN** is set and the device is in AoD RX mode

For AoA RX mode, the sample spacing after the reference period is determined by [DFECTRL1.TSWITCHSPACING](#), as listed in the table below.

| <a href="#">DFECTRL1.TSWITCHSPACING</a> | Sample spacing                                   |
|-----------------------------------------|--------------------------------------------------|
| 2 $\mu$ s                               | <a href="#">CTEINLINECONF.CTEINLINERXMODE1US</a> |
| 4 $\mu$ s                               | <a href="#">CTEINLINECONF.CTEINLINERXMODE2US</a> |
| Other                                   | <a href="#">DFECTRL1.TSAMPLESPACING</a>          |

Table 128: Sample spacing when [CTEINLINECONF.CTEINLINECTRLLEN](#) is set and the device is in AoA RX mode

For the reference- and switching periods, [DFECTRL1.TSAMPLESPACINGREF](#) and [DFECTRL1.TSAMPLESPACING](#) can be used to achieve oversampling.

### 7.1.27.13 IEEE 802.15.4 operation

With the [MODE=ieee802154\\_250kbit](#) the RADIO will comply with the IEEE 802.15.4-2006 standard implementing its 250 kbps, 2450 MHz, O-QPSK PHY.

The IEEE 802.15.4 standard differs from Nordic's proprietary and *Bluetooth* low energy modes. Notable differences include modulation scheme, channel structure, packet structure, security, and medium access control.

The main features of the IEEE 802.15.4 mode are:

- Ultra-low power 250 kbps, 2450 MHz, IEEE 802.15.4-2006 compliant link
- Clear channel assessment
- Energy detection scan
- CRC generation

#### 7.1.27.13.1 Packet structure

The IEEE 802.15.4 standard defines an on-the-air frame/packet that is different from what is used in BLE mode.

The following figure provides an overview of the physical frame structure and its timing.

Figure 156: IEEE 802.15.4 frame format (PPDU)

The standard uses the term *octet* for an 8-bit storage unit within the PPDU. For timing, the value *symbol* is used, and it has a duration of 16  $\mu$ s.

The total usable payload (PSDU) is 127 octets, but when CRC is in use, this is reduced to 125 octets of usable payload.

The preamble sequence consists of four octets that are all zero, and are used for synchronizing the RADIO's receiver. Following the preamble is the single octet *start of frame delimiter (SFD)*, with a fixed value of 0xA7. An alternate SFD can be programmed through the [SFD](#) register, providing an initial level of frame filtering for those who choose non-standard compliance. It is a valuable feature when operating in a congested or private network. The preamble sequence and the SFD are generated by the RADIO, and are not programmed by the user into the frame buffer.

Following the five octet *synchronization header (SHR)* is the single octet *phy header (PHR)*. The least significant seven bits of PHR denote the frame length of the following PSDU. The most significant bit is reserved and is set to zero for frames that are standard compliant. The RADIO reports all eight bits which can be used to carry additional information. The PHR is the first byte written to the frame data memory pointed to by [PACKETPTR](#). Frames with zero length are discarded, and the [FRAMESTART](#) event is not generated in this case.

The next N octets carry the data of the PHY packet, where N equals the value of the PHR. For an implementation also using the IEEE 802.15.4 MAC layer, the PHY data is a MAC frame of N-2 octets, since two octets occupy a CRC field.

As illustrated in the figure below, an IEEE 802.15.4 MAC layer frame always consists of

- A header:
  - The frame control field (FCF)
  - The sequence number
  - Addressing fields
- A payload
- The 16-bit frame control sequence (FCS)

Figure 157: IEEE 802.15.4 frame format (MPDU)

The two FCF octets contain information about the frame type, addressing, and other control flags. This field is decoded when using the assisted operating modes offered by the RADIO.

The sequence number is a single octet in size and is unique for a frame. It is used in the associated acknowledgement frame sent upon successful frame reception.

The addressing field can be zero (acknowledgement frame) or up to 20 octets in size. The field is used to direct packets to the correct recipient and denote its origin. IEEE 802.15.4 bases its addressing on networks being organized in PANs with 16-bit identifier and nodes having a 16-bit or 64-bit address. In the assisted receive mode, these parameters are analyzed for address matching and acknowledgement.

The MAC payload carries the data of the next higher layer, or in the case of a MAC command frame, information used by the MAC layer itself.

The two last octets contain the 16-bit ITU-T CRC. The FCS is calculated over the MAC header (MHR) and MAC payload (MSDU) parts of the frame. This field is calculated automatically when sending a frame, or indicated in the [CRCSTATUS](#) register when a frame is received. If configured, this feature is taken care of autonomously by the CRC module.

### 7.1.27.13.2 Operating frequencies

The IEEE 802.15.4 standard defines 16 channels, 11 - 26, of 5 MHz each, in the 2450 MHz frequency band.

To choose the correct channel center frequency, the **FREQUENCY** register must be programmed according to the table below.

| IEEE 802.15.4 channel | Center frequency (MHz) | FREQUENCY setting |
|-----------------------|------------------------|-------------------|
| Channel 11            | 2405                   | 5                 |
| Channel 12            | 2410                   | 10                |
| Channel 13            | 2415                   | 15                |
| Channel 14            | 2420                   | 20                |
| Channel 15            | 2425                   | 25                |
| Channel 16            | 2430                   | 30                |
| Channel 17            | 2435                   | 35                |
| Channel 18            | 2440                   | 40                |
| Channel 19            | 2445                   | 45                |
| Channel 20            | 2450                   | 50                |
| Channel 21            | 2455                   | 55                |
| Channel 22            | 2460                   | 60                |
| Channel 23            | 2465                   | 65                |
| Channel 24            | 2470                   | 70                |
| Channel 25            | 2475                   | 75                |
| Channel 26            | 2480                   | 80                |

Table 129: IEEE 802.15.4 center frequency definition

### 7.1.27.13.3 Energy detection (ED)

As required by the IEEE 802.15.4 standard, it must be possible to sample the received signal power within the bandwidth of a channel, for the purpose of determining presence of activity.

To prevent the channel signal from being decoded, the shortcut between the **READY** event and the **START** task should be disabled before putting the RADIO in receive mode. The energy detection (ED) measurement time, where RSSI samples are averaged, is 8 symbol periods, corresponding to 128  $\mu$ s. The standard further specifies the measurement to be a number between 0 and 255, where 0 shall indicate received power less than 10 dB above the selected receiver sensitivity. The power range of the ED values must be at least a 40 dB linear mapping with accuracy of  $\pm 6$  dB. See section 6.9.7 *Receiver ED* in the IEEE 802.15.4 standard for further details.

The following example shows how to perform a single energy detection measurement and convert to IEEE 802.15.4 scale.

#### IEEE 802.15.4 ED measurement example

```
#define ED_RSSISCALE 4 // From electrical specifications
uint8_t sample_ed(void)
{
    int val;
    NRF_RADIO->TASKS_EDSTART = 1; // Start
    while (NRF_RADIO->EVENTS_EDEND != 1) {
        // CPU can sleep here or do something else
        // Use of interrupts are encouraged
    }
    val = NRF_RADIO->EDSAMPLE; // Read level
    return (uint8_t)(val > 63 ? 255 : val * ED_RSSISCALE); // Convert to IEEE 802.15.4 scale
}
```

For scaling between hardware value and dBm, see equation [Figure 159: Conversion between hardware value and dBm](#) on page 427.

The `mlme-scan.req` primitive of the MAC layer uses the ED measurement to detect channels where there might be wireless activity. To assist this primitive, a tailored mode of operation is available where the ED measurement runs for a defined number of iterations keeping track of the maximum ED level. This is engaged by writing the `EDCNT` register to a value different from 0, where it will run the specified number of iterations and report the maximum energy measurement in the `EDSAMPLE` register. The scan is started with `EDSTART` task and its end indicated with the `EDEND` event. This significantly reduces the interrupt frequency and therefore power consumption. The following figure shows how the ED measurement will operate depending on the `EDCNT` register.

Figure 158: Energy detection measurement examples

The scan is stopped by writing the `EDSTOP` task. It will be followed by the `EDSTOPPED` event when the module has terminated.

#### 7.1.27.13.4 Clear channel assessment (CCA)

IEEE 802.15.4 implements a listen-before-talk channel access method to avoid collisions when transmitting, known as *carrier sense multiple access with collision avoidance (CSMA-CA)*. The key part of this is measuring if the wireless medium is busy or not.

The following clear channel assesment modes are supported:

- **CCA Mode 1** (energy above threshold): The medium is reported busy upon detecting any energy above the ED threshold.
- **CCA Mode 2** (carrier sense only): The medium is reported busy upon detection of a signal compliant with the IEEE 802.15.4 standard with the same modulation and spreading characteristics.
- **CCA Mode 3** (carrier sense with energy above threshold): The medium is reported busy using a logical combination (AND/OR) between the results from CCA Mode 1 and CCA Mode 2.

The clear channel assessment should survey a period equal to 8 symbols or  $128 \mu\text{s}$ .

The RADIO must be in receive mode and be able to receive correct packets when performing the CCA. The shortcut between `READY` and `START` must be disabled if baseband processing is not to be performed while the measurement is running.

#### CCA Mode 1

**CCA Mode 1** is enabled by first configuring the field `CCACTRL.CCAMODE`=EdMode and writing the `CCACTRL.CCAEDTHRES` field to a chosen value. Once the `CCASTART` task is written, the RADIO will

perform a ED measurement for 8 symbols and compare the measured level with that found in the `CCACTRL.CCAEDTHRES` field. If the measured value is higher than or equal to this threshold, the `CCABUSY` event is generated. If the measured level is less than the threshold, the `CCAIDLE` event is generated.

## CCA Mode 2

*CCA Mode 2* is enabled by configuring `CCACTRL.CCAMODE=CarrierMode`. The RADIO will sample to see if a valid SFD is found during the 8 symbols. If a valid SFD is detected, the `CCABUSY` event is generated and the device should not send any data. The `CCABUSY` event is also generated if the scan was performed during an ongoing frame reception. In the case where the measurement period completes with no SFD detection, the `CCAIDLE` event is generated. With `CCACTRL.CCACORRCNT` not being zero, the algorithm will look at the correlator output in addition to the SFD detection signal. If a SFD is reported during the scan period, it will terminate immediately indicating busy medium. Similarly, if the number of peaks above `CCACTRL.CCACORRTHRES` crosses the `CCACTRL.CCACORRCNT`, the `CCACTRL.CCABUSY` event is generated. If less than `CCACORRCOUNT` crossings are found and no SFD is reported, the `CCAIDLE` event will be generated and the device can send data.

## CCA Mode 3

*CCA Mode 3* is enabled by configuring `CCACTRL.CCAMODE=CarrierAndEdMode` or `CCACTRL.CCAMODE=CarrierOrEdMode`, performing the required logical combination of the result from CCA Mode 1 and 2. The `CCABUSY` or `CCAIDLE` events are generated by ANDing or ORing the *energy above threshold* and *carrier detection* scans.

## Shortcuts

An ongoing CCA can always be stopped by issuing the `CCASTOP` task. This will trigger the associated `CCASTOPPED` event.

For CCA mode automation, a number of shortcuts are available.

- To automatically switch between RX (when performing the CCA) and to TX where the packet is sent, the shortcut between `CCAIDLE` and `TXEN`, in conjunction with the short between `CCAIDLE` and `STOP` must be used.
- To automatically disable the RADIO whenever the CCA reports a busy medium, the shortcut between `CCABUSY` and `DISABLE` can be used.
- To immediately start a CCA after ramping up into RX mode, the shortcut between `RXREADY` and `CCASTART` can be used.

## Conversion

The conversion from a `CCAEDTHRES`, `CCA`, or `EDLEVEL` value to dBm can be done with the following equation, where `VALHARDWARE` is the hardware-reported values, being either `CCAEDTHRES`, `CCA` or `EDLEVEL`, and constants `ED_RSSISCALE` and `ED_RSSIOFFS` are from electrical specifications.

$$P_{RF}[dBm] = ED\_RSSIOFFS + ED\_RSSISCALE \times VAL_{HARDWARE}$$

Figure 159: Conversion between hardware value and dBm

### 7.1.27.13.5 Cyclic redundancy check (CRC)

IEEE 802.15.4 uses a 16-bit ITU-T cyclic redundancy check (CRC) calculated over the MAC header (MHR) and MAC service data unit (MSDU).

The standard defines the following generator polynomial:

$$G(x) = x^{16} + x^{12} + x^5 + 1$$

In receive mode the RADIO will trigger the CRC module when the first octet after the frame length (PHR) is received. The CRC will then update on each consecutive octet received. When a complete frame is received the **CRCSTATUS** register will be updated accordingly and the **CRCOK** or **CRCERROR** events generated. When the CRC module is enabled it will not write the two last octets (CRC) to the frame Data RAM. When transmitting, the CRC will be computed on the fly, starting with the first octet after PHR, and inserted as the two last octets in the frame. The EasyDMA will fetch frame length minus 2 octets from RAM and insert the CRC octets insitu.

Below is a code snippet for configuring the CRC module for correct operation when in IEEE 802.15.4 mode. The **CRCNCF** is written to 16-bit CRC and the **CRCPOLY** is written to 0x11021. The start value used by IEEE 802.15.4 is zero and **CRCINIT** is configured to reflect this.

```
/* 16-bit CRC with ITU-T polynomial with 0 as start condition*/
NRF_RADIO->CRCCNF = ((RADIO_CRCCNF_SKIPADDR_Ieee802154 << RADIO_CRCCNF_SKIPADDR_Pos) |
                     (RADIO_CRCCNF_LEN_Two << RADIO_CRCCNF_LEN_Pos));
NRF_RADIO->CRCPOLY = 0x11021;
NRF_RADIO->CRCINIT = 0;
```

The ENDIANESS subregister must be set to little-endian since the FCS field is transmitted from left bit to right.

### 7.1.27.13.6 Transmit sequence

The transmission is started by first putting the RADIO in receive mode and triggering the **RXEN** task.

An outline of the IEEE 802.15.4 transmission is illustrated in the figure below.

Figure 160: IEEE 802.15.4 transmit sequence

The receiver will ramp up and enter the RXIDLE state where the **READY** event is generated. Upon receiving the ready event, the CCA is started by triggering the **CCASTART** task. The chosen mode of assessment (**CCACTRL.CCAMODE** register) will be performed and signal the **CCAIDLE** or **CCABUSY** event 128 µs later. If the **CCABUSY** event is received, the RADIO will have to retry the CCA after a specific back-off period. This is outlined in the *IEEE 802.15.4 standard, Figure 69 in section 7.5.1.4 The CSMA-CA algorithm*.

If the **CCAIDLE** event is generated, a write to the **TXEN** task register enters the RADIO in TXRU state. The **READY** event will be generated when the RADIO is in TXIDLE state and ready to transmit. With the **PACKETPTR** pointing to the length (PHR) field of the frame, the **START** task can be written. The RADIO will send the four octet preamble sequence followed by the start of frame delimiter (**SFD** register). The first byte read from the Data RAM is the length field (PHR) followed by the transmission of the number of bytes indicated as the frame length. If the CRC module is configured it will run for PHR-2 octets. The last two octets will be substituted with the results from running the CRC. The necessary CRC parameters are sampled on the **START** task. The FCS field of the frame is little endian.

In addition to the already available shortcuts, one is provided between **READY** event and **CCASTART** task so that a CCA can automatically start when the receiver is ready. A second shortcut has been added between

CCAIDLE event and the TXEN task, so that upon detecting a clear channel the RADIO can immediately enter transmit mode.

### 7.1.27.13.7 Receive sequence

The reception is started by first putting the RADIO in receive mode. After writing to the RXEN task, the RADIO will start ramping up and enter the RXRU state.

When the READY event is generated, the RADIO enters the RXIDLE mode. For the baseband processing to be enabled, the START task must be written. An outline of the IEEE 802.15.4 reception can be found in the figure below.

Figure 161: IEEE 802.15.4 receive sequence

When a valid SHR is received the RADIO will start storing future octets (starting with PHR) to the data memory pointed to by PACKETPTR. After the SFD octet is received the FRAMESTART event is generated. If the CRC module is enabled it will start updating with the second byte received (first byte in payload) and run for the full frame length. The two last bytes in the frame are not written to RAM when CRC is configured. However, if the result of the CRC after running the full frame is zero, the CRCOK event will be generated. The END event is generated when the last octet has been received and is available in data memory.

When a packet is received a link quality indicator (LQI) is also generated and appended immediately after the last received octet. When using an IEEE 802.15.4 compliant frame, this will be just after the MSDU since the FCS is not reported. In the case of a non-compliant frame it will be appended after the full frame. The LQI reported by hardware must be converted to IEEE 802.15.4 range by an 8-bit saturating multiplication by 4, as shown in IEEE 802.15.4 ED measurement example on page 425. The LQI is only valid for frames equal to or longer than three octets. When receiving a frame the RSSI (reported as negative dB) will be measured at three points during the reception. These three values will be sorted and the middle one selected (median 3) to be remapped within the LQI range. The following figure illustrates the LQI measurement and how the data is arranged in data memory.

Figure 162: IEEE 802.15.4 frame in data memory

A shortcut has been added between the **FRAMESTART** event and the **BCSTART** task. This can be used to trigger a **BCMATCH** event after N bits, such as when inspecting the MAC addressing fields.

### 7.1.27.13.8 Interframe spacing (IFS)

The IEEE 802.15.4 standard defines a specific time that is allotted for the MAC sublayer to process received data. Interframe spacing (IFS) is used to prevent that two frames are transmitted too close together. If the transmission is requesting an acknowledgement, the space before the second frame shall be at least one IFS period.

The IFS is determined to be one of the following:

- IFS equals `macMinSIFSPeriod` (12 symbols) if the MPDU is less than or equal to `aMaxSIFSFrameSize` (18 octets) octets
- IFS equals `macMinLIFSPeriod` (40 symbols) if the MPDU is larger than `aMaxSIFSFrameSize`

Using the efficient assisted modes in the RADIO, the **TIFS** will be programmed with the correct value based on the frame being transmitted. If the assisted modes are not being used the user must update the **TIFS** register manually. The figure below provides details on what IFS period is valid in both acknowledged and unacknowledged transmissions.

Figure 163: Interframe spacing examples

### 7.1.27.14 EasyDMA

The RADIO uses EasyDMA to read and write packets to RAM without CPU involvement.

As illustrated in [Figure 135: RADIO block diagram](#) on page 409, the RADIO's EasyDMA utilizes the same [PACKETPTR](#) for receiving and transmitting packets. This pointer should be reconfigured by the CPU each time before RADIO is started by the [START](#) task. The [PACKETPTR](#) register is double-buffered, meaning that it can be updated and prepared for the next transmission.

The [END](#) event indicates that the last bit has been processed by the RADIO. The [DISABLED](#) event is issued to acknowledge that a [DISABLE](#) task is done.

The structure of a packet is described in detail in [Packet configuration](#) on page 409. The data that is stored in Data RAM and transported by EasyDMA consists of the following fields:

- S0
- LENGTH
- S1
- PAYLOAD

In addition, a static add-on is sent immediately after the payload.

The size of each of the above fields in the frame is configurable (see [Packet configuration](#) on page 409), and the space occupied in RAM depends on these settings. The size of the field can be zero, as long as the resulting frame complies with the chosen RF protocol.

All fields are extended in size to align with a byte boundary in RAM. For instance, a 3-bit long field on air will occupy 1 byte in RAM while a 9-bit long field will be extended to 2 bytes.

The packet's elements can be configured as follows:

- CI, TERM1, and TERM2 fields are only present in *Bluetooth* Low Energy Long Range mode
- S0 is configured through the [PCNF0.SOLEN](#) field
- LENGTH is configured through the [PCNF0.LFLEN](#) field
- S1 is configured through the [PCNF0.S1LEN](#) field
- Payload size is configured through the value in RAM corresponding to the LENGTH field
- Static add-on size is configured through the [PCNF1.STATLEN](#) field

The [PCNF1.MAXLEN](#) field configures the maximum packet payload plus add-on size in number of bytes that can be transmitted or received by the RADIO. This feature can be used to ensure that the RADIO does not overwrite, or read beyond, the RAM assigned to the packet payload. This means that if the LENGTH field of the packet payload exceeds [PCNF1.STATLEN](#), and the LENGTH field in the packet specifies a packet larger than configured in [PCNF1.MAXLEN](#), the payload will be truncated to the length specified in [PCNF1.MAXLEN](#).

**Note:** The `PCNF1.MAXLEN` field includes the payload and the add-on, but excludes the size occupied by the `S0`, `LENGTH`, and `S1` fields. This has to be taken into account when allocating RAM.

If the payload and add-on length is specified larger than `PCNF1.MAXLEN`, the RADIO will still transmit or receive in the same way as before, except the payload is now truncated to `PCNF1.MAXLEN`. The packet's `LENGTH` field will not be altered when the payload is truncated. The RADIO will calculate CRC as if the packet length is equal to `PCNF1.MAXLEN`.

**Note:** If `PACKETPTR` is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 18 for more information about the different memory regions.

The `END` event indicates that the last bit has been processed by the RADIO. The `DISABLED` event is issued to acknowledge that an `DISABLE` task is done.

### 7.1.27.15 Registers

| Base address | Domain  | Peripheral | Instance | Secure mapping | DMA security | Description   | Configuration |
|--------------|---------|------------|----------|----------------|--------------|---------------|---------------|
| 0x41008000   | NETWORK | RADIO      | RADIO    | NS             | NA           | 2.4 GHz radio |               |

Table 130: Instances

| Register                         | Offset | Security | Description                                                              |
|----------------------------------|--------|----------|--------------------------------------------------------------------------|
| <code>TASKS_TXEN</code>          | 0x000  |          | Enable RADIO in TX mode                                                  |
| <code>TASKS_RXEN</code>          | 0x004  |          | Enable RADIO in RX mode                                                  |
| <code>TASKS_START</code>         | 0x008  |          | Start RADIO                                                              |
| <code>TASKS_STOP</code>          | 0x00C  |          | Stop RADIO                                                               |
| <code>TASKS_DISABLE</code>       | 0x010  |          | Disable RADIO                                                            |
| <code>TASKS_RSSISTART</code>     | 0x014  |          | Start the RSSI and take one single sample of the receive signal strength |
| <code>TASKS_RSSISTOP</code>      | 0x018  |          | Stop the RSSI measurement                                                |
| <code>TASKS_BCSTART</code>       | 0x01C  |          | Start the bit counter                                                    |
| <code>TASKS_BCSTOP</code>        | 0x020  |          | Stop the bit counter                                                     |
| <code>TASKS_EDSTART</code>       | 0x024  |          | Start the energy detect measurement used in IEEE 802.15.4 mode           |
| <code>TASKS_EDSTOP</code>        | 0x028  |          | Stop the energy detect measurement                                       |
| <code>TASKS_CCASTART</code>      | 0x02C  |          | Start the clear channel assessment used in IEEE 802.15.4 mode            |
| <code>TASKS_CCASTOP</code>       | 0x030  |          | Stop the clear channel assessment                                        |
| <code>SUBSCRIBE_TXEN</code>      | 0x080  |          | Subscribe configuration for task <code>TXEN</code>                       |
| <code>SUBSCRIBE_RXEN</code>      | 0x084  |          | Subscribe configuration for task <code>RXEN</code>                       |

Packet address to be used for the next transmission or reception. When transmitting, the packet pointed to by this address will be transmitted and when receiving, the received packet will be written to this address. This address is a byte aligned RAM address.

**Note:** See the memory chapter for details about which memories are available for EasyDMA.

  ### 7.1.27.15.117 SWITCHPATTERN

Address offset: 0x928

GPIO patterns to be used for each antenna

Maximum 8 GPIOs can be controlled. To secure correct signal levels on the pins, the pins must be configured in the GPIO peripheral as described in Pin configuration.

If, during switching, the total number of antenna slots is bigger than the number of written patterns, the RADIO loops back to the pattern used after the reference pattern.

A minimum number of 3 patterns must be written.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | | ID               |  |  |  | A ## 7.1.27.16 Electrical specification

### 7.1.27.16.1 General radio characteristics

| Symbol                    | Description                      | Min. | Typ. | Max. | Units       |
|---------------------------|----------------------------------|------|------|------|-------------|
| $f_{OP}$                  | Operating frequencies            | ..   | ..   | ..   | MHz         |
| $f_{PLL,CH,SP}$           | PLL channel spacing              | ..   | ..   | ..   | MHz         |
| $f_{DELTA,1M}$            | Frequency deviation @ 1 Mbps     | ..   | ..   | ..   | kHz         |
| $f_{DELTA,BLE,1M}$        | Frequency deviation @ BLE 1 Mbps | ..   | ..   | ..   | kHz         |
| $f_{DELTA,2M}$            | Frequency deviation @ 2 Mbps     | ..   | ..   | ..   | kHz         |
| $f_{DELTA,BLE,2M}$        | Frequency deviation @ BLE 2 Mbps | ..   | ..   | ..   | kHz         |
| $fsk_{BPS}$               | On-the-air data rate             | ..   | ..   | ..   | kbps        |
| $f_{chip, IEEE 802.15.4}$ | Chip rate in IEEE 802.15.4 mode  | ..   | ..   | ..   | kchip,<br>s |

### 7.1.27.16.2 Radio current consumption (transmitter)

| Symbol                   | Description                                       | Min. | Typ. | Max. | Units |
|--------------------------|---------------------------------------------------|------|------|------|-------|
| $I_{TX,0dBm,DCDC}$       | TX only run current (DC/DC, 3 V) $P_{RF} = 0$ dBm |      | 3.2  |      | mA    |
| $I_{TX,0dBm}$            | TX only run current $P_{RF} = 0$ dBm              | ..   | ..   | ..   | mA    |
| $I_{TX,MINUS4dBm,DCDC}$  | TX only run current DC/DC, 3 V $P_{RF} = -4$ dBm  | ..   | ..   | ..   | mA    |
| $I_{TX,MINUS4dBm}$       | TX only run current $P_{RF} = -4$ dBm             | ..   | ..   | ..   | mA    |
| $I_{TX,MINUS8dBm,DCDC}$  | TX only run current DC/DC, 3 V $P_{RF} = -8$ dBm  | ..   | ..   | ..   | mA    |
| $I_{TX,MINUS8dBm}$       | TX only run current $P_{RF} = -8$ dBm             | ..   | ..   | ..   | mA    |
| $I_{TX,MINUS12dBm,DCDC}$ | TX only run current DC/DC, 3 V $P_{RF} = -12$ dBm | ..   | ..   | ..   | mA    |
| $I_{TX,MINUS12dBm}$      | TX only run current $P_{RF} = -12$ dBm            | ..   | ..   | ..   | mA    |
| $I_{TX,MINUS16dBm,DCDC}$ | TX only run current DC/DC, 3 V $P_{RF} = -16$ dBm | ..   | ..   | ..   | mA    |
| $I_{TX,MINUS16dBm}$      | TX only run current $P_{RF} = -16$ dBm            | ..   | ..   | ..   | mA    |
| $I_{TX,MINUS20dBm,DCDC}$ | TX only run current DC/DC, 3 V $P_{RF} = -20$ dBm | ..   | ..   | ..   | mA    |
| $I_{TX,MINUS20dBm}$      | TX only run current $P_{RF} = -20$ dBm            | ..   | ..   | ..   | mA    |
| $I_{TX,MINUS40dBm,DCDC}$ | TX only run current DC/DC, 3 V $P_{RF} = -40$ dBm | ..   | ..   | ..   | mA    |
| $I_{TX,MINUS40dBm}$      | TX only run current $P_{RF} = -40$ dBm            | ..   | ..   | ..   | mA    |
| $I_{START,TX,DCDC}$      | TX start-up current DC/DC, 3 V, $P_{RF} = 4$ dBm  | ..   | ..   | ..   | mA    |
| $I_{START,TX}$           | TX start-up current, $P_{RF} = 4$ dBm             | ..   | ..   | ..   | mA    |

### 7.1.27.16.3 Radio current consumption (Receiver)

| Symbol                 | Description                                        | Min. | Typ. | Max. | Units |
|------------------------|----------------------------------------------------|------|------|------|-------|
| $I_{RX,1M,DCDC}$       | RX only run current (DC/DC, 3 V) 1 Mbps/1 Mbps BLE |      | 2.6  |      | mA    |
| $I_{RX,1M}$            | RX only run current (LDO, 3 V) 1 Mbps/1 Mbps BLE   |      | 7.0  |      | mA    |
| $I_{RX,2M,DCDC}$       | RX only run current (DC/DC, 3 V) 2 Mbps/2 Mbps BLE |      | 3.0  |      | mA    |
| $I_{RX,2M}$            | RX only run current (LDO, 3 V) 2 Mbps/2 Mbps BLE   | ..   | ..   | ..   | mA    |
| $I_{START,RX,1M,DCDC}$ | RX start-up current (DC/DC, 3 V) 1 Mbps/1 Mbps BLE | ..   | ..   | ..   | mA    |
| $I_{START,RX,1M}$      | RX start-up current 1 Mbps/1 Mbps BLE              | ..   | ..   | ..   | mA    |

### 7.1.27.16.4 Transmitter specification

| Symbol     | Description            | Min. | Typ. | Max. | Units |
|------------|------------------------|------|------|------|-------|
| $P_{RF}$   | Maximum output power   |      | 3.0  |      | dBm   |
| $P_{RFC}$  | RF power control range | ..   | ..   | ..   | dB    |
| $P_{RFCR}$ | RF power accuracy      | ..   | ..   | ..   | dB    |

| Symbol                       | Description                                        | Min. | Typ. | Max. | Units |
|------------------------------|----------------------------------------------------|------|------|------|-------|
| $P_{RF1,1}$                  | 1st Adjacent Channel Transmit Power 1 MHz (1 Mbps) | ..   | ..   | ..   | dBc   |
| $P_{RF2,1}$                  | 2nd Adjacent Channel Transmit Power 2 MHz (1 Mbps) | ..   | ..   | ..   | dBc   |
| $P_{RF1,2}$                  | 1st Adjacent Channel Transmit Power 2 MHz (2 Mbps) | ..   | ..   | ..   | dBc   |
| $P_{RF2,2}$                  | 2nd Adjacent Channel Transmit Power 4 MHz (2 Mbps) | ..   | ..   | ..   | dBc   |
| $E_{vm}$                     | Error vector magnitude IEEE 802.15.4               | ..   | ..   | ..   | %rms  |
| $P_{harm2nd, IEEE 802.15.4}$ | 2nd harmonics in IEEE 802.15.4 mode                | ..   | ..   | ..   | dBm   |
| $P_{harm3rd, IEEE 802.15.4}$ | 3rd harmonics in IEEE 802.15.4                     | ..   | ..   | ..   | dBm   |

Figure 164: Output power, 1 Mbps Bluetooth low energy mode, at maximum TXPOWER setting (typical values)

Figure 165: Output power, 1 Mbps Bluetooth low energy mode, at 0 dBm TXPOWER setting (typical values)

### 7.1.27.16.5 Receiver operation

| Symbol                          | Description                                                                                 | Min. | Typ.  | Max. | Units |
|---------------------------------|---------------------------------------------------------------------------------------------|------|-------|------|-------|
| P <sub>RX,MAX</sub>             | Maximum received signal strength at < 0.1% PER                                              | ..   | ..    | ..   | dBm   |
| P <sub>SENS,IT,1M</sub>         | Sensitivity, 1 Mbps nRF mode ideal transmitter <sup>14</sup>                                | ..   | ..    | ..   | dBm   |
| P <sub>SENS,IT,2M</sub>         | Sensitivity, 2 Mbps nRF mode ideal transmitter <sup>15</sup>                                | ..   | ..    | ..   | dBm   |
| P <sub>SENS,IT,SP,1M,BLE</sub>  | Sensitivity, 1 Mbps BLE ideal transmitter, packet length ≤ 37 bytes BER=1E-3 <sup>16</sup>  |      | -97.5 |      | dBm   |
| P <sub>SENS,IT,LP,1M,BLE</sub>  | Sensitivity, 1 Mbps BLE ideal transmitter, packet length ≥ 128 bytes BER=1E-4 <sup>17</sup> | ..   | ..    | ..   | dBm   |
| P <sub>SENS,IT,SP,2M,BLE</sub>  | Sensitivity, 2 Mbps BLE ideal transmitter, packet length ≤ 37 bytes                         |      | -94.3 |      | dBm   |
| P <sub>SENS,IT,BLE LE125k</sub> | Sensitivity, 125 kbps BLE mode                                                              | ..   | ..    | ..   | dBm   |
| P <sub>SENS,IT,BLE LE500k</sub> | Sensitivity, 500 kbps BLE mode                                                              | ..   | ..    | ..   | dBm   |
| P <sub>SENS,IEEE 802.15.4</sub> | Sensitivity in IEEE 802.15.4 mode                                                           | ..   | ..    | ..   | dBm   |

<sup>14</sup> Typical sensitivity applies when ADDR0 is used for receiver address correlation. When ADDR[1...7] are used for receiver address correlation, the typical sensitivity for this mode is degraded by 3 dB.

<sup>15</sup> Typical sensitivity applies when ADDR0 is used for receiver address correlation. When ADDR[1..7] are used for receiver address correlation, the typical sensitivity for this mode is degraded by 3 dB.

<sup>16</sup> As defined in the *Bluetooth Core Specification v4.0 Volume 6: Core System Package (Low Energy Controller Volume)*

<sup>17</sup> Equivalent BER limit < 10E-04

Figure 166: Sensitivity, 1 Mbps Bluetooth low energy mode, Regulator = LDO (typical values)

### 7.1.27.16.6 RX selectivity

RX selectivity with equal modulation on interfering signal<sup>18</sup>

| Symbol                          | Description                                              | Min. | Typ. | Max. | Units |
|---------------------------------|----------------------------------------------------------|------|------|------|-------|
| C/I <sub>1M,co-channel</sub>    | 1Mbps mode, Co-Channel interference                      | ..   | ..   | ..   | dB    |
| C/I <sub>1M,-1MHz</sub>         | 1 Mbps mode, Adjacent (-1 MHz) interference              | ..   | ..   | ..   | dB    |
| C/I <sub>1M,+1MHz</sub>         | 1 Mbps mode, Adjacent (+1 MHz) interference              | ..   | ..   | ..   | dB    |
| C/I <sub>1M,-2MHz</sub>         | 1 Mbps mode, Adjacent (-2 MHz) interference              | ..   | ..   | ..   | dB    |
| C/I <sub>1M,+2MHz</sub>         | 1 Mbps mode, Adjacent (+2 MHz) interference              | ..   | ..   | ..   | dB    |
| C/I <sub>1M,-3MHz</sub>         | 1 Mbps mode, Adjacent (-3 MHz) interference              | ..   | ..   | ..   | dB    |
| C/I <sub>1M,+3MHz</sub>         | 1 Mbps mode, Adjacent (+3 MHz) interference              | ..   | ..   | ..   | dB    |
| C/I <sub>1M,±6MHz</sub>         | 1 Mbps mode, Adjacent (≥6 MHz) interference              | ..   | ..   | ..   | dB    |
| C/I <sub>1MBLE,co-channel</sub> | 1 Mbps BLE mode, Co-Channel interference                 | ..   | ..   | ..   | dB    |
| C/I <sub>1MBLE,-1MHz</sub>      | 1 Mbps BLE mode, Adjacent (-1 MHz) interference          | ..   | ..   | ..   | dB    |
| C/I <sub>1MBLE,+1MHz</sub>      | 1 Mbps BLE mode, Adjacent (+1 MHz) interference          | ..   | ..   | ..   | dB    |
| C/I <sub>1MBLE,-2MHz</sub>      | 1 Mbps BLE mode, Adjacent (-2 MHz) interference          | ..   | ..   | ..   | dB    |
| C/I <sub>1MBLE,+2MHz</sub>      | 1 Mbps BLE mode, Adjacent (+2 MHz) interference          | ..   | ..   | ..   | dB    |
| C/I <sub>1MBLE,&gt;3MHz</sub>   | 1 Mbps BLE mode, Adjacent (≥3 MHz) interference          | ..   | ..   | ..   | dB    |
| C/I <sub>1MBLE,image</sub>      | Image frequency interference                             | ..   | ..   | ..   | dB    |
| C/I <sub>1MBLE,image,1MHz</sub> | Adjacent (1 MHz) interference to in-band image frequency | ..   | ..   | ..   | dB    |
| C/I <sub>2M,co-channel</sub>    | 2 Mbps mode, Co-Channel interference                     | ..   | ..   | ..   | dB    |
| C/I <sub>2M,-2MHz</sub>         | 2 Mbps mode, Adjacent (-2 MHz) interference              | ..   | ..   | ..   | dB    |
| C/I <sub>2M,+2MHz</sub>         | 2 Mbps mode, Adjacent (+2 MHz) interference              | ..   | ..   | ..   | dB    |
| C/I <sub>2M,-4MHz</sub>         | 2 Mbps mode, Adjacent (-4 MHz) interference              | ..   | ..   | ..   | dB    |
| C/I <sub>2M,+4MHz</sub>         | 2 Mbps mode, Adjacent (+4 MHz) interference              | ..   | ..   | ..   | dB    |

<sup>18</sup> Desired signal level at PIN = -67 dBm. One interferer is used, having equal modulation as the desired signal. The input power of the interferer where the sensitivity equals BER = 0.1% is presented

| Symbol                                | Description                                              | Min. | Typ. | Max. | Units |
|---------------------------------------|----------------------------------------------------------|------|------|------|-------|

### 7.1.27.16.7 RX intermodulation

#### RX intermodulation<sup>19</sup>

| Symbol                      | Description                                                               | Min. | Typ. | Max. | Units |
|-----------------------------|---------------------------------------------------------------------------|------|------|------|-------|
| P <sub>IMD,5TH,1M</sub>     | IMD performance, 1 Mbps, 5th offset channel, packet length ≤ 37 bytes     | ..   | ..   | ..   | dBm   |
| P <sub>IMD,5TH,1M,BLE</sub> | IMD performance, BLE 1 Mbps, 5th offset channel, packet length ≤ 37 bytes | ..   | ..   | ..   | dBm   |
| P <sub>IMD,5TH,2M</sub>     | IMD performance, 2 Mbps, 5th offset channel, packet length ≤ 37 bytes     | ..   | ..   | ..   | dBm   |
| P <sub>IMD,5TH,2M,BLE</sub> | IMD performance, BLE 2 Mbps, 5th offset channel, packet length ≤ 37 bytes | ..   | ..   | ..   | dBm   |

### 7.1.27.16.8 Radio timing

| Symbol                        | Description                                                                                                              | Min. | Typ. | Max. | Units |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| t <sub>TXEN,BLE,1M</sub>      | Time between TXEN task and READY event after channel FREQUENCY configured (1 Mbps BLE and 150 μs TIFS)                   | ..   | ..   | ..   | μs    |
| t <sub>TXEN,FAST,BLE,1M</sub> | Time between TXEN task and READY event after channel FREQUENCY configured (1 Mbps BLE with fast ramp-up and 150 μs TIFS) | ..   | ..   | ..   | μs    |
| t <sub>TXDIS,BLE,1M</sub>     | When in TX, delay between DISABLE task and DISABLED event for MODE = Nrf_1Mbit and MODE = Ble_1Mbit                      | ..   | ..   | ..   | μs    |
| t <sub>RXEN,BLE,1M</sub>      | Time between the RXEN task and READY event after channel FREQUENCY configured (1 Mbps BLE)                               | ..   | ..   | ..   | μs    |

<sup>19</sup> Desired signal level at PIN = -64 dBm. Two interferers with equal input power are used. The interferer closest in frequency is not modulated, the other interferer is modulated equal with the desired signal. The input power of the interferers where the sensitivity equals BER = 0.1% is presented.

| Symbol                         | Description                                                                                                     | Min. | Typ. | Max. | Units   |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|------|------|------|---------|
| $t_{RXEN,FAST,BLE,1M}$         | Time between the RXEN task and READY event after channel FREQUENCY configured (1 Mbps BLE with fast ramp-up)    | ..   | ..   | ..   | $\mu s$ |
| $t_{RXDIS,BLE,1M}$             | When in RX, delay between DISABLE task and DISABLED event for MODE = Nrf_1Mbit and MODE = Ble_1Mbit             | ..   | ..   | ..   | $\mu s$ |
| $t_{TXDIS,BLE,2M}$             | When in TX, delay between DISABLE task and DISABLED event for MODE = Nrf_2Mbit and MODE = Ble_2Mbit             | ..   | ..   | ..   | $\mu s$ |
| $t_{RXDIS,BLE,2M}$             | When in RX, delay between DISABLE task and DISABLED event for MODE = Nrf_2Mbit and MODE = Ble_2Mbit             | ..   | ..   | ..   | $\mu s$ |
| $t_{TXEN,IEEE\ 802.15.4}$      | Time between TXEN task and READY event after channel FREQUENCY configured (IEEE 802.15.4)                       | ..   | ..   | ..   | $\mu s$ |
| $t_{TXEN,FAST,IEEE\ 802.15.4}$ | Time between TXEN task and READY event after channel FREQUENCY configured (IEEE 802.15.4 with fast ramp-up)     | ..   | ..   | ..   | $\mu s$ |
| $t_{TXDIS,IEEE\ 802.15.4}$     | When in TX, delay between DISABLE task and DISABLED event (IEEE 802.15.4)                                       | ..   | ..   | ..   | $\mu s$ |
| $t_{RXEN,IEEE\ 802.15.4}$      | Time between the RXEN task and READY event after channel FREQUENCY configured (IEEE 802.15.4)                   | ..   | ..   | ..   | $\mu s$ |
| $t_{RXEN,FAST,IEEE\ 802.15.4}$ | Time between the RXEN task and READY event after channel FREQUENCY configured (IEEE 802.15.4 with fast ramp-up) | ..   | ..   | ..   | $\mu s$ |
| $t_{RXDIS,IEEE\ 802.15.4}$     | When in RX, delay between DISABLE task and DISABLED event (IEEE 802.15.4)                                       | ..   | ..   | ..   | $\mu s$ |
| $t_{RX-to-TX\ turnaround}$     | Maximum TX-to-RX or RX-to-TX turnaround time in IEEE 802.15.4 mode                                              | ..   | ..   | ..   | $\mu s$ |

### 7.1.27.16.9 Received signal strength indicator (RSSI) specifications

| Symbol              | Description                                  | Min. | Typ. | Max. | Units   |
|---------------------|----------------------------------------------|------|------|------|---------|
| $RSSI_{ACC}$        | RSSI accuracy valid range -90 to -20 dBm     | ..   | ..   | ..   | dB      |
| $RSSI_{RESOLUTION}$ | RSSI resolution                              | ..   | ..   | ..   | dB      |
| $RSSI_{PERIOD}$     | RSSI sampling time from RSSI_START task      | ..   | ..   | ..   | $\mu s$ |
| $RSSI_{SETTLE}$     | RSSI settling time after signal level change | ..   | ..   | ..   | $\mu s$ |

### 7.1.27.16.10 Jitter

| Symbol                | Description                                                                                     | Min. | Typ. | Max. | Units   |
|-----------------------|-------------------------------------------------------------------------------------------------|------|------|------|---------|
| $t_{DISABLED/JITTER}$ | Jitter on DISABLED event relative to END event when shortcut between END and DISABLE is enabled | ..   | ..   | ..   | $\mu s$ |
| $t_{READY/JITTER}$    | Jitter on READY event relative to TXEN and RXEN task                                            | ..   | ..   | ..   | $\mu s$ |

### 7.1.27.16.11 IEEE 802.15.4 energy detection constants

| Symbol          | Description                                                           | Min. | Typ. | Max. | Units |
|-----------------|-----------------------------------------------------------------------|------|------|------|-------|
| $ED\_RSSISCALE$ | Scaling value when converting between hardware-reported value and dBm | 4    | 4    | 4    |       |
| $ED\_RSSIOFFS$  | Offset value when converting between hardware-reported value and dBm  | -92  | -92  | -92  |       |

## 7.1.28 RNG — Random number generator

The Random number generator (RNG) generates true non-deterministic random numbers based on internal thermal noise that are suitable for cryptographic purposes. The RNG does not require a seed value.

Figure 167: Random number generator

The RNG is started by triggering the START task and stopped by triggering the STOP task. When started, new random numbers are generated continuously and written to the VALUE register when ready. A VALRDY event is generated for every new random number that is written to the VALUE register. This means that after a VALRDY event is generated the CPU has the time until the next VALRDY event to read out the random number from the VALUE register before it is overwritten by a new random number.

### 7.1.28.1 Bias correction

A bias correction algorithm is employed on the internal bit stream to remove any bias toward '1' or '0'. The bits are then queued into an eight-bit register for parallel readout from the VALUE register.

It is possible to enable bias correction in the CONFIG register. This will result in slower value generation, but will ensure a statistically uniform distribution of the random values.

### 7.1.28.2 Speed

The time needed to generate one random byte of data is unpredictable, and may vary from one byte to the next. This is especially true when bias correction is enabled.

### 7.1.28.3 Registers

| Base address | Domain  | Peripheral | Instance | Secure mapping | DMA security | Description             | Configuration |
|--------------|---------|------------|----------|----------------|--------------|-------------------------|---------------|

## 7.1.28.4 Electrical specification

### 7.1.28.4.1 RNG Electrical Specification

| Symbol                 | Description                                                                                                                            | Min. | Typ. | Max. | Units         |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------|------|------|------|---------------|
| $t_{\text{RNG,START}}$ | Time from setting the START task to generation begins.<br>This is a one-time delay on START signal and does not apply between samples. | ..   | ..   | ..   | $\mu\text{s}$ |
| $t_{\text{RNG,RAW}}$   | Run time per byte without bias correction. Uniform distribution of 0 and 1 is not guaranteed.                                          | ..   | ..   | ..   | $\mu\text{s}$ |
| $t_{\text{RNG,BC}}$    | Run time per byte with bias correction. Uniform distribution of 0 and 1 is guaranteed. Time to generate a byte cannot be guaranteed.   | ..   | ..   | ..   | $\mu\text{s}$ |

## 7.1.29 RTC — Real-time counter

The real-time counter (RTC) module provides a generic, low-power timer on the low frequency clock source (LFCLK).

Figure 168: RTC block diagram

The RTC module features a 24-bit COUNTER, a 12-bit (1/X) prescaler, capture/compare registers, and a tick event generator.

### 7.1.29.1 Clock source

The RTC will run off the LFCLK.

When started, the RTC will automatically request the LFCLK source with RC oscillator if the LFCLK is not already running.

See [CLOCK — Clock control](#) on page 61 for more information about clock sources.

### 7.1.29.2 Resolution versus overflow and the prescaler

The relationship between the prescaler, counter resolution and overflow is summarized in the table below.

| Prescaler  | Counter resolution | Overflow       |
|------------|--------------------|----------------|
| 0          | 30.517 $\mu$ s     | 512 seconds    |
| $2^8-1$    | 7812.5 $\mu$ s     | 131072 seconds |
| $2^{12}-1$ | 125 ms             | 582.542 hours  |

Table 134: RTC resolution versus overflow

The counter increment frequency is given by the following equation:

$$f_{\text{RTC}} [\text{kHz}] = 32.768 / (\text{PRESCALER} + 1)$$

The **PRESCALER** register can only be written when the RTC is stopped.

The prescaler is restarted on tasks **START**, **CLEAR** and **TRIGOVRFW**. That is, the prescaler value is latched to an internal register (<<PRESC>>) on these tasks.

Examples:

1. Desired COUNTER frequency 100 Hz (10 ms counter period)

$$\text{PRESCALER} = \text{round}(32.768 \text{ kHz} / 100 \text{ Hz}) - 1 = 327$$

$$f_{\text{RTC}} = 99.9 \text{ Hz}$$

$$10009.576 \mu\text{s counter period}$$

2. Desired COUNTER frequency 8 Hz (125 ms counter period)

$$\text{PRESCALER} = \text{round}(32.768 \text{ kHz} / 8 \text{ Hz}) - 1 = 4095$$

$$f_{\text{RTC}} = 8 \text{ Hz}$$

$$125 \text{ ms counter period}$$

### 7.1.29.3 Counter register

The internal <<COUNTER>> register increments on LFCLK when the internal **PRESCALER** register (<<PRESC>>) is 0x00. <<PRESC>> is reloaded from the **PRESCALER** register. If enabled, the **TICK** event occurs on each increment of the **COUNTER**.

Figure 169: Timing diagram - COUNTER\_PRESCALER\_0

Figure 170: Timing diagram - COUNTER\_PRESCALER\_1

### 7.1.29.3.1 Reading the counter register

To read the COUNTER register, the internal <<COUNTER>> value is sampled.

To ensure that the <<COUNTER>> is safely sampled (considering that an LFCLK transition may occur during a read), the CPU and core memory bus are halted for four PCLK16M cycles. In addition, the read takes the CPU two PCLK16M cycles, resulting in the COUNTER register read taking maximum six PCLK16M clock cycles.

### 7.1.29.4 Overflow

An **OVRFLW** event is generated on **COUNTER** register overflow (overflowing from 0xFFFFF to 0).

The **TRIGOVRFLW** task will set the **COUNTER** value to 0xFFFFF0, to allow software test of the overflow condition.

**Note:** The **OVRFLW** event is disabled by default.

### 7.1.29.5 Tick event

The **TICK** event enables low-power tickless RTOS implementation, as it optionally provides a regular interrupt source for an RTOS with no need for use of the ARM SysTick feature.

Using the **TICK** event, rather than the SysTick, allows the CPU to be powered down while keeping RTOS scheduling active.

**Note:** The **TICK** event is disabled by default.

### 7.1.29.6 Event control

To optimize the RTC power consumption, events in the RTC can be individually disabled to prevent PCLK16M and HFCLK from being requested when those events are triggered. This is managed using the **EVTEN** register. Especially important is the **TICK** event.

This means that the RTC implements a slightly different task and event system compared to the standard system described in [Peripheral interface](#) on page 136. The RTC task and event system is illustrated in the figure below.

Figure 171: Tasks, events and interrupts in the RTC

### 7.1.29.7 Capture

The RTC implements one capture task for every available capture/compare register.

Every time `TASKS_CAPTURE[n]` is triggered, `<<COUNTER>>` is copied to the corresponding `CC[n]` register.

If the `CAPTURE` and `CLEAR` tasks are triggered at the same time, the `CAPTURE` task will be prioritized. This means that the `CC[n]` register for the corresponding `CAPTURE[n]` task will be set to the captured value before the counter is reset. There is a delay of 6 PCLK16M periods from when the `TASKS_CAPTURE[n]` is triggered until the corresponding `CC[n]` register is updated.

The `CAPTURE[n]` tasks will not generate `COMPARE[n]` events, even though `CC[n]` will then equal the COUNTER.

### 7.1.29.8 Compare

The RTC implements one `COMPARE` event for every available compare register.

When the `COUNTER` is incremented and then becomes equal to the value specified in the register `CC[n]`, the corresponding compare event `COMPARE[n]` is generated.

When writing a `CC[n]` register, the following behavior of the RTC `COMPARE` event should be noted:

- If a `CC` value is 0 when a `CLEARCLEAR` task is set, this will not trigger a `COMPARE` event.

Figure 172: Timing diagram - COMPARE\_CLEAR

- If a **CC** value is N, and the **COUNTER** value is N when the **START** task is set, this will not trigger a **COMPARE** event.

Figure 173: Timing diagram - COMPARE\_START

- A **COMPARE** event occurs when a **CC** value is N, and the **COUNTER** value transitions from N-1 to N.

Figure 174: Timing diagram - COMPARE

- If the **COUNTER** value is N, writing N+2 to a **CC** register is guaranteed to trigger a **COMPARE** event at N+2.

Figure 175: Timing diagram - COMPARE\_N+2

- If the **COUNTER** value is N, writing N or N+1 to a **CC** register may not trigger a **COMPARE** event.

Figure 176: Timing diagram - COMPARE\_N+1

- If the **COUNTER** value is N, and the current **CC** value is N+1 or N+2 when a new **CC** value is written, a match may trigger on the previous **CC** value before the new value takes effect. If the current **CC** value is greater than N+2 when the new value is written, there will be no event due to the old value.

Figure 177: Timing diagram - COMPARE\_N-1

- If the **COMPARE[i]\_CLEAR** short is enabled, the **COUNTER** will be cleared one **LFCLK** after the **COMPARE** event.

Figure 178: Timing diagram - COMPARE\_CLEAR

### 7.1.29.9 Task and event jitter/delay

Jitter or delay in the RTC, is due to the peripheral clock being a low frequency clock (LFCLK), which is not synchronous to the faster PCLK16M.

Registers in the peripheral interface that are part of the PCLK16M domain, have a set of mirrored registers in the LFCLK domain. For example, the **COUNTER** value accessible from the CPU is in the PCLK16M domain, and is latched on a read from an internal COUNTER register in the LFCLK domain. The **COUNTER** register is modified each time the RTC ticks. The registers are synchronised between the two clock domains (PCLK16M and LFCLK).

1. **CLEAR** and **STOP** (and **TRIGOVFLW**, which is not shown) will be delayed as long as it takes for the peripheral to clock a falling edge and a rising edge of the LFCLK. This is between 15.2585  $\mu$ s and 45.7755  $\mu$ s – rounded to 15  $\mu$ s and 46  $\mu$ s for the remainder of the section.

Figure 179: Timing diagram - DELAY\_CLEAR

Figure 180: Timing diagram - DELAY\_STOP

**Note:** When a **STOP** task is triggered, the PCLK16M domain will immediately prevent the generation of any EVENTS from the RTC. However, as seen in the figure above, the **COUNTER** value can still increment one final time.

- The **START** task will start the RTC. Assuming that the LFCLK was previously running and stable, the first increment of **COUNTER** (and instance of TICK event) will be typically after  $30.5 \mu\text{s} \pm 15 \mu\text{s}$ . Additional delay will occur if the RTC is started before the LFCLK is running, see **CLOCK — Clock control** on page 61 for LFLK startup times. The software should therefore wait for the first TICK if it has to make sure that the RTC is running. Sending a TRIGOVFLW task sets the **COUNTER** to a value close to overflow. However, since the update of **COUNTER** relies on a stable LFCLK, sending this task while LFCLK is not running will also add additional delay as described above. The figures show the smallest and largest delays on the **START** task, appearing as a  $\pm 15 \mu\text{s}$  jitter on the first **COUNTER** increment.

Figure 181: Timing diagram - JITTER\_START-

Figure 182: Timing diagram - JITTER\_START+

Tables below summarize the jitter introduced on tasks and events.

| Task                                     | Delay             |
|------------------------------------------|-------------------|
| CAPTURE, CLEAR, START, STOP, TRIGOVRFLOW | +15 to 46 $\mu$ s |

Table 135: RTC jitter magnitudes on tasks

| Operation/Function               | Jitter         |
|----------------------------------|----------------|
| START to COUNTER increment       | +/- 15 $\mu$ s |
| COMPARE to COMPARE <sup>20</sup> | +/- 62.5 ns    |

Table 136: RTC jitter magnitudes on events

## 7.1.29.10 Registers
