

## Introduction

The SAMRH71 is a high-performance microcontroller based on the 32-bit Arm Cortex-M7 RISC (5.04 CoreMark/MHz) processor with Floating Point Unit (FPU). The device operates at 100 MHz in typical conditions and features 128 Kbytes of Flash, 16 Kbytes of dual-cache memory, more than 1 Mbyte of embedded SRAM (384 Kbytes of TCM RAM and 768 Kbytes of multiport SRAM), external memory interfaces, such as EEPROM, Flash, SRAM, SDRAM (with embedded Error Correction Code) and QSPI. It is available either in a CQFP256-pin or TFBGA625-balls packages.

The SAMRH71 is ideal for many aerospace applications by integrating deterministic features (timers), analog controls (PWM), data analysis features, data storage features (Embedded SRAM memory and external memories) and various aerospace reception/transmission links to vehicle data, such as SpaceWire and 1553.

The device peripheral set includes Ethernet 10/100, two CAN-FD, up to 10 FLEXCOMs (USART/UART/SPI/I<sup>2</sup>C), SpaceWire and Mil Std 1553 links, as well as high-performance processors SHA and TRNG.

The SAMRH71 devices are high-performance Space microcontrollers that target critical missions for on-board computing, sensor management application and connectivity applications. They embed a concurrent AMBA system bus with advanced DMA features to perform several tasks simultaneously, without excessive processor workload. The SAMRH71 devices are implemented using the ATMX150RHA process that has been specially designed for aerospace applications by implementing on-chip transient and permanent error detection and correction.

## Features

- Core Arm Cortex-M7 running at 100 MHz in typical conditions
  - 16 Kbytes of I-Cache and 16 Kbytes of D-Cache with Error Code Correction (ECC)
  - Simple-precision and double-precision HW Floating Point Unit (FPU)
  - Memory Protection Unit (MPU) with 16 zones
  - DSP Instructions, Thumb®-2 Instruction Set
  - Embedded Trace Module (ETM) with instruction trace stream, including Trace Port Interface Unit (TPIU)
- Memories
  - 128 Kbytes embedded Flash with built-in ECC (up to 2 errors correction)
  - 384 Kbytes embedded SRAM for Tightly Coupled Memory (TCM) interface, running at the same frequency as the Cortex-M7 with built-in ECC (up to 1 error correction)
  - 768 Kbytes embedded Multiport SRAM with built-in ECC (up to 1 error correction) connected to the AHB system, running at the same frequency as system clock
  - Hardened External Memory Controller (HEMC) to address PROM, SRAM and SDRAM with variable data size (from 8 bits to 48 bits)
    - Six independent Chip Selects
    - Up to 2 Gbytes of external memory accessible
    - Built-in ECC, allowing the correction of up to 2 bits per 32 bits
- System Peripherals

- Built-In Power Fail Detection (PFD), Programmable Supply Monitors and Independent Watchdog for safe operation
- Non-Maskable Interrupt Controller (NMIC)
- Crystal or ceramic resonator oscillators: 3 MHz to 20 MHz main oscillator with failure detection
- RTC with Gregorian calendar and UTC mode, waveform generation in low-power modes
- RTC counter calibration circuitry compensates for 32.768 kHz crystal frequency variations
- 32-bit, low-power Real-time Timer (RTT)
- 4/8/10/12 MHz internal RC oscillator with 4 MHz default frequency for device start-up. In-application trimming access for frequency adjustment
- 32.768 kHz crystal oscillator or embedded 32 kHz RC oscillator as source of Low-Power mode device clock (SCLK)
- One PLL for system clock, and one PLL for peripherals
- One dual-port 32-channel central DMA Controller (XDMAC)
- Four 3-channel 32-bit Timer Counters (TC) with Capture, Waveform, Compare and PWM modes. Quadrature decoder logic and 2-bit Gray Up/Down Counter for stepper motor
- Two 4-channel 16-bit PWMs with complementary outputs, Dead Time Generator and several fault inputs per PWM for motor control, two external triggers to manage Power Factor Correction (PFC), DC-DC and lighting control
- Communication Peripherals
  - One 10/100 Ethernet MAC (GMAC)
    - Energy efficiency support (IEEE® 802.3az standard)
    - Ethernet AVB support with IEEE 802.1AS time stamping and IEEE 802.1Qav credit-based traffic-shaping hardware support
    - IEEE 1588 Precision Time Protocol (PTP)
  - Ten FLEXCOMs, each supporting USART/UART, SPI and TWI/I<sup>2</sup>C
  - Single data rate transfer Quad I/O Serial Peripheral Interface (QSPI)
  - CAN Controller compliant with CAN Protocol Version 2.0 Part A, B and ISO 11898-1:2015 and with Bosch CANFD Specification
  - SpaceWire interface with two SpaceWire ports and an Embedded SpaceWire router. Each link has a 200 Mbits/sec bit-rate capability. Integrated RMAP support.
  - One 1553 interface with redundant links compliant to MIL-STD-1553B standard. Bus Controller and Remote Terminal configurations available.
- Safety
  - Integrity Check Monitoring (ICM) on memories using Secure Hash Algorithm (SHA)
  - FlexProtect Matrix enabling user/privilege operations on peripherals
  - Watchdog running on independent uninterruptible monolithic clock
  - Clock and power failure detection events routed to normal interrupt or to the Non-Maskable Interrupt (NMI) controller:
    - CPU Frequency Monitor
    - Main Crystal Oscillator Failure Detection
    - 32.768 kHz Crystal Oscillator Frequency Monitor
    - Core Voltage Supply Monitor with internal Power Fail Detection
  - Write protection registers on selected peripherals
- Security

- True Random Number Generator (TRNG)
- Secure Hash Algorithm supporting SHA1, SHA224, SHA256, SHA384 and SHA512
- I/O
  - Up to 194 I/O lines with external interrupt capability (edge-sensitivity or level-sensitivity)
  - Up to seven parallel Input/Output Controllers (PIO)
- Operating Conditions
  - Supply voltage: 3.0V to 3.6V for VDDIO, 1.65V to 1.95V for VDDCORE, VDDPLLA and VDDPLLB, LVDS references: 1.25V
  - Operating temperature:
    - -55°C to +125°C for CQFP256
    - -55°C to +105°C for TFBGA625
- Fault Tolerance by Design
  - SEU detection through ECC protection (up to 2 corrections)
  - Hardware scrubbing on memories
- Radiation Performance:
  - Revision C:
    - No Single Event Latch-up below a LET of 62.5 MeV.cm<sup>2</sup>/mg @125°C.
    - TID immunity successfully tested up to 100 Krad(si) according to ESCC-22900 test method.
  - Revision E:
    - No Single Event Latch-up below a LET of 78 MeV.cm<sup>2</sup>/mg @125°C.
    - TID immunity successfully tested up to 100 Krad(si) according to ESCC-22900 test method.
- Note:** Detailed results about TID, SEL, and SEU available upon request.
- Packages
  - CQFP256, 256-lead, 18g
  - TFBGA625, 625-lead, 1.5g

| 16.3. Debug and Test Block Diagram.....                                   | 72  |
| 16.4. Debug and Test Pin Description.....                                 | 73  |
| 16.5. Application Examples.....                                           | 73  |
| 16.6. Functional Description.....                                         | 74  |
| 17. Bus Matrix (MATRIX).....                                              | 79  |
| 17.1. Description.....                                                    | 79  |
| 17.2. Embedded Characteristics.....                                       | 80  |
| 17.3. Memory Mapping.....                                                 | 80  |
| 17.4. Special Bus Granting Techniques.....                                | 81  |
| 17.5. No Default Master.....                                              | 81  |
| 17.6. Last Access Master.....                                             | 81  |
| 17.7. Fixed Default Master.....                                           | 81  |
| 17.8. Arbitration.....                                                    | 82  |
| 17.9. Register Write Protection.....                                      | 84  |
| 17.10. Privilege Protection of AHB and APB.....                           | 84  |
| 17.11. Register Summary.....                                              | 96  |
| 18. Chip Identifier (CHIPID).....                                         | 176 |
| 18.1. Description.....                                                    | 176 |
| 18.2. Embedded Characteristics.....                                       | 176 |
| 18.3. Register Summary.....                                               | 177 |
| 19. Hardened Embedded Flash Controller (HEFC).....                        | 181 |
| 19.1. Description.....                                                    | 181 |
| 19.2. Embedded Characteristics.....                                       | 181 |
| 19.3. Product Dependencies.....                                           | 181 |
| 19.4. Functional Description.....                                         | 182 |
| 19.5. Register Summary.....                                               | 198 |

|                                                   |     |

| 20. Supply Controller (SUPC).....                 | 220 |
| 20.1. Description.....                            | 220 |
| 20.2. Embedded Characteristics.....               | 220 |
| 20.3. Block Diagram.....                          | 220 |
| 20.4. Functional Description.....                 | 220 |
| 20.5. Register Summary.....                       | 224 |
| 21. Watchdog Timer (WDT).....                     | 231 |
| 21.1. Description.....                            | 231 |
| 21.2. Embedded Characteristics.....               | 231 |
| 21.3. Block Diagram.....                          | 231 |
| 21.4. Functional Description.....                 | 231 |
| 21.5. Register Summary.....                       | 234 |
| 22. Reinforced Safety Watchdog Timer (RSWDT)..... | 239 |
| 22.1. Description.....                            | 239 |
| 22.2. Embedded Characteristics.....               | 239 |
| 22.3. Block Diagram.....                          | 240 |
| 22.4. Functional Description.....                 | 240 |
| 22.5. Register Summary.....                       | 242 |
| 23. Reset Controller (RSTC).....                  | 247 |
| 23.1. Description.....                            | 247 |
| 23.2. Embedded Characteristics.....               | 247 |
| 23.3. Block Diagram.....                          | 247 |
| 23.4. Functional Description.....                 | 247 |
| 23.5. Register Summary.....                       | 252 |
| 24. Real-time Clock (RTC).....                    | 256 |
| 24.1. Description.....                            | 256 |
| 24.2. Embedded Characteristics.....               | 256 |
| 24.3. Block Diagram.....                          | 257 |
| 24.4. Product Dependencies.....                   | 257 |
| 24.5. Functional Description.....                 | 257 |
| 24.6. Register Summary.....                       | 266 |
| 25. Real-time Timer (RTT).....                    | 289 |
| 25.1. Description.....                            | 289 |
| 25.2. Embedded Characteristics.....               | 289 |
| 25.3. Block Diagram.....                          | 289 |
| 25.4. Functional Description.....                 | 289 |
| 25.5. Register Summary.....                       | 292 |
| 26. Clock Generator.....                          | 298 |
| 26.1. Description.....                            | 298 |
| 26.2. Embedded Characteristics.....               | 298 |
| 26.3. Block Diagram.....                          | 299 |
| 26.4. Slow Clock.....                             | 299 |
| 26.5. Main Clock.....                             | 300 |
| 26.6. PLLA Clock.....                             | 304 |

|                                                              |     |
|--------------------------------------------------------------|-----|
| 26.7. PLLB Clock.....                                        | 305 |
| 26.8. Divider and Phase Lock Loop Programming.....           | 305 |
| 27. Power Management Controller (PMC).....                   | 308 |
| 27.1. Description.....                                       | 308 |
| 27.2. Embedded Characteristics.....                          | 308 |
| 27.3. Block Diagram.....                                     | 309 |
| 27.4. Master Clock Controller.....                           | 309 |
| 27.5. SysTick External Clock.....                            | 309 |
| 27.6. Core and Bus Independent Clocks for Peripherals.....   | 310 |
| 27.7. Peripheral and Generic Clock Controller.....           | 310 |
| 27.8. Free-running Processor Clock.....                      | 310 |
| 27.9. Programmable Clock Output Controller.....              | 310 |
| 27.10. External Main Clock Failure Detection.....            | 311 |
| 27.11. 32.768 kHz External Slow Clock Frequency Monitor..... | 312 |
| 27.12. CPU Frequency Monitor.....                            | 312 |
| 27.13. Recommended Programming Sequence.....                 | 313 |
| 27.14. Clock Switching Details.....                          | 315 |
| 27.15. Register Write Protection.....                        | 317 |
| 27.16. Register Summary.....                                 | 319 |
| 28. Parallel Input/Ouput Controller (PIO).....               | 363 |
| 28.1. Description.....                                       | 363 |
| 28.2. Embedded Characteristics.....                          | 363 |
| 28.3. Block Diagram.....                                     | 364 |
| 28.4. Product Dependencies.....                              | 365 |
| 28.5. Functional Description.....                            | 365 |
| 28.6. I/O Lines Programming Example.....                     | 373 |
| 28.7. Register Summary.....                                  | 375 |
| 29. Hardened External Memory Controller (HEMC).....          | 399 |
| 29.1. Description.....                                       | 399 |
| 29.2. Embedded Characteristics.....                          | 399 |
| 29.3. Block Diagram.....                                     | 400 |
| 29.4. I/O Lines.....                                         | 400 |
| 29.5. Typical Applications.....                              | 400 |
| 29.6. Functional Description.....                            | 404 |
| 29.7. Register Summary.....                                  | 414 |
| 30. Hardened Error Correction Code (HECC) Controller.....    | 428 |
| 30.1. Description.....                                       | 428 |
| 30.2. Embedded Characteristics.....                          | 428 |
| 30.3. Block Diagram.....                                     | 428 |
| 30.4. Functional Description.....                            | 428 |
| 30.5. Hamming Code.....                                      | 429 |
| 30.6. BCH Code.....                                          | 432 |
| 30.7. HECC Testing.....                                      | 435 |
| 30.8. HECC Restrictions.....                                 | 436 |
| 30.9. Register Summary.....                                  | 437 |

|                                                                   |     |
|-------------------------------------------------------------------|-----|
| 31. Hardened Static Memory Controller (HSMC).....                 | 446 |
| 31.1. Description.....                                            | 446 |
| 31.2. Embedded Characteristics.....                               | 446 |
| 31.3. I/O Lines Description.....                                  | 446 |
| 31.4. Product Dependencies.....                                   | 446 |
| 31.5. Connection to External Devices.....                         | 446 |
| 31.6. Read, Write and Read-Modify-Write Single Access.....        | 447 |
| 31.7. Register Write Protection.....                              | 454 |
| 31.8. Coding Timing Parameters.....                               | 454 |
| 31.9. Usage Restriction.....                                      | 455 |
| 31.10. Read/Write Accesses Use Cases.....                         | 455 |
| 31.11. Automatic Wait States.....                                 | 459 |
| 31.12. External Wait.....                                         | 462 |
| 31.13. Register Summary.....                                      | 467 |
| 32. Hardened SDRAM Controller (HSDRAMC).....                      | 477 |
| 32.1. Description.....                                            | 477 |
| 32.2. Embedded Characteristics.....                               | 477 |
| 32.3. I/O Lines Description.....                                  | 477 |
| 32.4. Software Interface/SDRAM Organization, Address Mapping..... | 478 |
| 32.5. Product Dependencies.....                                   | 480 |
| 32.6. Interrupt Sources.....                                      | 480 |
| 32.7. Functional Description.....                                 | 480 |
| 32.8. Read/Write Access Use Cases.....                            | 484 |
| 32.9. Register Write Protection.....                              | 492 |
| 32.10. Register Summary.....                                      | 494 |
| 33. Special Function Registers (SFR).....                         | 509 |
| 33.1. Description.....                                            | 509 |
| 33.2. Embedded Characteristics.....                               | 509 |
| 33.3. Register Summary.....                                       | 510 |
| 34. DMA Controller (XDMAC).....                                   | 514 |
| 34.1. Description.....                                            | 514 |
| 34.2. Embedded Characteristics.....                               | 514 |
| 34.3. Block Diagram.....                                          | 515 |
| 34.4. Functional Description.....                                 | 515 |
| 34.5. Linked List Descriptor Operation.....                       | 519 |
| 34.6. XDMAC Maintenance Software Operations.....                  | 522 |
| 34.7. XDMAC Software Requirements.....                            | 523 |
| 34.8. Register Summary.....                                       | 524 |
| 35. 1553 Interface (1553).....                                    | 595 |
| 35.1. Description.....                                            | 595 |
| 35.2. Embedded Characteristics.....                               | 595 |
| 35.3. Block Diagram.....                                          | 595 |
| 35.4. Pin List.....                                               | 596 |
| 35.5. IP1553 Dependencies.....                                    | 596 |
| 35.6. Functional Description.....                                 | 596 |
| 35.7. Register Summary.....                                       | 608 |

|                                                             |      |
|-------------------------------------------------------------|------|
| 36. SpaceWire (SpW).....                                    | 635  |
| 36.1. Description.....                                      | 635  |
| 36.2. Embedded Characteristics.....                         | 635  |
| 36.3. Reference Documents.....                              | 635  |
| 36.4. Block Diagram.....                                    | 636  |
| 36.5. Product Dependencies.....                             | 636  |
| 36.6. SpaceWire Protocol.....                               | 637  |
| 36.7. Functional Description.....                           | 638  |
| 36.8. Register Summary.....                                 | 654  |
| 37. Ethernet MAC (GMAC).....                                | 769  |
| 37.1. Description.....                                      | 769  |
| 37.2. Embedded Characteristics.....                         | 769  |
| 37.3. Block Diagram.....                                    | 770  |
| 37.4. Signal Interfaces.....                                | 770  |
| 37.5. Product Dependencies.....                             | 771  |
| 37.6. Functional Description.....                           | 771  |
| 37.7. Programming Interface.....                            | 798  |
| 37.8. Register Summary.....                                 | 802  |
| 38. Quad Serial Peripheral Interface (QSPI).....            | 953  |
| 38.1. Description.....                                      | 953  |
| 38.2. Embedded Characteristics.....                         | 953  |
| 38.3. Block Diagram.....                                    | 954  |
| 38.4. Signal Description.....                               | 954  |
| 38.5. Product Dependencies.....                             | 954  |
| 38.6. Functional Description.....                           | 955  |
| 38.7. Register Summary.....                                 | 972  |
| 39. Flexible Serial Communication Controller (FLEXCOM)..... | 993  |
| 39.1. Description.....                                      | 993  |
| 39.2. Embedded Characteristics.....                         | 994  |
| 39.3. Block Diagram.....                                    | 997  |
| 39.4. I/O Lines Description.....                            | 997  |
| 39.5. Product Dependencies.....                             | 997  |
| 39.6. Register Accesses.....                                | 998  |
| 39.7. USART Functional Description.....                     | 998  |
| 39.8. SPI Functional Description.....                       | 1053 |
| 39.9. TWI Functional Description.....                       | 1072 |
| 39.10. Register Summary.....                                | 1118 |
| 40. Controller Area Network (MCAN).....                     | 1270 |
| 40.1. Description.....                                      | 1270 |
| 40.2. Embedded Characteristics.....                         | 1270 |
| 40.3. Block Diagram.....                                    | 1271 |
| 40.4. Product Dependencies.....                             | 1271 |
| 40.5. Functional Description.....                           | 1272 |
| 40.6. Register Summary.....                                 | 1299 |
| 41. Timer Counter (TC).....                                 | 1360 |

|                                                   |      |
|---------------------------------------------------|------|
| 41.1. Description.....                            | 1360 |
| 41.2. Embedded Characteristics.....               | 1360 |
| 41.3. Block Diagram.....                          | 1361 |
| 41.4. Pin List.....                               | 1362 |
| 41.5. Product Dependencies.....                   | 1362 |
| 41.6. Functional Description.....                 | 1362 |
| 41.7. Register Summary.....                       | 1384 |
| 42. Pulse Width Modulation Controller (PWM).....  | 1415 |
| 42.1. Description.....                            | 1415 |
| 42.2. Embedded Characteristics.....               | 1415 |
| 42.3. Block Diagram.....                          | 1417 |
| 42.4. I/O Lines Description.....                  | 1417 |
| 42.5. Product Dependencies.....                   | 1418 |
| 42.6. Functional Description.....                 | 1419 |
| 42.7. Register Summary.....                       | 1460 |
| 43. Integrity Check Monitor (ICM).....            | 1524 |
| 43.1. Description.....                            | 1524 |
| 43.2. Embedded Characteristics.....               | 1525 |
| 43.3. Block Diagram.....                          | 1525 |
| 43.4. Product Dependencies.....                   | 1526 |
| 43.5. Functional Description.....                 | 1526 |
| 43.6. Register Summary.....                       | 1540 |
| 44. True Random Number Generator (TRNG).....      | 1561 |
| 44.1. Description.....                            | 1561 |
| 44.2. Embedded Characteristics.....               | 1561 |
| 44.3. Block Diagram.....                          | 1561 |
| 44.4. Product Dependencies.....                   | 1561 |
| 44.5. Functional Description.....                 | 1561 |
| 44.6. Register Summary.....                       | 1563 |
| 45. Secure Hash Algorithm (SHA).....              | 1570 |
| 45.1. Description.....                            | 1570 |
| 45.2. Embedded Characteristics.....               | 1570 |

## 4. Space Quality Grade

The hermetic SAMRH71F20C-7GB is developed and manufactured in compliance with MIL-PRF-38535 and ESCC requirements for aerospace applications.

Screening and qualification flows are described in Aerospace and Defense AEQA0242 specification, which is available for download from the Microchip web site, [www.microchip.com/](http://www.microchip.com/).

**Table 4-1.** Temperature Grade for Space Products

| Temperature (°C) | Comments |
|------------------|----------|
| -55°C to +125°C  | —        |

## 5. Package and Pinout

In the tables that follow, the column “Reset State” indicates the reset state of the line with mnemonics.

- “PIO” / “I” signal

Indicates whether the PIO line resets in I/O mode or in peripheral mode. If “PIO” is mentioned, the PIO line is maintained in a static state as soon as the reset is released. As a result, the bit corresponding to the PIO line in the register PIO\_PSR (Peripheral Status Register) resets low.

If a signal name is mentioned in the “Reset State” column, the PIO line is assigned to this function and the corresponding bit in the PIO\_PSR resets high. This is the case of pins controlling memories, in particular the address lines, which require the pin to be driven as soon as the reset is released.

- “I” / “O”

Indicates whether the signal is in the input or output state.

- “PU” / “PD”

Indicates whether pull up, pull down, or nothing is enabled.

- “ST”

Indicates if Schmitt Trigger is enabled.

### 5.1 256-pin CQFP Package

For the 256-pin CQFP package drawing, refer to the section [49.1. 256-pin CQFP Package](#)

## 6. Power Supply and Power Control

### 6.1 Power Supply Inputs

The following table lists the power supply pins available on the SAMRH71.

**Table 6-1.** Power Supply Inputs

| Name     | Voltage Range, Nominal | Associated Ground | Cells Powered                                                                                                                                                            |
|----------|------------------------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VDDCORE  | 1.65V–1.95V,<br>1.8V   | GNDCORE           | Core Logic, Embedded memories (RAM and Flash), Embedded power switches, peripherals, RC oscillators (32K RC and mainRC), crystal oscillators (Main crystal (logic part)) |
| VDDPLLA  |                        | GNDPLLA           | PLLA Cell and crystal oscillators (32 kHz crystal (logic part))                                                                                                          |
| VDDPLL B |                        | GNDPLL B          | PLL B Cell                                                                                                                                                               |
| VDDIO    | 3.00V–3.60V,<br>3.3V   | GNDIO             | Peripheral I/O lines, Embedded memories (Flash), oscillator pads and crystal oscillators (32 kHz crystal and Main crystal (peripheral part))                             |
| SPWREF   | 1.25V                  | GNDIO             | SpaceWire reference level for LVDS signals (SpaceWire0–1)                                                                                                                |

**Note:** All supply inputs must be powered irrespective of function usage. However, SPWREF is optional.

### 6.2 Power-up and Power-down Sequencing

#### 6.2.1 Power-Up

There are no particular critical requirements in the establishment of the device power supplies still Microchip recommends the following:

1. VDDCORE (VDDPLLA/B)
2. VDDIO

Microchip recommends NRST must be held low at power-on until the supplies have reached their nominal values.

#### 6.2.2 Power-Down

There are no critical supply power-off requirements in the removal of power to the device still Microchip recommends the following:

1. VDDIO
2. VDDCORE (VDDPLLA/B)

There is embedded Power-Off management hardware to prevent unintended device activity when the supplies drop outside their operational limits.

### 6.3 Active Mode

Active mode is the nominal mode with the core clock running from the fast RC oscillator, the main crystal oscillator or the PLLA/B. The Power Management Controller can be used to adapt the frequency and to disable the peripheral clocks.

## 7. Input/Output Lines

### 7.1 General-Purpose I/O (GPIO) Lines

General-purpose I/O lines are managed by PIO Controllers. All I/Os have several input or output modes, such as pull-up or pull-down, input Schmitt triggers, multi drive (open-drain) or input change interrupt. Programming of these modes is performed independently for each I/O line through the PIO controller user interface. For additional information, refer to “Parallel Input/Output Controller (PIO)”.

The typical pull-up value is 15 k $\Omega$  and the typical pull-down value is 10 k $\Omega$ . GPIO lines are cold-sparing unless otherwise indicated.

### 7.2 System I/O Lines

#### 7.2.1 Serial Wire Debug Port (SW-DP) Pins

The SW-DP pins SWCLK and SWDIO are commonly provided on a standard 20-pin JTAG connector defined by Arm. For more details about voltage reference and reset state, refer to the [Table 3-1](#).

At start-up, debug pins are configured in SWD mode to allow connection with debugging probe. For more details, refer to section [Debug and Test Features](#).

Debug pins can be used as standard I/Os to provide users more general input/output pins when the debug port is not needed in the end application. Mode selection between JTAG mode (System IO mode) and general IO mode is performed through the PIO Controller.

The JTAGSEL pin is used to select the JTAG boundary scan when asserted at a high level. It integrates a permanent pull-down resistor of about 10 k $\Omega$  to GND, so that it can be left unconnected for normal operations.

#### 7.2.2 Embedded Trace Module (ETM) Pins

The Embedded Trace Module (ETM) depends on the Trace Port Interface Unit (TPIU) to export data out of the system.

The TPUI features the following pins:

- TRACECLK is always exported to enable synchronization with the data.
- TRACED0–TRACED3 is the instruction trace stream.

### 7.3 NRST Pin

The NRST pin is a pure input, with a permanent pull-up resistor of 15 k $\Omega$ .

## 8. Architecture Interconnect

The system architecture is based on the Arm Cortex-M7 processor connected to the main AHB Bus Matrix, the embedded Flash and the multiport SRAM.

### 8.1 Core, Bus Matrices and Memories Interconnect

The AHBP interface is a single 32-bit wide interface enabling access to the peripherals connected on the main bus matrix. It is used for data access only. Instruction fetches are never performed on the interface. The bus, AHBP or AXIM, accessing the peripheral memory area [0x40000000 to 0x5FFFFFFF] is selected in the AHBP Control register.

The memory blocks used for ITCM and DTCMs are fully accessible for all the DMAs through the AHBS interface.

The AXIM interface is a single 64-bit wide interface that connects to the system through the AXI bridge and the AHB bus matrix and allows the following:

- Instruction fetches
- Data-cache linefills and evictions
- Non-cacheable normal-type memory data accesses
- Device and strongly-ordered type data accesses, normally to peripherals

The interconnect of the other masters and slaves is described in [Bus Matrix \(MATRIX\)](#).

The figure below shows the connections of the different Cortex-M7 ports.

**Figure 8-1.** General Interconnect Block Diagram

## 8.2 Memory Protection with FlexProtect

FlexProtect is a protection unit on the AHB matrix that manages the access rights for privilege and user accesses. It prevents any access to the memory or peripheral areas that might result in a configuration change or data corruption/modification by a DMA.

This feature, in conjunction with the Cortex-M7 MPU, provides full protection of each slave for any master access.

## 9. Product Mapping

**Figure 9-1. SAMRH71 Product Mapping**

## 10. Memories

### 10.1 External Memories

The SAMRH71 features one Hardened External Memory Controller (HEMC) to provide an interface to a wide range of external memories and to any parallel peripheral. The PROM, SRAM and SDRAM are supported. For additional information, refer to these sections [Hardened External Memory Controller \(HEMC\)](#), [Hardened SDRAM Controller \(HSDRAMC\)](#) and [Hardened Static Memory Controller \(HSMC\)](#).

### 10.2 Embedded Memories

#### 10.2.1 Tightly Coupled Memory (TCM) RAM

The TCM RAM, protected by ECC, optimizes the efficiency of the Cortex-M7 and AHB masters accesses. The TCM RAM is composed of these two blocks:

- One 128-Kbyte block used for ITCM
- One 256-Kbyte block used for DTCM0/DTCM1

**Figure 10-1.** TCM RAM Mapping

The 384 Kbytes of TCM RAM are accessible in a non-contiguous address space for the Cortex-M7 TCM interfaces:

- 128 Kbytes at address 0 through ITCM interface
- 256 Kbytes at address 0x20000000 through DTCM0 and DTCM1

After reset :

- ITCM is disabled to be make the internal Flash (HEFC) or HEMC accessible at address 0. The Flash or HEMC must embed code to enable the TCM link and to perform a copy from Flash or HEMC to ITCM memory through the AHBS.

- DTCM0/1 are enabled for boot and variables.

To execute the code from ITCM, follow these steps:

1. Start executing the code from Flash or HEMC.
2. Enable the ITCM interface and perform a global initialization of I/DTCM memories, to align data and checksum.
3. Perform a copy (through AHBS) of the code to execute from Flash or HEMC to TCM RAM (ITCM).
4. The stack and variables are allocated in the DTCM address space.
5. Jump in the ITCM code.

### 10.2.2 Internal Multiport SRAM (FlexRAM)

The 768-Kbyte Multiport SRAM, protected by ECC, has several ports connected either to the AHB matrix or to the Cortex-M7 by the AXI-to-AHB Bridge (decreasing working frequency by two compared to TCM RAM) to enable simultaneous accesses:

- Three 32-bit ports are connected to the AHB matrix
- Two 32-bit ports are connected to the Cortex-M7 processor

### 10.2.3 Flash Memories

### 10.2.3.1 Embedded Flash Overview

The Flash memory plane is made of 4 x 32 Kbytes planes, placed in parallel, hence the embedded Flash memory has a global size of 128 Kbytes.

The embedded Flash memory is made of 512 pages of 256 bytes 4 x (16 x 4 bytes) of data. Additionally, the Flash memory embeds more space to store HECC data (64 Kbytes total). The embedded HECC can detect and correct up to 2 bits in each 32-bit data.

Additionally, the embedded Flash memory has two additional rows (xrow0, xrow1), which contains the following:

- Xrow0: 128 user fuse bits, 32 NVM calibration bits and 32 lock bits
- Xrow1: End user signature: 256 bytes available to the user. The user signature can be used to store information, such as trimming, keys and so on, that the user does not want to be erased by the software ERASE command. Read, write and erase of this area is allowed.

### Figure 10-2. Memory Plane Overview

### 10.2.3.2 Hardened Embedded Flash Controller (HEFC)

The Hardened Embedded Flash Controller (HEFC) manages accesses performed by the system masters. It enables reading the Flash and writing the latch buffer. It also contains a User Interface mapped on the APB. The HEFC ensures the interface of the Flash block. It manages the programming, erasing, locking and unlocking sequences of the Flash using a full set of commands. Refer to the section "Hardened Embedded Flash Controller (HEFC)" for details.

### 10.2.3.3 General-purpose NVM (GPNVM) Bits

SAMRH71 devices feature four words of general-purpose NVM (GPNVM). The bits can be cleared or set, through the "Clear GPNVM Bit" and "Set GPNVM Bit" commands of the HEFC User Interface.

The GPNVM0[1] bit selects the debug interface. Other bits throughout the GPNVM words are used to store the factory-programmed trim values for the on-board clock sources.

**Table 10-1.** General-purpose Non volatile Memory Bits

| GPNVM Word | Bit   | Function                                                           |
|------------|-------|--------------------------------------------------------------------|
| 0          | 1     | Debug interface selection<br>0: JTAG interface<br>1: SWD interface |
|            | 10:8  | Factory value for PFD trim                                         |
| 1          | 1:0   | Factory value for Main RC temperature trim.                        |
|            | 3:2   | Factory value for Second RC temperature trim.                      |
|            | 6:4   | Factory value for Main RC 4 MHz frequency trim.                    |
|            | 9:7   | Factory value for Main RC 8 MHz frequency trim.                    |
|            | 12:10 | Factory value for Main RC 10 MHz frequency trim.                   |
|            | 15:13 | Factory value for Main RC 12 MHz frequency trim.                   |
|            | 18:16 | Factory value for Second RC 4 MHz frequency trim.                  |
|            | 21:19 | Factory value for Second RC 8 MHz frequency trim.                  |
|            | 24:22 | Factory value for Second RC 10 MHz frequency trim.                 |
|            | 27:25 | Factory value for Second RC 12 MHz frequency trim.                 |
| 2 and 3    | 27:0  | Duplicates of GPNVM Word 1                                         |

### 10.2.4 Boot Strategies

The SAMRH71 can boot from several memories:

- Internal Flash memory through HEFC
- External PROM memory through HEMC

The selection is performed by reading the value BOOT\_MODE PIO (PF24) during reset:

- 0b0: Internal Flash memory (HEFC)
- 0b1: External PROM memory (HEMC)

The selection made by the BOOT\_MODE PIO(PF24) mirrors the address of the selected memory to 0x00000000, allowing the processor to boot on this memory. By default, the ITCM is located at address 0x00000000 when enabled.

**Note:** Set the BOOT\_MODE pin (PF24 with internal 15k pull-up) to the correct logic level before releasing nRST during power-on or operation to ensure the correct boot memory area is chosen for execution.

## 11. Event System

### 11.1 Real-time Management

The signals generated by the peripherals are designed to be directly routed to peripherals managing/using these events without processor intervention. Peripherals receiving events contain logic by which to select the one required.

**Table 11-1.** Real-time Mapping List

| Function            | Application                                                   | Description                                                                              | Source                                                                              | Destination                                    |

## 12. Peripherals

### 12.1 Peripheral Identifiers

The table below defines the Peripheral Identifiers of the SAMRH71. A peripheral identifier is required for the control of the peripheral interrupt with the Nested Vectored Interrupt Controller (NVIC) and control of the peripheral clock with the Power Management Controller (PMC).

**Table 12-1.** Peripheral Identifiers

| Instance ID | Instance Name | NVIC Interrupt | PMC Clock Control | Generic Clock | Instance Description                                                           |
|-------------|---------------|----------------|-------------------|---------------|--------------------------------------------------------------------------------|
| 0           | SUPC          | X              | –                 | –             | Supply Controller                                                              |
| 1           | RSTC          | X              | –                 | –             | Reset Controller                                                               |
| 2           | RTC           | X              | –                 | –             | Real Time Clock                                                                |
| 3           | RTT           | X              | –                 | –             | Real Time Timer                                                                |

## 12.3 FLEXCOM Features

The FLEXCOM embeds all communication interfaces.

**Important:** HW flow control is not functional with the DMA.

**Table 12-3.** FLEXCOM Configuration

| FUNC  | Sub Function               | FLEXCOM |         |         |         |         |         |         |         |         |         |
|-------|----------------------------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
|       |                            | 0       | 1       | 2       | 3       | 4       | 5       | 6       | 7       | 8       | 9       |

## 13. ARM Cortex-M7 (ARM)

Refer to the following Arm reference documents, which are available for download at [www.arm.com](http://www.arm.com).

- *Cortex-M7 Processor User Guide* (ARM DUI 0646B)
- *Cortex-M7 Technical Reference Manual* (ARM DDI 0489D)

### 13.1 ARM Cortex-M7 Configuration

The table below gives the configuration for the Arm Cortex-M7 processor in SAMRH71.

**Table 13-1.** Arm Cortex-M7 Configuration

| Features                       | Configuration                                             |
|--------------------------------|-----------------------------------------------------------|
| <b>Debug</b>                   |                                                           |
| Comparator set                 | Full comparator set: 4 DWT and 8 FPB comparators          |
| ETM support                    | Instruction ETM interface                                 |
| Internal Trace support (ITM)   | ITM and DWT trace functionality implemented               |
| CTI and WIC                    | Not embedded                                              |
| <b>TCM</b>                     |                                                           |
| ITCM maximum size              | 128 Kbytes                                                |
| DTCM maximum size              | 256 Kbytes                                                |
| <b>Cache</b>                   |                                                           |
| Cache size                     | 16 Kbytes for instruction cache, 16 Kbytes for data cache |
| Number of sets                 | 256 for instruction cache, 128 for data cache             |
| Number of ways                 | 2 for instruction cache, 4 for data cache                 |
| Number of words per cache line | 8 words (32 bytes)                                        |
| ECC on Cache                   | Embedded                                                  |
| <b>NVIC</b>                    |                                                           |
| IRQ number                     | 91                                                        |
| IRQ priority levels            | 3                                                         |
| <b>MPU</b>                     |                                                           |
| Number of regions              | 16                                                        |
| <b>FPU</b>                     |                                                           |
| FPU precision                  | Single and double precision                               |
| <b>AHB Port</b>                |                                                           |
| AHBP addressing size           | 512 Mbytes                                                |
| <b>Core</b>                    |                                                           |
| Architecture                   | Little Endian fixed                                       |

## 14. TCM Hardened Error Correction Code (TCMHECC)

### 14.1 Description

The TCM Hardened Error Correction Code (TCMHECC) is a module embedded in the TCM interface to protect data against radiation effects.

### 14.2 Embedded Characteristics

- Embedded Hamming Code to Correct One Error and Detect up to Two Errors per 32-bit Word
- Interrupt Capabilities
  - One interrupt dedicated to fixable errors
  - One interrupt dedicated to unfixable errors
- Error Counters Available for Statistical Reporting
  - One counter dedicated to fixable errors
  - One counter dedicated to unfixable errors
- Embedded TCMHECC Testing Mode

### 14.3 Block Diagram

Figure 14-1. TCM Memories – HECC Protection – Block Overview

### 14.4 Functional Description

#### 14.4.1 Overview

The TCMHECC comprises of the following:

- Four Hamming encoders/decoders:
  - One Hamming for ITCM MSB – 32 bits
  - One Hamming for ITCM LSB – 32 bits
  - One Hamming for DTCM0 – 32 bits
  - One Hamming for DTCM1 – 32 bits
- An APB end user interface:
  - To enable/disable the TCMHECC protection

- To activate/deactivate the TCMHECC test mode for all Hamming blocks (independently in read or write mode)
- To reset the TCMHECC fixable and unfixable counters
- An APB end user interface for errors status and reporting:
  - Indicates whether fixable errors have been detected and corrected on-the-fly, and quantifies them
  - Indicates whether unfixable errors have been detected and quantifies them
  - The indication can be done either by interruption or by polling
  - Indicates the address and the origin of the last TCMHECC error detected

#### 14.4.2 Operation

When enabled, the TCMHECC operates at each access to the memories.

However, the TCMHECC detection and correction is performed only on read/fetch accesses, by comparing the TCMHECC checksum stored in memory to the one locally computed from data read.

**Note:** When TCMHECC is enabled on the TCM (ITCM/DTCM) memories, the read-modify-write feature on ITCM/DTCM memories must be enabled to ensure the integrity of the ECC checkbits on sub-word writes.

**Notes:** At power up, the DATA and CHECKSUM of the (I/D)TCM memories are not coherent. Before enabling the TCMHECC feature, a full initialization of the (I/D)TCM memories must align DATA and CHECKSUM information. For that, the following procedure must be applied:

1. Deactivate RMW and RETRY feature and activate the ENABLE feature on (I/D)TCM.
2. Read and write back all content of I/D(TCM).
  - a. Deactivate the TCMHECC feature and read the DATA of the (I/D)TCM memories.
  - b. Activate the TCMHECC feature and write the DATA +CHECKSUM on the (I/D)TCM memories.

**Important:** At this step, only Write 64-bit instruction must be used.

3. Reactivate the RMW feature and RETRY and the ENABLE feature on (I/D)TCM.

At this step, the (I/D)TCM is fully initialized and DATA and CHECKSUM are aligned.

#### 14.4.3 Interrupt Sources

Using the TCMHECC interrupt requires the interrupt controller to be programmed first.

### 14.5 Hamming Code

The Hamming code used is Hamming(39,32). For each 32-bit word, a 7-bit checksum is generated. With this correction code, errors of one bit can be corrected (fixable error) and errors of up to two bits (unfixable errors) can be detected.

#### 14.5.1 Write Access

When the processor performs a write access to a TCMHECC protected memory, the TCMHECC also writes the 7-bit TCMHECC checksum on this memory.

#### 14.5.2 Read Access

When the processor performs a read access to a TCMHECC protected memory, it reads data and the associated checksum. The checksum read from the TCMHECC protected memory is compared against the checksum generated by the TCMHECC from the same read data. Any discrepancy yields

an error and a syndrome is computed to further qualify the error as a fixable error or unfixable error.

### 14.5.3 Fixable Error

If a fixable error occurs, a retry signal is raised, then the processor may re-access the same data. For this second access, no timing penalty is incurred.

The fixable error event is reported in the Status register (TCMHECC\_SR) and the address of the corresponding error is reported in the Fail Address register (TCMHECC\_FAILAR).

If the fixable error occurs in the Instruction TCM (ITCM) or in Data TCM (DTCM) memory, the flag TCMHECC\_SR.FIX\_I or TCMHECC\_SR.FIX\_D is raised, respectively.

If previously enabled, fixable interrupts are also generated.

When a fixable error is detected, a memory number indicates which memory is involved (TCMHECC\_SR.MEM\_ID\_I or TCMHECC\_SR.MEM\_ID\_D).

The fixable error remains in memory until a software-initiated rewrite is performed at the faulty memory location.

**CAUTION** In the interrupt handler, reading the status will clear the interrupt. If a read to the fail address is performed in the handler after the status has been read, this will generate a new unexpected interrupt as the error hasn't been corrected yet.

**CAUTION** The Write-back sequence shall be done only in 64-bit for ITCM.

To track the number of fixable errors, a fixable error counter is available. It is incremented each time a fixable error, whether in the DTCM or the ITCM, is detected and until a counter overflow is detected.

The fixable counter is reset using RST\_NOFIX\_CPT in TCMHECC\_CR.

### 14.5.4 Unfixable Error

The unfixable error event is reported in the Status register (TCMHECC\_SR) and the address of the corresponding error is reported in the Fail Address register (TCMHECC\_FAILAR).

If the unfixable error occurs in the Instruction TCM (ITCM) or in Data TCM (DTCM) memory, the flag TCMHECC\_SR.NOFIX\_I or TCMHECC\_SR.NOFIX\_D is raised, respectively.

If previously enabled, unfixable interrupts are also generated.

When an unfixable error is detected, a memory number indicates which memory is involved (TCMHECC\_SR.MEM\_ID\_I or TCMHECC\_SR.MEM\_ID\_D).

The unfixable error remains in memory until a software-initiated rewrite is performed at the faulty memory location.

**CAUTION** The Write sequence shall be done only in 64-bit for ITCM.

To track the number of unfixable errors, an unfixable error counter is available. It is incremented each time an unfixable error, whether in the DTCM or the ITCM, is detected and until a counter overflow is detected.

The unfixable counter is reset using RST\_NOFIX\_CPT in TCMHECC\_CR.

## 14.6 TCMHECC Testing

Operation of the TCMHECC can be bypassed for testing purposes and is controlled in the Control register (TCMHECC\_CR).

When testing mode is activated, it is applied on the four Hamming encoder/decoder blocks.

### 14.6.1 Write Test

When TCMHECC write bypass is enabled (TCMHECC\_CR.TEST\_MODE\_WR=1), the test checksum (TCMHECC\_TESTCB1.TCB1 and TCMHECC\_TESTCB1.TCB2) replaces the TCMHECC-generated checksum during a data store.

- TCMHECC\_TESTCB1.TCB1 is relative to DTCM0, DTCM1, ITCM (LSB)
- TCMHECC\_TESTCB1.TCB2 is relative to ITCM (MSB)

**Note:** When a write 64-bit data is used in Write Data Test mode, the same data must be written twice (on the 32-bit MSB and the 32-bit LSB) because only ECC\_TESTCB1.TCB1 is used to inject checksum on DTCM0 and DTCM1.

### 14.6.2 Read Test

When the TCMHECC read diagnostic is enabled (TCMHECC\_CR.TEST\_MODE\_RD=1), the test checksum (TCMHECC\_TESTCB1.TCB1 and TCMHECC\_TESTCB1.TCB2) is updated with the read checksum during a data load or an instruction fetch.

**Note:** In read test mode, only read of 8-, 16- or 32-bit data can be performed in order to have the corresponding checksum read stored in ECC\_TESTCB1.TCB1.

If 64-bit read data instruction is used, only checksum corresponding to the 32-bit LSB is stored in ECC\_TESTCB1.TCB1. Reading the checksum corresponding to the 32-bit MSB is not possible.

## 14.7 Register Summary

| Offset              | Name            | Bit Pos. | 7              | 6              | 5             | 4           | 3           | 2            | 1            | 0           |
|---------------------|-----------------|----------|----------------|----------------|---------------|-------------|-------------|--------------|--------------|-------------|

| Reset  |    |    |                   |             |    |                  |                  |        |
| Bit    | 7  | 6  | 5                 | 4           | 3  | 2                | 1                | 0      |
|        |    |    | RST_NOFIX_C<br>PT | RST_FIX_CPT |    | TEST_MODE_<br>WR | TEST_MODE_<br>RD | ENABLE |
| Access |    |    | R/W               | R/W         |    | R/W              | R/W              | R/W    |
| Reset  |    |    | 0                 | 0           |    | 0                | 0                | 1      |

**Bit 5 – RST\_NOFIX\_CPT** Reset the Unfixable Error Counter  
 This bit automatically returns to '0' once the operation is done.

| Value | Description                                 |
|-------|---------------------------------------------|
| 0     | No effect.                                  |
| 1     | Resets the TCMHECC unfixable error counter. |

**Bit 4 – RST\_FIX\_CPT** Reset the Fixable Error Counter  
 This bit automatically returns to '0' once the operation is done.

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | No effect.                                |
| 1     | Resets the TCMHECC fixable error counter. |

**Bit 2 – TEST\_MODE\_WR** Test Mode of TCMHECC Protection - Write Mode  
 The ENABLE bit must be enabled to use TEST\_MODE\_WR.

| Value | Description                     |
|-------|---------------------------------|
| 0     | Write test mode is deactivated. |
| 1     | Write test mode is activated.   |

**Bit 1 – TEST\_MODE\_RD** Test Mode of TCMHECC Protection - Read Mode  
 The ENABLE bit must be enabled to use TEST\_MODE\_RD.

| Value | Description                    |
|-------|--------------------------------|
| 0     | Read test mode is deactivated. |
| 1     | Read test mode is activated.   |

**Bit 0 – ENABLE** TCMHECC Protection Enable

| Value | Description                |
|-------|----------------------------|
| 0     | Protection is deactivated. |
| 1     | Protection is activated.   |

14.7.2 TCMHECC Test Mode Register 1

**Name:** TCMHECC\_TESTCB1  
**Offset:** 0x4  
**Reset:** 0x00000000  
**Property:** Read/Write

TCB1[7] and TCB2[7] are fixed to 0.

**Bits 15:8 – TCB2[7:0]** Test Check Bit (8-bit)  
Check bit for test purposes (ITCM\_MSB is stored here).  
TCB2[7] is fixed to 0.

**Bits 7:0 – TCB1[7:0]** Test Check Bit (8-bit)  
Check bit for test purposes (D0TCM, D1TCM or ITCM LSB is stored here).  
TCB1[7] is fixed to 0.

#### Bit 29 – MEM\_ID\_D Memory Identification Number

Defines the memory to which the error corresponds.

| Value | Description        |
|-------|--------------------|
| 0     | DTCM0 is selected. |
| 1     | DTCM1 is selected. |

#### Bit 28 – MEM\_ID\_I Memory Identification Number

Defines the memory to which the error corresponds.

| Value | Description           |
|-------|-----------------------|
| 0     | ITCM LSB is selected. |
| 1     | ITCM MSB is selected. |

#### Bit 27 – ONE One

Always fixed to 1.

#### Bits 26:24 – HES[2:0] Hardware Error Size

Identifies the size of the failed access.  
Always fixed to 010=word.

#### Bit 15 – OVER\_NOFIX Counter Overflow

| Value | Description                                                            |
|-------|------------------------------------------------------------------------|
| 0     | No overflow has occurred since the last read on the unfixable counter. |
| 1     | An overflow has occurred since the last read on the unfixable counter. |

#### Bits 14:10 – CPT\_NOFIX[4:0] 5-bit Counter

Counts the number of unfixable errors detected for one type of memory during the mission.

**Bit 9 – MEM\_NOFIX\_D** Unfixable Error Status in Data Memory

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | No unfixable error detected on data memory           |
| 1     | An unfixable error has been detected in data memory. |

**Bit 8 – MEM\_NOFIX\_I** Unfixable Error Status in Instruction Memory

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | No unfixable error detected on instruction memory           |
| 1     | An unfixable error has been detected in instruction memory. |

**Bit 7 – OVER\_FIX** Counter Overflow

| Value | Description                                                          |
|-------|----------------------------------------------------------------------|
| 0     | No overflow has occurred since the last read on the fixable counter. |
| 1     | An overflow has occurred since the last read on the fixable counter. |

**Bits 6:2 – CPT\_FIX[4:0]** 5-bit Counter

Counts the number of fixable errors detected for one type of memory during the mission.

**Bit 1 – MEM\_FIX\_D** Fixable Error Status in Data Memory

| Value | Description                                       |
|-------|---------------------------------------------------|
| 0     | No fixable error detected on data memory          |
| 1     | A fixable error has been detected on data memory. |

**Bit 0 – MEM\_FIX\_I** Fixable Error Status in Instruction Memory

| Value | Description                                              |
|-------|----------------------------------------------------------|
| 0     | No fixable error detected on instruction memory          |
| 1     | A fixable error has been detected on instruction memory. |

14.7.4 TCMHECC Interrupt Enable Register

**Name:** TCMHECC\_IER  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

- 0: No effect.
- 1: Enables the corresponding interrupt.

Bit 3 – MEM\_NOFIX\_D Unfixable Error On Data

Bit 2 – MEM\_FIX\_D Fixable Error On Data

Bit 1 – MEM\_NOFIX\_I Unfixable Error On Instruction

Bit 0 – MEM\_FIX\_I Fixable Error On Instruction

14.7.5 TCMHECC Interrupt Disable Register

**Name:** TCMHECC\_IDR  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

- 0: No effect.
- 1: Disables the corresponding interrupt.

Bit 3 – MEM\_NOFIX\_D Unfixable Error On Data

Bit 2 – MEM\_FIX\_D Fixable Error On Data

Bit 1 – MEM\_NOFIX\_I Unfixable Error On Instruction

Bit 0 – MEM\_FIX\_I Fixable Error On Instruction

14.7.6 TCMHECC Interrupt Mask Register

**Name:** TCMHECC\_IMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

|        |    |    |    |    |             |           |             |           |
|--------|----|----|----|----|-------------|-----------|-------------|-----------|

#### Bits 31:0 – ADDRESS[31:0] Address of the Error Detected on DCTM

The address of the faulty data detected when a fixable or an unfixable error occurs in DTCM memory.

## 15. FlexRAM Memory and Embedded Hardened ECC (FLEXRAMECC) Controller

### 15.1 Description

The FlexRAM comprises 768 Kbytes of internal protected memory.

The embedded Hardened Error Correction Code (HECC) Controller for FlexRAM protects this data against the effects of radiation.

### 15.2 Embedded Characteristics

- 768 Kbytes of Internal Memory
- Three Slaves Access the HMATRIX
- Three Channels Depending on the Memory Type and the Access Used
- Embedded Hamming Code to Correct One Error and Detect up to Two Errors
- Interrupt Capabilities
  - One interrupt dedicated to Fixable Errors
  - One interrupt dedicated to Unfixable Errors
- Error Counter Available for Statistical Reporting
  - One counter dedicated to Fixable Errors
  - One counter dedicated to Unfixable Errors
- Embedded HECC for FlexRAM Testing Mode

### 15.3 Block Diagram

Figure 15-1. Block Diagram

### 15.4 Functional Description

#### 15.4.1 Overview

The HECC for FlexRAM comprises the following:

- One encoder/decoder Hamming

- An APB end user interface used to configure:
  - The FLEXRAMECC test mode (independently in read or write mode)
  - The reset of the FLEXRAMECC fixable and unfixable counters
- An APB end user interface for errors status and reporting:
  - Indicates whether fixable errors have been detected and corrected on-the-fly, and quantifies them
  - Indicates whether unfixable errors have been detected and quantifies them
  - The indication can be done either by interruption or by polling
  - Indicates the address and the status of the last FLEXRAMECC error detected

### 15.4.2 Operation

When enabled, the FLEXRAMECC operates at each access to the memories.

However, the FLEXRAMECC detection and correction is performed only on read/fetch accesses, by comparing the FLEXRAMECC checksum stored in memory to the one locally computed from data read.

### 15.4.3 Interrupt Sources

Using the FLEXRAMECC interrupt requires the interrupt controller to be programmed first.

## 15.5 Hamming Code

The Hamming code used is the Hamming(39,32). For each 32-bit word, a 7-bit checksum is generated. With this correction code, errors of one bit can be corrected (fixable error) and errors of up to two bits (unfixable errors) can be detected.

### 15.5.1 Write Access

When the processor performs a write access to an FLEXRAMECC protected memory, it also writes the 7-bit FLEXRAMECC checksum on the FLEXRAMECC protected memory.

### 15.5.2 Read Access

When the processor performs a read access to a FLEXRAMECC protected memory, it reads data and the associated checksum. The checksum read from the FLEXRAMECC protected memory is compared against the checksum generated by the FLEXRAMECC from the same read data. Any discrepancy yields an error and a syndrome is computed to further qualify the error as a fixable error or unfixable error.

### 15.5.3 Fixable Error

The correction of a fixable error is performed on-the-fly inside the processor during the current access and no timing penalty is incurred. It is also automatically corrected inside the memory.

The fixable error event is reported in the Status register (FLEXRAMECC\_SR) and the address of the corresponding error is reported in the Fail Address register (FLEXRAMECC\_FAILAR). If previously enabled, a fixable interrupt is generated.

To track the number of fixable errors, a fixable error counter is available. It is incremented each time a fixable error is detected and until a counter overflow is detected.

It is possible for the end user to reset the fixable counter using RST\_FIX\_CPT in the Control register (FLEXRAMECC\_CR).

### 15.5.4 Unfixable Error

The unfixable error event is reported in FLEXRAMECC\_SR and the address of the corresponding error is reported in FLEXRAMECC\_FAILAR. If previously enabled, an unfixable interrupt is generated.

To track the number of unfixable errors, an unfixable error counter is available. It is incremented each time an unfixable error is detected and until a counter overflow is detected.

It is possible for the end user to reset the unfixable counter using RST\_NOFIX\_CPT in FLEXRAMECC\_CR.

## 15.6 FLEXRAMECC Testing

Operation of the FLEXRAMECC can be bypassed for testing purposes and is controlled in FLEXRAMECC\_CR.

### 15.6.1 Write Test

When FLEXRAMECC write bypass is enabled (FLEXRAMECC\_CR.TEST\_MODE\_WR=1), the test checksum (FLEXRAMECC\_TESTCB1.TCB1) replaces the FLEXRAMECC generated checksum during a data store.

### 15.6.2 Read Test

When the FLEXRAMECC read diagnostic is enabled (FLEXRAMECC\_CR.TEST\_MODE\_RD=1), the test checksum (FLEXRAMECC\_TESTCB1.TCB1) is updated with the read checksum during a data load or an instruction fetch.

**Note:** The FLEXRAMECC test routine must be executed entirely from the instruction cache (when activated) or from an area without the FLEXRAMECC activated and different from the one being accessed. Otherwise, the checksum read during instruction fetch will overwrite those from the area to be tested.

## 15.7 Register Summary

| Offset              | Name                  | Bit Pos. | 7              | 6              | 5             | 4           | 3    | 2            | 1            | 0         |
|---------------------|-----------------------|----------|----------------|----------------|---------------|-------------|------|--------------|--------------|-----------|
| 0x00                | FLEXRAMECC_CR         | 7:0      |                |                | RST_NOFIX_CPT | RST_FIX_CPT |      | TEST_MODE_WR | TEST_MODE_RD | ONE       |
|                     |                       | 15:8     |                |                |               |             |      |              |              |           |

### 15.7.1 FLEXRAMECC Control Register

**Name:** FLEXRAMECC\_CR  
**Offset:** 0x0  
**Reset:** 0x00000001  
**Property:** Read/Write

|        |    |    |                   |             |    |                  |                  |          |
|--------|----|----|-------------------|-------------|----|------------------|------------------|----------|
| Bit    | 31 | 30 | 29                | 28          | 27 | 26               | 25               | 24       |
| Access |    |    |                   |             |    |                  |                  |          |
| Reset  |    |    |                   |             |    |                  |                  |          |
| Bit    | 23 | 22 | 21                | 20          | 19 | 18               | 17               | 16       |
| Access |    |    |                   |             |    |                  |                  |          |
| Reset  |    |    |                   |             |    |                  |                  |          |
| Bit    | 15 | 14 | 13                | 12          | 11 | 10               | 9                | 8        |
| Access |    |    |                   |             |    |                  |                  |          |
| Reset  |    |    |                   |             |    |                  |                  |          |
| Bit    | 7  | 6  | 5                 | 4           | 3  | 2                | 1                | 0        |
| Access |    |    | RST_NOFIX_C<br>PT | RST_FIX_CPT |    | TEST_MODE_<br>WR | TEST_MODE_<br>RD | ONE      |
| Reset  |    |    | R/W<br>0          | R/W<br>0    |    | R/W<br>0         | R/W<br>0         | R/W<br>1 |

#### Bit 5 – RST\_NOFIX\_CPT Reset the Unfixable Error Counter

This bit automatically returns to '0' once the operation is done.

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | No effect.                              |
| 1     | Resets the ECC unfixable error counter. |

#### Bit 4 – RST\_FIX\_CPT Reset the Fixable Error Counter

This bit automatically returns to '0' once the operation is done.

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Resets the ECC fixable error counter. |

#### Bit 2 – TEST\_MODE\_WR Test Mode of ECC Protection - Write Mode

| Value | Description                     |
|-------|---------------------------------|
| 0     | Write test mode is deactivated. |
| 1     | Write test mode is activated.   |

#### Bit 1 – TEST\_MODE\_RD Test Mode of ECC Protection - Read Mode

| Value | Description                    |
|-------|--------------------------------|
| 0     | Read test mode is deactivated. |
| 1     | Read test mode is activated.   |

#### Bit 0 – ONE Always '1'.

15.7.2 FLEXRAMECC Test Mode Register 1

Name: FLEXRAMECC\_TESTCB1  
Offset: 0x4  
Reset: 0x00000000  
Property: Read/Write

Bits 7:0 – TCB1[7:0] Test Check Bit  
Check bit for test purposes.

### 15.7.3 FLEXRAMECC Status Register

**Name:** FLEXRAMECC\_SR  
**Offset:** 0xC  
**Reset:** 0x0A000000  
**Property:** Read/Write

|        |    |    |    |    |      |     |          |     |
|--------|----|----|----|----|------|-----|----------|-----|
| Bit    | 31 | 30 | 29 | 28 | 27   | 26  | 25       | 24  |
|        |    |    |    |    | TYPE |     | HES[2:0] |     |
| Access |    |    |    |    | R/W  | R/W | R/W      | R/W |
| Reset  |    |    |    |    | 1    | 0   | 1        | 0   |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |            |     |     |                |     |     |   |           |
|--------|------------|-----|-----|----------------|-----|-----|---|-----------|
| Bit    | 15         | 14  | 13  | 12             | 11  | 10  | 9 | 8         |
|        | OVER_NOFIX |     |     | CPT_NOFIX[4:0] |     |     |   | MEM_NOFIX |
| Access | R/W        | R/W | R/W | R/W            | R/W | R/W |   | R/W       |
| Reset  | 0          | 0   | 0   | 0              | 0   | 0   |   | 0         |

|        |          |     |     |              |     |     |   |         |
|--------|----------|-----|-----|--------------|-----|-----|---|---------|
| Bit    | 7        | 6   | 5   | 4            | 3   | 2   | 1 | 0       |
|        | OVER_FIX |     |     | CPT_FIX[4:0] |     |     |   | MEM_FIX |
| Access | R/W      | R/W | R/W | R/W          | R/W | R/W |   | R/W     |
| Reset  | 0        | 0   | 0   | 0            | 0   | 0   |   | 0       |

**Bit 27 – TYPE** Write or Read Access. Always '1'.

| Value | Description   |
|-------|---------------|
| 0     | Write access. |
| 1     | Read access.  |

**Bits 26:24 – HES[2:0]** Hardware Error Size  
Identifies the size of the failed access.

**Bit 15 – OVER\_NOFIX** Counter Overflow

| Value | Description                                                        |
|-------|--------------------------------------------------------------------|
| 0     | No overflow has occurred since the last read on unfixable counter. |
| 1     | An overflow has occurred since the last read on unfixable counter. |

**Bits 14:10 – CPT\_NOFIX[4:0]** 5-bit Counter  
Counts the number of unfixable errors detected for one type of memory during the mission.

**Bit 8 – MEM\_NOFIX** Unfixable Error Status

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No unfixable error detected.          |
| 1     | An unfixable error has been detected. |

**Bit 7 – OVER\_FIX** Counter Overflow

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No overflow has occurred since the last read. |
| 1     | An overflow has occurred since the last read. |

**Bits 6:2 – CPT\_FIX[4:0]** 5-bit Counter

Counts the number of fixable errors detected for one type of memory during the mission.

**Bit 0 – MEM\_FIX** Fixable Error Status

A fixable error has been detected.

| Value | Description                        |
|-------|------------------------------------|
| 0     | No fixable error detected.         |
| 1     | A fixable error has been detected. |

### 15.7.4 FLEXRAMECC Interrupt Enable Register

**Name:** FLEXRAMECC\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

- 0: No effect.
- 1: Enables the corresponding interrupt.

|        |    |    |    |    |    |    |           |         |
|--------|----|----|----|----|----|----|-----------|---------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25        | 24      |
|        |    |    |    |    |    |    |           |         |
| Access |    |    |    |    |    |    |           |         |
| Reset  |    |    |    |    |    |    |           |         |
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17        | 16      |
|        |    |    |    |    |    |    |           |         |
| Access |    |    |    |    |    |    |           |         |
| Reset  |    |    |    |    |    |    |           |         |
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9         | 8       |
|        |    |    |    |    |    |    |           |         |
| Access |    |    |    |    |    |    |           |         |
| Reset  |    |    |    |    |    |    |           |         |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2  | 1         | 0       |
|        |    |    |    |    |    |    | MEM_NOFIX | MEM_FIX |
| Access |    |    |    |    |    |    | W         | W       |
| Reset  |    |    |    |    |    |    | –         | –       |

**Bit 1 – MEM\_NOFIX** Unfixable Error

**Bit 0 – MEM\_FIX** Fixable Error

15.7.5 FLEXRAMECC Interrupt Disable Register

**Name:** FLEXRAMECC\_IDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

- 0: No effect.
- 1: Disables the corresponding interrupt.

Bit 1 – MEM\_NOFIX Unfixable Error

Bit 0 – MEM\_FIX Fixable Error

15.7.6 FLEXRAMECC Interrupt Mask Register

**Name:** FLEXRAMECC\_IMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

|        |    |    |    |    |    |    |           |         |
|--------|----|----|----|----|----|----|-----------|---------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25        | 24      |
|        |    |    |    |    |    |    |           |         |
| Access |    |    |    |    |    |    |           |         |
| Reset  |    |    |    |    |    |    |           |         |
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17        | 16      |
|        |    |    |    |    |    |    |           |         |
| Access |    |    |    |    |    |    |           |         |

#### Bits 31:0 – ADDRESS[31:0] Address of the Error Detected

The address of the faulty data detected when a fixable or unfixable error occurs.

## 16. Debug and Test Features

### 16.1 Description

The device features a number of complementary debug and test capabilities. The Serial Wire Debug Port (SW-DP) is used for standard debugging functions, such as downloading code and single-stepping through programs. It also embeds a serial wire trace.

### 16.2 Associated Documents

The device implements the standard Arm CoreSight macrocell. For detailed information on CoreSight, refer to the following documents which are available at [www.arm.com/](http://www.arm.com/):

- Cortex-M7 User Guide Reference Manual (ARM DUI 0646B)
- Cortex-M7 Technical Reference Manual (ARM DDI 0489D)
- CoreSight Technology System Design Guide (ARM DGI 0012)
- CoreSight Components Technical Reference Manual (ARM DDI 0314)
- Arm Debug Interface v5 Architecture Specification (Doc. ARM IHI 0031)
- ARMv7-M Architecture Reference Manual (ARM DDI 0403E)

### 16.3 Debug and Test Block Diagram

Figure 16-1. Debug and Test Block Diagram

## 16.4 Debug and Test Pin Description

**Table 16-1.** Debug and Test Signal List

| Signal Name                                      | Function                                  | Type   | Active Level |
|--------------------------------------------------|-------------------------------------------|--------|--------------|
| <b>Reset/Test</b>                                |                                           |        |              |
| NRST                                             | Microcontroller Reset                     | Input  | Low          |
| TST                                              | Test Select                               | Input  | –            |
| <b>Serial Wire Debug Port/JTAG Boundary Scan</b> |                                           |        |              |
| TCK/SWCLK                                        | Test Clock/Serial Wire Clock              | Input  | –            |
| TDI                                              | Test Data In                              | Input  | –            |
| TDO/TRACESWO                                     | Test Data Out/Trace Asynchronous Data Out | Output | –            |
| TMS/SWDIO                                        | Test Mode Select/Serial Wire Input/Output | Input  | –            |
| JTAGSEL                                          | JTAG Selection                            | Input  | High         |
| <b>Trace Debug Port</b>                          |                                           |        |              |
| TRACECLK                                         | Trace Clock                               | Output | –            |
| TRACED0–3                                        | Trace Data                                | Output | –            |

## 16.5 Application Examples

### 16.5.1 Debug Environment

The figure below shows a complete debug environment example. The SW-DP interface is used for standard debugging functions, such as downloading code and single-stepping through the program and viewing core and peripheral registers.

**Figure 16-2.** Application Debug Environment Example

### 16.5.2 Test Environment

The figure below shows a test environment example (JTAG Boundary scan). Test vectors are sent and interpreted by the tester. In this example, the “board in test” is designed using a number of JTAG-compliant devices. These devices can be connected to form a single scan chain.

**Figure 16-3. Application Test Environment Example**

## 16.6 Functional Description

### 16.6.1 Test Pin

The TST pin is used for JTAG Boundary Scan Manufacturing Test or Fast Flash Programming mode. The TST pin integrates a permanent pull-down resistor of about 10 kΩ to GND, so that it can be left unconnected for normal operations.

### 16.6.2 Debug Architecture

The figure below shows the debug architecture used. The Cortex-M7 embeds six functional units for debug:

- Serial Wire Debug Port (SW-DP) debug access
- FPB (Flash Patch Breakpoint), (no FP\_REMAP register supported in Cortex-M7)
- DWT (Data Watchpoint and Trace)
- ITM (Instrumentation Trace Macrocell)
- 6-pin Embedded Trace Macrocell (ETM) for instruction trace stream, including CoreSight Trace Port Interface Unit (TPIU)
- IEEE1149.1 JTAG Boundary scan on all digital pins

The debug architecture information that follows is mainly dedicated to developers of SW-DP Emulators/Probes and debugging tool vendors for Cortex-M7-based microcontrollers. For further details on SW-DP, refer to the Cortex-M7 Technical Reference Manual.

**Figure 16-4. Debug Architecture**

### 16.6.3 Serial Wire Debug Port (SW-DP) Pins

The SW-DP pins SWCLK and SWDIO are commonly provided on a standard 20-pin JTAG connector defined by Arm. For more details on voltage reference and reset state, refer to [Table 3-1](#).

At start-up, SW-DP pins are configured in SW-DP mode to allow connection with debugging probe.

**Note:** For final application, the SWDIO and SWCLK shall be connected to external pull down to avoid having floating signals.

SW-DP pins can be used as standard I/Os to provide users more general input/output pins when the debug port is not needed in the end application. Mode selection between SW-DP mode (System I/O mode) and general I/O mode is performed through the PIO Controller. Configuration of the pad for pull-up, triggers, debouncing and glitch filters is possible regardless of the mode.

The JTAGSEL pin is used to select the JTAG boundary scan when asserted at a high level. It integrates a permanent pull-down resistor of about 10 kΩ to GND, so that it can be left unconnected for normal operations.

The JTAG debug ports TDI, TDO, TMS and TCK are inactive. They are provided for Boundary Scan Manufacturing Test purposes only. By default the SW-DP is active; TDO/TRACESWO can be used for trace.

**Table 16-2. SW-DP Pin List**

| Pin Name     | JTAG Boundary Scan | Serial Wire Debug Port         |
|--------------|--------------------|--------------------------------|
| TMS/SWDIO    | TMS                | SWDIO                          |
| TCK/SWCLK    | TCK                | SWCLK                          |
| TDI          | TDI                | –                              |
| TDO/TRACESWO | TDO                | TRACESWO (optional: ITM trace) |

SW-DP is selected when JTAGSEL is low. It is not possible to switch directly between SW-DP and JTAG boundary scan operations. A chip reset must be performed after JTAGSEL is changed.

### 16.6.4 Embedded Trace Module (ETM) Pins

The Embedded Trace Module (ETM) uses the Trace Port Interface Unit (TPIU) to export data out of the system.

The TPIU features these pins:

- TRACECLK – Always exported to enable synchronization back with the data. PCK3 is used internally.
- TRACED0–3 – The instruction trace stream.

### 16.6.5 Flash Patch Breakpoint (FPB)

The FPB implements hardware breakpoints. No Flash patching is available in the Cortex-M7.

### 16.6.6 Data Watchpoint and Trace (DWT)

The DWT contains four comparators which can be configured to generate:

- PC sampling packets at set intervals
- PC or Data watchpoint packets
- Watchpoint event to halt core

The DWT contains counters for:

- Clock cycle (CYCCNT)
- Folded instructions
- Load Store Unit (LSU) operations
- CPI (all instruction cycles except for the first cycle)
- Interrupt overhead

### 16.6.7 Instrumentation Trace Macrocell (ITM)

The ITM is an application driven trace source that supports printf style debugging to trace Operating System (OS) and application events, and emits diagnostic system information. The ITM emits trace information as packets which can be generated by three different sources with several priority levels:

- Software trace: Software can write directly to ITM stimulus registers. This can be done using the “printf” function. For more information, see [Flash Patch Breakpoint \(FPB\)](#).
- Hardware trace: The ITM emits packets generated by the DWT.
- Timestamping: Timestamps are emitted relative to packets. The ITM contains a 21-bit counter to generate the timestamp.

#### 16.6.7.1 How to Configure the ITM

The following example describes how to output trace data in asynchronous trace mode.

1. Configure the TPIU for asynchronous trace mode. See [How to Configure the TPIU](#).
2. Enable the write accesses into the ITM registers by writing “0xC5ACCE55” into the Lock Access Register (Address: 0xE0000FB0)
3. Write 0x00010015 into the Trace Control register:
  - Enable ITM.
  - Enable Synchronization packets.
  - Enable SWO behavior.
  - Fix the ATB ID to 1.
4. Write 0x1 into the Trace Enable register:
  - Enable the Stimulus port 0.
5. Write 0x1 into the Trace Privilege register:
  - Stimulus port 0 only accessed in privileged mode (Clearing a bit in this register will result in the corresponding stimulus port being accessible in user mode.)

6. Write into the Stimulus port 0 register: TPIU (Trace Port Interface Unit)  
The TPIU acts as a bridge between the on-chip trace data and the Instruction Trace Macrocell (ITM).  
The TPIU formats and transmits trace data off-chip at frequencies asynchronous to the core.

### 16.6.7.2 Asynchronous Mode

The TPIU is configured in Asynchronous mode, trace data are output using the single TRACESWO pin. The TRACESWO signal is multiplexed with the TDO signal. As a consequence, asynchronous trace mode is only available when the Serial Wire Debug mode is selected.

Two encoding formats are available for the single pin output:

- Manchester encoded stream. This is the reset value.
- NRZ\_based UART byte structure

### 16.6.7.3 How to Configure the TPIU

This example only concerns the asynchronous trace mode.

1. Set the TRCENA bit to 1 into the Debug Exception and Monitor Register (0xE000EDFC) to enable the use of trace and debug blocks.
2. Write 0x2 into the Selected Pin Protocol Register.
  - Select the Serial Wire output – NRZ
3. Write 0x100 into the Formatter and Flush Control Register.
4. Set the suitable clock prescaler value into the Async Clock Prescaler Register to scale the baud rate of the asynchronous output (this can be done automatically by the debugging tool).

## 16.6.8 IEEE1149.1 JTAG Boundary Scan

IEEE1149.1 JTAG Boundary Scan allows pin-level access independent of the device packaging technology.

IEEE1149.1 JTAG Boundary Scan is enabled when TST is tied to low and JTAGSEL tied to high during power-up. These pins must be maintained in their respective states for the duration of the boundary scan operation. The SAMPLE, EXTEST and BYPASS functions are implemented. In Serial Wire Debug mode, the Arm processor responds with a non-JTAG chip ID that identifies the processor. This is not IEEE1149.1 JTAG-compliant.

It is not possible to switch directly between JTAG Boundary Scan and SWJ Debug Port operations. A chip reset must be performed after JTAGSEL is changed.

A Boundary Scan Descriptor Language (BSDL) file to set up the test is provided on [www.microchip.com](http://www.microchip.com).

### 16.6.8.1 JTAG Boundary Scan Register

The Boundary Scan Register (BSR) contains a number of bits which correspond to active pins and associated control signals.

Each input/output pin corresponds to a 3-bit register in the BSR. The OUTPUT bit contains data that can be forced on the pad. The INPUT bit facilitates the observability of data applied to the pad. The CONTROL bit selects the direction of the pad.

For more information, refer to BSDL files available on [www.microchip.com](http://www.microchip.com).

16.6.9 ID Code Register

## 17. Bus Matrix (MATRIX)

### 17.1 Description

The Bus Matrix (MATRIX) implements a multi-layer AHB, based on the AHB-Lite protocol, that enables parallel access paths between multiple masters and slaves in a system, thus increasing the overall bandwidth.

The MATRIX interconnects up to 16 masters up to 16 slaves. The normal latency to connect a master to a slave is one cycle, except the default master of the accessed slave which is connected directly (zero cycle latency).

The MATRIX user interface is compliant with the ARM Advanced Peripheral Bus.

#### 17.1.1 Matrix Masters

**Table 17-1.** List of Bus Matrix Masters

|           |                                  |
|-----------|----------------------------------|
| Master 0  | Cortex-M7 Port 0                 |
| Master 1  | Cortex-M7 Port 1                 |
| Master 2  | Cortex-M7 Peripheral Port (AHBP) |
| Master 3  | XDMAC Port 0                     |
| Master 4  | CAN0 DMA                         |
| Master 5  | CAN1 DMA                         |
| Master 6  | GMAC DMA                         |
| Master 7  | SPW Master 0-TX                  |
| Master 8  | SPW Master 1-RX                  |
| Master 9  | SPW Master 2-RMAP                |
| Master 10 | IP1553                           |
| Master 11 | ICM                              |
| Master 12 | XDMAC Port 1                     |

#### 17.1.2 Matrix Slaves

**Table 17-2.** List of Bus Matrix Slaves

|         |                       |
|---------|-----------------------|
| Slave 0 | FlexRAM               |
| Slave 1 | FlexRAM               |
| Slave 2 | Internal Flash (HEFC) |
| Slave 3 | HEMC                  |
| Slave 4 | QSPI                  |
| Slave 5 | Peripheral Bridge     |
| Slave 6 | AHB Slave             |
| Slave 7 | FlexRAM               |

#### 17.1.3 Master to Slave Access

All the Masters can normally access all the Slaves. However, some paths do not make sense. Thus, these paths are forbidden or simply not wired, and shown as “-” in the following table.

**Table 17-3.** Master to Slave Access

| Slave | Master | 0   | 1           | 2               | 3           | 4           | 5           | 6      | 7      | 8           | 9      | 10  | 11              | 12 |

## 17.2 Embedded Characteristics

- AMBA Advanced High-performance Bus (AHB Lite) Compliant Interfaces
- 32-bit Data Bus
- APB-Compliant User Interface
- Thirteen Masters
- Eight Slaves
- One Decoder for Each Master
- Several Possible Boot Memories for Each Master before Remap
- One Remap Function for Each Master
- Support for Long Bursts of 32, 64, 128 and Up to the 256-beat Word Burst AHB Limit
- Enhanced Programmable Mixed Arbitration for Each Slave
  - Round-Robin
  - Fixed Priority
  - Latency Quality of Service
- Programmable Default Master for Each Slave
  - No Default Master
  - Last Accessed Default Master
  - Fixed Default Master
- Deterministic Maximum Access Latency for Masters
- Zero or One Cycle Arbitration Latency for the First Access of a Burst
- Bus Lock Forwarding to Slaves
- Master Number Forwarding to Slaves
- One Special Function Register for Each Slave (Not dedicated)
- Register Write Protection of User Interface Registers
- User/Privilege Protection

## 17.3 Memory Mapping

The Bus Matrix provides one decoder for every AHB master interface. The decoder offers each AHB master several memory mappings. Each memory area may be assigned to several slaves. Booting at the same address while using different AHB slaves (that is external RAM, internal Flash, so on) becomes possible.

The Bus Matrix user interface provides the Master Remap Control Register (MATRIX\_MRCR) that performs the remap action for every master independently.

## 17.4 Special Bus Granting Techniques

The MATRIX provides some speculative bus granting techniques in order to anticipate access requests from masters. Hence, latency is reduced at first access of a burst or, for a single transfer, as long as the slave is free from any other master access. It does not provide any benefit if the slave is continuously accessed by more than one master, since arbitration is pipelined and has no negative effect on the slave bandwidth or access latency.

This bus granting technique sets a different default master for every slave.

At the end of the current access, if no other request is pending, the slave remains connected to its associated default master. A slave can be associated with three kinds of default masters:

- No default master
- Last access master
- Fixed default master

To change from one type of default master to another, the user interface provides Slave Configuration registers (MATRIX\_SCFGx), one for every slave, which set a default master for each slave. MATRIX\_SCFGx contain two fields to manage master selection: DEFMSTR\_TYPE and FIXED\_DEFMSTR. The 2-bit DEFMSTR\_TYPE field selects the default master type (no default, last access master, fixed default master), whereas the 4-bit FIXED\_DEFMSTR field selects a fixed default master provided that DEFMSTR\_TYPE is set to fixed default master. See section [17.11.3. MATRIX\\_SCFG0](#).

## 17.5 No Default Master

After the end of the current access, if no other request is pending, the slave is disconnected from all masters.

This configuration incurs one latency clock cycle for the first access of a burst after bus Idle. Arbitration without default master may be used for masters that perform significant bursts or several transfers with no Idle cycle in-between, or if the slave bus bandwidth is widely used by one or more masters.

This configuration provides no benefit on access latency or bandwidth when reaching maximum slave bus throughput whatever the number of requesting masters.

## 17.6 Last Access Master

After the end of the current access, if no other request is pending, the slave remains connected to the last master that performed an access request.

This enables the MATRIX to remove the one latency cycle for the last master that accessed the slave. Other non-privileged masters still get one latency clock cycle if they need to access the same slave. This technique is useful for masters that mainly perform single accesses or short bursts with some Idle cycles in-between.

This configuration provides no benefit on access latency or bandwidth when reaching maximum slave bus throughput whatever is the number of requesting masters.

## 17.7 Fixed Default Master

After the end of the current access, if no other request is pending, the slave connects to its fixed default master. Unlike the last access master, the fixed default master does not change unless the user modifies it by software (FIXED\_DEFMSTR field of the related MATRIX\_SCFG).

This allows the MATRIX arbiters to remove the one latency clock cycle for the fixed default master of the slave. All requests attempted by the fixed default master do not cause any arbitration latency,

whereas other non-privileged masters get one latency cycle. This technique is useful for a master that mainly performs single accesses or short bursts with Idle cycles in-between.

This configuration provides no benefit on access latency or bandwidth when reaching maximum slave bus throughput, regardless of the number of requesting masters.

## 17.8 Arbitration

The MATRIX provides an arbitration technique that reduces latency when conflicts occur, i.e., when two or more masters try to access the same slave at the same time. One arbiter per slave is provided, thus arbitrating each slave specifically.

The user can either choose one of the following arbitration types, or mix them for each slave:

1. Round-robin Arbitration (default)
2. Fixed Priority Arbitration

The resulting algorithm may be complemented by selecting a default master configuration for each slave.

When re-arbitration must be done, specific conditions apply. See section [17.8.1. Arbitration Scheduling](#).

### 17.8.1 Arbitration Scheduling

Each arbiter has the ability to arbitrate between two or more different master requests. In order to avoid burst breaking as well as to provide the maximum throughput for slave interfaces, arbitration may only take place during the following cycles:

- Idle Cycles: When a slave is not connected to any master or is connected to a master which is not currently accessing it.
- Single Cycles: When a slave is currently doing a single access.
- End of Burst Cycles: When the current cycle is the last cycle of a burst transfer. For defined length burst, predicted end of burst matches the size of the transfer but is managed differently for undefined length burst. See section [17.8.1.1. Undefined Length Burst Arbitration](#).
- Slot Cycle Limit: When the slot cycle counter has reached the limit value indicating that the current master access is too long and must be broken. See section [17.8.1.2. Slot Cycle Limit Arbitration](#).

#### 17.8.1.1 Undefined Length Burst Arbitration

In order to prevent long burst lengths that can lock the access to the slave for an excessive period of time, the user can trigger the re-arbitration before the end of the incremental bursts. The re-arbitration period can be selected from the following Undefined Length Burst Type (ULBT) possibilities:

- Unlimited: no predetermined end of burst is generated. This value enables 1 Kbyte burst lengths.
- 1-beat bursts: predetermined end of burst is generated at each single transfer during the INCR transfer.
- 4-beat bursts: predetermined end of burst is generated at the end of each 4-beat boundary during INCR transfer.
- 8-beat bursts: predetermined end of burst is generated at the end of each 8-beat boundary during INCR transfer.
- 16-beat bursts: predetermined end of burst is generated at the end of each 16-beat boundary during INCR transfer.
- 32-beat bursts: predetermined end of burst is generated at the end of each 32-beat boundary during INCR transfer.

- 64-beat bursts: predetermined end of burst is generated at the end of each 64-beat boundary during INCR transfer.
- 128-beat bursts: predetermined end of burst is generated at the end of each 128-beat boundary during INCR transfer.

Undefined-length bursts lower than 8 beats should not be used since this may decrease the overall bus bandwidth due to arbitration and slave latencies at each first access of a burst.

However, if the length of undefined-length bursts is known for a master, it is recommended to configure MATRIX\_MCFG.ULBT accordingly.

### 17.8.1.2 Slot Cycle Limit Arbitration

The MATRIX contains specific logic to break long accesses, such as very long bursts on a very slow slave (e.g., an external low speed memory). At each arbitration time, a counter is loaded with the value previously written in MATRIX\_SCFGx.SLOT\_CYCLE and decreased at each clock cycle. When the counter elapses, the arbiter has the ability to re-arbitrate at the end of the current system bus access cycle.

Unless a master has a very tight access latency constraint, which could lead to data overflow or underflow due to a badly undersized internal FIFO with respect to its throughput, the Slot Cycle Limit should be disabled (SLOT\_CYCLE = 0) or set to its default maximum value in order not to inefficiently break long bursts performed by some masters.

In most cases, this feature is not needed and should be disabled for power saving.

This feature cannot prevent any slave from locking its access indefinitely.

### 17.8.2 Arbitration Priority Scheme

The MATRIX arbitration scheme is organized in priority pools, each corresponding to an access criticality class as shown in the “Latency Quality of Service” column in the table below. When the Latency Quality of Service is enabled for a master-slave pair through the MATRIX, the priority pool number to use for arbitration at the slave port is determined from the master. When the Latency Quality of Service is disabled, it is determined through the MATRIX user interface. See [17.11.12. MATRIX\\_PRAS0](#).

After reset, the Latency Quality of Service is enabled by default on all of the master ports that are connected to a master driving the Latency Quality of Service signals, as shown in the bit LQOSEN of [17.11.12. MATRIX\\_PRAS0](#) and [17.11.13. MATRIX\\_PRBS0](#).

**Table 17-4.** Arbitration Priority Pools

| Priority Pool | Latency Quality of Service |
|---------------|----------------------------|
| 3             | Latency Critical           |
| 2             | Latency Sensitive          |
| 1             | Bandwidth Sensitive        |
| 0             | Background Transfers       |

Round-robin priority is used in the highest and lowest priority pools 3 and 0, whereas fixed level priority is used between priority pools and in the intermediate priority pools 2 and 1.

For each slave, each master is assigned to one of the slave priority pools based on the Latency Quality of Service inputs or to the priority registers for slaves (MxPR fields of MATRIX\_PRAS and MATRIX\_PRBS). When evaluating master requests, this priority pool level always takes precedence.

After reset, most of the masters belong to the lowest priority pool (MxPR = 0, Background Transfer) and are therefore granted bus access in a true round-robin order.

The highest priority pool must be specifically reserved for masters requiring very low access latency. If more than one master belongs to this pool, those masters are granted bus access in a biased round-robin manner which enables tight and deterministic maximum access latency from system bus requests. In the worst case, any currently occurring high-priority master request is granted after the current bus master access has ended and any other high priority pool master requests have been granted once each.

The lowest priority pool shares the remaining bus bandwidth between masters.

Intermediate priority pools enable fine priority tuning. Typically, a latency-sensitive master or a bandwidth-sensitive master use such a priority level. The higher the priority level (MxPR value), the higher the master priority.

For good CPU performance, it is recommended to let the CPU priority configured with the default reset value 2 (Latency Sensitive).

All combinations of MxPR values are allowed for all masters and slaves. For example, some masters might be assigned the highest priority pool (round-robin), and remaining masters the lowest priority pool (round-robin), with no master for intermediate fixed priority levels.

### 17.8.2.1 Round-Robin Arbitration

This algorithm is only used in the highest and lowest priority pools. It allows the MATRIX arbiters to properly dispatch requests from different masters to the same slave. If two or more master requests are active at the same time in the priority pool, they are serviced in a round-robin increasing master number order.

### 17.8.2.2 Fixed Priority Arbitration

The fixed priority arbitration algorithm is the first and only arbitration algorithm applied between masters from distinct priority pools. It is also used in priority pools other than the highest and lowest priority pools (intermediate priority pools).

Fixed priority arbitration enables the MATRIX arbiters to dispatch the requests from different masters to the same slave by using the fixed priority defined by the user in the MxPR field for each master in the registers, MATRIX\_PRAS and MATRIX\_PRBS. If two or more master requests are active at the same time, the master with the highest priority MxPR number is serviced first.

In intermediate priority pools, if two or more master requests with the same priority are active at the same time, the master with the highest number is serviced first.

## 17.9 Register Write Protection

To prevent any single software error from corrupting MATRIX behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the Write Protection Mode register (MATRIX\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the Write Protection Status register (MATRIX\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS flag is reset by writing the MATRIX\_WPMR with the appropriate access key WPKEY.

## 17.10 Privilege Protection of AHB and APB

User/Privilege protection is supported through the filtering of each slave access with the master User/Privilege protection bit.

The Protection Unit adds the ability to manage the access rights for Privilege and User accesses. The access rights are defined through the hardware and software configuration of the device. The operating mode is the following:

- The Bus Masters transmit requests with the Privilege or User access right.
- The MATRIX, according to its configuration and the request, grants or denies the access.

The slave address space is divided into one or more slave regions. The slave regions are generally contiguous parts of the slave address space. The slave region is potentially split into an access denied area (upper part) and a protected region which can be split (lower part), unless the slave-protected region occupies the whole slave region. The protected region itself may or may not be split into one Privilege-eligible area and one User area. The Privilege-eligible area may be independently Privileged for read access and for write access.

For one slave region, the following characteristics are configured by hardware or software:

- Base Address of the slave region
- The Max Size of the slave region—a maximum size for the region's physical content
- The Top Size of the slave-protected region—the actually programmed or fixed size for the region's physical content
- The Split Size of the slave-protected region—the size of one of the two protected areas of the region
- Whether Split Size is defined downward from the top of the protected region, or upward from its base address

The following figure shows how the terms defined here are implemented in a Slave address space.

**Figure 17-1.** Generic Partitioning of the Slave Address Space

A set of MATRIX protection registers are used to specify, for each slave, the protection mode required for accessing this slave, and slave-protected region or slave-protected area. See [17.11.36. MATRIX\\_PSR0](#), [17.11.43. MATRIX\\_PASSR0](#) and [17.11.52. MATRIX\\_PRTSRy](#).

Additional MATRIX protection registers are used to specify, for each peripheral bus slave, the protection mode required for accessing this slave (see [17.11.53. MATRIX\\_PPSELR0](#)).

The MATRIX registers can only be accessed in Privileged mode.

The MATRIX propagates the protection bit down to the slaves to let them perform additional protection checks, and the MATRIX itself allows or denies the access to the slaves via its embedded protection unit.

Access violations may be reported either by a slave through the bus error response (example from the system-to-peripheral bus (AHB/APB Bridge)), or by the MATRIX embedded protection unit. In both cases, a bus error response is sent to the offending master and the error is flagged in the [Master Error Status Register](#). An interrupt can be sent if it has been enabled for that master by

writing into the [Master Error Interrupt Enable Register](#). Thus, the offending master is identified. The offending address is registered in the [17.11.33. MATRIX\\_MEARx](#), so that the slave and the targeted protected region are also known.

Depending on the hardware parameters and software configuration, the address space of each slave-protected region may or may not be split into two parts: one User and one Privileged.

Five different protection types of slaves are supported. The number of protected regions is set by design for each slave, independently, from 1 to 8, totaling from 1 up to 16 protected areas for each protection-configurable slave.

## 17.10.1 Protection Types of System Bus Slaves

### 17.10.1.1 Principles

The MATRIX supports five different protection types of slaves: two fixed types and three configurable types. The protection type of an AHB slave is set at hardware design among the following:

- Always User
- Always Privileged
- Internal Protected
- External Protected
- Scalable Protected

The protection type is set at hardware design on a per-master and a per-slave basis. Always User and Always Privilege protection types are not software-configurable.

The different protection types have the following characteristics:

- **Always User** slaves have no access right restriction. Their address space is precisely set by design. Any out-of-address range access is denied and reported.
- **Always Privilege** slaves can only be accessed by a Privileged master request. Their address space is precisely set by design. Any User access or out-of-address range access is denied and reported.
- **Internal Protected** type is intended for internal memories such as RAM, ROM or embedded Flash. The Internal Protected slave has one or several slave regions, and each has a hardware-fixed base address and Protected Region Top. Each slave region may be split through software configuration into one User area plus one Privilege-eligible area. Inside each slave-protected region, the split boundary is programmable in powers of 2 from 4 Kbytes up to the full slave-protected region address space. The protected area located below the split boundary may be configured as the User or the Privilege-eligible one. The Privilege-eligible area may be independently configured as Read User and/or Write Privileged. Any access with access right or address range violation is denied and reported.
- **External Protected** type is intended for external memories on the EBI, such as DDR, SDRAM or external ROM. The External Protected slave has identical features as the Internal Protected slave, plus the ability to configure each of its slave-protected region address space sizes according to the external memory parts used. This avoids mirroring Privileged areas into User areas, and further restricts the overall accessible address range. Any access with access right violation or configured address range violation is denied and reported.
- **Scalable Protected** type is intended for external memories with a dedicated slave, such as DDR. The Scalable Protected slave is divided into a fixed number of scalable, equally sized, and contiguous protected regions. Each of them can be split in the same way as for Internal or External Protected slaves. The protected region size must be configured by software, so that the equally-sized regions fill the actual available memory. This avoids mirroring Privileged areas into

User areas, and further restricts the overall accessible address range. Any access with access right violation or configured address range violation is denied and reported.

As the protection type is set at hardware design on a per-master and per-slave basis, it is possible to set some slave access protection as configurable from one or some particular masters, and to set the access as Always Privileged from all the other masters.

As the protection type is set by design at the slave region level, different protected region types can be mixed inside a single slave.

Similarly, the mapping base address and the accessible address range of each slave or slave region may have been hardware-restricted on a per-master basis from no access to full slave address space.

**Table 17-5.** Slave Protection Types

| Slave | Peripherals                                               | #hsel                                                                                                                                        | Mode                                                                                                                 | Max Size                                    |

**Note:**

1. The HEMC embeds its own protection unit. See section 29. [Hardened External Memory Controller \(HEMC\)](#) for details.

### 17.10.1.2 Examples

**Note:** The following examples are generic and not product-specific. They illustrate in a general manner the operation of the protection functionality.

The table below shows an example of Protection Type settings. This example is constructed with the following characteristics:

- Slave0 is an Internal Memory containing 1 region:

- The Access from Master0 to Slave0 is Always User
- The Access from Master1 and Master2 to Slave0 is Internal Protected with 1 region and with the same Software Configuration (Choice of SPLIT0 and the Protection Configuration bits LAUSERH, RDUSERH, WRUSERH).
- Slave1 is an EBI containing 2 regions:
  - The Access from Master1 to Slave1 is Always User
  - The Access from Master0 and Master2 to Slave1 is External Protected with 2 regions and with the same Software Configuration (Choice of TOP0, TOP1, SPLIT0, SPLIT1 and the Protection Configuration bits LAUSERH, RDUSERH, WRUSERH).

**Table 17-6.** Protection Type Setting Example

| Slave                     | Master0                         | Master1                        | Master2                         |
|---------------------------|---------------------------------|--------------------------------|---------------------------------|
| Slave0<br>Internal Memory | Always User                     | Internal Protected<br>1 Region | Internal Protected<br>1 Region  |
| Slave1<br>EBI             | External Protected<br>2 Regions | Always Privileged              | External Protected<br>2 Regions |

The following figure shows an Internal Protected slave example. This example is based on the following hypothesis:

- The slave is an Internal Memory containing 1 region. The Slave region Max Size is 4 Mbytes.
- The slave region 0 base address equals 0x10 000 000. Its Top Size is 512 Kbytes (hardware configuration).
- The slave software configuration is as follows:
  - SPLIT0 is set to 256 Kbytes.
  - LAUSERH0 is set to 0, the low area of region 0 is the Privilege-eligible one.
  - RDUSERH0 is set to 0, region 0 Privilege-eligible area is Privileged for reads.
  - WRUSERH0 is set to 0, region 0 Privilege-eligible area is Privileged for writes.

**Figure 17-2.** Partitioning Example of an Internal Protected Slave Featuring 1 Protected Region of 512 Kbytes Split into 1 or 2 Protected Areas of 4 Kbytes to 512 Kbytes

**Note:** The slave-protected areas split inside the protected region are configured by writing into the [Protected Areas Split Slave Registers](#).

The following figure shows an External Protected slave example. This example is based on the following hypothesis:

- The slave is an EBI containing 2 regions. The slave size is 2\*256 Mbytes. Each slave region Max Size is 256 Mbytes.
- The slave region 0 base address equals 0x10 000 000. It is connected to a 32 Mbytes memory, for example an external DDR. The slave region 0 Top Size must be set to 32 Mbytes.
- The slave region 1 base address equals 0x20 000 000. It is connected to a 2 Mbytes memory, for example an external Flash. The slave region 1 Top Size must be set to 2 Mbytes.
- The slave software configuration is as follows:
  - TOP0 is set to 32 Mbytes.

- TOP1 is set to 2 Mbytes.
- SPLIT0 is set to 4 Mbytes.
- SPLIT1 is set to 1 Mbyte.
- LAUSERH0 is set to 1, the low area of region 0 is the User one.
- RDUSERH0 is set to 0, region 0 Privilege-eligible area is Privileged for reads.
- WRUSERH0 is set to 0, region 0 Privilege-eligible area is Privileged for writes.
- LAUSERH1 is set to 0, the low area of region 1 is the Privilege-eligible one.
- RDUSERH1 is set to 1, region 1 Privilege-eligible area is User for reads.
- WRUSERH1 is set to 0, region 1 Privilege-eligible area is Privileged for writes.

**Figure 17-3.** Partitioning Example: External Protected Slave Featuring 2 Protected Regions of 4 Kbytes to 128 Mbytes Each and Up to 4 Protected Areas of 4 Kbytes to 128 Mbytes

**Note:** The slave region sizes are configured by writing into the [17.11.52. MATRIX\\_PRTSRy](#). The slave-protected area split inside each region is configured by writing into the [Protected Areas Split Slave Registers](#).

The following figure shows a Scalable Protected slave example. This example is based on the following hypothesis:

- The slave is an external memory with dedicated slave containing 4 regions, for example an external DDR.

- The slave size is 512 Mbytes.
- The slave base address equals 0x40 000 000. It is connected to a 256 Mbytes external memory.
- As the connected memory size is 256 Mbytes and there are 4 regions, the size of each region is 64 Mbytes. This gives the value of the slave region Max Size and Top Size. The slave region 0 Top Size must be configured to 64 Mbytes.
- The slave software configuration is as follows:
  - TOP0 is set to 64 Mbytes.
  - SPLIT0 is set to 4 Kbytes.
  - SPLIT1 is set to 64 Mbytes, so its low area occupies the whole region 1.
  - SPLIT2 is set to 4 Kbytes.
  - SPLIT3 is set to 32 Mbytes.
  - LAUSERH0 is set to 0, the low area of region 0 is the Privilege-eligible one.
  - RDUSERH0 is set to 1, region 0 Privilege-eligible area is User for reads.
  - WRUSERH0 is set to 0, region 0 Privilege-eligible area is Privileged for writes.
  - LAUSERH1 is set to 1, the low area of region 1 is the User one.
  - RDUSERH1 is 'don't care' since the low area occupies the whole region 1.
  - WRUSERH1 is 'don't care' since the low area occupies the whole region 1.
  - LAUSERH2 is set to 1, the low area of region 2 is the User one.
  - RDUSERH2 is set to 0, region 2 Privilege-eligible area is Privileged for reads.
  - WRUSERH2 is set to 0, region 2 Privilege-eligible area is Privileged for writes.
  - LAUSERH3 is set to 0, the low area of region 3 is the Privilege-eligible one.
  - RDUSERH3 is set to 0, region 3 Privilege-eligible area is Privileged for reads.
  - WRUSERH3 is set to 0, region 3 Privilege-eligible area is Privileged for writes.

**Figure 17-4.** Partitioning Example: Scalable Protected Slave Featuring 4 Equally-sized Protected Regions of 1 Mbytes to 128 Mbytes Each and Up to 8 Protected Areas of 4 Kbytes to 128 Mbytes

**Note:** The slaves' generic protected regions sizes are configured by writing into field PRTOP0 of the [17.11.52. MATRIX\\_PRTSRy](#) and the custom slave-protected areas splits inside each region are configured by writing into the [Protected Areas Split Slave Registers](#).

### 17.10.2 Protection of APB Slaves

To be able to configure the protection mode required for accessing a particular peripheral bus slave connected behind the system-to-peripheral bus (AHB/APB Bridge), the MATRIX features three 32-bit [17.11.53. MATRIX\\_PPSELRO](#). Some of these bits may have been set by design to a Privileged or a User value, when others are programmed by software (see section [17.11.53. MATRIX\\_PPSELRO](#)).

The system-to-peripheral bus bridge compares the incoming master request protection bit with the required protection for the selected peripheral, and accepts or denies access. In the last case, its bus error response is internally flagged in the MATRIX [Master Error Status Register](#); the offending address is registered in the [17.11.33. MATRIX\\_MEARx](#).

## 17.11 Register Summary

| Offset | Name          | Bit Pos. | 7               | 6 | 5                  | 4 | 3 | 2                 | 1 | 0             |
|--------|---------------|----------|-----------------|---|--------------------|---|---|-------------------|---|---------------|
| 0x00   | MATRIX_MCFG0  | 7:0      |                 |   |                    |   |   | ULBT[2:0]         |   |               |

|-------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | UNLIMITED | Unlimited Length Burst—No predicted end of burst is generated, therefore INCR bursts coming from this master can only be broken if the Slave Slot Cycle Limit is reached. If the Slot Cycle Limit is not reached, the burst is normally completed by the master, at the latest, on the next AHB 1 Kbyte address boundary, allowing up to 256-beat word bursts or 128-beat double-word bursts.<br><br>This value should not be used in the very particular case of a master capable of performing back-to-back undefined length bursts on a single slave, since this could indefinitely freeze the slave arbitration and thus prevent another master from accessing this slave. |
| 1     | SINGLE    | Single Access—The undefined length burst is treated as a succession of single accesses, allowing re-arbitration at each beat of the INCR burst or bursts sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 2     | 4_BEAT    | 4-beat Burst—The undefined length burst or bursts sequence is split into 4-beat bursts or less, allowing re-arbitration every 4 beats.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 3     | 8_BEAT    | 8-beat Burst—The undefined length burst or bursts sequence is split into 8-beat bursts or less, allowing re-arbitration every 8 beats.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 4     | 16_BEAT   | 16-beat Burst—The undefined length burst or bursts sequence is split into 16-beat bursts or less, allowing re-arbitration every 16 beats.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 5     | 32_BEAT   | 32-beat Burst—The undefined length burst or bursts sequence is split into 32-beat bursts or less, allowing re-arbitration every 32 beats.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 6     | 64_BEAT   | 64-beat Burst—The undefined length burst or bursts sequence is split into 64-beat bursts or less, allowing re-arbitration every 64 beats.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 7     | 128_BEAT  | 128-beat Burst—The undefined length burst or bursts sequence is split into 128-beat bursts or less, allowing re-arbitration every 128 beats.<br><br>Unless duly needed, the ULBT should be left at its default 0 value for power saving.                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Bits 2:0 – ULBT[2:0] Undefined Length Burst Type**

| Value | Name      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | UNLIMITED | Unlimited Length Burst—No predicted end of burst is generated, therefore INCR bursts coming from this master can only be broken if the Slave Slot Cycle Limit is reached. If the Slot Cycle Limit is not reached, the burst is normally completed by the master, at the latest, on the next AHB 1 Kbyte address boundary, allowing up to 256-beat word bursts or 128-beat double-word bursts.<br><br>This value should not be used in the very particular case of a master capable of performing back-to-back undefined length bursts on a single slave, since this could indefinitely freeze the slave arbitration and thus prevent another master from accessing this slave. |
| 1     | SINGLE    | Single Access—The undefined length burst is treated as a succession of single accesses, allowing re-arbitration at each beat of the INCR burst or bursts sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 2     | 4_BEAT    | 4-beat Burst—The undefined length burst or bursts sequence is split into 4-beat bursts or less, allowing re-arbitration every 4 beats.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 3     | 8_BEAT    | 8-beat Burst—The undefined length burst or bursts sequence is split into 8-beat bursts or less, allowing re-arbitration every 8 beats.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 4     | 16_BEAT   | 16-beat Burst—The undefined length burst or bursts sequence is split into 16-beat bursts or less, allowing re-arbitration every 16 beats.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 5     | 32_BEAT   | 32-beat Burst—The undefined length burst or bursts sequence is split into 32-beat bursts or less, allowing re-arbitration every 32 beats.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 6     | 64_BEAT   | 64-beat Burst—The undefined length burst or bursts sequence is split into 64-beat bursts or less, allowing re-arbitration every 64 beats.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Bits 21:18 – FIXED\_DEFMSTR[3:0] Fixed Default Master**

This is the number of the Default Master for this slave. Only used if DEFMSTR\_TYPE is 2. Specifying the number of a master which is not connected to the selected slave is equivalent to setting DEFMSTR\_TYPE to 0.

**Bits 17:16 – DEFMSTR\_TYPE[1:0] Default Master Type**

| Value | Name  | Description                                                                                                                                                                                                                                                                                                              |

**Bits 8:0 – SLOT\_CYCLE[8:0] Maximum Bus Grant Duration for Masters**

When SLOT\_CYCLE AHB clock cycles have elapsed since the last arbitration, a new arbitration takes place to let another master access this slave. If another master is requesting the slave bus, then the current master burst is broken.

If SLOT\_CYCLE = 0, the Slot Cycle Limit feature is disabled and bursts always complete unless broken according to the ULBT.

This limit has been placed in order to enforce arbitration so as to meet potential latency constraints of masters waiting for slave access.

This limit must not be too small. Unreasonably small values break every burst and the Bus Matrix arbitrates without performing any data transfer. The default maximum value is usually an optimal conservative choice.

In most cases, this feature is not needed and should be disabled for power saving.

See section [Slot Cycle Limit Arbitration](#) for details.

### Bits 21:18 – FIXED\_DEFMSTR[3:0] Fixed Default Master

This is the number of the Default Master for this slave. Only used if DEFMSTR\_TYPE is 2. Specifying the number of a master which is not connected to the selected slave is equivalent to setting DEFMSTR\_TYPE to 0.

### Bits 17:16 – DEFMSTR\_TYPE[1:0] Default Master Type

| Value | Name  | Description                                                                                                                                                                                                                                                                                                          |
|-------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | NONE  | No Default Master—At the end of the current slave access, if no other master request is pending, the slave is disconnected from all masters.<br>This results in a one clock cycle latency for the first access of a burst transfer or for a single access.                                                           |
| 1     | LAST  | Last Default Master—At the end of the current slave access, if no other master request is pending, the slave stays connected to the last master having accessed it.<br>This results in not having one clock cycle latency when the last master tries to access the slave again.                                      |
| 2     | FIXED | Fixed Default Master—At the end of the current slave access, if no other master request is pending, the slave connects to the fixed master the number that has been written in the FIXED_DEFMSTR field.<br>This results in not having one clock cycle latency when the fixed master tries to access the slave again. |

### Bits 8:0 – SLOT\_CYCLE[8:0] Maximum Bus Grant Duration for Masters

When SLOT\_CYCLE AHB clock cycles have elapsed since the last arbitration, a new arbitration takes place to let another master access this slave. If another master is requesting the slave bus, then the current master burst is broken.

If SLOT\_CYCLE = 0, the Slot Cycle Limit feature is disabled and bursts always complete unless broken according to the ULBT.

This limit has been placed in order to enforce arbitration so as to meet potential latency constraints of masters waiting for slave access.

This limit must not be too small. Unreasonably small values break every burst and the Bus Matrix arbitrates without performing any data transfer. The default maximum value is usually an optimal conservative choice.

In most cases, this feature is not needed and should be disabled for power saving.

See section [Slot Cycle Limit Arbitration](#) for details.

### Bits 21:18 – FIXED\_DEFMSTR[3:0] Fixed Default Master

This is the number of the Default Master for this slave. Only used if DEFMSTR\_TYPE is 2. Specifying the number of a master which is not connected to the selected slave is equivalent to setting DEFMSTR\_TYPE to 0.

### Bits 17:16 – DEFMSTR\_TYPE[1:0] Default Master Type

| Value | Name  | Description                                                                                                                                                                                                                                                                                                              |
|-------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | NONE  | No Default Master—At the end of the current slave access, if no other master request is pending, the slave is disconnected from all masters.<br><br>This results in a one clock cycle latency for the first access of a burst transfer or for a single access.                                                           |
| 1     | LAST  | Last Default Master—At the end of the current slave access, if no other master request is pending, the slave stays connected to the last master having accessed it.<br><br>This results in not having one clock cycle latency when the last master tries to access the slave again.                                      |
| 2     | FIXED | Fixed Default Master—At the end of the current slave access, if no other master request is pending, the slave connects to the fixed master the number that has been written in the FIXED_DEFMSTR field.<br><br>This results in not having one clock cycle latency when the fixed master tries to access the slave again. |

### Bits 8:0 – SLOT\_CYCLE[8:0] Maximum Bus Grant Duration for Masters

When SLOT\_CYCLE AHB clock cycles have elapsed since the last arbitration, a new arbitration takes place to let another master access this slave. If another master is requesting the slave bus, then the current master burst is broken.

If SLOT\_CYCLE = 0, the Slot Cycle Limit feature is disabled and bursts always complete unless broken according to the ULBT.

This limit has been placed in order to enforce arbitration so as to meet potential latency constraints of masters waiting for slave access.

This limit must not be too small. Unreasonably small values break every burst and the Bus Matrix arbitrates without performing any data transfer. The default maximum value is usually an optimal conservative choice.

In most cases, this feature is not needed and should be disabled for power saving.

See section [Slot Cycle Limit Arbitration](#) for details.

## 17.11.9 Bus Matrix Slave Configuration Register 6

**Name:** MATRIX\_SCFG6  
**Offset:** 0x58  
**Reset:** 0x000001FF  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

|        | 0               | 0   | 0                  | 0   | 0   | 0   | 0                 | 0             |

#### Bits 21:18 – FIXED\_DEFMSTR[3:0] Fixed Default Master

This is the number of the Default Master for this slave. Only used if DEFMSTR\_TYPE is 2. Specifying the number of a master which is not connected to the selected slave is equivalent to setting DEFMSTR\_TYPE to 0.

#### Bits 17:16 – DEFMSTR\_TYPE[1:0] Default Master Type

| Value | Name  | Description                                                                                                                                                                                                                                                                                                          |
|-------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | NONE  | No Default Master—At the end of the current slave access, if no other master request is pending, the slave is disconnected from all masters.<br>This results in a one clock cycle latency for the first access of a burst transfer or for a single access.                                                           |
| 1     | LAST  | Last Default Master—At the end of the current slave access, if no other master request is pending, the slave stays connected to the last master having accessed it.<br>This results in not having one clock cycle latency when the last master tries to access the slave again.                                      |
| 2     | FIXED | Fixed Default Master—At the end of the current slave access, if no other master request is pending, the slave connects to the fixed master the number that has been written in the FIXED_DEFMSTR field.<br>This results in not having one clock cycle latency when the fixed master tries to access the slave again. |

#### Bits 8:0 – SLOT\_CYCLE[8:0] Maximum Bus Grant Duration for Masters

When SLOT\_CYCLE AHB clock cycles have elapsed since the last arbitration, a new arbitration takes place to let another master access this slave. If another master is requesting the slave bus, then the current master burst is broken.

If SLOT\_CYCLE = 0, the Slot Cycle Limit feature is disabled and bursts always complete unless broken according to the ULBT.

This limit has been placed in order to enforce arbitration so as to meet potential latency constraints of masters waiting for slave access.

This limit must not be too small. Unreasonably small values break every burst and the Bus Matrix arbitrates without performing any data transfer. The default maximum value is usually an optimal conservative choice.

In most cases, this feature is not needed and should be disabled for power saving.

See section [Slot Cycle Limit Arbitration](#) for details.

**17.11.12 Bus Matrix Priority Register A For Slave 0**

**Name:** MATRIX\_PRAS0  
**Offset:** 0x80  
**Reset:** 0x00007000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

Values in the Bus Matrix Priority Registers are product-dependent.

**Bits 2, 6, 10, 14, 18, 22, 26, 30 – LQOSENx Latency Quality of Service Enable for Master x**

| Value | Description                                                                                                                                          |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Disables propagation of Latency Quality of Service from the Master x to the Slave and apply MxPR priority for all access from Master x to the Slave. |
| 1     | Enables the propagation of Latency Quality of Service from the Master x to the Slave if supported by the Master x.                                   |

**Bits 0:1, 4:5, 8:9, 12:13, 16:17, 20:21, 24:25, 28:29 – MxPR Master x Priority**

Fixed priority of Master x for accessing the selected slave. The higher the number, the higher the priority.

All the masters programmed with the same MxPR value for the slave make up a priority pool. Round-robin arbitration is used in the lowest (MxPR = 0) and highest (MxPR = 3) priority pools. Fixed priority is used in intermediate priority pools (MxPR = 1) and (MxPR = 2).

See section [Arbitration Priority Scheme](#) for details.

If LQOSENx bit is cleared, then this priority value is used as it for arbitration and downward propagation to the slave. If LQOSENx bit is set, then this priority acts as the upper limit for the Latency Quality of Service from Master x.

For masters other than the CPU, the usual value of this field should be 0x0 if LQOSENx bit is cleared, and 0x1 if LQOSENx bit is set. For the CPU master, the usual value of this field should be 0x2.

**17.11.13 Bus Matrix Priority Register B For Slave 0**

| Reset  |    | 0        | 0          | 0   |    | 0        | 0          | 0   |

**Bits 2, 6, 10, 14, 18, 22, 26, 30 – LQOSENx Latency Quality of Service Enable for Master x**

| Value | Description                                                                                                                                          |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Disables propagation of Latency Quality of Service from the Master x to the Slave and apply MxPR priority for all access from Master x to the Slave. |
| 1     | Enables the propagation of Latency Quality of Service from the Master x to the Slave if supported by the Master x.                                   |

**Bits 0:1, 4:5, 8:9, 12:13, 16:17, 20:21, 24:25, 28:29 – MxPR Master x Priority**

Fixed priority of Master x for accessing the selected slave. The higher the number, the higher the priority.

All the masters programmed with the same MxPR value for the slave make up a priority pool. Round-robin arbitration is used in the lowest (MxPR = 0) and highest (MxPR = 3) priority pools. Fixed priority is used in intermediate priority pools (MxPR = 1) and (MxPR = 2).

See section [Arbitration Priority Scheme](#) for details.

If LQOSENx bit is cleared, then this priority value is used as it for arbitration and downward propagation to the slave. If LQOSENx bit is set, then this priority acts as the upper limit for the Latency Quality of Service from Master x.

For masters other than the CPU, the usual value of this field should be 0x0 if LQOSENx bit is cleared, and 0x1 if LQOSENx bit is set. For the CPU master, the usual value of this field should be 0x2.

**17.11.16 Bus Matrix Priority Register A For Slave 2**

**Name:** MATRIX\_PRAS2  
**Offset:** 0x90  
**Reset:** 0x00007002  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

Values in the Bus Matrix Priority Registers are product-dependent.

## Bits 2, 6, 10, 14, 18, 22, 26, 30 – LQOSENx Latency Quality of Service Enable for Master x

| Value | Description                                                                                                                                          |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Disables propagation of Latency Quality of Service from the Master x to the Slave and apply MxPR priority for all access from Master x to the Slave. |
| 1     | Enables the propagation of Latency Quality of Service from the Master x to the Slave if supported by the Master x.                                   |

## Bits 0:1, 4:5, 8:9, 12:13, 16:17, 20:21, 24:25, 28:29 – MxPR Master x Priority

Fixed priority of Master x for accessing the selected slave. The higher the number, the higher the priority.

All the masters programmed with the same MxPR value for the slave make up a priority pool. Round-robin arbitration is used in the lowest (MxPR = 0) and highest (MxPR = 3) priority pools. Fixed priority is used in intermediate priority pools (MxPR = 1) and (MxPR = 2).

See section [Arbitration Priority Scheme](#) for details.

If LQOSENx bit is cleared, then this priority value is used as it for arbitration and downward propagation to the slave. If LQOSENx bit is set, then this priority acts as the upper limit for the Latency Quality of Service from Master x.

For masters other than the CPU, the usual value of this field should be 0x0 if LQOSENx bit is cleared, and 0x1 if LQOSENx bit is set. For the CPU master, the usual value of this field should be 0x2.

## 17.11.20 Bus Matrix Priority Register A For Slave 4

**Name:** MATRIX\_PRAS4  
**Offset:** 0xA0  
**Reset:** 0x00000020  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

Values in the Bus Matrix Priority Registers are product-dependent.

|        |    |         |           |     |    |         |           |     |

**Bits 2, 6, 10, 14, 18, 22, 26, 30 – LQOSENx** Latency Quality of Service Enable for Master x

| Value | Description                                                                                                                                          |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Disables propagation of Latency Quality of Service from the Master x to the Slave and apply MxPR priority for all access from Master x to the Slave. |
| 1     | Enables the propagation of Latency Quality of Service from the Master x to the Slave if supported by the Master x.                                   |

**Bits 0:1, 4:5, 8:9, 12:13, 16:17, 20:21, 24:25, 28:29 – MxPR** Master x Priority

Fixed priority of Master x for accessing the selected slave. The higher the number, the higher the priority.

All the masters programmed with the same MxPR value for the slave make up a priority pool. Round-robin arbitration is used in the lowest (MxPR = 0) and highest (MxPR = 3) priority pools. Fixed priority is used in intermediate priority pools (MxPR = 1) and (MxPR = 2).

See section [Arbitration Priority Scheme](#) for details.

If LQOSENx bit is cleared, then this priority value is used as it for arbitration and downward propagation to the slave. If LQOSENx bit is set, then this priority acts as the upper limit for the Latency Quality of Service from Master x.

For masters other than the CPU, the usual value of this field should be 0x0 if LQOSENx bit is cleared, and 0x1 if LQOSENx bit is set. For the CPU master, the usual value of this field should be 0x2.

## 17.11.25 Bus Matrix Priority Register B for Slave 6

**Name:** MATRIX\_PRBS6  
**Offset:** 0xB4  
**Reset:** 0x00070000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

Values in the Bus Matrix Priority Registers are product-dependent.

|-------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Disables propagation of Latency Quality of Service from the Master x to the Slave and apply MxPR priority for all access from Master x to the Slave. |
| 1     | Enables the propagation of Latency Quality of Service from the Master x to the Slave if supported by the Master x.                                   |

**Bits 0:1, 4:5, 8:9, 12:13, 16:17, 20:21, 24:25, 28:29 – MxPR Master x Priority**

Fixed priority of Master x for accessing the selected slave. The higher the number, the higher the priority.

All the masters programmed with the same MxPR value for the slave make up a priority pool. Round-robin arbitration is used in the lowest (MxPR = 0) and highest (MxPR = 3) priority pools. Fixed priority is used in intermediate priority pools (MxPR = 1) and (MxPR = 2).

See section [Arbitration Priority Scheme](#) for details.

If LQOSENx bit is cleared, then this priority value is used as it for arbitration and downward propagation to the slave. If LQOSENx bit is set, then this priority acts as the upper limit for the Latency Quality of Service from Master x.

For masters other than the CPU, the usual value of this field should be 0x0 if LQOSENx bit is cleared, and 0x1 if LQOSENx bit is set. For the CPU master, the usual value of this field should be 0x2.

## 17.11.28 MATRIX Master Remap Control Register

**Name:** MATRIX\_MRCR  
**Offset:** 0x0100  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

| Bit    | 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8    |
|        | WPKEY[7:0]   |    |    |    |    |    |    |      |
| Access | W            | W  | W  | W  | W  | W  | W  | W    |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        | CFGFRZ       |    |    |    |    |    |    | WPEN |
| Access | R/W          |    |    |    |    |    |    | R/W  |
| Reset  | 0            |    |    |    |    |    |    | 0    |

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                                                      |
|----------|--------|------------------------------------------------------------------------------------------------------------------|
| 0x4D4154 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN and CFGFRZ bits. Always reads as 0. |

#### Bit 7 – CFGFRZ Configuration Freeze

| Value | Description                                                                                                                                                                 |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The MATRIX configuration is not frozen.                                                                                                                                     |
| 1     | Freezes the MATRIX configuration until hardware reset. The registers that can be protected by the WPEN bit and the Write Protection Mode Register are no longer modifiable. |

#### Bit 0 – WPEN Write Protection Enable

See section [Register Write Protection](#) for the list of registers that can be write-protected.

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | Disables the write protection if WPKEY corresponds to 0x4D4154 ("MAT" in ASCII). |
| 1     | Enables the write protection if WPKEY corresponds to 0x4D4154 ("MAT" in ASCII).  |

### 17.11.35 MATRIX Write Protection Status Register

**Name:** MATRIX\_WPSR  
**Offset:** 0x01E8  
**Reset:** 0x00000000  
**Property:** Read-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |             |    |    |    |    |    |    |    |
|--------|-------------|----|----|----|----|----|----|----|
| Bit    | 23          | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | WPVSR[15:8] |    |    |    |    |    |    |    |
| Access | R           | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

|        |            |    |    |    |    |    |   |   |
|--------|------------|----|----|----|----|----|---|---|
| Bit    | 15         | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        | WPVSR[7:0] |    |    |    |    |    |   |   |
| Access | R          | R  | R  | R  | R  | R  | R | R |
| Reset  | 0          | 0  | 0  | 0  | 0  | 0  | 0 | 0 |

|        |   |   |   |   |   |   |   |      |
|--------|---|---|---|---|---|---|---|------|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0    |
|        |   |   |   |   |   |   |   | WPVS |
| Access |   |   |   |   |   |   |   | R    |
| Reset  |   |   |   |   |   |   |   | 0    |

#### Bits 23:8 – WPVSR[15:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

#### Bit 0 – WPVS Write Protection Violation Status

| Value | Description                                                                                                                                                                                                           |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protection violation has occurred since the last write of the MATRIX_WPMR.                                                                                                                                   |
| 1     | A write protection violation has occurred since the last write of the MATRIX_WPMR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

**17.11.36 Protection Slave Register 0**

**Name:** MATRIX\_PSR0  
**Offset:** 0x0200  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

Values in the Bus Matrix Protection Registers are product-dependent.

|--------|----------|----------|----------|----------|----------|----------|----------|----------|
| Bit    | 7        | 6        | 5        | 4        | 3        | 2        | 1        | 0        |
|        | LAUSERH7 | LAUSERH6 | LAUSERH5 | LAUSERH4 | LAUSERH3 | LAUSERH2 | LAUSERH1 | LAUSERH0 |
| Access | R/W      | R/W      | R/W      | R/W      | R/W      | R/W      | R/W      | R/W      |
| Reset  | 0        | 0        | 0        | 0        | 0        | 0        | 0        | 0        |

**Bits 24, 25, 26, 27, 28, 29, 30, 31 – DPSOAx** Downward Protection Split Address for HSELx Protected Region

| Value | Description                                                                                                                                                                                                   |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | For the HSELx AHB slave-protected region, the protected area split MATRIX_PASSR / PASPLITx defines the size of the slave-protected area starting from the base address of the slave protected region and up.  |
| 1     | For the HSELx AHB slave-protected region, the protected area split MATRIX_PASSR / PASPLITx defines the size of the slave-protected area starting from the end address of the slave-protected region and down. |

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – WRUSERHx** Write USER for HSELx Protected Region

Privilege-eligible Area access rights:

| WRUSERHx/RDUSERHx | User Access | Privileged Access |
|-------------------|-------------|-------------------|
| 00                | Denied      | Write-Read        |
| 01                | Read        | Write-Read        |
| 10                | Write       | Write-Read        |
| 11                | Write-Read  | Write-Read        |

| Value | Description                                                                                                                                                                                                                                     |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The HSELx AHB slave-protected region is split into one Write Privileged and one Write User area, according to LAUSERHx and MATRIX_PASSR / PASPLITx. That is, the so defined privilege-eligible high or low area is Privileged for Write access. |
| 1     | The HSELx AHB slave-protected region is User for Write access.                                                                                                                                                                                  |

**Bits 8, 9, 10, 11, 12, 13, 14, 15 – RDUSERHx** Read USER for HSELx Protected Region

| Value | Description                                                                                                                                                                                                                                  |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The HSELx AHB slave-protected region is split into one Read Privileged and one Read User area, according to LAUSERHx and MATRIX_PASSR / PASPLITx. That is, the so defined privilege-eligible high or low area is Privileged for Read access. |
| 1     | The HSELx AHB slave-protected region is User for Read access.                                                                                                                                                                                |

#### Bits 0, 1, 2, 3, 4, 5, 6, 7 – LAUSERHx Low Area USER in HSELx Protected Region

| Value | Description                                                                                                                                                                                                                              |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The protection of the HSELx AHB slave area laying below the corresponding MATRIX_PASSR / PASPLITx boundary is configured according to RDUSERHx and WRUSERHx. The whole remaining HSELx upper address space is configured as User access. |
| 1     | The HSELx AHB slave address area laying below the corresponding MATRIX_PASSR / PASPLITx boundary is configured as User access, and the whole remaining upper address space according to RDUSERHx and WRUSERHx.                           |

**17.11.37 Protection Slave Register 1**

**Name:** MATRIX\_PSR1  
**Offset:** 0x0204  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

Values in the Bus Matrix Protection Registers are product-dependent.

| Reset  | 0        | 0        | 0        | 0        | 0        | 0        | 0        | 0        |

**Bits 24, 25, 26, 27, 28, 29, 30, 31 – DPSOAx** Downward Protection Split Address for HSELx Protected Region

| Value | Description                                                                                                                                                                                                   |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | For the HSELx AHB slave-protected region, the protected area split MATRIX_PASSR / PASPLITx defines the size of the slave-protected area starting from the base address of the slave protected region and up.  |
| 1     | For the HSELx AHB slave-protected region, the protected area split MATRIX_PASSR / PASPLITx defines the size of the slave-protected area starting from the end address of the slave-protected region and down. |

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – WRUSERHx** Write USER for HSELx Protected Region

Privilege-eligible Area access rights:

| WRUSERHx/RDUSERHx | User Access | Privileged Access |
|-------------------|-------------|-------------------|
| 00                | Denied      | Write-Read        |
| 01                | Read        | Write-Read        |
| 10                | Write       | Write-Read        |
| 11                | Write-Read  | Write-Read        |

| Value | Description                                                                                                                                                                                                                                     |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The HSELx AHB slave-protected region is split into one Write Privileged and one Write User area, according to LAUSERHx and MATRIX_PASSR / PASPLITx. That is, the so defined privilege-eligible high or low area is Privileged for Write access. |
| 1     | The HSELx AHB slave-protected region is User for Write access.                                                                                                                                                                                  |

**Bits 8, 9, 10, 11, 12, 13, 14, 15 – RDUSERHx** Read USER for HSELx Protected Region

| Value | Description                                                                                                                                                                                                                                  |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The HSELx AHB slave-protected region is split into one Read Privileged and one Read User area, according to LAUSERHx and MATRIX_PASSR / PASPLITx. That is, the so defined privilege-eligible high or low area is Privileged for Read access. |
| 1     | The HSELx AHB slave-protected region is User for Read access.                                                                                                                                                                                |

#### Bits 0, 1, 2, 3, 4, 5, 6, 7 – LAUSERHx Low Area USER in HSELx Protected Region

| Value | Description                                                                                                                                                                                                                              |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The protection of the HSELx AHB slave area laying below the corresponding MATRIX_PASSR / PASPLITx boundary is configured according to RDUSERHx and WRUSERHx. The whole remaining HSELx upper address space is configured as User access. |
| 1     | The HSELx AHB slave address area laying below the corresponding MATRIX_PASSR / PASPLITx boundary is configured as User access, and the whole remaining upper address space according to RDUSERHx and WRUSERHx.                           |

**17.11.38 Protection Slave Register 2**

**Name:** MATRIX\_PSR2  
**Offset:** 0x0208  
**Reset:** 0x00010101  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

**Bits 24, 25, 26, 27, 28, 29, 30, 31 – DPSOAx** Downward Protection Split Address for HSELx Protected Region

| Value | Description                                                                                                                                                                                                   |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | For the HSELx AHB slave-protected region, the protected area split MATRIX_PASSR / PASPLITx defines the size of the slave-protected area starting from the base address of the slave protected region and up.  |
| 1     | For the HSELx AHB slave-protected region, the protected area split MATRIX_PASSR / PASPLITx defines the size of the slave-protected area starting from the end address of the slave-protected region and down. |

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – WRUSERHx** Write USER for HSELx Protected Region

Privilege-eligible Area access rights:

| WRUSERHx/RDUSERHx | User Access | Privileged Access |
|-------------------|-------------|-------------------|
| 00                | Denied      | Write-Read        |
| 01                | Read        | Write-Read        |
| 10                | Write       | Write-Read        |
| 11                | Write-Read  | Write-Read        |

| Value | Description                                                                                                                                                                                                                                     |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The HSELx AHB slave-protected region is split into one Write Privileged and one Write User area, according to LAUSERHx and MATRIX_PASSR / PASPLITx. That is, the so defined privilege-eligible high or low area is Privileged for Write access. |
| 1     | The HSELx AHB slave-protected region is User for Write access.                                                                                                                                                                                  |

**Bits 8, 9, 10, 11, 12, 13, 14, 15 – RDUSERHx** Read USER for HSELx Protected Region

| Value | Description                                                                                                                                                                                                                                  |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The HSELx AHB slave-protected region is split into one Read Privileged and one Read User area, according to LAUSERHx and MATRIX_PASSR / PASPLITx. That is, the so defined privilege-eligible high or low area is Privileged for Read access. |
| 1     | The HSELx AHB slave-protected region is User for Read access.                                                                                                                                                                                |

#### Bits 0, 1, 2, 3, 4, 5, 6, 7 – LAUSERHx Low Area USER in HSELx Protected Region

| Value | Description                                                                                                                                                                                                                              |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The protection of the HSELx AHB slave area laying below the corresponding MATRIX_PASSR / PASPLITx boundary is configured according to RDUSERHx and WRUSERHx. The whole remaining HSELx upper address space is configured as User access. |
| 1     | The HSELx AHB slave address area laying below the corresponding MATRIX_PASSR / PASPLITx boundary is configured as User access, and the whole remaining upper address space according to RDUSERHx and WRUSERHx.                           |

**17.11.40 Protection Slave Register 4**

**Name:** MATRIX\_PSR4  
**Offset:** 0x0210  
**Reset:** 0x00010101  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

Values in the Bus Matrix Protection Registers are product-dependent.

**Bits 0:3, 4:7, 8:11, 12:15, 16:19, 20:23, 24:27, 28:31 – PASPLITx Protected Areas Split for HSELx Protected Region**

This field defines the boundary address offset where the HSELx AHB slave-protected region splits into two Protected Areas whose access is controlled according to the corresponding MATRIX\_PSR. If this size is set at or above the HSELx Region Size, then the MATRIX\_PSR register settings apply to the unique protected area then covering the whole HSELx Protected Region.

| PASPLITx | Split Offset | Protected Low Area Size |
|----------|--------------|-------------------------|

## Bits 0:3, 4:7, 8:11, 12:15, 16:19, 20:23, 24:27, 28:31 – PRTOPx HSELx Protected Region Top

This field defines the size of the HSELx protected region address space. Invalid sizes for the slave region must never be programmed. Valid sizes and number of protected regions are product, slave and slave configuration dependent.

**Note:** The slaves featuring multiple scalable contiguous protected regions have a single PRTOP0 field for all the protected regions.

If this HSELx protected region size is set at or below the MATRIX\_PASSR / PASPLITx Protected Areas Split size, then the MATRIX\_PSR register settings apply to the unique protected area then covering the whole HSELx protected region

| PRTOPx | Top Offset | Protected Region Size |
|--------|------------|-----------------------|
| 0000   | 0x00001000 | 4 Kbytes              |

## 18. Chip Identifier (CHIPID)

### 18.1 Description

Chip Identifier (CHIPID) registers are used to recognize the device and its revision. These registers provide the sizes and types of the on-chip memories, as well as the set of embedded peripherals.

Two CHIPID registers are embedded: Chip ID register (CHIPID\_CIDR) and Chip ID Extension register (CHIPID\_EXID). Both registers contain a hard-wired value that is read-only.

The CHIPID\_CIDR register contains the following fields:

- VERSION: Identifies the revision of the silicon
- EPROC: Indicates the embedded ARM processor
- NVPTYP and NVPSIZ: Identify the type of embedded non-volatile memory and the size
- SRAMSIZ: Indicates the size of the embedded SRAM
- ARCH: Identifies the set of embedded peripherals
- EXT: Shows the use of the extension identifier register

The CHIPID\_EXID register is device-dependent and reads '0' if CHIPID\_CIDR.EXT = 0.

### 18.2 Embedded Characteristics

- Chip ID Registers
  - Identification of the Device Revision, Sizes of the Embedded Memories, Set of Peripherals, Embedded Processor

## 18.3 Register Summary

| Offset | Name        | Bit Pos. | 7            | 6           | 5 | 4            | 3            | 2 | 1 | 0 |
|--------|-------------|----------|--------------|-------------|---|--------------|--------------|---|---|---|
| 0x00   | CHIPID_CIDR | 7:0      | EPROC[2:0]   |             |   | VERSION[4:0] |              |   |   |   |

#### Bits 31:0 – EXID[31:0] Chip ID Extension

This field is cleared if CHIPID\_CIDR.EXT = 0.

## 19. Hardened Embedded Flash Controller (HEFC)

### 19.1 Description

The Hardened Embedded Flash Controller (HEFC) provides a high-level interface between the internal Flash plane and the 32-bit internal bus.

Its 128-bit wide memory interface increases performance. It also manages the programming, erasing, locking and unlocking sequences of Flash memories using a full set of commands. One of the commands returns the embedded Flash descriptor definition that informs the system about the Flash organization, thus making the software generic.

This block embeds an ECC functionality to protect the embedded memory against cumulative radiation effects.

### 19.2 Embedded Characteristics

- Flash Plane Features Managed by HEFC
  - 32 NVM calibration bits
  - 128 end-user fuse bits (GPNVM) available
  - 32 lock bits, protecting each the 32 first pages against unwanted write or erase operations
  - 256 bytes of User Signature Area available
- Global HEFC Features
  - Commands protected by a keyword
  - Erases the entire Flash
  - Erases by group of pages (available group sizes in pages: 4, 8, 16, 32)
  - Erases by page
  - Supports erasing before programming
  - Register write protection
- HEFC Data Reliability
  - BCH ECC module and extra parity implemented
    - Detects up to 3 errors per 32-bit word
    - Corrects up to 2 errors per 32-bit word
- Error notification by interruption or flag
- HEFC Power Management
  - Memory plane power ON/OFF control
  - Memory plane insulation

### 19.3 Product Dependencies

#### 19.3.1 Power/Reset/Clock Management

The Hardened Embedded Flash Controller (HEFC) must be clocked by a 4 MHz clock at startup. Prior to any use (for boot, and so on), Flash modules driven by the HEFC must be properly powered-on and calibrated. The HEFC is responsible of this full power-up sequence based on the 4 MHz clock. Once this power-up sequence is done, the HEFC module notifies it.

Clocks provided to Flash modules must not exceed 20 MHz and are generated by the HEFC itself with a ratio of 3 ( $CLK_{Flash} = CLK_{HEFC}/3$ );  $CLK_{HEFC}$  must not exceed 60 MHz. Thus after the startup sequence, the 4 MHz clock may be changed but must not exceed 60 MHz.

Flash modules may be insulated and powered off during the application phase using the power management techniques embedded in the HEFC.

The write/erase clock is provided by the PMC. It must be configured at 2 MHz and enabled before using the erase/write feature on Flash memory.

### 19.3.2 Interrupt Sources

The HEFC interrupt lines are connected to the interrupt controller. Using the HEFC interrupts requires the interrupt controller to be programmed first. The HEFC interrupts are generated only if the corresponding value of Flash Mode register (HEFC\_FMR) is '1'. For Flash Ready Interrupt, HEFC\_FMR.FRDI must be set to '1' and for Flash Power Status Interrupt, HEFC\_FMR.FPSI must be set to '1'.

## 19.4 Functional Description

### 19.4.1 Aerospace Restrictions

The write and erase processes of the embedded Flash memories are not allowed during flights. Furthermore, for better data retention in a radiation environment, the HEFC offers the possibility for the end user to power-up or power-down (with automatic insulation process) the Flash memories.

### 19.4.2 Embedded Flash Organization

The embedded Flash interfaces directly with the internal bus. The embedded Flash is composed of the following:

- One memory plane organized in:
  - One write buffer (latch buffer) that manages page programming. The write buffer size is equal to the page size (256 bytes of data and 128 bytes of ECC). This buffer is write-only and accessible all along the 128-KByte address space, so that each word can be written to its final address.
  - One array of 512 pages (256 bytes of data and 128 bytes of ECC)
  - Two additional rows which contain:
    - Xrow[0]: 128 fuse bits (GPVNM), 32 lock bits and 32 NVM calibration bits (see [Flash Commands](#) for details on how they can be accessed)
    - Xrow[1] (User signature area): 1 page of 256 bytes and 128 bytes of ECC

**Note:** Each 32 data bits (except for Xrow[0]) can be protected using 16 extra bits. The HEFC uses 13 extra bits to protect the 32 data bits on-the-fly. The 3 extra bits that are unused are padded to '0' and erased to '1'.

- An ECC block to protect end user data against cumulative radiation events with a BCH code (32 bits of data protected by 13 bits of checksum). Per 32-databit word, one or two errors are corrected while three errors are detected. If a word contains 4 or more errors, the ECC block behaves unpredictably. All detected errors are monitored and notified.
- A Flash controller to interface the 128-Kbyte memory plane with the 32-bit interface AMBA bus. The memory plane responds natively to the different write/read AMBA commands:
  - When an AMBA READ command is received by the controller, a 128-bit READ operation is performed through the 128-Kbyte memory plane to collect the data. For more details, see [Read Operations](#).
  - When an AMBA WRITE command is received by the controller, a LOAD operation is performed into the latch buffer (equivalent to one page). In a second step, a write command pushes these latched data to the Flash memories. For more details, see [Write Commands](#).

The other commands to control the memory plane are sent by the end user through the dedicated Flash Command register (HEFC\_FCR). See [Flash Commands](#) for details.

Thus, this block:

- Manages high level requests from the end user
- Generates the appropriate sequences to Flash memories
- Routes the dataflow from end user to Flash memories and from Flash memories to end user
- Drives the insulation controller
- An insulation controller (driven by the Flash controller) to manage Flash memories' insulation and their power-up or power-down. For additional information, refer to [Flash Power Management](#).

**Figure 19-1.** Embedded Flash Overview

Figure 19-2. Flash Memory Plane Overview

-  Calibration bits (32 bits \* 4) – each memory has its own calibration bits, thus 128 calibration bits are managed from memory plane's point of view
-  General Purpose bits (32 bits \* 4) – each memory has 32 bits dedicated for general purpose (useful for storing chip configuration)
-  Lock bits (32 bits) – each memory as 32 lock bits to lock the 32 first pages, but all memories are seen as a single memory from end-user point of view, thus the 32 lock bits are managed in the same way at a time for all memories, thus, only 32 effective lock bits are seen.
-  User Data (48 bits) – each data (from array or Xrow[1]) are 48 bits wide in each memory, HEFC manages these 48 bits to protect 32-bits of data with 13-bits of ECC (BCH + Parity). This means that each data could be corrected on-the-fly if one or two errors are detected.

Figure 19-3. Flash Memory Plane Areas

Figure 19-4. Flash Memory Plane Lockable Region

19.4.3 Read Operations

An optimized controller manages embedded Flash reads, thus increasing performance when the processor is running in Thumb2 mode by means of the 128-bit-wide memory interface.

The Flash memory is accessible through 8-, 16- and 32-bit reads.

As the Flash block size is smaller than the address space reserved for the internal memory area, the embedded Flash wraps around the address space and appears to be repeated within it.

19.4.4 Flash Commands

19.4.4.1 Introduction

The HEFC offers a set of commands to manage programming of Flash memory plane, locking and unlocking lockable regions, consecutive programming, full Flash erasing, so on.

The commands are listed in the following table:

| Command                   | Value | Mnemonic |
|---------------------------|-------|----------|
| Get Flash descriptor      | 0x00  | GETD     |
| Write page                | 0x01  | WP       |
| Write page and lock       | 0x02  | WPL      |
| Erase all                 | 0x05  | EA       |
| Erase page                | 0x06  | EP       |
| Erase pages               | 0x07  | EPA      |
| Set lock bit              | 0x08  | SLB      |
| Clear lock bit            | 0x09  | CLB      |
| Get lock bit              | 0x0A  | GLB      |
| Set GPNVM bit             | 0x0B  | SGPB     |
| Clear GPNVM bit           | 0x0C  | CGPB     |
| Get GPNVM bit             | 0x0D  | GGPB     |
| Get CALIB bit             | 0x10  | GALB     |
| Write user signature      | 0x12  | WUS      |
| Erase user signature      | 0x13  | EUS      |
| Start read user signature | 0x14  | STUS     |
| Stop read user signature  | 0x15  | SPUS     |

In order to execute one of these commands, select the required command using the FCMD field in the Flash Command register (HEFC\_FCR). As soon as HEFC\_FCR is written, the FRDY flag and the FVALUE field in the Flash Result register (HEFC\_FRR) are automatically cleared. Once the current command has completed, the FRDY flag is automatically set. If an interrupt has been enabled by setting the bit HEFC\_FMR.FRDY, the corresponding interrupt line of the interrupt controller is activated.

All the commands are protected by the same keyword, which must be written in the eight highest bits of HEFC\_FCR.

Writing HEFC\_FCR with data that does not contain the correct key and/or with an invalid command has no effect on the whole memory plane, but the FCMDE flag is set in the Flash Status register (HEFC\_FSR). This flag is automatically cleared by a read access to HEFC\_FSR.

When the current command writes or erases a page in a locked region, the command has no effect on the whole memory plane, but the FLOCKE flag is set in HEFC\_FSR. This flag is automatically cleared by a read access to HEFC\_FSR.

**Figure 19-5.** Command State Chart

#### 19.4.4.2 Get Flash Descriptor Commands

This command provides the system with information on the Flash organization. The system can take full advantage of this information. For instance, a device could be replaced by one with more Flash capacity, and so the software is able to adapt itself to the new configuration.

To get the embedded Flash descriptor, the application writes the GETD command in HEFC\_FCR. The first word of the descriptor can be read by the software application in HEFC\_FRR as soon as the FRDY flag in HEFC\_FSR rises. The next reads of HEFC\_FRR provide the following word of the descriptor. If extra read operations to HEFC\_FRR are done after the last word of the descriptor has been returned, the HEFC\_FRR value is 0 until the next valid command.

**Table 19-1.** Flash Descriptor Definition

| Symbol | Word Index | Description                 |
|--------|------------|-----------------------------|
| FL_ID  | 0          | Flash interface description |

| .....continued |                     |                                                                                                                                          |
|----------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Symbol         | Word Index          | Description                                                                                                                              |
| FL_SIZE        | 1                   | Flash size in bytes                                                                                                                      |
| FL_PAGE_SIZE   | 2                   | Page size in bytes                                                                                                                       |
| FL_NB_PLANE    | 3                   | Number of planes                                                                                                                         |
| FL_PLANE[0]    | 4                   | Number of bytes in the plane                                                                                                             |
| FL_NB_LOCK     | 4 + FL_NB_PLANE     | Number of lock bits. A bit is associated with a lock region. A lock bit is used to prevent write or erase operations in the lock region. |
| FL_LOCK[0]     | 4 + FL_NB_PLANE + 1 | Number of bytes in the first lock region                                                                                                 |

### 19.4.4.3 Write Commands

DMA write accesses must be 32-bit aligned. If a single byte is to be written in a 32-bit word, the rest of the word must be written with ones.

Several commands are used to program the Flash:

- Write Page (WP): one page is entirely written
- Write Page then Lock (WPL): one page is entirely written, then locked

Only 0 values can be programmed using Flash technology; 1 is the erased value. In order to program words in a page, the page must first be erased. Commands are available to erase the full memory plane or a given number of pages. With the EWP command, a page erase is done automatically before a page programming.

After programming, the page (if it is one of the first 32) can be locked to prevent miscellaneous write or erase sequences. The lock bit can be automatically set after page programming using the WPL command.

Data to be programmed in the Flash must be written in an internal latch buffer before writing the programming command in HEFC\_FCR. Data can be written at their final destination address, as the latch buffer is mapped into the Flash memory address space and wraps around within this Flash address space.

Byte and half-word AHB accesses to the latch buffer are not allowed. Only 32-bit word accesses are supported.

32-bit words must be written continuously, in either ascending or descending order. Writing the latch buffer in a random order is not permitted. This prevents mapping a C-code structure to the latch buffer and accessing the data of the structure in any order. It is instead recommended to fill in a C-code structure in SRAM and copy it in the latch buffer in a continuous order.

The HEFC generates its own clock for Flash modules and ensures proper sequencing regarding clock ratio.

The latch buffer is automatically re-initialized, that is, written with logical 1, after execution of each programming command. The programming sequence is as follows:

1. Write the data to be programmed in the latch buffer.
2. Write the programming command in HEFC\_FCR. This automatically clears HEFC\_FSR.FRDY.
3. When Flash programming is completed, HEFC\_FSR.FRDY rises. If an interrupt has been enabled by setting HEFC\_FMR.FRDY, the interrupt line of the HEFC is activated.

The following two errors can be detected in HEFC\_FSR after a programming sequence:

- Command Error: A bad keyword has been written in HEFC\_FCR.
- Lock Error: The page to be programmed belongs to a locked region. A command must be run previously to unlock the corresponding region.

Only one page can be programmed at a time. It is only possible to program all the bits of a page (full page programming).

When a 'Write Page' (WP) command is issued, the HEFC starts the programming sequence and all the bits written at 0 in the latch buffer are cleared in the Flash memory array.

**Note:** During programming, that is, until HEFC\_FSR.FDRY rises, access to the Flash is not allowed.

#### 19.4.4.3.1 Full Page Programming

To program a full page, all the bits of the page must be erased before writing the latch buffer and issuing the WP command. The latch buffer must be written in ascending order, starting from the first address of the page.

**Figure 19-6. Full Page Programming**

#### 19.4.4.3.2 Data Write Access into Latch Buffer

All write accesses to the latch buffer must be performed in 32-bit mode. The latch buffer must be fully written contiguously from beginning to end, prior to issuing any write commands. If no data is required at a given address in the latch buffer, then it must be written with '1'.

Below are examples of writing one value to latch buffers:

- 8-bit data (0xA5) at address 0x0001 in latch buffer:
  - Latch buffer must be erased first (all '1')

- Latch buffer must be filled, with a 32-bit access at offset 0x0000, Data = 0xFFFFA5FF (bit not required for data must be filled with '1')
- 16-bit data (0xCAFE) at address 0x0002 in latch buffer:
  - Latch buffer must be erased first (all '1')
  - Latch buffer must be filled, with a 32-bit access at offset 0x0000, Data = 0xCAFEFFFF (bit not required for data must be filled with '1')
- 32-bit data (0xCAFEF00D) at address 0x0004 in latch buffer:
  - Latch buffer must be erased first (all '1')
  - Latch buffer must be filled, with a 32-bit access at offset 0x0004, Data = 0xCAFEF00D (all bits of the word are relevant)

Once all addresses of the latch buffer are loaded (with data or with '1'), a WP command must be launched with the page number argument to write it in Flash plane memories.

#### 19.4.4.4 Erase Commands

Erase commands are allowed only on unlocked regions. Depending on the Flash memory, several commands can be used to erase the Flash:

- Erase All Memory (EA): All memory is erased. The processor must not fetch code from the Flash memory.
- Erase Page (EP): 1 page is erased in the Flash memory plane. The page to be erased is specified by the FARG field of the HEFC\_FCR.
- Erase Pages (EPA): 4, 8, 16 or 32 pages are erased in the Flash memory plane. The first page to be erased is specified in the FARG[15:2] field of the HEFC\_FCR and must be a multiple of 4, 8, 16 or 32 depending on the number of pages to erase at the same time.

If the processor is fetching code from the Flash memory while the EPA command is being executed, the processor accesses are stalled until the EPA command is completed. To avoid stalling the processor, the code can be run out of internal SRAM.

The erase sequence is the following:

1. Erase starts as soon as one of the erase commands and the FARG field are written in HEFC\_FCR. For the EPA command, the two lowest bits of the FARG field define the number of pages to be erased (FARG[1:0]):

**Table 19-2.** HEFC\_FCR.FARG Field for EPA Command

| FARG[1:0] | Number of pages to be erased with EPA command |
|-----------|-----------------------------------------------|
| 0         | 4 pages                                       |
| 1         | 8 pages                                       |
| 2         | 16 pages                                      |
| 3         | 32 pages                                      |

2. When erasing is completed, the bit HEFC\_FSR.FRDY rises. If an interrupt has been enabled by setting the bit HEFC\_FMR.FRDY, the interrupt line of the interrupt controller is activated.

Two errors can be detected in HEFC\_FSR after an erasing sequence:

- Command Error: A bad keyword has been written in HEFC\_FCR.
- Lock Error: At least one page to be erased belongs to a locked region. The erase command has been refused, no page has been erased. A command must be run previously to unlock the corresponding region.

#### 19.4.4.5 Lock Bit Protection

Each Lock bit is associated with one page in the embedded Flash memory plane. Only the 32 first pages are lockable by using the 32 available lock bits. Thus, one lock region is defined as one lock page in the embedded Flash memory plane. These regions prevent writing/erasing protected pages.

The following are lock bit commands:

- Set Lock Bit (SLB) – to lock a page
- Clear Lock Bit (CLB) – to unlock a page
- Get Lock Bit (CLB) – to get the status of a page

The following are lock sequence:

1. Execute the 'Set Lock Bit' command by writing HEFC\_FCR.FCMD with the SLB command and HEFC\_FCR.FARG with a page number to be protected.
2. When the locking completes, the bit HEFC\_FSR.FRDY rises. If an interrupt has been enabled by setting HEFC\_FMR.FRDY, the interrupt line of the interrupt controller is activated.
3. The result of the SLB command can be checked by running a 'Get Lock Bit' (GLB) command.

**Note:** The value of the FARG argument passed together with the SLB command must not exceed the higher lock bit index available in the product.

The following error may be detected in HEFC\_FSR after a programming sequence:

- Command Error: A bad keyword has been written in HEFC\_FCR.

It is possible to clear lock bits previously set. After the lock bits are cleared, the locked region can be erased or programmed. The unlock sequence is the following:

1. Execute the 'Clear Lock Bit' command by writing HEFC\_FCR.FCMD with the CLB command and HEFC\_FCR.FARG with a page number to be unprotected.
2. When the unlock operation completes, the bit HEFC\_FSR.FRDY rises. If an interrupt has been enabled by setting HEFC\_FMR.FRDY, the interrupt line of the interrupt controller is activated.

**Note:** The value of the FARG argument passed together with the CLB command must not exceed the higher lock bit index available in the product.

The following error may be detected in HEFC\_FSR after a programming sequence:

- Command Error: A bad keyword has been written in HEFC\_FCR.

The status of lock bits can be returned by the HEFC. The 'Get Lock Bit' sequence is the following:

1. Execute the 'Get Lock Bit' command by writing HEFC\_FCR.FCMD with the GLB command. HEFC\_FCR.FARG is meaningless.
2. Lock bits can be read by the software application in HEFC\_FRR. The word read corresponds to the 32 lock bits. Extra reads to HEFC\_FRR return 0.

For example, if the third bit of the first word read in HEFC\_FRR is set, the third lock region is locked.

The following error may be detected in HEFC\_FSR after a programming sequence:

- Command Error: A bad keyword has been written in HEFC\_FCR.

**Note:** Once locked, pages are no longer accessible even in read (0xFFFFFFFF is read) .

#### 19.4.4.6 GPNVM Bits

GPNVM bits do not interfere with the embedded Flash memory plane.

The GPNVM bits commands are the following one:

- Set GPNVM Bit (SGPB) – used to set a GPNVM bit

- Clear GPNVM Bit (CGPB) – used to clear a GPNVM bit
- Get GPNVM Bit (GGPB) – used to get the status of a GPNVM bit

The 'Set GPNVM Bit' sequence is the following:

1. Execute the 'Set GPNVM Bit' command by writing HEFC\_FCR.FCMD with the SGPB command and HEFC\_FCR.FARG with the number of GPNVM bits to be set.
2. When the GPNVM bit is set, the bit HEFC\_FSR.FRDY rises. If an interrupt was enabled by setting the bit HEFC\_FMR.FRDY, the interrupt line of the interrupt controller is activated.
3. The result of the SGPB command can be checked by running a 'Get GPNVM Bit' (GGPB) command.

**Note:** The value of the FARG argument passed together with the SGPB command must not exceed the higher GPNVM index available in the product. Flash data content is not altered if FARG exceeds the limit. Command Error is detected only if FARG is greater than 128.

The following error may be detected in HEFC\_FSR after a programming sequence:

- Command Error: A bad keyword has been written in HEFC\_FCR.

It is possible to clear GPNVM bits previously set. The 'Clear GPNVM Bit' sequence is the following:

1. Execute the 'Clear GPNVM Bit' command by writing HEFC\_FCR.FCMD with the CGPB command and HEFC\_FCR.FARG with the number of GPNVM bits to be cleared.
2. When the clear completes, the bit HEFC\_FSR.FRDY rises. If an interrupt has been enabled by setting the bit HEFC\_FMR.FRDY, the interrupt line of the interrupt controller is activated.

**Note:** The value of the FARG argument passed together with the CGPB command must not exceed the higher GPNVM index available in the product. Flash data content is not altered if FARG exceeds the limit. Command Error is detected only if FARG is greater than 128.

The following error may be detected in HEFC\_FSR after a programming sequence:

- Command Error: A bad keyword has been written in HEFC\_FCR.

The status of GPNVM bits can be returned by the HEFC. The sequence is the following:

1. Execute the 'Get GPNVM Bit' command by writing HEFC\_FCR.FCMD with the GGPB command. Field HEFC\_FCR.FARG is meaningless.
2. GPNVM bits can be read by the software application in HEFC\_FRR. The first word read corresponds to the 32 first GPNVM bits; the reads that follow provide the next 32 GPNVM bits as long as it is meaningful. Extra reads to HEFC\_FRR return 0.

For example, if the third bit of the first word read in HEFC\_FRR is set, the third GPNVM bit is active.

The following error may be detected in HEFC\_FSR after a programming sequence:

- Command Error: A bad keyword has been written in HEFC\_FCR.

**Note:** Access to the Flash in read is permitted when a 'Set GPNVM Bit', 'Clear GPNVM Bit' or 'Get GPNVM Bit' command is executed.

Refer to [General-purpose NVM \(GPNVM\) bits](#) for a complete list of GPNVM bits and their functions.

#### 19.4.4.7 User Signature Area

Each product contains a user signature area of 256 bytes of data (and 128 bytes of ECC). It can be used for storage. See the figure "Flash Memory Areas".

Write, Erase and Read the user signature area is allowed using the following commands:

- Write User Signature (WUS)
- Erase User Signature (EUS)

- Start Read User Signature (STUS)
- Stop Read User Signature (SPUS)

The sequence to write the user signature area is the following:

- Fill the write latch buffer, within the internal memory area address space.
- Execute the 'Write User Signature' command by writing HEFC\_FCR.FCMD with the WUS command. Field HEFC\_FCR.FARG is meaningless.
- When programming is completed, HEFC\_FSR.FRDY rises. If an interrupt has been enabled by setting HEFC\_FMR.FRDY, the corresponding interrupt line of the interrupt controller is activated.

The following error may be detected in HEFC\_FSR after this sequence:

- Command Error: A bad keyword has been written in HEFC\_FCR.

The sequence to erase the user signature area is the following:

1. Execute the 'Erase User Signature' command by writing HEFC\_FCR.FCMD with the EUS command. Field HEFC\_FCR.FARG is meaningless.
2. When programming is completed, HEFC\_FSR.FRDY rises. If an interrupt has been enabled by setting HEFC\_FMR.FRDY, the corresponding interrupt line of the interrupt controller is activated.

The following error may be detected in HEFC\_FSR after this sequence:

- Command Error: A bad keyword has been written in HEFC\_FCR.

The sequence to read the user signature area is the following:

1. Execute the 'Start Read User Signature' command by writing HEFC\_FCR.FCMD with the STUS command. Field HEFC\_FCR.FARG is meaningless.
2. Wait until HEFC\_FSR.FRDY falls to read the user signature area. The user signature area is located in the first 256 bytes of the Flash memory mapping. The 'Start Read User Signature' command reuses some addresses of the memory plane but the user signature area is physically different from the memory plane.
3. To stop reading the user signature area, execute the 'Stop Read User Signature' command by writing HEFC\_FCR.FCMD with the SPUS command. Field HEFC\_FCR.FARG is meaningless.
4. When the SPUS command has been executed, HEFC\_FSR.FRDY rises. If an interrupt was enabled by setting HEFC\_FMR.FRDY, the interrupt line of the interrupt controller is activated.

Note that during the sequence, the software cannot be fetched from the Flash memory plane.

The following error may be detected in HEFC\_FSR after this sequence:

- Command Error: A bad keyword has been written in HEFC\_FCR.

## 19.4.5 Flash Power Management

The embedded Flash plane of 128 Kbytes is made of 4 Flash submodules of 32 Kbytes. The HEFC embeds a full power management mechanism that is partially configurable by the end user.

### 19.4.5.1 Initial Power-Up or Global Reset

To minimize the contribution of the power-up of Flash modules on the inrush current at initial power-up, the sequence described below is automatically applied:

**Figure 19-7.** Flash Modules Power-Up Sequence – [System]**Table 19-3.** Sequence Times (Flash Module Power-up Sequence Only)

| Time | Duration                  | Description                                                                                                                                                                                                                    |
|------|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| t1   | Some system clock periods | Once the HEFC global reset is released, logic starts to operate. After some initialization steps, the power switches sequence is launched.                                                                                     |
| t2   | > 750 $\mu$ s             | Power switch 0 startup time.                                                                                                                                                                                                   |
| t3   | > 750 $\mu$ s             | Power switch 1 startup time.                                                                                                                                                                                                   |
| t4   | > 750 $\mu$ s             | Power switch 2 startup time.                                                                                                                                                                                                   |
| t5   | > 750 $\mu$ s             | Power switch 3 startup time.                                                                                                                                                                                                   |
| t6   | > 2100 $\mu$ s            | Once all Flash modules are started, the HEFC releases Flash signal insulation. A specific boot-up sequence is then applied on the Flash modules. At the end of this sequence, the HEFC and its Flash modules are ready to use. |

**Note:** By default, the delay applied for power switch start-up phase is around 750  $\mu$ s. The HEFC ensures this delay to be > 750  $\mu$ s.

#### 19.4.5.2 End User Power-Down

During the application run phase, the HEFC offers the possibility to the end user to power switched-off Flash modules when not used by clearing HEFC\_FPMR.PWS\_EN. Powering down Flash modules ensures a better data reliability in the context of space applications, as powered-down Flash modules are more immune to radiation effects.

Prior to being switched off and in order to not have any impact on the running system, Flash modules are insulated.

The timing diagram below shows the sequence applied on power-off request event.

**Figure 19-8.** Flash Modules Power-Down Sequence – [End user]

### 19.4.5.3 End User Power-Up

Prior to powering up the Flash modules, the end user can configure the power switch delay applicable for each one. (See HEFC\_FPMR.PWS\_DLY for available values). Depending on this value, the end user must also properly set the value of HEFC\_FPMR.VAR\_FACTOR to handle the time required to set up the system clock. The end user power-up sequence is activated by setting HEFC\_FPMR.PWS\_EN.

**Figure 19-9.** Flash Modules Power-Up Sequence – [End user]

## 19.4.6 HECC Management

### 19.4.6.1 Overview

The Hardened Error Code Correction (HECC) is a module embedded to protect data against radiation effects. It is embedded next to the Hardened Flash Controller (HEFC).

### 19.4.6.2 Features

- BCH Code + Extra Parity Code Embedded
  - To correct up to 2 errors
  - To detect up to 3 errors
- Interrupt Capabilities
  - 1 interrupt for unfixable error
  - 1 interrupt for fixable error
- Error Counter Available and for Statistics Reporting
  - 1 counter dedicated to fixable errors,
  - 1 counter dedicated to unfixable errors.
- Embedded HECC Testing Mode

### 19.4.6.3 Product Dependencies

#### 19.4.6.3.1 Clocks Management

The Hardened Error Checker / Corrector (HECC) channels' encoders / decoders are fully asynchronous. Interface, control and status modules are system clock dependent. The HECC clock is provided by PMC module. Therefore, it shall be programmed first.

#### 19.4.6.3.2 Interrupt Sources

The Hardened Error Checker / Corrector (HECC) handles fixable and unfixable errors. These two kinds of errors can generate their own interrupt. Using the HECC interrupt requires the interrupt controller to be programmed first.

### 19.4.6.4 Functional Description

#### 19.4.6.4.1 Functional Block

The HECC block is made of:

- 1 encoder/decoder BCH + an extra parity bit
- An APB end user interface for configuration:
  - to enable/disable the HECC protection
  - to activate/deactivate the HECC test mode (independently in read or write mode),
  - to reset the HECC fixable and unfixable counters,
- An APB end user interface for errors status and reporting:
  - Indicate whether fixable error(s) has been detected and corrected on-the-fly, and quantifies them,
  - To indicate whether unfixable error(s) has been detected and quantifies them,
  - The indication can be done either by interruption or by polling,
  - To indicate the address and the status (type, size and origin) of the last HECC error detected.
- 4 channels to access the 4 Flash memories, which constitute the whole plane. (Only the channel 0 is relevant to set parameters, others channels (1 to 3) use the same parameters as channel 0).

#### 19.4.6.4.2 Operation

When enabled (HEFC\_HECC\_CRX.ENABLE='1' and HEFC\_HECC\_CRX.ECC12\_ENABLE='1'), the HECC operates on every access to the memories.

Nevertheless, the HECC detection and correction is performed only on read/fetch accesses, by comparing the HECC checksum stored in memory to the one locally computed from data read.

#### 19.4.6.4.3 BCH Code + Extra Parity Bit

The BCH code used is BCH(45,32,2) code. For each 32-bit word, a 13-bit (12bit of checksum + 1 extra parity bit ) is generated. With this correcting code, up to 2-bit error can be corrected (named fixable error later on). Up to 3-bit errors can be detected (named unfixable error later on).

#### 19.4.6.4.4 Write Access

When the processor performs a write access to an HECC protected memory, it also writes the 13-bit checksum on the HECC protected memory. Other bits are driven low unless HECC testing is enabled.

#### 19.4.6.4.5 Read Access

When the processor performs a read access to an HECC protected memory, it reads data and its associated checksum. The checksum read from HECC protected memory is compared against the checksum generated by the HECC from the same read data. Any discrepancy yields an error and a syndrome is computed to further qualify the error as fixable error or unfixable error.

#### 19.4.6.4.6 Fixable Error

The correction is performed on-the-fly inside the processor during the current access and no timing penalty is incurred.

The fixable error event is reported in the Fail Address register (HEFC\_HECC\_FAILAR) and in the Fail Status register (HEFC\_HECC\_SR). If previously enabled, a fixable interrupt (HEFC\_HECC\_ISR.FIX) is generated.

The fixable error remains in memory until a software-initiated rewrite is performed at the faulty memory location.

**CAUTION** In the interrupt handler, reading the status will clear the interrupt. If a read to the fail address is performed in the handler after the status has been read, this will generate a new unexpected interrupt as the error has not been corrected yet.

To permit later statistical study, a fixable error counter is available. It is incremented each time a fixable error is detected and until a counter overflow is detected.

It is possible for the end-user to reset the fixable counter when it is needed.

#### 19.4.6.4.7 Unfixable Error

The unfixable error event is reported in the Fail Address register (HEFC\_HECC\_FAILAR) and in the Fail Status register (HEFC\_HECC\_SR). If previously enabled, an unfixable interrupt (HEFC\_HECC\_ISR.NOFIX) is generated.

To permit later statistical study, an unfixable error counter is available. It is incremented each time an unfixable error is detected and until a counter overflow is detected.

It is possible for the end-user to reset the unfixable counter when it is needed.

**Note:** If more than three errors are detected, the BCH decoder with its extra parity bit cannot handle them properly (either fixable or unfixable error will be unpredictively raised).

#### 19.4.6.4.8 Status Report

On error occurrences, following elements are stored in coordination with either **HEFC\_HECC\_SR.MEM\_FIX** or **HEFC\_HECC\_SR.MEM\_NOFIX** flags:

- **HEFC\_HECC\_FAILAR** stores the failed address,
- **HEFC\_HECC\_SR.MEM\_ID** stores the bank identification,
- **HEFC\_HECC\_SR.TYPE** stores the access type,
- **HEFC\_HECC\_SR.HES** store the access size.

While not read, **HEFC\_HECC\_SR** locks error flags and previous listed elements. Prior to reading **HEFC\_HECC\_SR**, it is required to read **HEFC\_HECC\_FAILAR** to get the failed address.

Reading the **HEFC\_HECC\_SR** results in clearing pending flags. **HEFC\_HECC\_SR** as well as previously listed elements' contents become irrelevant.

#### 19.4.6.4.9 HECC Testing

Operation of the HECC can be bypassed for testing purpose and is controlled in an HECC Configuration register (HEFC\_HECC\_SR).

#### 19.4.6.4.10 Write Test

When HECC write bypass is enabled (HEFC\_HECC\_CR.TEST\_MODE\_WR=1), the test checksum (HEFC\_HECC\_TESTCBx.TCB) replaces the HECC generated checksum during a data store.

#### 19.4.6.4.11 Read Test

When HECC read diagnostic is enabled (HEFC\_HECC\_CR.TEST\_MODE\_RD = 1), the test checksum (HEFC\_HECC\_TESTCBx.TCB) are updated with the read checksum during a data load or an instruction fetch.

**Note:** Parity is taken into account for error detection but only a 12-bit checksum is reported in HEFC\_HECC\_TESTCBx.TCB field.

### 19.4.7 Register Write Protection

To prevent any single software error from corrupting HEFC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the ([HEFC\\_WPMR](#)).

The following registers can be write-protected:

- HEFC Flash Mode Register
- HEFC Flash Power Management Register

## 19.5 Register Summary

| Offset                  | Name          | Bit Pos. | 7             | 6                | 5                 | 4           | 3               | 2                | 1                | 0                    |
|-------------------------|---------------|----------|---------------|------------------|-------------------|-------------|-----------------|------------------|------------------|----------------------|
| 0x00                    | HEFC_FMR      | 7:0      |               |                  |                   |             |                 |                  | FPSI             | FRDY                 |

19.5.1 HEFC Flash Mode Register

Name: HEFC\_FMR  
Offset: 0x00  
Reset: 0x00010400  
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the [“HEFC Write Protection Mode Register”](#).

Bit 16 – ONE Must be written to 1

Bit 1 – FPSI Flash Power Status Interrupt Enable

| Value | Description                                               |
|-------|-----------------------------------------------------------|
| 0     | Flash Power Status Enable does not generate an interrupt. |
| 1     | Flash Power Status Enable generates an interrupt.         |

Bit 0 – FRDY Flash Ready Interrupt Enable

| Value | Description                                                   |
|-------|---------------------------------------------------------------|
| 0     | Flash ready does not generate an interrupt.                   |
| 1     | Flash ready (to accept a new command) generates an interrupt. |

## 19.5.2 HEFC Flash Command Register

**Name:** HEFC\_FCR  
**Offset:** 0x04  
**Reset:** –  
**Property:** Write-only

|        |            |    |    |    |    |    |    |    |

### Bits 31:24 – FKEY[7:0] Flash Write Protection Key

| Value | Name   | Description                                                                                                                                                                  |
|-------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0x5A  | PASSWD | The 0x5A value enables the command defined by the bits of the register. If the field is written with a different value, the write is not performed and no action is started. |

### Bits 23:8 – FARG[15:0] Flash Command Argument

|                                                  |                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Bits 7:0 – FCMD[7:0] Flash Command

| Value | Name | Description               |
|-------|------|---------------------------|
| 0x00  | GETD | Get Flash descriptor      |
| 0x01  | WP   | Write page                |
| 0x02  | WPL  | Write page and lock       |
| 0x05  | EA   | Erase all                 |
| 0x06  | EP   | Erase page                |
| 0x07  | EPA  | Erase pages               |
| 0x08  | SLB  | Set lock bit              |
| 0x09  | CLB  | Clear lock bit            |
| 0x0A  | GLB  | Get lock bit              |
| 0x0B  | SGPB | Set GPNVM bit             |
| 0x0C  | CGPB | Clear GPNVM bit           |
| 0x0D  | GGPB | Get GPNVM bit             |
| 0x10  | GALB | Get CALIB bit             |
| 0x12  | WUS  | Write user signature      |
| 0x13  | EUS  | Erase user signature      |
| 0x14  | STUS | Start read user signature |
| 0x15  | SPUS | Stop read user signature  |

### 19.5.3 HEFC Flash Status Register

**Name:** HEFC\_FSR  
**Offset:** 0x08  
**Reset:** 0x00000001  
**Property:** Read-only

|        |    |    |    |       |    |        |       |      |
|--------|----|----|----|-------|----|--------|-------|------|
| Bit    | 31 | 30 | 29 | 28    | 27 | 26     | 25    | 24   |

|        |    |    |    |       |    |        |       |      |
| Access |    |    |    |       |    |        |       |      |
| Reset  |    |    |    |       |    |        |       |      |
| Bit    | 7  | 6  | 5  | 4     | 3  | 2      | 1     | 0    |
|        |    |    |    | WREER |    | FLOCKE | FCMDE | FRDY |
| Access |    |    |    | R     |    | R      | R     | R    |
| Reset  |    |    |    | 0     |    | 0      | 0     | 1    |

**Bit 4 – WREER** Write Register Error Status (cleared on read)  
 This flag is automatically cleared when HEFC\_FSR is read or HEFC\_FCR is written.

| Value | Description                                                             |
|-------|-------------------------------------------------------------------------|
| 0     | No register writing error has happened since the last read of HEFC_FSR. |
| 1     | Register writing error has happened since the last read of HEFC_FSR.    |

**Bit 2 – FLOCKE** Flash Lock Error Status (cleared on read)  
 This flag is automatically cleared when HEFC\_FSR is read or HEFC\_FCR is written.

| Value | Description                                                                                      |
|-------|--------------------------------------------------------------------------------------------------|
| 0     | No programming/erase of at least one locked region has happened since the last read of HEFC_FSR. |
| 1     | Programming/erase of at least one locked region has happened since the last read of HEFC_FSR.    |

**Bit 1 – FCMDE** Flash Command Error Status (cleared on read or by writing HEFC\_FCR)

| Value | Description                                                           |
|-------|-----------------------------------------------------------------------|
| 0     | No invalid commands and no bad keywords were written in HEFC_FMR.     |
| 1     | An invalid command and/or a bad keyword was/were written in HEFC_FMR. |

**Bit 0 – FRDY** Flash Ready Status (cleared when Flash is busy)  
 When set, this flag triggers an interrupt if the FRDY flag is set in HEFC\_FMR.  
 This flag is automatically cleared when the HEFC is busy.

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | The HEFC is busy.                         |
| 1     | The HEFC is ready to start a new command. |

### 19.5.4 HEFC Flash Result Register

**Name:** HEFC\_FRR  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |               |     |     |     |     |     |     |     |

**Bits 31:0 – FVALUE[31:0]** Flash Result Value  
 The result of a Flash command is returned in this register. If the size of the result is greater than 32 bits, the next resulting value is accessible at the next register read.

### 19.5.5 HEFC Flash Power Management Register

**Name:** HEFC\_FPMR  
**Offset:** 0x40  
**Reset:** 0x0001320B  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [HEFC Write Protection Mode Register](#).

#### Bit 16 – FUNC\_ISOL\_CTRL\_N Flash Insulation Control Status

| Value | Description                                       |
|-------|---------------------------------------------------|
| 0     | Flash memory is insulated from the whole product. |
| 1     | Flash memory is connected to the whole product.   |

#### Bits 13:8 – VAR\_FACTOR[5:0] Variation Factor

This field is a ratio to adapt the power switch delay versus the end user frequency.

The allowable range is 0 to 63.

$\text{VAR\_FACTOR} = 10 * (\text{Freq\_MCK} / \text{Freq\_10MHZ})$

As a consequence, the delay between the two power switches is  $t(\text{freq\_MCK}, \text{VAR\_FACTOR})$

$= t(\text{PWS\_DELAY}(10 \text{ MHz}, 10) * \text{VAR\_FACTOR} / \text{freq\_MCK})$ .

#### Bits 3:2 – PWS\_DLY[1:0] Power Switch Delay

This field specifies the delay to apply between each power switch (reference conditions RC=10 MHz, VAR\_FACTOR=10).

| Value | Name  | Description                                                  |
|-------|-------|--------------------------------------------------------------|
| 0     | 75US  | Delay is set to 75 $\mu\text{s}$ (RC=10 MHz, VAR_FACTOR=10)  |
| 1     | 150US | Delay is set to 150 $\mu\text{s}$ (RC=10 MHz, VAR_FACTOR=10) |
| 2     | 300US | Delay is set to 300 $\mu\text{s}$ (RC=10 MHz, VAR_FACTOR=10) |
| 3     | 600US | Delay is set to 600 $\mu\text{s}$ (RC=10 MHz, VAR_FACTOR=10) |

#### Bit 1 – PWS\_STAT Power Switch Status

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | Power switch is off or power-up sequence is ongoing. |

| Value | Description                |
|-------|----------------------------|
| 1     | Power-up sequence is done. |

**Bit 0 – PWS\_EN** Power Switch Enable

| Value | Description          |
|-------|----------------------|
| 0     | Power switch is off. |
| 1     | Power switch is on.  |

## 19.5.6 HEFC Write Protection Mode Register

**Name:** HEFC\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |              |    |    |      |         |        |         |      |
|--------|--------------|----|----|------|---------|--------|---------|------|
| Bit    | 31           | 30 | 29 | 28   | 27      | 26     | 25      | 24   |
|        | WPKEY[23:16] |    |    |      |         |        |         |      |
| Access | W            | W  | W  | W    | W       | W      | W       | W    |
| Reset  | 0            | 0  | 0  | 0    | 0       | 0      | 0       | 0    |
| Bit    | 23           | 22 | 21 | 20   | 19      | 18     | 17      | 16   |
|        | WPKEY[15:8]  |    |    |      |         |        |         |      |
| Access | W            | W  | W  | W    | W       | W      | W       | W    |
| Reset  | 0            | 0  | 0  | 0    | 0       | 0      | 0       | 0    |
| Bit    | 15           | 14 | 13 | 12   | 11      | 10     | 9       | 8    |
|        | WPKEY[7:0]   |    |    |      |         |        |         |      |
| Access | W            | W  | W  | W    | W       | W      | W       | W    |
| Reset  | 0            | 0  | 0  | 0    | 0       | 0      | 0       | 0    |
| Bit    | 7            | 6  | 5  | 4    | 3       | 2      | 1       | 0    |
|        |              |    |    | USER | ERASEWP | LOCKWP | GPNVMWP | WPEN |
| Access |              |    |    | R/W  | R/W     | R/W    | R/W     | R/W  |
| Reset  |              |    |    | 0    | 0       | 0      | 0       | 0    |

### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                             |
|----------|--------|-----------------------------------------------------------------------------------------|
| 0x454643 | PASSWD | Writing any other value in this field aborts the write operation.<br>Always reads as 0. |

### Bit 4 – USER User Signature Write Protection

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 0     | Write and Erase User signature commands selected by HEFC_FCR.FCMD are enabled.  |
| 1     | Write and Erase User signature commands selected by HEFC_FCR.FCMD are disabled. |

### Bit 3 – ERASEWP Page, Sector and Plane Write Protection

| Value | Description                                                           |
|-------|-----------------------------------------------------------------------|
| 0     | Write and Erase Page commands selected by HEFC_FCR.FCMD are enabled.  |
| 1     | Write and Erase Page commands selected by HEFC_FCR.FCMD are disabled. |

### Bit 2 – LOCKWP Lock Bit Write Protection

| Value | Description                                                             |
|-------|-------------------------------------------------------------------------|
| 0     | Set and Clear lock bit commands selected by HEFC_FCR.FCMD are enabled.  |
| 1     | Set and Clear lock bit commands selected by HEFC_FCR.FCMD are disabled. |

### Bit 1 – GPNVMWP GPNVM Bit Write Protection

| Value | Description                                                          |
|-------|----------------------------------------------------------------------|
| 0     | Set and Clear GPNVM commands selected by HEFC_FCR.FCMD are enabled.  |
| 1     | Set and Clear GPNVM commands selected by HEFC_FCR.FCMD are disabled. |

**Bit 0 – WPEN** Write Protection Enable

See Section 5.7 “Flash Power Switch Control and Status” for the list of registers that can be protected.

| Value | Description                                                                    |
|-------|--------------------------------------------------------------------------------|
| 0     | Disables the write protection if WPKEY corresponds to 0x454643 (EFC in ASCII). |
| 1     | Enables the write protection if WPKEY corresponds to 0x454643 (EFC in ASCII).  |

### 19.5.7 HECC Control Register 0

**Name:** HEFC\_HECC\_CR0  
**Offset:** 0x100  
**Reset:** 0x00000041  
**Property:** Read/Write

The configuration of HEFC\_HECC\_CR0 is duplicated in all HEFC\_HECC\_CRx.

|        |    |            |             |             |    |            |            |        |
|--------|----|------------|-------------|-------------|----|------------|------------|--------|
| Bit    | 31 | 30         | 29          | 28          | 27 | 26         | 25         | 24     |
|        |    |            |             |             |    |            |            |        |
| Access |    |            |             |             |    |            |            |        |
| Reset  |    |            |             |             |    |            |            |        |
| Bit    | 23 | 22         | 21          | 20          | 19 | 18         | 17         | 16     |
|        |    |            |             |             |    |            |            |        |
| Access |    |            |             |             |    |            |            |        |
| Reset  |    |            |             |             |    |            |            |        |
| Bit    | 15 | 14         | 13          | 12          | 11 | 10         | 9          | 8      |
|        |    |            |             |             |    |            |            |        |
| Access |    |            |             |             |    |            |            |        |
| Reset  |    |            |             |             |    |            |            |        |
| Bit    | 7  | 6          | 5           | 4           | 3  | 2          | 1          | 0      |
|        |    | ECC12_ENAB | RST_NOFIX_C | RST_FIX_CPT |    | TEST_MODE_ | TEST_MODE_ | ENABLE |
|        |    | LE         | PT          |             |    | WR         | RD         |        |
| Access |    | R/W        | R/W         | R/W         |    | R/W        | R/W        | R/W    |
| Reset  |    | 1          | 0           | 0           |    | 0          | 0          | 1      |

#### Bit 6 – ECC12\_ENABLE BCH ECC Enable

| Value | Description                                                          |
|-------|----------------------------------------------------------------------|
| 0     | Reserved                                                             |
| 1     | If register Bit0 ENABLE is also '1' then BCH 12-bit ECC is selected. |

#### Bit 5 – RST\_NOFIX\_CPT Reset the Unfixable Error Counter

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | No effect.                              |
| 1     | Resets the ECC unfixable error counter. |

#### Bit 4 – RST\_FIX\_CPT Reset the Fixable Error Counter

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Resets the ECC fixable error counter. |

#### Bit 2 – TEST\_MODE\_WR Test Mode of ECC Protection - Write Mode

The ENABLE bit must be enabled to use this bit.

| Value | Description               |
|-------|---------------------------|
| 0     | Test mode is deactivated. |
| 1     | Test mode is activated.   |

#### Bit 1 – TEST\_MODE\_RD Test Mode of ECC Protection - Read Mode

The ENABLE bit must be enabled to use this bit.

| Value | Description               |
|-------|---------------------------|
| 0     | Test mode is deactivated. |

| Value | Description             |
|-------|-------------------------|
| 1     | Test mode is activated. |

**Bit 0 – ENABLE ECC Protection Enable**

| Value | Description                |
|-------|----------------------------|
| 0     | Protection is deactivated. |
| 1     | Protection is activated.   |

## 19.5.8 HECC Control Register x [x=1..3]

**Name:** HEFC\_HECC\_CRx  
**Offset:** 0x0104 + (x-1)\*0x04 [x=1..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |            |             |             |   |            |            |        |
|--------|---|------------|-------------|-------------|---|------------|------------|--------|
| Bit    | 7 | 6          | 5           | 4           | 3 | 2          | 1          | 0      |
|        |   | ECC12_ENAB | RST_NOFIX_C | RST_FIX_CPT |   | TEST_MODE_ | TEST_MODE_ | ENABLE |
|        |   | LE         | PT          |             |   | WR         | RD         |        |
| Access |   | R/W        | R/W         | R/W         |   | R/W        | R/W        | R/W    |
| Reset  |   | 0          | 0           | 0           |   | 0          | 0          | 0      |

### Bit 6 – ECC12\_ENABLE BCH ECC Enable

| Value | Description                                                          |
|-------|----------------------------------------------------------------------|
| 0     | Reserved                                                             |
| 1     | If register Bit0 ENABLE is also '1' then BCH 12-bit ECC is selected. |

### Bit 5 – RST\_NOFIX\_CPT Reset the Unfixable Error Counter

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | No effect.                              |
| 1     | Resets the ECC unfixable error counter. |

### Bit 4 – RST\_FIX\_CPT Reset the Fixable Error Counter

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Resets the ECC fixable error counter. |

### Bit 2 – TEST\_MODE\_WR Test Mode of ECC Protection - Write Mode

The ENABLE bit must be enabled to use this bit.

| Value | Description               |
|-------|---------------------------|
| 0     | Test mode is deactivated. |
| 1     | Test mode is activated.   |

### Bit 1 – TEST\_MODE\_RD Test Mode of ECC Protection - Read Mode

The ENABLE bit must be enabled to use this bit.

| Value | Description               |
|-------|---------------------------|
| 0     | Test mode is deactivated. |
| 1     | Test mode is activated.   |

**Bit 0 – ENABLE** ECC Protection Enable

| Value | Description                |
|-------|----------------------------|
| 0     | Protection is deactivated. |
| 1     | Protection is activated.   |

### 19.5.9 HECC Test Mode Register x

**Name:** HEFC\_HECC\_TESTCBx  
**Offset:** 0x0140 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

The configuration of HEFC\_HECC\_CR0 is duplicated in the other HEFC\_HECC\_CRx.

|        |           |     |     |     |     |     |     |     |
|--------|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31        | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |           |     |     |     |     |     |     |     |
| Access |           |     |     |     |     |     |     |     |
| Reset  |           |     |     |     |     |     |     |     |
| Bit    | 23        | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        |           |     |     |     |     |     |     |     |
| Access |           |     |     |     |     |     |     |     |
| Reset  |           |     |     |     |     |     |     |     |

|        | TCB[15:8] |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7         | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | TCB[7:0]  |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 15:0 – TCB[15:0] Test Check Bit (16 bits)

Check bit for testing purposes.  
 For BCH code, the checksum is made of the parity bit, located at TCB[12], and checkbit data, located at TCB[11:0].

## 19.5.10 HECC Status Register

**Name:** HEFC\_HECC\_SR  
**Offset:** 0x180  
**Reset:** 0x02000000  
**Property:** Read-only

|        |    |    |             |    |      |          |    |    |

**Bits 29:28 – MEM\_ID[1:0]** Memory Identification Number  
Indicates to which memory the error refers.

| Value | Description |
|-------|-------------|
| 0     | Memory 0    |
| 1     | Memory 1    |
| 2     | Memory 2    |
| 3     | Memory 3    |

**Bit 27 – TYPE** Write or Read Access

| Value | Description   |
|-------|---------------|
| 0     | Write access. |
| 1     | Read access.  |

**Bits 26:24 – HES[2:0]** Hardware Error Size  
Identifies the size of the failed access.

**Bit 15 – OVER\_NOFIX** Counter Overflow

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | No overflow has occurred since the last read.  |
| 1     | One overflow has occurred since the last read. |

**Bits 14:10 – CPT\_NOFIX[4:0]** 5-bit Counter  
Counts the number of unfixable errors detected for one type of memory during the mission.

**Bit 8 – MEM\_NOFIX** Unfixable Error Status  
An unfixable error has been detected.

**Bit 7 – OVER\_FIX** Counter Overflow

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | No overflow has occurred since the last read.  |
| 1     | One overflow has occurred since the last read. |

**Bits 6:2 – CPT\_FIX[4:0]** 5-bit Counter

Counts the number of fixable errors detected for one type of memory during the mission.

**Bit 0 – MEM\_FIX** Fixable Error Status

A fixable error has been detected.

19.5.11 HECC Interrupt Enable Register

**Name:** HEFC\_HECC\_IER  
**Offset:** 0x184  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

- 0: No effect.
- 1: Enables the corresponding interrupt.

Bit 1 – MEM\_NOFIX Unfixable Error

Bit 0 – MEM\_FIX Fixable Error

19.5.12 HECC Interrupt Disable Register

**Name:** HEFC\_HECC\_IDR  
**Offset:** 0x188  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

- 0: No effect.
- 1: Disables the corresponding interrupt.

**Bits 31:0 – ADDRESS[31:0] Address of the Error Detected**

The address of the faulty data detected when a single or multiple error occurs.

## 20. Supply Controller (SUPC)

### 20.1 Description

The Supply Controller (SUPC) is in charge of sequencing the internal circuits ( RC oscillators, so on) at device power-up, generating the slow clocks (MD\_SLCK and TD\_SLCK) and managing the Supply Monitor.

### 20.2 Embedded Characteristics

- Supply Monitor Detection on VDDCORE to Trigger a Core Reset
- Slow Clock Generation:
  - MD\_SLCK — Monitoring domain slow clock
  - TD\_CLK — Timing domain slow clock

### 20.3 Block Diagram

Figure 20-1. Supply Controller Block Diagram

### 20.4 Functional Description

#### 20.4.1 Overview

From a power domain perspective, the device is classified as the following two digital power areas:

- VDDIO – Includes powered I/O pads and Flash memories
- VDDCORE – Powers the entire circuit, including logic and embedded memories

The SUPC includes the following functions:

- Internal circuits (RC oscillators and so on) sequencing at power-up
- Slow clock generation
- Power supply monitoring

At power-up (VDDIO and VDDCORE rise), the SUPC is maintained in reset until VDDCORE rises to its nominal value and the NRST pin is released. Once released from reset, the SUPC sequentially releases the reset of HEFC. Then, when the power-up sequence of the HEFC is completed, the release of the core logic reset signal (vddcore\_nreset) is performed.

The SUPC slow clock generator provides the system with:

- TD\_SLCK (Timing Domain Slow Clock) – This clock, generally sourced from the 32.768 kHz external slow clock, is routed to the RTC and RTT peripherals.
- MD\_SLCK (Monitoring Domain Slow Clock) – This clock, generally sourced from the Slow RC oscillator, feeds safety-critical functions of the device (WDT, RSTC, SUPC, frequency monitors and detectors, PMC start-up time counters).

TD\_SCLK can be sourced either from the 32.768 kHz external slow clock or from the slow RC oscillator. MD\_SCLK is sourced from slow RC oscillator. At power-up, they both default to the slow RC oscillator.

The Supply Monitoring section of the SUPC includes a fixed supply monitor on VDDCORE. The output can either generate a software interrupt or a reset of the core logic.

At power-down, as soon as VDDCORE falls below the Supply Monitor threshold, the SUPC is reset. This leads to a complete loss of the SUPC configuration (slow clock sources, supply monitoring functions, so on). In Run mode, the vddcore\_nreset signal is immediately asserted.

#### 20.4.2 Slow Clock Generator

As soon as VDDIO is supplied, both the 32.768 kHz crystal oscillator and the slow RC oscillator are powered. The slow RC oscillator is always enabled. The slow RC oscillator provides a faster start-up time than the 32.768 kHz external slow clock.

The user can select the 32.768 kHz external slow clock to be the source of the TD\_SLCK, as it provides a more accurate frequency than the slow RC oscillator.

For TD\_SLCK, the 32.768 kHz external slow clock is selected by setting the TDXTALSEL bit in the SUPC Control register (SUPC\_CR).

For MD\_SLCK, the slow RC oscillator is the only available clock source.

The following sequences must be followed to switch from the slow RC oscillator to the 32.768 kHz external slow clock:

Case 1: The 32.768 kHz external slow clock was not previously enabled.

1. Adjust the 32.768 kHz external slow clock start-up time in fields FXTALSTUP and SXTALSTUP of SUPC\_MR.
2. Start and select the 32.768 kHz external slow clock as the source of TD\_SLCK by setting TDXTALSEL in SUPC\_CR.
3. The switching of TD\_SLCK is effective when TDOSCSEL is set in SUPC\_SR.  
**Note:** This flag is set at the end of the 32.768 kHz external slow clock start-up period, which can last from a few hundreds of millisecond to a few seconds.

Case 2: The 32.768 kHz external slow clock is already enabled and selected as the source of TD\_SLCK.

1. Select the 32.768 kHz external slow clock as the source of TD\_SLCK by setting either TDXTALSEL in SUPC\_CR.
2. The switching of TD\_SLCK is effective when TDOSCSEL is set in SUPC\_SR.

The switching time may vary depending on the slow RC oscillator output frequency. The switch of the slow clock source is glitch-free.

Reverting to the slow RC oscillator as the clock source of TD\_SLCK is only possible by resetting the SUPC.

The user can also set the 32.768 kHz external slow clock in Bypass mode instead of connecting a crystal. In this case, the user has to provide the external clock signal on XIN32. The input characteristics of the XIN32 pin are given in the section Electrical Characteristics. To enter Bypass mode, SUPC\_MR.OSCBYPASS must be set before setting TDXTALSEL.

### 20.4.3 Power-up, Power-down and SUPC Reset

The SUPC is powered by VDDCORE and is reset by the NRST pin. During reset, the system is in the following state:

- The SUPC is in reset state, and consequently,
- The core reset signal vddcore\_nreset is asserted.
- The I/O pins default to their reset state as described in the section “Package and Pinout”.

The slow RC oscillator is the default oscillator of the SUPC at power-up.

As soon as voltages are valid, the SUPC exits its reset state and, after five slow RC oscillator cycles, enables the VDDCORE supply monitor. When the output signal of this supply monitor (SMcore\_out) indicates a valid VDDCORE voltage for at least one slow RC oscillator cycle, the core logic reset signal vddcore\_nreset is de-asserted to the Reset Controller input.

At power-down (i.e., as soon as VDDCORE falls below its SM VTH- threshold), the SUPC is reset and its configuration is immediately lost. Without any sequencing, the core reset signal (vddcore\_nreset) is asserted, the I/Os configuration is lost (they default to their reset state), the oscillators and PLLs are switched off.

### 20.4.4 Core Reset

The Supply Controller manages the vddcore\_nreset signal to the Reset Controller, as described in [Power-up, Power-down and SUPC Reset](#). The vddcore\_nreset signal is normally asserted before shutting down the core power supply and released as soon as the core power supply is correctly regulated.

The VDDCORE supply monitor detection source can be programmed to activate vddcore\_nreset.

#### 20.4.4.1 VDDCORE Supply Monitor Reset

The VDDCORE supply monitor provides the SMcore\_out signal to the SUPC. This signal indicates that the digital VDDCORE voltage is in a nominal range. If this signal is lost for longer than 1 slow clock period, the SUPC asserts vddcore\_nreset if SUPC\_MR.CORSMRSTEN is written to ‘1’.

If CORSMRSTEN is set and the VDDCORE voltage is too low, the vddcore\_nreset signal is asserted for a minimum of one slow clock cycle and de-asserted as soon as SMcore\_out indicates a valid VDDCORE voltage.

### 20.4.5 Register Write Protection

To prevent any single software error from corrupting SYSC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [System Controller Write Protection Mode Register](#) (SYSC\_WPMR).

The following registers can be write-protected:

- RSTC Mode Register
- RTT Mode Register
- RTT Alarm Register
- RTC Control Register
- RTC Mode Register

- RTC Time Alarm Register
- RTC Calendar Alarm Register
- [Supply Controller Control Register](#)
- [Supply Controller Supply Monitor Mode Register](#)
- [Supply Controller Mode Register](#)
- [Supply Controller Status Register](#)

## 20.4.6 System Controller (SYSC) User Interface

**Table 20-1.** System Controller Registers

| Offset    | System Controller Peripheral   | Name      |
|-----------|--------------------------------|-----------|
| 0x00–0x0C | Reset Controller               | RSTC      |
| 0x10–0x2C | Supply Controller              | SUPC      |
| 0x30–0x3C | Real Time Timer                | RTT       |
| 0x50–0x5C | Watchdog Timer                 | WDT       |
| 0x60–0x8C | Real Time Clock                | RTC       |
| 0x90–0xE0 | Reserved                       | –         |
| 0xE4      | Write Protection Mode Register | SYSC_WPMR |
| 0xE8–0xF8 | Reserved                       | –         |

## 20.5 Register Summary

| Offset              | Name      | Bit Pos. | 7            | 6         | 5        | 4          | 3         | 2    | 1 | 0    |
|---------------------|-----------|----------|--------------|-----------|----------|------------|-----------|------|---|------|

| Reset  |          |    |    |    | –         | –    |    |    |

#### Bits 31:24 – KEY[7:0] Password

| Value | Name   | Description                                                       |
|-------|--------|-------------------------------------------------------------------|
| 0xA5  | PASSWD | Writing any other value in this field aborts the write operation. |

#### Bit 3 – TDXTALSEL Timing Domain Crystal Oscillator Select

0 (NO\_EFFECT): No effect.  
 1 (CRYSTAL\_SEL): If KEY is correct, the slow clock of the timing domain (TD\_SLCK) is connected to the 32.768 kHz crystal oscillator output.

#### Bit 2 – ZERO ZERO

0 : if the KEY is correct, ZERO shall be always write at '0'.  
 1 : do not used, writing this value to '1' can leads to unsupported behaviour

20.5.2 Supply Controller Supply Monitor Mode Register

Name: SUPC\_SMMR  
Offset: 0x04  
Reset: 0x00000000  
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the [System Controller Write Protection Mode Register](#).

Bit 23 – CORESMUSEL Core Supply Monitor User Selection

| Value | Description                                                                                                         |
|-------|---------------------------------------------------------------------------------------------------------------------|
| 0     | The VDDCORE supply monitor threshold is set to its unique value. Refer to the section “Electrical Characteristics”. |
| 1     | Reserved.                                                                                                           |

### 20.5.3 Supply Controller Mode Register

**Name:** SUPC\_MR  
**Offset:** 0x08  
**Reset:** 0x00004A00  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [System Controller Write Protection Mode Register](#).

|        |          |           |          |           |    |    |    |    |
|--------|----------|-----------|----------|-----------|----|----|----|----|
| Bit    | 31       | 30        | 29       | 28        | 27 | 26 | 25 | 24 |
|        | KEY[7:0] |           |          |           |    |    |    |    |
| Access | W        | W         | W        | W         | W  | W  | W  | W  |
| Reset  | 0        | 0         | 0        | 0         | 0  | 0  | 0  | 0  |
| Bit    | 23       | 22        | 21       | 20        | 19 | 18 | 17 | 16 |
|        |          | FXTALSTUP |          | OSCBYPASS |    |    |    |    |
| Access |          | R/W       |          | R/W       |    |    |    |    |
| Reset  |          | 0         |          | 0         |    |    |    |    |
| Bit    | 15       | 14        | 13       | 12        | 11 | 10 | 9  | 8  |
|        |          |           | CORSMDIS | CORSRSTEN |    |    |    |    |
| Access |          |           | R/W      | R/W       |    |    |    |    |
| Reset  |          |           | 0        | 0         |    |    |    |    |
| Bit    | 7        | 6         | 5        | 4         | 3  | 2  | 1  | 0  |
| Access |          |           |          |           |    |    |    |    |
| Reset  |          |           |          |           |    |    |    |    |

#### Bits 31:24 – KEY[7:0] Password Key

| Value | Name   | Description                                                       |
|-------|--------|-------------------------------------------------------------------|
| 0xA5  | PASSWD | Writing any other value in this field aborts the write operation. |

#### Bit 22 – FXTALSTUP Fast Start-up 32.768 kHz external slow clock

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | External slow clock start-up time is 52800 slow RC periods. |
| 1     | External slow clock start-up time is 1 slow RC period.      |

#### Bit 20 – OSCBYPASS Oscillator Bypass

0 (NO\_EFFECT): No effect. Clock selection depends on the value of XTALSEL (SUPC\_CR).  
 1 (BYPASS): The 32.768 kHz crystal oscillator is bypassed if XTALSEL (SUPC\_CR) is set. OSCBYPASS must be set prior to setting XTALSEL.

#### Bit 13 – CORSMDIS VDDCORE Supply Monitor Disable

0 (ENABLE): The VDDCORE supply monitor is enabled.  
 1 (DISABLE): The VDDCORE supply monitor is disabled.

#### Bit 12 – CORSRSTEN VDDCORE Supply Monitor Reset Enable

0 (NOT\_ENABLE): The core reset signal vddcore\_nreset is not affected when a VDDCORE supply monitor detection occurs.  
 1 (ENABLE): The core reset signal, vddcore\_nreset is asserted when a VDDCORE supply monitor detection occurs.

## 20.5.4 Supply Controller Status Register

**Name:** SUPC\_SR  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read-only

Because of the asynchronism between the Slow Clock (MD\_SLCK) and the System Clock (MCK), the status register flag reset is taken into account only 2 slow clock cycles after the read of the SUPC\_SR.

This register can only be written if the WPEN bit is cleared in the [System Controller Write Protection Mode Register](#).

|        |          |    |    |    |           |    |    |    |
|--------|----------|----|----|----|-----------|----|----|----|
| Bit    | 31       | 30 | 29 | 28 | 27        | 26 | 25 | 24 |
|        |          |    |    |    |           |    |    |    |
| Access |          |    |    |    |           |    |    |    |
| Reset  |          |    |    |    |           |    |    |    |
| Bit    | 23       | 22 | 21 | 20 | 19        | 18 | 17 | 16 |
|        |          |    |    |    |           |    |    |    |
| Access |          |    |    |    |           |    |    |    |
| Reset  |          |    |    |    |           |    |    |    |
| Bit    | 15       | 14 | 13 | 12 | 11        | 10 | 9  | 8  |
|        |          |    |    |    |           |    |    |    |
| Access |          |    |    |    |           |    |    |    |
| Reset  |          |    |    |    |           |    |    |    |
| Bit    | 7        | 6  | 5  | 4  | 3         | 2  | 1  | 0  |
|        | TDOSCSEL |    |    |    | CORSMRSTS |    |    |    |
| Access | R        |    |    |    | R         |    |    |    |
| Reset  | 0        |    |    |    | 0         |    |    |    |

### Bit 7 – TDOSCSEL 32 kHz Oscillator Selection Status

0 (RC): The timing domain slow clock, TD\_SLCK, is generated by the slow RC oscillator.

1 (CRYST): The timing domain slow clock, TD\_SLCK, is generated by the 32.768 kHz external slow clock.

### Bit 3 – CORSMRSTS VDDCORE Supply Monitor Reset Status (cleared on read)

0 (NO): No VDDCORE Supply Monitor reset event has been detected since the last read of the SUPC\_SR.

1 (PRESENT): At least one VDDCORE Supply Monitor reset event has been detected since the last read of the SUPC\_SR.

When the voltage remains below the defined threshold, there is no VDDCORE Supply Monitor reset event at the output of the VDDCORE Supply Monitor detection cell. The VDDCORE Supply Monitor reset event occurs only when there is a voltage transition below the threshold.

## 20.5.5 Supply Controller Power Register

**Name:** SUPC\_PWR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |    |    |    |    |      |    |    |
|--------|----|----|----|----|----|------|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26   | 25 | 24 |
|        |    |    |    |    |    |      |    |    |
| Access |    |    |    |    |    |      |    |    |
| Reset  |    |    |    |    |    |      |    |    |
| Bit    | 23 | 22 | 21 | 20 | 19 | 18   | 17 | 16 |
|        |    |    |    |    |    | ZERO |    |    |
| Access |    |    |    |    |    | R    |    |    |
| Reset  |    |    |    |    |    | 0    |    |    |
| Bit    | 15 | 14 | 13 | 12 | 11 | 10   | 9  | 8  |
|        |    |    |    |    |    |      |    |    |
| Access |    |    |    |    |    |      |    |    |
| Reset  |    |    |    |    |    |      |    |    |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2    | 1  | 0  |
|        |    |    |    |    |    |      |    |    |
| Access |    |    |    |    |    |      |    |    |
| Reset  |    |    |    |    |    |      |    |    |

### Bit 18 – ZERO ZERO

This bit is read-only.

0 : The monitoring domain slow clock, MD\_SLCK, is generated by the slow RC oscillator.

1: Reserved.

## 20.5.6 System Controller Write Protection Mode Register

**Name:** SYSC\_WPMR  
**Offset:** 0xD4  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |              |    |    |    |    |    |    |      |
|--------|--------------|----|----|----|----|----|----|------|
| Bit    | 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        | WPKEY[23:16] |    |    |    |    |    |    |      |
| Access | R            | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 23           | 22 | 21 | 20 | 19 | 18 | 17 | 16   |
|        | WPKEY[15:8]  |    |    |    |    |    |    |      |
| Access | R            | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0    |

|        |              |    |    |    |    |    |    | WPEN |
| Access |              |    |    |    |    |    |    | R/W  |
| Reset  |              |    |    |    |    |    |    | 0    |

### Bits 31:8 – WPKEY[23:0] Write Protection Key.

| Value    | Name   | Description                                                                                             |
|----------|--------|---------------------------------------------------------------------------------------------------------|
| 0x525443 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit.<br>Always reads as 0. |

### Bit 0 – WPEN Write Protection Enable

See [Register Write Protection](#) for the list of registers that can be write-protected.

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | Disables the write protection if WPKEY corresponds to 0x525443 ("RTC" in ASCII). |
| 1     | Enables the write protection if WPKEY corresponds to 0x525443 ("RTC" in ASCII).  |

## 21. Watchdog Timer (WDT)

### 21.1 Description

The Watchdog Timer (WDT) is used to prevent system lock-up if the software becomes trapped in a deadlock. It features a 12-bit down counter that allows a watchdog period of up to 16 seconds (slow clock around 32 kHz). It can generate a general reset or a processor reset only. In addition, it can be stopped while the processor is in Debug mode.

### 21.2 Embedded Characteristics

- 12-bit Key-protected Programmable Counter
- Watchdog Clock is Independent from Processor Clock
- Provides Reset or Interrupt Signals to the System
- Counter May Be Stopped while the Processor is in Debug State or in Idle Mode

### 21.3 Block Diagram

Figure 21-1. Watchdog Timer Block Diagram

### 21.4 Functional Description

The Watchdog Timer is used to prevent system lock-up if the software becomes trapped in a deadlock. It is supplied with VDDCORE. It restarts with initial values on processor reset.

The watchdog is built around a 12-bit down counter, which is loaded with the value defined in the field WDV of the Mode Register (WDT\_MR). The Watchdog Timer uses the slow clock divided by 128 to establish the maximum watchdog period to be 16 seconds (with a typical slow clock of 32.768 kHz).

After a processor reset, the value of WDV is 0xFFFF, corresponding to the maximum value of the counter with the external reset generation enabled (field WDRSTEN at 1 after a backup reset). This means that a default watchdog is running at reset, i.e., at power-up. The user can either disable the WDT by setting bit WDT\_MR.WDDIS or reprogram the WDT to meet the maximum watchdog period the application requires.

When setting the WDDIS bit, and while it is set, the fields WDV and WDD must not be modified.

If the watchdog is restarted by writing into the Control Register (WDT\_CR), WDT\_MR must not be programmed during a period of time of three slow clock periods following the WDT\_CR write access. In any case, programming a new value in WDT\_MR automatically initiates a restart instruction.

WDT\_MR can be written until a LOCKMR command is issued in WDT\_CR. Only a processor reset resets it. Writing WDT\_MR reloads the timer with the newly programmed mode parameters.

In normal operation, the user reloads the watchdog at regular intervals before the timer underflow occurs, by setting bit WDT\_CR.WDRSTT. The watchdog counter is then immediately reloaded from WDT\_MR and restarted, and the slow clock 128 divider is reset and restarted. WDT\_CR is write-protected. As a result, writing WDT\_CR without the correct hard-coded key has no effect. If an underflow does occur, the “wdt\_fault” signal to the Reset Controller is asserted if bit WDT\_MR.WDRSTEN is set. Moreover, the bit WDUNF is set in the Status Register (WDT\_SR).

The reload of the watchdog must occur while the watchdog counter is within a window between 0 and WDD. WDD is defined in WDT\_MR.

Any attempt to restart the watchdog while the watchdog counter is between WDV and WDD results in a watchdog error, even if the watchdog is disabled. The bit WDT\_SR.WDERR is updated and the “wdt\_fault” signal to the Reset Controller is asserted.

Note that this feature can be disabled by programming a WDD value greater than or equal to the WDV value. In such a configuration, restarting the Watchdog Timer is permitted in the whole range [0; WDV] and does not generate an error. This is the default configuration on reset (the WDD and WDV values are equal).

The status bits WDUNF (Watchdog Underflow) and WDERR (Watchdog Error) trigger an interrupt, provided the bit WDT\_MR.WDFIEN is set. The signal “wdt\_fault” to the Reset Controller causes a watchdog reset if the WDRSTEN bit is set as already explained in the Reset Controller documentation. In this case, the processor and the Watchdog Timer are reset, and the WDERR and WDUNF flags are reset.

If a reset is generated or if WDT\_SR is read, the status bits are reset, the interrupt is cleared, and the “wdt\_fault” signal to the reset controller is deasserted.

Writing WDT\_MR reloads and restarts the down counter.

While the processor is in debug state, the counter may be stopped depending on the value programmed for the bits WDIDLEHLT and WDDBGHLT in WDT\_MR.

When the watchdog reaches the timeout value, a low pulse with a duration of 30 µsec is detected on NWDTO pin.

### 21.5.1 Watchdog Timer Control Register

**Name:** WDT\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

The WDT\_CR register values must not be modified within three slow clock periods following a restart of the watchdog performed by a write access in WDT\_CR. Any modification will cause the watchdog to trigger an end of period earlier than expected.

|        |          |    |    |        |    |    |    |        |

#### Bits 31:24 – KEY[7:0] Password

| Value | Name   | Description                                                       |
|-------|--------|-------------------------------------------------------------------|
| 0xA5  | PASSWD | Writing any other value in this field aborts the write operation. |

#### Bit 4 – LOCKMR Lock Mode Register Write Access

| Value | Description                                                                                       |
|-------|---------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                        |
| 1     | Locks the Mode Register (WDT_MR) if KEY is written to 0xA5, write access to WDT_MR has no effect. |

#### Bit 0 – WDRSTT Watchdog Restart

| Value | Description                                      |
|-------|--------------------------------------------------|
| 0     | No effect.                                       |
| 1     | Restarts the watchdog if KEY is written to 0xA5. |

### 21.5.2 Watchdog Timer Mode Register

**Name:** WDT\_MR  
**Offset:** 0x04  
**Reset:** 0x3FFF2FFF  
**Property:** Read/Write

Write access to this register has no effect if the LOCKMR command is issued in WDT\_CR (unlocked on hardware reset).

The WDT\_MR register values must not be modified within three slow clock periods following a restart of the watchdog performed by a write access in WDT\_CR. Any modification will cause the watchdog to trigger an end of period earlier than expected.

|        | WDV[7:0] |         |           |          |           |     |     |     |
| Access | R/W      | R/W     | R/W       | R/W      | R/W       | R/W | R/W | R/W |
| Reset  | 1        | 1       | 1         | 1        | 1         | 1   | 1   | 1   |

#### Bit 29 – WDIDLEHLT Watchdog Idle Halt

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | The watchdog runs when the system is in idle state.  |
| 1     | The watchdog stops when the system is in idle state. |

#### Bit 28 – WDDBGHLT Watchdog Debug Halt

| Value | Description                                              |
|-------|----------------------------------------------------------|
| 0     | The watchdog runs when the processor is in debug state.  |
| 1     | The watchdog stops when the processor is in debug state. |

#### Bits 27:16 – WDD[11:0] Watchdog Delta Value

Defines the permitted range for reloading the Watchdog Timer.

If the Watchdog Timer value is less than or equal to WDD, setting bit WDT\_CR.WDRSTT restarts the timer.

If the Watchdog Timer value is greater than WDD, setting bit WDT\_CR.WDRSTT causes a watchdog error.

#### Bit 15 – WDDIS Watchdog Disable

When setting the WDDIS bit, and while it is set, the fields WDV and WDD must not be modified.

| Value | Description                 |
|-------|-----------------------------|
| 0     | Enables the Watchdog Timer. |

| Value | Description                  |
|-------|------------------------------|
| 1     | Disables the Watchdog Timer. |

**Bit 14 – WDRPROC** Watchdog Reset Processor

| Value | Description                                                                           |
|-------|---------------------------------------------------------------------------------------|
| 0     | If WDRSTEN is 1, a watchdog fault (underflow or error) activates all resets.          |
| 1     | If WDRSTEN is 1, a watchdog fault (underflow or error) activates the processor reset. |

**Bit 13 – WDRSTEN** Watchdog Reset Enable

| Value | Description                                                        |
|-------|--------------------------------------------------------------------|
| 0     | A watchdog fault (underflow or error) has no effect on the resets. |
| 1     | A watchdog fault (underflow or error) triggers a watchdog reset.   |

**Bit 12 – WDFIEN** Watchdog Fault Interrupt Enable

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | A watchdog fault (underflow or error) has no effect on interrupt. |
| 1     | A watchdog fault (underflow or error) asserts interrupt.          |

**Bits 11:0 – WDV[11:0]** Watchdog Counter Value

Defines the value loaded in the 12-bit watchdog counter.

21.5.3 Watchdog Timer Status Register

Name: WDT\_SR  
Offset: 0x08  
Reset: 0x00000000  
Property: Read-only

Bit 1 – WDERR Watchdog Error (cleared on read)

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | No watchdog error occurred since the last read of WDT_SR.           |
| 1     | At least one watchdog error occurred since the last read of WDT_SR. |

Bit 0 – WDUNF Watchdog Underflow (cleared on read)

| Value | Description                                                             |
|-------|-------------------------------------------------------------------------|
| 0     | No watchdog underflow occurred since the last read of WDT_SR.           |
| 1     | At least one watchdog underflow occurred since the last read of WDT_SR. |

## 22. Reinforced Safety Watchdog Timer (RSWDT)

### 22.1 Description

The Reinforced Safety Watchdog Timer (RSWDT) works in parallel with the Watchdog Timer (WDT) to reinforce safe watchdog operations.

The RSWDT can be used to reinforce the safety level provided by the WDT in order to prevent system lock-up if the software becomes trapped in a deadlock. The RSWDT works in a fully operable mode, independent of the WDT. Its clock source is automatically selected from either the Slow RC oscillator clock, or from the Main RC oscillator divided clock to get an equivalent Slow RC oscillator clock. If the WDT clock source (for example, the 32 kHz crystal oscillator) fails, the system lock-up is no longer monitored by the WDT because the RSWDT performs the monitoring. Thus, there is no lack of safety regardless of the external operating conditions. The RSWDT shares the same features as the WDT (i.e., a 12-bit down counter that allows a watchdog period of up to 16 seconds with slow clock at 32.768 kHz). It can generate a general reset or a processor reset only. In addition, it can be stopped while the processor is in Debug mode or Idle mode.

### 22.2 Embedded Characteristics

- Automatically Selected Reliable RSWDT Clock Source (independent of WDT clock source)
- 12-bit Key-protected Programmable Counter
- Provides Reset or Interrupt Signals to the System
- Counter may be Stopped While Processor is in Debug State or Idle Mode

## 22.3 Block Diagram

Figure 22-1. Reinforced Safety Watchdog Timer Block Diagram

## 22.4 Functional Description

The RSWDT is supplied by VDDCORE. The RSWDT is initialized with default values on processor reset or on a power-on sequence and is disabled (its default mode) under such conditions.

The RSWDT must not be enabled if the WDT is disabled.

The Main RC oscillator divided clock is selected if the Main RC oscillator is already enabled by the application (CKGR\_MOR.MOSCRGEN = 1) or if the WDT is driven by the Slow RC oscillator.

The RSWDT is built around a 12-bit down counter, which is loaded with a slow clock value other than that of the slow clock in the WDT, defined in the WDV (Watchdog Counter Value) field of the Mode Register (RSWDT\_MR). The RSWDT uses the slow clock divided by 128 to establish the maximum watchdog period to be 16 seconds (with a typical slow clock of 32.768 kHz).

After a processor reset, the value of RSWDT\_MR.WDV is 0xFFFF, corresponding to the maximum value of the counter with the external reset generation enabled (RSWDT\_MR.WDRSTEN = 1 after a backup reset). This means that a default watchdog is running at reset, i.e., at power-up.

If the watchdog is restarted by writing into the Control Register (RSWDT\_CR), the RSWDT\_MR must not be programmed during a period of time of three slow clock periods following the RSWDT\_CR write access. Programming a new value in the RSWDT\_MR automatically initiates a restart instruction.

RSWDT\_MR can be written only once. Only a processor reset resets it. Writing RSWDT\_MR reloads the timer with the newly programmed mode parameters.

In normal operation, the user reloads the watchdog at regular intervals before the timer underflow occurs, by setting bit RSWDT\_CR.WDRSTT. The watchdog counter is then immediately reloaded from the RSWDT\_MR and restarted, and the slow clock 128 divider is reset and restarted. The RSWDT\_CR is write-protected. As a result, writing RSWDT\_CR without the correct hard-coded key has no effect. If an underflow does occur, the “wdt\_fault” signal to the Reset Controller is asserted if RSWDT\_MR.WDRSTEN is set. Moreover, WDUNF (Watchdog Underflow) is set in the Status Register (RSWDT\_SR).

The status bits WDUNF and WDERR trigger an interrupt, provided the WDFIEN bit is set in the RSWDT\_MR. The signal “wdt\_fault” to the Reset Controller causes a Watchdog reset if the WDRSTEN bit. For details, refer to the section “Reset Controller (RSTC)”. In this case, the processor and the RSWDT are reset, and the WDUNF and WDERR flags are reset.

If a reset is generated, or if RSWDT\_SR is read, the status bits are reset, the interrupt is cleared, and the “wdt\_fault” signal to the reset controller is deasserted.

Writing RSWDT\_MR reloads and restarts the down counter.

The RSWDT is disabled after any power-on sequence.

While the processor is in Debug state or in Idle mode, the counter may be stopped depending on the value programmed for the WDIDLEHLT and WDDBGHLT bits in the RSWDT\_MR.

**Figure 22-2. Watchdog Behavior**

22.5 Register Summary

| Offset | Name     | Bit Pos. | 7            | 6 | 5         | 4        | 3             | 2 | 1 | 0      |
|--------|----------|----------|--------------|---|-----------|----------|---------------|---|---|--------|

### 22.5.1 Reinforced Safety Watchdog Timer Control Register

**Name:** RSWDT\_CR  
**Offset:** 0x00  
**Property:** Write-only

**Bits 31:24 – KEY[7:0] Password**

| Value | Name   | Description                                                       |
|-------|--------|-------------------------------------------------------------------|
| 0xC4  | PASSWD | Writing any other value in this field aborts the write operation. |

**Bit 0 – WDRSTT Watchdog Restart**

| Value | Description            |
|-------|------------------------|
| 0     | No effect.             |
| 1     | Restarts the watchdog. |

## 22.5.2 Reinforced Safety Watchdog Timer Mode Register

**Name:** RSWDT\_MR  
**Offset:** 0x04  
**Reset:** 0x3FFFAFFF  
**Property:** Read/Write Once

**Note:** The first write access prevents any further modification of the value of this register; read accesses remain possible. The WDV value must not be modified within three slow clock periods following a restart of the watchdog performed by means of a write access in the RSWDT\_CR, else the watchdog may trigger an end of period earlier than expected.

|        |              |    |           |          |    |               |    |    |
|--------|--------------|----|-----------|----------|----|---------------|----|----|
| Bit    | 31           | 30 | 29        | 28       | 27 | 26            | 25 | 24 |

|        | ALLONES[7:0] |    |           |          |    |               |    |    |
| Access |              |    |           |          |    |               |    |    |
| Reset  | 1            | 1  | 1         | 1        | 1  | 1             | 1  | 1  |
| Bit    | 15           | 14 | 13        | 12       | 11 | 10            | 9  | 8  |
|        | WDDIS        |    | WDRSTEN   | WDFIEN   |    | WDV[11:8]     |    |    |
| Access |              |    |           |          |    |               |    |    |
| Reset  | 1            |    | 1         | 0        | 1  | 1             | 1  | 1  |
| Bit    | 7            | 6  | 5         | 4        | 3  | 2             | 1  | 0  |
|        | WDV[7:0]     |    |           |          |    |               |    |    |
| Access |              |    |           |          |    |               |    |    |
| Reset  | 1            | 1  | 1         | 1        | 1  | 1             | 1  | 1  |

### Bit 29 – WDIDLEHLT Watchdog Idle Halt

| Value | Description                                       |
|-------|---------------------------------------------------|
| 0     | The RSWDT runs when the system is in idle mode.   |
| 1     | The RSWDT stops when the system is in idle state. |

### Bit 28 – WDDBGHLT Watchdog Debug Halt

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | The RSWDT runs when the processor is in debug state.  |
| 1     | The RSWDT stops when the processor is in debug state. |

### Bits 27:16 – ALLONES[11:0] Must Always Be Written with 0xFF

### Bit 15 – WDDIS Watchdog Disable

| Value | Description         |
|-------|---------------------|
| 0     | Enables the RSWDT.  |
| 1     | Disables the RSWDT. |

### Bit 13 – WDRSTEN Watchdog Reset Enable

| Value | Description                                                        |
|-------|--------------------------------------------------------------------|
| 0     | A Watchdog fault (underflow or error) has no effect on the resets. |
| 1     | A Watchdog fault (underflow or error) triggers a watchdog reset.   |

### Bit 12 – WDFIEN Watchdog Fault Interrupt Enable

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | A Watchdog fault (underflow or error) has no effect on interrupt. |
| 1     | A Watchdog fault (underflow or error) asserts interrupt.          |

**Bits 11:0 – WDV[11:0] Watchdog Counter Value**

Defines the value loaded in the 12-bit watchdog counter.

22.5.3 Reinforced Safety Watchdog Timer Status Register

Name: RSWDT\_SR  
Offset: 0x08  
Reset: 0x00000000  
Property: Read-only

Bit 0 – WDUNF Watchdog Underflow

| Value | Description                                                               |
|-------|---------------------------------------------------------------------------|
| 0     | No watchdog underflow occurred since the last read of RSWDT_SR.           |
| 1     | At least one watchdog underflow occurred since the last read of RSWDT_SR. |

## 23. Reset Controller (RSTC)

### 23.1 Description

The Reset Controller (RSTC), driven by software, external reset pin and peripheral events, handles all the resets of the system without any external components. It reports which reset occurred last.

The RSTC also drives simultaneously the peripheral and processor resets. The peripheral resets can be controlled independently.

### 23.2 Embedded Characteristics

- Driven by Software, External Reset Pin and Peripheral Events
- Management of All System Resets, Including
  - Processor
  - Peripheral Set
- Reset Source Status
  - Status of the last reset
  - Either software reset, watchdog reset, 32.768 kHz external slow clock failure detection reset, CPU clock failure detection
- External Reset Signal Control and Shaping

### 23.3 Block Diagram

Figure 23-1. Reset Controller Block Diagram

### 23.4 Functional Description

#### 23.4.1 Overview

The RSTC is made up of an NRST manager and a reset state manager. The RSTC clock is MD\_SLCK (monitoring SLCK domain). The RSTC generates the following reset signals:

- `proc_nreset`: Processor reset line (also resets the Watchdog Timer)
- `periph_nreset`: Affects the full set of embedded peripherals
- `periph_n_separate_reset[n]`: Affects the embedded peripheral separately

**Note:** `proc_nreset` and `periph_nreset` are driven in the same way.

These reset signals are asserted by the RSTC, either on events generated by peripherals, events on NRST pin, or on software action. The reset state manager controls the generation of reset signals.

The RSTC Mode register (`RSTC_MR`), used to configure the RSTC, is powered with `VDDCORE`, so that its configuration is saved as long as `VDDCORE` is on.

## 23.4.2 NRST Manager

NRST behaves as an input and the system is held in reset if NRST is tied to GND by an external signal.

The NRST manager samples the NRST input pin.

### 23.4.2.1 NRST Signal

The NRST manager samples the NRST pin at `MD_SLCK` speed.

The NRST pin must be asserted for at least 1 `MD_SLCK` clock cycle to ensure execution of a reset.

## 23.4.3 Reset States

The reset state manager handles the different reset sources and generates the internal reset signals. It reports the reset status in `RSTTYP` of the Status Register (`RSTC_SR`). The update of `RSTC_SR.RSTTYP` is performed when the processor reset is released.

### 23.4.3.1 General Reset

A general reset occurs:

- when a `VDDCORE` fall is detected by the Supply Monitor (`VDDCORE` is not correctly powered externally)
- at an NRST pin request

The `vddcore_nreset` signal is asserted by the Supply Controller when a general reset occurs.

All the reset signals are released and `RSTC_SR.RSTTYP` reports a general reset. As the `RSTC_MR` is written to '0', the NRST line rises two cycles after the `vddcore_nreset`.

The figure below shows how the general reset affects the reset signals.

**Figure 23-2.** General Reset Timing Diagram

### 23.4.3.2 32.768 kHz External Slow Clock Failure Detection Reset

The 32.768 kHz external slow clock failure detection reset is done when the 32.768 kHz external slow clock frequency monitoring circuitry in the PMC detects a failure and RSTC\_MR.SCKSW is written to '1'. This reset lasts three slow clock cycles.

When RSTC\_MR.SCKSW is written to '0', the 32.768 kHz external slow clock fault has no impact on the RSTC.

During the 32.768 kHz external slow clock failure detection reset, the processor reset and the peripheral reset are asserted.

When the 32.768 kHz external slow clock failure generates a VDDCORE reset, PMC\_SR.EXT32KERR is automatically cleared by the peripheral and core reset.

**Figure 23-3.** 32.768 kHz External Slow Clock Failure Detection Reset Timing Diagram

### 23.4.3.3 CPU Clock Failure Detection Reset

The CPU clock failure detection reset is done when the CPU frequency monitoring circuitry in the PMC detects a failure and RSTC\_MR.SCKSW is written to '1'. This reset lasts three MD\_SLCK cycles.

When RSTC\_MR.SCKSW is written to '0', the 32.768 kHz external slow clock fault has no impact on the RSTC.

During a CPU clock failure detection reset, the processor reset and the peripheral reset are asserted.

When the CPU clock failure generates a VDDCORE reset, PMC\_SR.EXT32KERR is automatically cleared by the peripheral and core reset.

**Figure 23-4.** CPU Clock Failure Detection Reset Timing Diagram

### 23.4.3.4 Watchdog Reset

The watchdog reset is entered when a watchdog fault occurs. This reset lasts three MD\_SLCK cycles.

When in watchdog reset, the processor reset and the peripheral reset are asserted.

The NWDTx pin indicates if the Watchdog x has expired or not:

- If NWDTx is '1', the WDT expiration does not occur.
- If NWDTx is '0', the WDT expiration occurs.

The Watchdog Timer is reset by the proc\_nreset signal. As the watchdog fault always causes a processor reset if WDT\_MR.WDRSTEN is written to '1', the Watchdog Timer is always reset after a watchdog reset, and the Watchdog is enabled by default and with a period set to a maximum.

When WDT\_MR.WDRSTEN is written to '0', the watchdog fault has no impact on the RSTC.

**Figure 23-5. Watchdog Reset Timing Diagram**

### 23.4.3.5 Software Reset

The RSTC offers commands to assert the different reset signals. These commands are performed by writing the Control register (RSTC\_CR) with the following bits at '1':

- RSTC\_CR.PROCRST: Writing a '1' to PROCRST resets the processor and all the embedded peripherals, including the memory system and, in particular, the Remap Command.
- RSTC\_CR.PERIID and RSTC\_CR.PERIIDON: Writing a '1' to PERIIDON and setting the peripheral identifier in PERIID resets the corresponding peripheral. To reset a peripheral, follow the steps below:
  - a. Deactivate the different clocks of the peripheral to reset.
  - b. Write a '1' to RSTC\_CR.PERIIDON and set the peripheral identifier in RSTC\_CR.PERIID.

Then reactivate the clocks of the peripheral that has been reset.

The SpaceWire (SpW) must have the clocks activated when the reset is launched.

**Note:** There is a list of peripherals that can be individually reset: SPACE\_WIREx, 1553, GMAC, CANx, PIOx, FlexCOMx, PWMx, SHA, ICM, TRNG, QSPI, and HEMC (where x implies several instances are embedded. Each instance can be individually reset).

The software reset is entered if at least one of these bits is written to '1' by the software. All these commands can be performed independently or simultaneously. The software reset lasts three MD\_SLCK cycles.

The internal reset signals are asserted as soon as the register write is performed. This is detected on the Master Clock (MCK). They are released when the software reset has ended, i.e., synchronously to MD\_SLCK.

If and only if the RSTC\_CR.PROCRST is written to '1', the RSTC reports the software status in field RSTC\_SR.RSTTYP. Other software resets are not reported in RSTTYP.

As soon as a software operation is detected, RSTC\_SR.SRCMP is written to '1'. SRCMP is cleared at the end of the software reset. No other software reset can be performed while SRCMP is written to '1', and writing any value in the RSTC\_CR has no effect.

**Figure 23-6. Software Reset Timing Diagram**

#### 23.4.4 Reset State Priorities

The reset state manager manages the priorities among the different reset sources. The resets are listed in order of priority as follows:

1. General reset
2. 32.768 kHz External Slow Clock Detection reset
3. CPU Clock Failure Detection reset
4. Watchdog reset
5. Software reset

Specific cases are listed below:

- When in software reset:
  - A watchdog event has priority over the current state.
  - The NRST has no effect.
- When in watchdog reset:
  - The processor reset is active and so a software reset cannot be programmed.

## 23.5 Register Summary

| Offset | Name    | Bit Pos. | 7           | 6 | 5 | 4        | 3      | 2 | 1           | 0       |
|--------|---------|----------|-------------|---|---|----------|--------|---|-------------|---------|
| 0x00   | RSTC_CR | 7:0      |             |   |   | PERIIDON | EXTRST |   |             | PROCRST |

| Access |             |    |    | W        | W      |    |    | W       |
| Reset  |             |    |    | –        | –      |    |    | –       |

#### Bits 31:24 – KEY[7:0] System Reset Key

| Value | Name   | Description                                                       |
|-------|--------|-------------------------------------------------------------------|
| 0xA5  | PASSWD | Writing any other value in this field aborts the write operation. |

#### Bits 15:8 – PERIID[7:0] Peripheral Identifier

Configures the identifier of peripheral to be reset.

**Note:** There is a list of peripherals that can be individually reset: SPACE\_WIREx, 1553, GMAC, CANx, PIOx, FlexCOMx, PWMx, SHA, ICM, TRNG, QSPI, and HEMC (where x implies several instances are embedded. Each instance can be individually reset).

#### Bit 4 – PERIIDON Peripheral Identifier Validation

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No effect.                                    |
| 1     | Validates the RSTC_CR.PERIID bit field value. |

#### Bit 3 – EXTRST External Reset

| Value | Description                          |
|-------|--------------------------------------|
| 0     | No effect.                           |
| 1     | If KEY = 0xA5, asserts the NRST pin. |

#### Bit 0 – PROCRST Processor Reset

| Value | Description                                                           |
|-------|-----------------------------------------------------------------------|
| 0     | No effect.                                                            |
| 1     | If KEY = 0xA5, resets the processor and all the embedded peripherals. |

## 23.5.2 RSTC Status Register

**Name:** RSTC\_SR  
**Offset:** 0x04  
**Reset:** 0x00010000  
**Property:** Read-only

The reset value assumes that a general reset has been performed, subject to change if other types of reset are generated.

|        |    |    |    |    |    |    |    |    |

| Access |   |   |   |   |   |   |   |   |
| Reset  |   |   |   |   |   |   |   |   |

### Bit 17 – SRCMP Software Reset Command in Progress

When set, this bit indicates that a software reset command is in progress and that no further software reset should be performed until the end of the current one. This bit is automatically cleared at the end of the current software reset.

| Value | Description                                                                                   |
|-------|-----------------------------------------------------------------------------------------------|
| 0     | No software command is being performed by the RSTC. The RSTC is ready for a software command. |
| 1     | A software reset command is being performed by the RSTC. The RSTC is busy.                    |

### Bit 16 – NRSTL NRST Pin Level

Registers the NRST pin level sampled on each MCK rising edge.

### Bits 10:8 – RSTTYP[2:0] Reset Type

This field reports the cause of the last processor reset. Reading this RSTC\_SR does not reset this field.

| Value | Name            | Description                                             |
|-------|-----------------|---------------------------------------------------------|
| 0     | GENERAL_RST     | First power-up reset                                    |
| 1     | –               | Reserved                                                |
| 2     | WDT_RST         | Watchdog fault occurred                                 |
| 3     | SOFT_RST        | Processor reset required by the software                |
| 4     | –               | Reserved                                                |
| 5     | –               | Reserved                                                |
| 6     | CPU_FAIL_RST    | CPU clock failure detection occurred                    |
| 7     | SLCK_EXTERN_RST | 32.768 kHz external slow clock detection fault occurred |

### 23.5.3 RSTC Mode Register

**Name:** RSTC\_MR  
**Offset:** 0x08  
**Reset:** 0x00000001  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

|        |          |     |     |     |        |     |       |     |
|--------|----------|-----|-----|-----|--------|-----|-------|-----|
| Bit    | 31       | 30  | 29  | 28  | 27     | 26  | 25    | 24  |
|        | KEY[7:0] |     |     |     |        |     |       |     |
| Access | R/W      | R/W | R/W | R/W | R/W    | R/W | R/W   | R/W |
| Reset  | 0        | 0   | 0   | 0   | 0      | 0   | 0     | 0   |
| Bit    | 23       | 22  | 21  | 20  | 19     | 18  | 17    | 16  |
| Access |          |     |     |     |        |     |       |     |
| Reset  |          |     |     |     |        |     |       |     |
| Bit    | 15       | 14  | 13  | 12  | 11     | 10  | 9     | 8   |
| Access |          |     |     |     |        |     |       |     |
| Reset  |          |     |     |     |        |     |       |     |
| Bit    | 7        | 6   | 5   | 4   | 3      | 2   | 1     | 0   |
|        |          |     |     |     | CPUFEN |     | SCKSW |     |
| Access |          |     |     |     | R/W    |     | R/W   |     |
| Reset  |          |     |     |     | 0      |     | 0     |     |

#### Bits 31:24 – KEY[7:0] Write Access Password

| Value | Name   | Description                                                                             |
|-------|--------|-----------------------------------------------------------------------------------------|
| 0xA5  | PASSWD | Writing any other value in this field aborts the write operation.<br>Always reads as 0. |

#### Bit 3 – CPUFEN CPU Fail Enable

| Value | Description                                                                |
|-------|----------------------------------------------------------------------------|
| 0     | The detection of a CPU clock failure has no effect.                        |
| 1     | The detection of a CPU clock failure resets the logic supplied by VDDCORE. |

#### Bit 1 – SCKSW Slow Clock Switching

| Value | Description                                                                             |
|-------|-----------------------------------------------------------------------------------------|
| 0     | The detection of a 32.768 kHz External Slow clock has no effect.                        |
| 1     | The detection of a 32.768 kHz External Slow clock resets the logic supplied by VDDCORE. |

## 24. Real-time Clock (RTC)

### 24.1 Description

The Real-time Clock (RTC) peripheral is designed for very low power consumption. For optimal functionality, the RTC requires an accurate external 32.768 kHz clock, which can be provided by a crystal oscillator.

It combines a complete time-of-day clock with alarm and a Gregorian or Persian calendar, complemented by a programmable periodic interrupt. The alarm and calendar registers are accessed by a 32-bit data bus.

The time and calendar values are coded in binary-coded decimal (BCD) format. The time format can be 24-hour mode or 12-hour mode with an AM/PM indicator. The number of periods of 1/1024 seconds within 1 second is reported. This information allows a timestamping with an accuracy higher than 1 millisecond.

Updating time and calendar fields and configuring the alarm fields are performed by a parallel capture on the 32-bit data bus. An entry control is performed to avoid loading registers with incompatible BCD format data or with an incompatible date according to the current month/year/century.

A clock divider calibration circuitry can be used to compensate for crystal oscillator frequency variations.

An RTC output can be programmed to generate several waveforms, including a prescaled clock derived from 32.768 kHz.

### 24.2 Embedded Characteristics

- Full Asynchronous Design for Ultra Low Power Consumption
- Gregorian and Persian Modes Supported
- Milliseconds Image Report
- Programmable Periodic Interrupt
- Safety/security Features:
  - Valid Time and Date Programming Check
  - On-The-Fly Time and Date Validity Check
- Counters Calibration Circuitry to Compensate for Crystal Oscillator Variations
- Waveform Generation
- Register Write Protection

## 24.3 Block Diagram

Figure 24-1. Real-time Clock Block Diagram

## 24.4 Product Dependencies

### 24.4.1 Power Management

The Real-time Clock is continuously clocked at 32.768 kHz. The Power Management Controller has no effect on RTC behavior.

### 24.4.2 Interrupt

Within the System Controller, the RTC interrupt is OR-wired with all the other module interrupts.

Only one System Controller interrupt line is connected on one of the internal sources of the interrupt controller.

RTC interrupt requires the interrupt controller to be programmed first.

When a System Controller interrupt occurs, the service routine must first determine the cause of the interrupt. This is done by reading each status register of the System Controller peripherals successively.

## 24.5 Functional Description

The RTC provides a full binary-coded decimal (BCD) clock that includes century (19/20), year (with leap years), month, date, day, hours, minutes and seconds reported in [RTC Time Register \(RTC\\_TIMR\)](#).

The MS field in the [RTC Milliseconds Register \(RTC\\_MSR\)](#) reports the number of periods of 1/1024 seconds elapsed within 1 second. The MS field is cleared at the beginning of each 1-second period.

The MS field can be used for timestamping with an accuracy higher than 1 ms. It can also be post-processed by software to provide the millisecond value. The data in milliseconds can be obtained by multiplying the value read in the MS field by 1000/1024 (for an optimal accuracy, the result must be rounded and not truncated).

The valid year range is up to 2099 in Gregorian mode (or 1300 to 1499 in Persian mode).

The RTC can operate in 24-hour mode or in 12-hour mode with an AM/PM indicator.

Corrections for leap years are included (all years divisible by 4 being leap years except 1900). This is correct up to the year 2099.

The RTC can generate configurable waveforms on RTCOUT0/1 outputs.

### 24.5.1 Reference Clock

The reference clock is the Slow Clock (SLCK) which can be driven internally or by an external 32.768 kHz crystal.

During low-power modes of the processor, the oscillator runs and power consumption is critical. The crystal selection must consider the current consumption for power saving and the frequency drift due to temperature effect on the circuit for time accuracy.

### 24.5.2 Timing

The RTC is updated in real time at one-second intervals in Normal mode for the counters of seconds, at one-minute intervals for the counter of minutes and so on.

Due to the asynchronous operation of the RTC with respect to the rest of the chip, to be certain that the value read in the RTC registers (century, year, month, date, day, hours, minutes, seconds) are valid and stable, it is necessary to read these registers twice. If the data is the same both times, then it is valid. Therefore, a minimum of two and a maximum of three accesses are required.

### 24.5.3 Alarm

The RTC has five programmable fields: month, date, hours, minutes and seconds.

Each of these fields can be enabled or disabled to match the alarm condition:

- If all the fields are enabled, an alarm flag is generated (the corresponding flag is asserted and an interrupt generated if enabled) at a given month, date, hour/minute/second.
- If only the “seconds” field is enabled, then an alarm is generated every minute.

Depending on the combination of fields enabled, a large number of possibilities are available to the user ranging from minutes to 365/366 days.

Hour, minute and second matching alarms (SECEN, MINEN, HOUREN) can be enabled independently of SEC, MIN, HOUR fields.

**Note:** To change one of the SEC, MIN, HOUR, DATE, MONTH fields, it is recommended to disable the field before changing the value and then re-enable it after the change has been made. This requires up to three accesses to the RTC\_TIMALR or RTC\_CALALR. The first access clears the enable corresponding to the field to change (SECEN, MINEN, HOUREN, DATEEN, MTHEN). If the field is already cleared, this access is not required. The second access performs the change of the value (SEC, MIN, HOUR, DATE, MONTH). The third access is required to re-enable the field by writing 1 in SECEN, MINEN, HOUREN, DATEEN, MTHEN fields.

### 24.5.4 Error Checking when Programming

Verification on user interface data is performed when accessing the century, year, month, date, day, hours, minutes, seconds and alarms. A check is performed on illegal BCD entries such as illegal date of the month with regard to the year and century configured.

If one of the time fields is not correct, the data is not loaded into the register/counter and a flag is set in the validity register. The user can not reset this flag. It is reset as soon as an acceptable value is programmed. This avoids any further side effects in the hardware. The same procedure is followed for the alarm.

The following checks are performed:

1. Century (check if it is in range 19–20 or 13–14 in Persian mode)
2. Year (BCD entry check)
3. Date (check range 01–31)
4. Month (check if it is in BCD range 01–12, check validity regarding “date”)
5. Day (check range 1–7)

6. Hour (BCD checks: in 24-hour mode, check range 00–23 and check that AM/PM flag is not set if RTC is set in 24-hour mode; in 12-hour mode check range 01–12)
7. Minute (check BCD and range 00–59)
8. Second (check BCD and range 00–59)

**Note:** If the 12-hour mode is selected by means of the RTC Mode Register (RTC\_MR), a 12-hour value can be programmed and the returned value on RTC\_TIMR will be the corresponding 24-hour value. The entry control checks the value of the AM/PM indicator (bit 22 of RTC\_TIMR) to determine the range to be checked.

### 24.5.5 RTC Internal Free Running Counter Error Checking

To improve the reliability and security of the RTC, a permanent check is performed on the internal free running counters to report non-BCD or invalid date/time values.

An error is reported by TDERR bit in the status register (RTC\_SR) if an incorrect value has been detected. The flag can be cleared by setting the TDERRCLR bit in the Status Clear Command Register (RTC\_SCCR).

The TDERR error flag will be set again if the source of the error has not been cleared before clearing the TDERR flag. The clearing of the source of such error can be done by reprogramming a correct value on RTC\_CALR and/or RTC\_TIMR.

The RTC internal free running counters may automatically clear the source of TDERR due to their roll-over (i.e., every 10 seconds for SECONDS[3:0] field in RTC\_TIMR). In this case the TDERR is held high until a clear command is asserted by TDERRCLR bit in RTC\_SCCR.

### 24.5.6 Updating Time/Calendar

#### 24.5.6.1 Description

The update of the time/calendar must be synchronized on a second periodic event by either polling the RTC\_SR.SEC status bit or by enabling the SECEN interrupt in the RTC\_IER register.

Once the second event occurs, the user must stop the RTC by setting the corresponding field in the Control Register (RTC\_CR). Bit UPDTIM must be set to update time fields (hour, minute, second) and bit UPDCAL must be set to update calendar fields (century, year, month, date, day).

The ACKUPD bit must then be read to 1 by either polling the RTC\_SR or by enabling the ACKUPD interrupt in the RTC\_IER. Once ACKUPD is read to 1, it is mandatory to clear this flag by writing the corresponding bit in the RTC\_SCCR, after which the user can write to the Time Register, the Calendar Register, or both.

Once the update is finished, the user must write UPDTIM and/or UPDCAL to 0 in the RTC\_CR.

The timing sequence of the time/calendar update is described in the figure below.

When entering the programming mode of the calendar fields, the time fields remain enabled and both the time and the calendar fields are stopped. This is due to the location of the calendar logical circuitry (downstream for low-power considerations). It is highly recommended to prepare all the fields to be updated before entering programming mode. In successive update operations, the user must wait for at least one second after resetting the UPDTIM/UPDCAL bit in the RTC\_CR before setting these bits again. This is done by waiting for the SEC flag in the RTC\_SR before setting the UPDTIM/UPDCAL bit. After resetting UPDTIM/UPDCAL, the SEC flag must also be cleared.

**Figure 24-2. Time/Calendar Update Timing Diagram**

**Figure 24-3.** Gregorian and Persian Modes Update Sequence

### 24.5.7 RTC Accurate Clock Calibration

The crystal oscillator that drives the RTC may not be as accurate as expected mainly due to temperature variation. The RTC is equipped with circuitry able to correct slow clock crystal drift.

To compensate for possible temperature variations over time, this accurate clock calibration circuitry can be programmed on-the-fly and also programmed during application manufacturing, in order to correct the crystal frequency accuracy at room temperature (20–25°C). The typical clock drift range at room temperature is  $\pm 20$  ppm.

In the device operating temperature range, the 32.768 kHz crystal oscillator clock inaccuracy can be up to -200 ppm.

The RTC clock calibration circuitry allows positive or negative correction in a range of 1.5 ppm to 1950 ppm.

The calibration circuitry is fully digital. Thus, the configured correction is independent of temperature, voltage, process, so on, and no additional measurement is required to check that the correction is effective.

If the correction value configured in the calibration circuitry results from an accurate crystal frequency measure, the remaining accuracy is bounded by the values listed below:

- Below 1 ppm, for an initial crystal drift between 1.5 ppm up to 20 ppm, and from 30 ppm to 90 ppm
- Below 2 ppm, for an initial crystal drift between 20 ppm up to 30 ppm, and from 90 ppm to 130 ppm
- Below 5 ppm, for an initial crystal drift between 130 ppm up to 200 ppm

The calibration circuitry does not modify the 32.768 kHz crystal oscillator clock frequency but it acts by slightly modifying the 1 Hz clock period from time to time. The correction event occurs every  $1 + [(20 - (19 \times \text{HIGHPPM})) \times \text{CORRECTION}]$  seconds. When the period is modified, depending on the sign of the correction, the 1 Hz clock period increases or reduces by around 4 ms. Depending on the CORRECTION, NEGPPM and HIGHPPM values configured in RTC\_MR, the period interval between two correction events differs.

**Figure 24-4.** Calibration Circuitry

**Figure 24-5. Calibration Circuitry Waveforms**

The inaccuracy of a crystal oscillator at typical room temperature ( $\pm 20$  ppm at 20–25 °C) can be compensated if a reference clock/signal is used to measure such inaccuracy. This kind of calibration operation can be set up during the final product manufacturing by means of measurement equipment embedding such a reference clock. The correction of value must be programmed into the (RTC\_MR), and this value is kept as long as the circuitry is powered (backup area). Removing the backup power supply cancels this calibration. This room temperature calibration can be further processed by means of the networking capability of the target application.

To ease the comparison of the inherent crystal accuracy with the reference clock/signal during manufacturing, an internal prescaled 32.768 kHz clock derivative signal can be assigned to drive RTC output. To accommodate the measure, several clock frequencies can be selected among 1 Hz, 32 Hz, 64 Hz, 512 Hz.

The clock calibration correction drives the internal RTC counters but can also be observed in the RTC output when one of the following three frequencies 1 Hz, 32 Hz or 64 Hz is configured. The correction is not visible in the RTC output if 512 Hz frequency is configured.

Note that this adjustment does not take into account the temperature variation.

The frequency drift (up to -200 ppm) due to temperature variation can be compensated using a reference time if the application can access such a reference. If a reference time cannot be used, a temperature sensor can be placed close to the crystal oscillator in order to get the operating temperature of the crystal oscillator. Once obtained, the temperature may be converted using a lookup table (describing the accuracy/temperature curve of the crystal oscillator used) and RTC\_MR configured accordingly. The calibration can be performed on-the-fly. This adjustment method is not based on a measurement of the crystal frequency/drift and therefore can be improved by means of the networking capability of the target application.

If no crystal frequency adjustment has been done during manufacturing, it is still possible to do it. In the case where a reference time of the day can be obtained through LAN/WAN network, it is possible to calculate the drift of the application crystal oscillator by comparing the values read on RTC Time Register (RTC\_TIMR) and programming the HIGHPPM and CORRECTION fields on RTC\_MR according to the difference measured between the reference time and those of RTC\_TIMR.

#### 24.5.8 Waveform Generation

Waveforms can be generated in order to take advantage of the RTC inherent prescalers while the RTC is the only powered circuitry (Low-power mode of operation, Backup mode) or in any active mode. Entering Backup or Low-power operating modes does not affect the waveform generation outputs.

The outputs RTCOUT0 and RTCOUT1 can be configured to provide several types of waveforms. The figure below illustrates the different signals available to generate RTCOUT0 and RTCOUT1.

PIO lines associated to the RTC outputs must be selected via the PIO controller and if RTC\_MR.ENx has been written to 1.

**Figure 24-6. Waveform Generation**

## 24.6 Register Summary

| Offset              | Name       | Bit Pos. | 7        | 6               | 5         | 4          | 3        | 2          | 1             | 0      |  |
|---------------------|------------|----------|----------|-----------------|-----------|------------|----------|------------|---------------|--------|--|

### Bits 17:16 – CALEVSEL[1:0] Calendar Event Selection

The event that generates the flag CALEV in RTC\_SR depends on the value of CALEVSEL

| Value | Name  | Description                                            |
|-------|-------|--------------------------------------------------------|
| 0     | WEEK  | Week change (every Monday at time 00:00:00)            |
| 1     | MONTH | Month change (every 01 of each month at time 00:00:00) |
| 2     | YEAR  | Year change (every January 1 at time 00:00:00)         |
| 3     | YEAR  | Reserved                                               |

### Bits 9:8 – TIMEVSEL[1:0] Time Event Selection

The event that generates the flag TIMEV in RTC\_SR depends on the value of TIMEVSEL.

| Value | Name     | Description           |
|-------|----------|-----------------------|
| 0     | MINUTE   | Minute change         |
| 1     | HOURL    | Hour change           |
| 2     | MIDNIGHT | Every day at midnight |
| 3     | NOON     | Every day at noon     |

### Bit 1 – UPDCAL Update Request Calendar Register

Calendar counting consists of day, date, month, year and century counters. Calendar counters can be programmed once this bit is set and acknowledged by the bit ACKUPD of the RTC\_SR.

| Value | Description                                                                           |
|-------|---------------------------------------------------------------------------------------|
| 0     | No effect or, if UPDCAL has been previously written to 1, stops the update procedure. |
| 1     | Stops the RTC calendar counting.                                                      |

### Bit 0 – UPDTIM Update Request Time Register

Time counting consists of second, minute and hour counters. Time counters can be programmed once this bit is set and acknowledged by the bit ACKUPD of the RTC\_SR.

| Value | Description                                                                           |
|-------|---------------------------------------------------------------------------------------|
| 0     | No effect or, if UPDTIM has been previously written to 1, stops the update procedure. |
| 1     | Stops the RTC time counting.                                                          |

## 24.6.2 RTC Mode Register

**Name:** RTC\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |    |              |     |    |            |     |     |
|--------|----|----|--------------|-----|----|------------|-----|-----|
| Bit    | 31 | 30 | 29           | 28  | 27 | 26         | 25  | 24  |
|        |    |    | TPERIOD[1:0] |     |    | THIGH[2:0] |     |     |
| Access |    |    | R/W          | R/W |    | R/W        | R/W | R/W |
| Reset  |    |    | 0            | 0   |    | 0          | 0   | 0   |

|        |     |           |     |     |     |           |     |     |
|--------|-----|-----------|-----|-----|-----|-----------|-----|-----|
| Bit    | 23  | 22        | 21  | 20  | 19  | 18        | 17  | 16  |
|        | EN1 | OUT1[2:0] |     |     | EN0 | OUT0[2:0] |     |     |
| Access | R/W | R/W       | R/W | R/W | R/W | R/W       | R/W | R/W |
| Reset  | 0   | 0         | 0   | 0   | 0   | 0         | 0   | 0   |

|        |         |                 |     |     |     |     |     |     |
|--------|---------|-----------------|-----|-----|-----|-----|-----|-----|
| Bit    | 15      | 14              | 13  | 12  | 11  | 10  | 9   | 8   |
|        | HIGHPPM | CORRECTION[6:0] |     |     |     |     |     |     |
| Access | R/W     | R/W             | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0       | 0               | 0   | 0   | 0   | 0   | 0   | 0   |

|        |   |   |   |        |   |   |         |       |
|--------|---|---|---|--------|---|---|---------|-------|
| Bit    | 7 | 6 | 5 | 4      | 3 | 2 | 1       | 0     |
|        |   |   |   | NEGPPM |   |   | PERSIAN | HRMOD |
| Access |   |   |   | R/W    |   |   | R/W     | R/W   |
| Reset  |   |   |   | 0      |   |   | 0       | 0     |

### Bits 29:28 – TPERIOD[1:0] Period of the Output Pulse

| Value | Name    | Description |
|-------|---------|-------------|
| 0     | P_1S    | 1 second    |
| 1     | P_500MS | 500 ms      |
| 2     | P_250MS | 250 ms      |
| 3     | P_125MS | 125 ms      |

### Bits 26:24 – THIGH[2:0] High Duration of the Output Pulse

| Value | Name    | Description  |
|-------|---------|--------------|
| 0     | H_31MS  | 31.2 ms      |
| 1     | H_16MS  | 15.6 ms      |
| 2     | H_4MS   | 3.91 ms      |
| 3     | H_976US | 976 $\mu$ s  |
| 4     | H_488US | 488 $\mu$ s  |
| 5     | H_122US | 122 $\mu$ s  |
| 6     | H_30US  | 30.5 $\mu$ s |
| 7     | H_15US  | 15.2 $\mu$ s |

### Bit 23 – EN1 PIO Line Enable

This bit is write-only.

| Value | Description                                     |
|-------|-------------------------------------------------|
| 0     | The PIO line associated to RTCOUT1 is disabled. |
| 1     | The PIO line associated to RTCOUT1 is enabled.  |

### Bits 22:20 – OUT1[2:0] RTCOUT1 Output Source Selection

| Value | Name    | Description               |
|-------|---------|---------------------------|
| 0     | NO_WAVE | No waveform, stuck at '0' |

| Value | Name         | Description                          |
|-------|--------------|--------------------------------------|
| 1     | FREQ1HZ      | 1 Hz square wave                     |
| 2     | FREQ32HZ     | 32 Hz square wave                    |
| 3     | FREQ64HZ     | 64 Hz square wave                    |
| 4     | FREQ512HZ    | 512 Hz square wave                   |
| 5     | ALARM_TOGGLE | Output toggles when alarm flag rises |
| 6     | ALARM_FLAG   | Output is a copy of the alarm flag   |
| 7     | PROG_PULSE   | Duty cycle programmable pulse        |

**Bit 19 – EN0** PIO Line Enable  
This bit is write-only.

| Value | Description                                     |
|-------|-------------------------------------------------|
| 0     | The PIO line associated to RTCOUT0 is disabled. |
| 1     | The PIO line associated to RTCOUT0 is enabled.  |

**Bits 18:16 – OUT0[2:0]** RTCOUT0 OutputSource Selection

| Value | Name         | Description                          |
|-------|--------------|--------------------------------------|
| 0     | NO_WAVE      | No waveform, stuck at '0'            |
| 1     | FREQ1HZ      | 1 Hz square wave                     |
| 2     | FREQ32HZ     | 32 Hz square wave                    |
| 3     | FREQ64HZ     | 64 Hz square wave                    |
| 4     | FREQ512HZ    | 512 Hz square wave                   |
| 5     | ALARM_TOGGLE | Output toggles when alarm flag rises |
| 6     | ALARM_FLAG   | Output is a copy of the alarm flag   |
| 7     | PROG_PULSE   | Duty cycle programmable pulse        |

**Bit 15 – HIGHPPM** HIGH PPM Correction

If the absolute value of the correction to be applied is lower than 30 ppm, it is recommended to clear HIGHPPM. HIGHPPM set to 1 is recommended for 30 ppm correction and above.

Formula:

If HIGHPPM = 0, then the clock frequency correction range is from 1.5 ppm up to 98 ppm. The RTC accuracy is less than 1 ppm for a range correction from 1.5 ppm up to 30 ppm.

The correction field must be programmed according to the required correction in ppm; the formula is as follows:

$$\text{CORRECTION} = \frac{3906}{20 \times \text{ppm}} - 1$$

The value obtained must be rounded to the nearest integer prior to being programmed into CORRECTION field.

If HIGHPPM = 1, then the clock frequency correction range is from 30.5 ppm up to 1950 ppm. The RTC accuracy is less than 1 ppm for a range correction from 30.5 ppm up to 90 ppm.

The correction field must be programmed according to the required correction in ppm; the formula is as follows:

$$\text{CORRECTION} = \frac{3906}{\text{ppm}} - 1$$

The value obtained must be rounded to the nearest integer prior to be programmed into CORRECTION field.

If NEGPPM is set to 1, the ppm correction is negative (used to correct crystals that are faster than the nominal 32.768 kHz).

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | Lower range ppm correction with accurate correction.  |
| 1     | Higher range ppm correction with accurate correction. |

**Bits 14:8 – CORRECTION[6:0]** Slow Clock Correction

| Value | Description   |
|-------|---------------|
| 0     | No correction |

| Value | Description                                                                             |
|-------|-----------------------------------------------------------------------------------------|
| 1-127 | The slow clock will be corrected according to the formula given in HIGHPPM description. |

#### Bit 4 – NEGPPM Negative PPM Correction

See CORRECTION and HIGHPPM field descriptions.

NEGPPM must be cleared to correct a crystal slower than 32.768 kHz.

| Value | Description                                                           |
|-------|-----------------------------------------------------------------------|
| 0     | Positive correction (the divider will be slightly higher than 32768). |
| 1     | Negative correction (the divider will be slightly lower than 32768).  |

#### Bit 1 – PERSIAN PERSIAN Calendar

| Value | Description         |
|-------|---------------------|
| 0     | Gregorian calendar. |
| 1     | Persian calendar.   |

#### Bit 0 – HRMOD 12-/24-hour Mode

| Value | Description               |
|-------|---------------------------|
| 0     | 24-hour mode is selected. |
| 1     | 12-hour mode is selected. |

### 24.6.3 RTC Time Register

**Name:** RTC\_TIMR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |      |     |     |     |     |     |     |
|--------|----|------|-----|-----|-----|-----|-----|-----|
| Bit    | 31 | 30   | 29  | 28  | 27  | 26  | 25  | 24  |
|        |    |      |     |     |     |     |     |     |
| Access |    |      |     |     |     |     |     |     |
| Reset  |    |      |     |     |     |     |     |     |
| Bit    | 23 | 22   | 21  | 20  | 19  | 18  | 17  | 16  |
|        |    | AMPM |     |     |     |     |     |     |
| Access |    | R/W  | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |    | 0    | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15 | 14   | 13  | 12  | 11  | 10  | 9   | 8   |
|        |    |      |     |     |     |     |     |     |
| Access |    | R/W  | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |    | 0    | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7  | 6    | 5   | 4   | 3   | 2   | 1   | 0   |
|        |    |      |     |     |     |     |     |     |
| Access |    | R/W  | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |    | 0    | 0   | 0   | 0   | 0   | 0   | 0   |

**Bit 22 – AMPM** Ante Meridiem Post Meridiem Indicator

This bit is the AM/PM indicator in 12-hour mode.

| Value | Description |
|-------|-------------|
| 0     | AM.         |
| 1     | PM.         |

**Bits 21:16 – HOUR[5:0]** Current Hour

The range that can be set is 1–12 (BCD) in 12-hour mode or 0–23 (BCD) in 24-hour mode.

**Bits 14:8 – MIN[6:0]** Current Minute

The range that can be set is 0–59 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

**Bits 6:0 – SEC[6:0]** Current Second

The range that can be set is 0–59 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

## 24.6.4 RTC Calendar Register

**Name:** RTC\_CALR  
**Offset:** 0x0C  
**Reset:** 0x01E11320  
**Property:** Read/Write

|        |           |     |           |            |     |     |     |     |
|--------|-----------|-----|-----------|------------|-----|-----|-----|-----|
| Bit    | 31        | 30  | 29        | 28         | 27  | 26  | 25  | 24  |
|        |           |     | DATE[5:0] |            |     |     |     |     |
| Access |           |     | R/W       | R/W        | R/W | R/W | R/W | R/W |
| Reset  |           |     | 0         | 0          | 0   | 0   | 0   | 1   |
| Bit    | 23        | 22  | 21        | 20         | 19  | 18  | 17  | 16  |
|        | DAY[2:0]  |     |           | MONTH[4:0] |     |     |     |     |
| Access | R/W       | R/W | R/W       | R/W        | R/W | R/W | R/W | R/W |
| Reset  | 1         | 1   | 1         | 0          | 0   | 0   | 0   | 1   |
| Bit    | 15        | 14  | 13        | 12         | 11  | 10  | 9   | 8   |
|        | YEAR[7:0] |     |           |            |     |     |     |     |
| Access | R/W       | R/W | R/W       | R/W        | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0         | 1          | 0   | 0   | 1   | 1   |
| Bit    | 7         | 6   | 5         | 4          | 3   | 2   | 1   | 0   |
|        |           |     | CENT[6:0] |            |     |     |     |     |
| Access |           | R/W | R/W       | R/W        | R/W | R/W | R/W | R/W |
| Reset  |           | 0   | 1         | 0          | 0   | 0   | 0   | 0   |

### Bits 29:24 – DATE[5:0] Current Day in Current Month

The range that can be set is 01–31 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

### Bits 23:21 – DAY[2:0] Current Day in Current Week

The range that can be set is 1–7 (BCD).

The coding of the number (which number represents which day) is user-defined as it has no effect on the date counter.

### Bits 20:16 – MONTH[4:0] Current Month

The range that can be set is 01–12 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

### Bits 15:8 – YEAR[7:0] Current Year

The range that can be set is 00–99 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

### Bits 6:0 – CENT[6:0] Current Century

The range that can be set is 19–20 (Gregorian) or 13–14 (Persian) (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

## 24.6.5 RTC Time Alarm Register

**Name:** RTC\_TIMALR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

To change one of the SEC, MIN, HOUR fields, it is recommended to disable the field before changing the value and then re-enable it after the change has been made. This requires up to three accesses to the RTC\_TIMALR. The first access clears the enable corresponding to the field to change (SECEN, MINEN, HOUREN). If the field is already cleared, this access is not required. The second access performs the change of the value (SEC, MIN, HOUR). The third access is required to re-enable the field by writing 1 in SECEN, MINEN, HOUREN fields.

|        |        |          |           |     |     |     |     |     |
|--------|--------|----------|-----------|-----|-----|-----|-----|-----|
| Bit    | 31     | 30       | 29        | 28  | 27  | 26  | 25  | 24  |
| Access |        |          |           |     |     |     |     |     |
| Reset  |        |          |           |     |     |     |     |     |
| Bit    | 23     | 22       | 21        | 20  | 19  | 18  | 17  | 16  |
| Access | HOUREN | AMPM     | HOUR[5:0] |     |     |     |     |     |
| Reset  | R/W    | R/W      | R/W       | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0      | 0        | 0         | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15     | 14       | 13        | 12  | 11  | 10  | 9   | 8   |
| Access | MINEN  | MIN[6:0] |           |     |     |     |     |     |

| Reset  | 0      | 0        | 0         | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7      | 6        | 5         | 4   | 3   | 2   | 1   | 0   |
| Access | SECEN  | SEC[6:0] |           |     |     |     |     |     |
| Reset  | R/W    | R/W      | R/W       | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0      | 0        | 0         | 0   | 0   | 0   | 0   | 0   |

### Bit 23 – HOUREN Hour Alarm Enable

| Value | Description                          |
|-------|--------------------------------------|
| 0     | The hour-matching alarm is disabled. |
| 1     | The hour-matching alarm is enabled.  |

### Bit 22 – AMPM AM/PM Indicator

This field is the alarm field corresponding to the BCD-coded hour counter.

### Bits 21:16 – HOUR[5:0] Hour Alarm

This field is the alarm field corresponding to the BCD-coded hour counter.

### Bit 15 – MINEN Minute Alarm Enable

| Value | Description                            |
|-------|----------------------------------------|
| 0     | The minute-matching alarm is disabled. |
| 1     | The minute-matching alarm is enabled.  |

### Bits 14:8 – MIN[6:0] Minute Alarm

This field is the alarm field corresponding to the BCD-coded minute counter.

### Bit 7 – SECEN Second Alarm Enable

| Value | Description                            |
|-------|----------------------------------------|
| 0     | The second-matching alarm is disabled. |
| 1     | The second-matching alarm is enabled.  |

**Bits 6:0 – SEC[6:0] Second Alarm**

This field is the alarm field corresponding to the BCD-coded second counter.

## 24.6.6 RTC Calendar Alarm Register

**Name:** RTC\_CALALR  
**Offset:** 0x14  
**Reset:** 0x01010000  
**Property:** Read/Write

To change one of the DATE, MONTH fields, it is recommended to disable the field before changing the value and then re-enable it after the change has been made. This requires up to three accesses to the RTC\_CALALR. The first access clears the enable corresponding to the field to change (DATEEN, MTHEN). If the field is already cleared, this access is not required. The second access performs the change of the value (DATE, MONTH). The third access is required to re-enable the field by writing 1 in DATEEN, MTHEN fields.

|        |        |    |           |            |     |     |     |     |
|--------|--------|----|-----------|------------|-----|-----|-----|-----|
| Bit    | 31     | 30 | 29        | 28         | 27  | 26  | 25  | 24  |
|        | DATEEN |    | DATE[5:0] |            |     |     |     |     |
| Access | R/W    |    | R/W       | R/W        | R/W | R/W | R/W | R/W |
| Reset  | 0      |    | 0         | 0          | 0   | 0   | 0   | 1   |
| Bit    | 23     | 22 | 21        | 20         | 19  | 18  | 17  | 16  |
|        | MTHEN  |    |           | MONTH[4:0] |     |     |     |     |
| Access | R/W    |    |           | R/W        | R/W | R/W | R/W | R/W |
| Reset  | 0      |    |           | 0          | 0   | 0   | 0   | 1   |
| Bit    | 15     | 14 | 13        | 12         | 11  | 10  | 9   | 8   |
| Access |        |    |           |            |     |     |     |     |
| Reset  |        |    |           |            |     |     |     |     |
| Bit    | 7      | 6  | 5         | 4          | 3   | 2   | 1   | 0   |
| Access |        |    |           |            |     |     |     |     |
| Reset  |        |    |           |            |     |     |     |     |

### Bit 31 – DATEEN Date Alarm Enable

| Value | Description                          |
|-------|--------------------------------------|
| 0     | The date-matching alarm is disabled. |
| 1     | The date-matching alarm is enabled.  |

### Bits 29:24 – DATE[5:0] Date Alarm

This field is the alarm field corresponding to the BCD-coded date counter.

### Bit 23 – MTHEN Month Alarm Enable

| Value | Description                           |
|-------|---------------------------------------|
| 0     | The month-matching alarm is disabled. |
| 1     | The month-matching alarm is enabled.  |

### Bits 20:16 – MONTH[4:0] Month Alarm

This field is the alarm field corresponding to the BCD-coded month counter.

## 24.6.7 RTC Status Register

**Name:** RTC\_SR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |       |       |       |     |       |        |
|--------|---|---|-------|-------|-------|-----|-------|--------|
| Bit    | 7 | 6 | 5     | 4     | 3     | 2   | 1     | 0      |
|        |   |   | TDERR | CALEV | TIMEV | SEC | ALARM | ACKUPD |
| Access |   |   | R     | R     | R     | R   | R     | R      |
| Reset  |   |   | 0     | 0     | 0     | 0   | 0     | 0      |

### Bit 5 – TDERR Time and/or Date Free Running Error

| Value | Name         | Description                                                                                                                                      |
|-------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | CORRECT      | The internal free running counters are carrying valid values since the last read of the Status Register (RTC_SR).                                |
| 1     | ERR_TIMEDATE | The internal free running counters have been corrupted (invalid date or time, non-BCD values) since the last read and/or they are still invalid. |

### Bit 4 – CALEV Calendar Event

The calendar event is selected in the CALEVSEL field in the Control Register (RTC\_CR) and can be any one of the following events: week change, month change and year change.

| Value | Name        | Description                                                    |
|-------|-------------|----------------------------------------------------------------|
| 0     | NO_CALEVENT | No calendar event has occurred since the last clear.           |
| 1     | CALEVENT    | At least one calendar event has occurred since the last clear. |

### Bit 3 – TIMEV Time Event

The time event is selected in the TIMEVSEL field in the Control Register (RTC\_CR) and can be any one of the following events: minute change, hour change, noon, midnight (day change).

| Value | Name        | Description                                                |
|-------|-------------|------------------------------------------------------------|
| 0     | NO_TIMEVENT | No time event has occurred since the last clear.           |
| 1     | TIMEVENT    | At least one time event has occurred since the last clear. |

### Bit 2 – SEC Second Event

| Value | Name        | Description                                                  |
|-------|-------------|--------------------------------------------------------------|
| 0     | NO_SECEVENT | No second event has occurred since the last clear.           |
| 1     | SECEVENT    | At least one second event has occurred since the last clear. |

### Bit 1 – ALARM Alarm Flag

| Value | Name          | Description                               |
|-------|---------------|-------------------------------------------|
| 0     | NO_ALARMEVENT | No alarm matching condition occurred.     |
| 1     | ALARMEVENT    | An alarm matching condition has occurred. |

#### Bit 0 – ACKUPD Acknowledge for Update

| Value | Name    | Description                                    |
|-------|---------|------------------------------------------------|
| 0     | FREERUN | Time and calendar registers cannot be updated. |
| 1     | UPDATE  | Time and calendar registers can be updated.    |

## 24.6.8 RTC Status Clear Command Register

**Name:** RTC\_SCCR  
**Offset:** 0x1C  
**Reset:** –  
**Property:** Write-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |          |        |        |        |        |        |
|--------|---|---|----------|--------|--------|--------|--------|--------|
| Bit    | 7 | 6 | 5        | 4      | 3      | 2      | 1      | 0      |
|        |   |   | TDERRCLR | CALCLR | TIMCLR | SECCLR | ALRCLR | ACKCLR |
| Access |   |   | W        | W      | W      | W      | W      | W      |
| Reset  |   |   | –        | –      | –      | –      | –      | –      |

### Bit 5 – TDERRCLR Time and/or Date Free Running Error Clear

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | No effect.                                                        |
| 1     | Clears corresponding status flag in the Status Register (RTC_SR). |

### Bit 4 – CALCLR Calendar Clear

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | No effect.                                                        |
| 1     | Clears corresponding status flag in the Status Register (RTC_SR). |

### Bit 3 – TIMCLR Time Clear

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | No effect.                                                        |
| 1     | Clears corresponding status flag in the Status Register (RTC_SR). |

### Bit 2 – SECCLR Second Clear

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | No effect.                                                        |
| 1     | Clears corresponding status flag in the Status Register (RTC_SR). |

### Bit 1 – ALRCLR Alarm Clear

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | No effect.                                                        |
| 1     | Clears corresponding status flag in the Status Register (RTC_SR). |

### Bit 0 – ACKCLR Acknowledge Clear

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | No effect.                                                        |
| 1     | Clears corresponding status flag in the Status Register (RTC_SR). |

## 24.6.9 RTC Interrupt Enable Register

**Name:** RTC\_IER  
**Offset:** 0x20  
**Reset:** –  
**Property:** Write-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |         |       |       |       |       |       |
|--------|---|---|---------|-------|-------|-------|-------|-------|
| Bit    | 7 | 6 | 5       | 4     | 3     | 2     | 1     | 0     |
|        |   |   | TDERREN | CALEN | TIMEN | SECEN | ALREN | ACKEN |
| Access |   |   | W       | W     | W     | W     | W     | W     |
| Reset  |   |   | –       | –     | –     | –     | –     | –     |

### Bit 5 – TDERREN Time and/or Date Error Interrupt Enable

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No effect.                                    |
| 1     | The time and date error interrupt is enabled. |

### Bit 4 – CALEN Calendar Event Interrupt Enable

| Value | Description                                       |
|-------|---------------------------------------------------|
| 0     | No effect.                                        |
| 1     | The selected calendar event interrupt is enabled. |

### Bit 3 – TIMEN Time Event Interrupt Enable

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No effect.                                    |
| 1     | The selected time event interrupt is enabled. |

### Bit 2 – SECEN Second Event Interrupt Enable

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | No effect.                                |
| 1     | The second periodic interrupt is enabled. |

### Bit 1 – ALREN Alarm Interrupt Enable

| Value | Description                     |
|-------|---------------------------------|
| 0     | No effect.                      |
| 1     | The alarm interrupt is enabled. |

### Bit 0 – ACKEN Acknowledge Update Interrupt Enable

| Value | Description                                      |
|-------|--------------------------------------------------|
| 0     | No effect.                                       |
| 1     | The acknowledge for update interrupt is enabled. |

## 24.6.10 RTC Interrupt Disable Register

**Name:** RTC\_IDR  
**Offset:** 0x24  
**Reset:** –  
**Property:** Write-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|

### Bit 5 – TDERRDIS Time and/or Date Error Interrupt Disable

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | No effect.                                     |
| 1     | The time and date error interrupt is disabled. |

### Bit 4 – CALDIS Calendar Event Interrupt Disable

| Value | Description                                        |
|-------|----------------------------------------------------|
| 0     | No effect.                                         |
| 1     | The selected calendar event interrupt is disabled. |

### Bit 3 – TIMDIS Time Event Interrupt Disable

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | No effect.                                     |
| 1     | The selected time event interrupt is disabled. |

### Bit 2 – SECDIS Second Event Interrupt Disable

| Value | Description                                |
|-------|--------------------------------------------|
| 0     | No effect.                                 |
| 1     | The second periodic interrupt is disabled. |

### Bit 1 – ALRDIS Alarm Interrupt Disable

| Value | Description                      |
|-------|----------------------------------|
| 0     | No effect.                       |
| 1     | The alarm interrupt is disabled. |

### Bit 0 – ACKDIS Acknowledge Update Interrupt Disable

| Value | Description                                       |
|-------|---------------------------------------------------|
| 0     | No effect.                                        |
| 1     | The acknowledge for update interrupt is disabled. |

## 24.6.11 RTC Interrupt Mask Register

**Name:** RTC\_IMR  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read-only

### Bit 5 – TDERR Time and/or Date Error Mask

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | The time and/or date error event is disabled. |
| 1     | The time and/or date error event is enabled.  |

### Bit 4 – CAL Calendar Event Interrupt Mask

| Value | Description                                        |
|-------|----------------------------------------------------|
| 0     | The selected calendar event interrupt is disabled. |
| 1     | The selected calendar event interrupt is enabled.  |

### Bit 3 – TIM Time Event Interrupt Mask

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | The selected time event interrupt is disabled. |
| 1     | The selected time event interrupt is enabled.  |

### Bit 2 – SEC Second Event Interrupt Mask

| Value | Description                                |
|-------|--------------------------------------------|
| 0     | The second periodic interrupt is disabled. |
| 1     | The second periodic interrupt is enabled.  |

### Bit 1 – ALR Alarm Interrupt Mask

| Value | Description                      |
|-------|----------------------------------|
| 0     | The alarm interrupt is disabled. |
| 1     | The alarm interrupt is enabled.  |

### Bit 0 – ACK Acknowledge Update Interrupt Mask

| Value | Description                                       |
|-------|---------------------------------------------------|
| 0     | The acknowledge for update interrupt is disabled. |
| 1     | The acknowledge for update interrupt is enabled.  |

## 24.6.12 RTC Valid Entry Register

**Name:** RTC\_VER  
**Offset:** 0x2C  
**Reset:** 0x00000000  
**Property:** Read-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |

| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |   |   |          |          |       |       |
|--------|---|---|---|---|----------|----------|-------|-------|
| Bit    | 7 | 6 | 5 | 4 | 3        | 2        | 1     | 0     |
|        |   |   |   |   | NVCALALR | NVTIMALR | NVCAL | NVTIM |
| Access |   |   |   |   | R        | R        | R     | R     |
| Reset  |   |   |   |   | 0        | 0        | 0     | 0     |

### Bit 3 – NVCALALR Non-valid Calendar Alarm

| Value | Description                                                                |
|-------|----------------------------------------------------------------------------|
| 0     | No invalid data has been detected in RTC_CALALR (Calendar Alarm Register). |
| 1     | RTC_CALALR has contained invalid data since it was last programmed.        |

### Bit 2 – NVTIMALR Non-valid Time Alarm

| Value | Description                                                            |
|-------|------------------------------------------------------------------------|
| 0     | No invalid data has been detected in RTC_TIMALR (Time Alarm Register). |
| 1     | RTC_TIMALR has contained invalid data since it was last programmed.    |

### Bit 1 – NVCAL Non-valid Calendar

| Value | Description                                                        |
|-------|--------------------------------------------------------------------|
| 0     | No invalid data has been detected in RTC_CALR (Calendar Register). |
| 1     | RTC_CALR has contained invalid data since it was last programmed.  |

### Bit 0 – NVTIM Non-valid Time

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | No invalid data has been detected in RTC_TIMR (Time Register).    |
| 1     | RTC_TIMR has contained invalid data since it was last programmed. |

## 24.6.13 RTC Milliseconds Register

**Name:** RTC\_MSR  
**Offset:** 0xD0  
**Reset:** 0x00000000  
**Property:** Read-only

|        |         |    |    |    |    |    |         |    |
|--------|---------|----|----|----|----|----|---------|----|
| Bit    | 31      | 30 | 29 | 28 | 27 | 26 | 25      | 24 |
|        |         |    |    |    |    |    |         |    |
| Access |         |    |    |    |    |    |         |    |
| Reset  |         |    |    |    |    |    |         |    |
| Bit    | 23      | 22 | 21 | 20 | 19 | 18 | 17      | 16 |
|        |         |    |    |    |    |    |         |    |
| Access |         |    |    |    |    |    |         |    |
| Reset  |         |    |    |    |    |    |         |    |
| Bit    | 15      | 14 | 13 | 12 | 11 | 10 | 9       | 8  |
|        |         |    |    |    |    |    | MS[9:8] |    |
| Access |         |    |    |    |    |    | R       | R  |
| Reset  |         |    |    |    |    |    | 0       | 0  |
| Bit    | 7       | 6  | 5  | 4  | 3  | 2  | 1       | 0  |
|        | MS[7:0] |    |    |    |    |    |         |    |
| Access | R       | R  | R  | R  | R  | R  | R       | R  |
| Reset  | 0       | 0  | 0  | 0  | 0  | 0  | 0       | 0  |

### Bits 9:0 – MS[9:0] Number of 1/1024 seconds elapsed within 1 second

This field reports a multiple of 1/1024 seconds. The field is synchronized with the fields reported in RTC\_TIMR. Thus the MS field is cleared after each elapsed second. This field is incremented monotonically over a period of 1 second and can be used for timestamping with an accuracy better than 1 millisecond.

## 25. Real-time Timer (RTT)

## 25.1 Description

The Real-time Timer (RTT) is built around a 32-bit counter used to count roll-over events of the programmable 16-bit prescaler driven from the 32-kHz slow clock source. It generates a periodic interrupt and/or triggers an alarm on a programmed value.

The RTT can also be configured to be driven by the 1Hz RTC signal, thus taking advantage of a calibrated 1Hz clock.

The slow clock source can be fully disabled to reduce power consumption when only an elapsed seconds count is required.

## 25.2 Embedded Characteristics

- 32-bit Free-running Counter on prescaled slow clock or RTC calibrated 1Hz clock
- 16-bit Configurable Prescaler
- Interrupt on Alarm or Counter Increment

### 25.3 Block Diagram

**Figure 25-1. Real-time Timer Block Diagram**

## 25.4 Functional Description

The programmable 16-bit prescaler value can be configured through the RTPRES field in the RTT Mode register (RTT\_MR).

Configuring the RTPRES field value to 0x8000 (default value) corresponds to feeding the real-time counter with a 1Hz signal (if the slow clock is 32.768 kHz). The 32-bit counter can count up to  $2^{32}$  seconds, corresponding to more than 136 years, then roll over to 0. Bit RTTINC in the RTT Status Register (RTT\_SR) is set each time there is a prescaler roll-over.

The real-time 32-bit counter can also be supplied by the 1Hz RTC clock. This mode is interesting when the RTC 1Hz is calibrated (CORRECTION field  $\neq 0$  in RTC\_MR) in order to guaranty the synchronism between RTC and RTT counters.

Setting the RTC1HZ bit in the RTT\_MR drives the 32-bit RTT counter from the 1Hz RTC clock. In this mode, the RTPRES field has no effect on the 32-bit counter.

The prescaler roll-over generates an increment of the real-time timer counter if RTC1HZ = 0. Otherwise, if RTC1HZ = 1, the RTT counter is incremented every second. The RTTINC bit is set independently from the 32-bit counter increment.

The RTT can also be used as a free-running timer with a lower time-base. The best accuracy is achieved by writing RTPRES to 3 in RTT\_MR.

Programming RTPRES to 1 or 2 is forbidden.

If the RTT is configured to trigger an interrupt, the interrupt occurs two slow clock cycles after reading the RTT\_SR. To prevent several executions of the interrupt handler, the interrupt must be disabled in the interrupt handler and re-enabled when the RTT\_SR is cleared.

The CRTV field can be read at any time in the RTT Value register (RTT\_VR). As this value can be updated asynchronously with the Master Clock, the CRTV field must be read twice at the same value to read a correct value.

The current value of the counter is compared with the value written in the RTT Alarm register (RTT\_AR). If the counter value matches the alarm, the ALMS bit in the RTT\_SR is set. The RTT\_AR is set to its maximum value (0xFFFFFFFF) after a reset.

The ALMS flag is always a source of the RTT alarm signal that may be used to exit the system from low power modes (see the Real-time Timer Block Diagram above).

The alarm interrupt must be disabled (ALMIEN must be cleared in RTT\_MR) when writing a new ALMV value in the RTT\_AR.

The RTTINC bit can be used to start a periodic interrupt, the period being one second when the RTPRES field value = 0x8000 and the slow clock = 32.768 kHz.

The RTTINCIEN bit must be cleared prior to writing a new RTPRES value in the RTT\_MR.

Reading the RTT\_SR automatically clears the RTTINC and ALMS bits.

Writing the RTTRST bit in the RTT\_MR immediately reloads and restarts the clock divider with the new programmed value. This also resets the 32-bit counter.

When not used, the RTT can be disabled in order to suppress dynamic power consumption in this module. This can be achieved by setting the RTTDIS bit in the RTT\_MR.

**Figure 25-2. RTT Counting**

## 25.5 Register Summary

| Offset | Name   | Bit Pos. | 7            | 6 | 5 | 4      | 3 | 2      | 1         | 0      |

## 25.5.1 Real-time Timer Mode Register

**Name:** RTT\_MR  
**Offset:** 0x00  
**Reset:** 0x00008000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

### Bit 24 – RTC1HZ Real-Time Clock 1Hz Clock Selection

| Value | Description                                                                |
|-------|----------------------------------------------------------------------------|
| 0     | The RTT 32-bit counter is driven by the 16-bit prescaler roll-over events. |
| 1     | The RTT 32-bit counter is driven by the 1Hz RTC clock.                     |

### Bit 20 – RTTDIS Real-time Timer Disable

| Value | Description                                         |
|-------|-----------------------------------------------------|
| 0     | The RTT is enabled.                                 |
| 1     | The RTT is disabled (no dynamic power consumption). |

### Bit 18 – RTTRST Real-time Timer Restart

| Value | Description                                                                                                |
|-------|------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                 |
| 1     | Reloads and restarts the clock divider with the new programmed value. This also resets the 32-bit counter. |

### Bit 17 – RTTINCIEN Real-time Timer Increment Interrupt Enable

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | The bit RTTINC in RTT_SR has no effect on interrupt. |
| 1     | The bit RTTINC in RTT_SR asserts interrupt.          |

### Bit 16 – ALMIEN Alarm Interrupt Enable

| Value | Description                                        |
|-------|----------------------------------------------------|
| 0     | The bit ALMS in RTT_SR has no effect on interrupt. |
| 1     | The bit ALMS in RTT_SR asserts interrupt.          |

**Bits 15:0 – RTPRES[15:0] Real-time Timer Prescaler Value**

Defines the number of SLCK periods required to increment the RTT. The RTTINCIEN bit must be cleared prior to writing a new RTPRES value.

RTPRES is defined as follows:

- RTPRES = 0: The prescaler period is equal to  $2^{16}$  \* SLCK periods.
- RTPRES = 1 or 2: forbidden.
- RTPRES  $\neq$  0,1 or 2: The prescaler period is equal to RTPRES \* SLCK periods.

### 25.5.2 Real-time Timer Alarm Register

**Name:** RTT\_AR  
**Offset:** 0x04  
**Reset:** 0xFFFFFFFF  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

The alarm interrupt must be disabled (ALMIEN must be cleared in RTT\_MR) when writing a new ALMV value.

|        |             |     |     |     |     |     |     |     |
|--------|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31          | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | ALMV[31:24] |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 1           | 1   | 1   | 1   | 1   | 1   | 1   | 1   |
| Bit    | 23          | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | ALMV[23:16] |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 1           | 1   | 1   | 1   | 1   | 1   | 1   | 1   |
| Bit    | 15          | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | ALMV[15:8]  |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 1           | 1   | 1   | 1   | 1   | 1   | 1   | 1   |
| Bit    | 7           | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | ALMV[7:0]   |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 1           | 1   | 1   | 1   | 1   | 1   | 1   | 1   |

#### Bits 31:0 – ALMV[31:0] Alarm Value

When the CRTV value in RTT\_VR equals the ALMV field, the ALMS flag is set in RTT\_SR. As soon as the ALMS flag rises, the CRTV value equals ALMV+1 (refer to the figure *RTT Counting* above).

### 25.5.3 Real-time Timer Value Register

**Name:** RTT\_VR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read-only

| Bit    | 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|--------|-------------|----|----|----|----|----|----|----|
|        | CRTV[31:24] |    |    |    |    |    |    |    |
| Access | R           | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 23          | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | CRTV[23:16] |    |    |    |    |    |    |    |
| Access | R           | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | CRTV[15:8]  |    |    |    |    |    |    |    |
| Access | R           | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7           | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | CRTV[7:0]   |    |    |    |    |    |    |    |
| Access | R           | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 31:0 – CRTV[31:0] Current Real-time Value

Returns the current value of the RTT.

As CRTV can be updated asynchronously, it must be read twice at the same value.

25.5.4 Real-time Timer Status Register

Name: RTT\_SR  
Offset: 0x0C  
Reset: 0x00000000  
Property: Read-only

Bit 1 – RTTINC Prescaler Roll-over Status (cleared on read)

| Value | Description                                                        |
|-------|--------------------------------------------------------------------|
| 0     | No prescaler roll-over occurred since the last read of the RTT_SR. |
| 1     | Prescaler roll-over occurred since the last read of the RTT_SR.    |

Bit 0 – ALMS Real-time Alarm Status (cleared on read)

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | The Real-time Alarm has not occurred since the last read of RTT_SR. |
| 1     | The Real-time Alarm occurred since the last read of RTT_SR.         |

## 26. Clock Generator

### 26.1 Description

The Clock Generator user interface is embedded within the Power Management Controller and is described in the Register Summary. However, the Clock Generator registers are named CKGR\_.

### 26.2 Embedded Characteristics

The Clock Generator is made up of:

- A low-power 32.768 kHz Crystal Oscillator with Bypass mode, to connect an external slow clock
- A low-power Slow RC Oscillator (32 kHz typical)
- A 3 MHz to 20 MHz Main Crystal Oscillator with Bypass mode, to connect an external Main clock
- A Main RC Oscillator and a PLLB-dedicated RC Oscillator, each with Four Selectable Output Frequencies: 4/8/12/10 MHz. By default 4 MHz is selected.
- Two 40MHz to 200MHz Programmable PLLs A,B (inputs from 8MHz to 20MHz).

It provides the following clocks:

- MD\_SLCK— Monitoring Domain Slow clock. This clock, generally sourced from the Slow RC oscillator, feeds safety-critical functions of the device (WDT, RSTC, SUPC, frequency monitors and detectors, PMC start-up time counters).
- TD\_CLK— Timing Domain Slow clock. This clock, generally sourced from the 32.768 kHz external slow clock, is routed to the RTC and RTT peripherals.
- MAINCK— Output of the Main clock oscillator selection: either the external Main clock or Main RC oscillator
- PLLACK— Output of the divider and the 40 MHz to 200 MHz programmable PLL (PLLA)
- PLLBCK— Output of the divider and the 40 MHz to 200 MHz programmable PLL (PLLB)

## 26.3 Block Diagram

Figure 26-1. Clock Generator Block

Diagram

## 26.4 Slow Clock

The Supply Controller embeds a slow clock generator that is supplied with the VDDIO power supply. As soon as VDDIO is supplied, both the 32.768 kHz crystal oscillator and the Slow RC oscillator are powered, but only the Slow RC oscillator is enabled. This allows the monitoring Slow clock (MD\_SLCK) to be valid in a short time (about 100  $\mu$ s).

MD\_SLCK is generated only by the Slow RC oscillator. TD\_SLCK is generated either by the 32.768 kHz external slow clock or by the Slow RC oscillator.

To select the clock source, the selection is made via the TDXTALSEL bit in the Supply Controller Control register (SUPC\_CR).

### 26.4.1 Slow RC Oscillator (32 kHz typical)

By default, the Slow RC oscillator is enabled and selected as a source of MD\_SLCK and TD\_SLCK. It is the only available source for MD\_SCLK.

Compared to the 32.768 kHz crystal oscillator, this oscillator offers a faster start-up time and is less exposed to the external environment, as it is fully integrated. However, its output frequency is subject to larger variations with supply voltage, temperature and manufacturing process. Therefore, the user must take these variations into account when this oscillator is used as a time base (start-up counter, frequency monitor, so on). Refer to the section “Electrical Characteristics”.

This oscillator is disabled by clearing the SUPC\_CR.TDXTALSEL.

### 26.4.2 32.768 kHz Crystal Oscillator

By default, the 32.768 kHz oscillator is disabled. To use this oscillator, the XIN32 and XOUT32 pins must be connected to a 32.768 kHz crystal or to a ceramic resonator. Refer to the section “Electrical Characteristics” for appropriate loading capacitors selection on XIN32 and XOUT32. To ensure the integrity of the sensitive analog signals XIN32/XOUT32, it is recommended to include guard rings and ground planes on the PCB between the signal pins and the crystal.

Note that the user is not required to use the 32.768 kHz crystal oscillator and can use the Slow RC oscillator instead. Using the 32.768 kHz crystal oscillator provides a more accurate frequency than the Slow RC oscillator.

To select the 32.768 kHz crystal oscillator as the source of TD\_SLCK, SUPC\_CR.TDXTALSEL must be set. The crystal oscillator is directly connected to XIN32 and XOUT32.

If the user does not need the 32.768 kHz crystal oscillator, the XIN32 pins must be pulled externally.

The user can also set the 32.768 kHz crystal oscillator in Bypass mode instead of connecting a crystal. In this case, the user must provide the external clock signal on XIN32. For input characteristics of the XIN32 pin, refer to the section “Electrical Characteristics”. To enter Bypass mode, the OSCBYPASS bit of the Supply Controller Mode register (SUPC\_MR) must be set prior to setting SUPC\_CR.TDXTALSEL.

## 26.5 Main Clock

The Main clock (MAINCK) has two sources:

- A Main RC oscillator (4/8/12/10 MHz) with a fast start-up time and that is selected by default to start the system. Its default frequency is 4 MHz.
- A main crystal oscillator with Bypass mode, to connect external Main clock

**Figure 26-2.** Main Clock (MAINCK) Block Diagram

### 26.5.1 Main RC Oscillator

After reset, the Main RC oscillator is enabled with the 4 MHz frequency selected. This oscillator is selected as the source of MAINCK. MAINCK is the default clock selected to start the system.

The software can disable or enable the Main RC oscillator with the MOSCRCE bit in the Clock Generator Main Oscillator register (CKGR\_MOR).

The output frequency of the Main RC oscillator can be selected among 4/8/12/10 MHz. Selection is done by configuring MOSCRCF in CKGR\_MOR. When changing the frequency selection, the MOSCRCS bit in the Status register (PMC\_SR) is automatically cleared and MAINCK is stopped until the oscillator is stabilized. Once the oscillator is stabilized, MAINCK restarts and PMC\_SR.MOSCRCS is set. Note that enabling the Main RC oscillator (MOSCRCE = 1) and changing its frequency (MOSCRCF) at the same time is not allowed.

This oscillator must be enabled first and its frequency changed in a second step.

When disabling the Main RC oscillator by clearing CKGR\_MOR.MOSCRCE, the PMC\_SR.MOSCRCS bit is automatically cleared, indicating that the oscillator is OFF.

Setting the MOSCRCS bit in the Interrupt Enable register (PMC\_IER) triggers an interrupt to the processor.

### 26.5.2 PLLB-dedicated RC Oscillator

The system embeds a second RC oscillator that is dedicated to driving the PLLB reference clock. It is enabled by setting the EN bit in the PMC\_OSC2 register.

The output frequency of the PLLB-dedicated RC oscillator can be selected among 4/8/12/10 MHz. Selection is done by configuring the field OSCRCF in PMC\_OSC2 register. The RC oscillator is enabled by default.

The frequency selection must not be performed while the PLLB is operating with this RC oscillator as reference clock. The PLLB must first be disabled to change this RC oscillator frequency.

### 26.5.3 Main RC Oscillator Frequency Adjustment

The 4/8/12/10 MHz frequencies are factory-centered to the typical values by using Flash calibration bits (refer to the section "Electrical Characteristics"). The Flash calibration bits setting stored for the Main RC oscillator frequencies (4, 8, 12 and 10 MHz) vary from device to device.

To get a starting point when changing the CAL4, CAL8, CAL12 or CAL10 fields, it is recommended to first read their corresponding Flash calibration bits in the Flash controller..

The user can adjust the value of the Main RC oscillator frequency by modifying the trimming values on 4, 8, 12 and 10 MHz. This may be used to compensate frequency drifts due to temperature or voltage. Values written by the user application in the Oscillator Calibration register (PMC\_OCR1) are reset after each power-up or software reset. By default, SEL4/SEL8/ SEL12/SEL10 are cleared, so the Main RC oscillator is driven with the factory-programmed Flash calibration bits which are programmed during chip production. In order to calibrate the oscillator lower frequency, SEL4 must be set to '1' and a valid trim value must be configured in CAL4. Likewise, SEL8/12/10 must be set to '1' and a trim value must be configured in CAL8/12/10 in order to adjust the other frequencies of the oscillator. It is not possible to adjust the oscillator frequency while operating from this oscillator.

When trimming one frequency, the selected frequency should not be the same as the one selected in CKGR\_MOR.MOSCRCF. For instance, when writing SEL4 and CAL4 bits, the selected frequency in CKGR\_MOR.MOSCRCF must be 8/12/10 MHz.

Prior to write the new trim value in CAL4, CAL8/ CAL12/ CAL10 fields in PMC\_OCR1 register, the bit EN\_WR\_CALIB in PMC\_OSC2 must be set to '1' in order to enable write operation in calibration register.

At any time, the user can measure the main RC oscillator output frequency by means of the Main Frequency Counter (refer to Section 26.5.8. [Main Frequency Counter](#)). Once the frequency measurement is done, the main RC oscillator calibration fields (CALRC\_FREQx) can be adjusted accordingly to correct this oscillator output frequency.

Trim values in the CALn bitfields are composed of two trim parameters: temperature and frequency. CALn[1:0] are used for RC temperature trim, while CALn[4:2] are used for frequency trim. CALn[6:5] are not used

#### 26.5.4 Second RC Oscillator Frequency Adjustment

The Second RC oscillator frequencies of 4, 8, 12 and 10 MHz are factory-centered to the typical values by using Flash calibration bits (refer to the section "Electrical Characteristics"). The Flash calibration bit settings stored for the Second RC oscillator frequencies vary from device to device.

To get a starting point when changing the CAL4, CAL8, CAL10 or CAL12 fields, it is recommended to first read their corresponding Flash calibration bits in the Flash controller.

The user can adjust the value of the Second RC oscillator frequency by modifying the trimming values set in production for the Second RC Oscillator frequencies. This may be used to compensate frequency drifts due to temperature or voltage. Values written by the user application in the Oscillator Calibration register (PMC\_OCR2) are reset after each power-up or software reset. By default, the SELn bits are cleared, so the Main RC oscillator is driven with the factory-programmed Flash calibration bits which are programmed during chip production.

In order to calibrate the oscillator lower frequency of 4MHz, SEL4 must be set to '1' and a valid trim value must be configured in CAL4. Likewise, SEL8, SEL10 or SEL12 must be set to '1' and a trim value must be configured in CAL8, CAL10 or CAL12 in order to adjust the other frequencies of the oscillator.

It is not possible to adjust the oscillator frequency while operating from this oscillator.

When trimming one frequency, the selected frequency should not be the same as the one selected in PMC\_OSC2.OSCRCF. For instance, when writing SEL4 and CAL4 bits to modify the 4 MHz clock option, the selected frequency in PMC\_OSC2.OSCRCF must be either 8, 12 or 10 MHz

Prior to write the new trim value in CALn fields in PMC\_OCR2 register, the bit EN\_WR\_CALIB in PMC\_OSC2 must be set to '1' in order to enable write operation in calibration register.

Trim values in the CALn bitfields are composed of two trim parameters: temperature and frequency. CALn[1:0] are used for RC temperature trim, while CALn[4:2] are used for frequency trim. CALn[6:5] are not used.

#### 26.5.5 Main Crystal Oscillator

After reset, the Main crystal oscillator is disabled and is not selected as the source of MAINCK.

As the source of MAINCK, the Main crystal oscillator provides a very precise frequency. The software enables or disables this oscillator in order to reduce power consumption via CKGR\_MOR.MOSCXTEN.

When disabling this oscillator by clearing the CKGR\_MOR.MOSCXTEN, PMC\_SR.MOSCXTS is automatically cleared, indicating the oscillator is off.

When enabling this oscillator, the user must initiate the start-up time counter. The start-up time depends on the characteristics of the external device connected to this oscillator.

When CKGR\_MOR.MOSCXTEN and CKGR\_MOR.MOSCXTST are written to enable this oscillator, PMC\_SR.MOSCXTS is cleared and the counter starts counting down on MD\_SLCK divided by 8 from the CKGR\_MOR.MOSCXTST value. Since the CKGR\_MOR.MOSCXTST value is coded with 8 bits, the start-up time can be programmed up to 65536 MD\_SLCK periods, corresponding to about 62 ms when running at 32.768 kHz.

When the start-up time counter reaches '0', PMC\_SR.MOSCXTS is set, indicating that the oscillator is stabilized. Setting the MOSCXTS bit in the Interrupt Mask register (PMC\_IMR) can trigger an interrupt to the processor.

### 26.5.6 Main Clock Source Selection

The source of MAINCK can be selected from the following:

- The Main RC oscillator
- An external Main clock signal provided on the XIN and XOUT pins (Main crystal oscillator selected)
- An external Main clock signal provided on the XIN input (Bypass mode of the Main crystal oscillator)

The advantage of the Main RC oscillator is its fast start-up time. By default, this oscillator is selected to start the system and it must be selected prior to entering Wait mode.

The advantage of the external Main clock is its high level of accuracy.

The selection of the input is made with bit CKGR\_MOR.MOSCSEL. The switchover of the MAINCK source is glitch-free, so there is no need to run MCK out of MD\_SLCK, PLLACK or PLLBCK in order to change the selection. PMC\_SR.MOSCSELS indicates when the switch sequence is done.

If a PLL is selected as the source of MCK, the system automatically switches the MCK source to MAINCK during the switching operation, then sets the MCK source back to the selected PLL after the switch is complete. This sequence happens under any one of the following cases:

- switching from the Main RC oscillator to the Main Crystal oscillator;
- switching from the Main Crystal oscillator to the Main RC oscillator;
- changing the output frequency of the Main RC oscillator.

Setting PMC\_IMR.MOSCSELS triggers an interrupt to the processor.

### 26.5.7 Bypassing the Main Crystal Oscillator

Prior to bypassing the Main crystal oscillator, the external clock frequency provided on the XIN pin must be stable and within the values specified in the XIN Clock characteristics in the section "Electrical Characteristics".

The sequence is as follows:

1. Ensure that an external clock is connected on XIN.
2. Enable the bypass by setting CKGR\_MOR.MOSCXTBY.
3. Disable the Main crystal oscillator by clearing CKGR\_MOR.MOSCXTEN.

### 26.5.8 Main Frequency Counter

The Main frequency counter measures the Main RC oscillator and the external Main clock against the MD\_SLCK and is managed by CKGR\_MCFR.

During the measurement period, the Main frequency counter increments at the speed of the clock defined by the bit CKGR\_MCFR.CCSS.

A measurement is started in the following cases:

- When CKGR\_MCFR.RCMEAS is written to '1'.
- When the Main RC oscillator is selected as the source of MAINCK and when this oscillator is stable (when the MOSCRCS bit is set)
- When the external Main clock is selected as the source of MAINCK and when this clock is stable (when the MOSCXTS bit is set)
- When MAINCK source selection is modified

The measurement period ends at the 16th falling edge of MD\_SLCK, the MAINFRDY bit in CKGR\_MCFR is set and the counter stops counting. Its value can be read in the MAINF field of CKGR\_MCFR and gives the number of clock cycles during 16 periods of MD\_SLCK, so that the frequency of the Main RC oscillator or external Main clock can be determined.

If switching the source of MAINCK to the external Main clock from the Main RC oscillator, follow the programming sequence below to ensure that the oscillator is present and that its frequency is valid:

1. Enable the external Main clock by setting CKGR\_MOR.MOSCXTEN. Configure the CKGR\_MOR.MOSCXTST field with the external Main clock start-up time as defined in the section “Electrical Characteristics”.
2. Wait for PMC\_SR.MOSCXTS flag to rise, indicating the end of a start-up period of the external Main clock.
3. Select the external Main clock as the source clock of the Main frequency counter by setting CKGR\_MCFR.CCSS.
4. Initiate a frequency measurement by setting CKGR\_MCFR.RCMEAS.
5. Read CKGR\_MCFR.MAINFRDY until its value equals 1.
6. Read CKGR\_MCFR.MAINF and compute the value of the external Main clock.

If the MAINF value is valid, software can switch MAINCK to the external Main clock. Refer to [Main Clock Source Selection](#).

**Figure 26-3.** Main Frequency Counter Block Diagram

## 26.6 PLLA Clock

The PLLA clock (PLLACK) is generated from MAINCK by the PLLA and a predivider. This combination allows a wide range of frequencies.

The figure below shows the block diagram of the dividers and PLLA blocks.

**Figure 26-4.** Divider and PLLA Block Diagram

## 26.7 PLLB Clock

The PLLB clock (PLLBACK) is generated by the PLLB from MAINCK, or RC2CK and a predivider. This combination allows a wide range of frequencies.

The figure below shows the block diagram of the dividers and PLLB blocks.

**Figure 26-5.** Divider and PLLB Block Diagram

## 26.8 Divider and Phase Lock Loop Programming

The valid input frequency range of the PLLA is 8 MHz to 20 MHz and the valid output frequency range of the PLLA is 40 MHz to 200 MHz. The multiplier factor (MULA ratio) between the output and the input can be set in the range 1 to 25 in steps of 1.

The valid input frequency range of the PLLB is 8 MHz to 20 MHz and the valid output frequency range of the PLLB is 40 MHz to 200 MHz. The multiplier factor (MULB ratio) between the output and the input can be set in the range 1 to 25 in steps of 1.

The PLL (PLLA or PLLB) must first be correctly configured:

- Select the correct VCO frequency range depending on the output frequency requested (CKGR\_PLLAR.FREQVCO and CKGR\_PLLBR.FREQVCO)
- Select the correct value of the PLL's charge pump current (PMC\_PLL\_CFG.OUTCUR\_PLLA and PMC\_PLL\_CFG.OUTCUR\_PLLB),
- Select the correct resistors and capacitors values embedded inside the PLL to ensure its stability (PMC\_PLL\_CFG.FLT\_PLLA and PMC\_PLL\_CFG.FLT\_PLLB),

When a divider field (DIV) is cleared, the output of the corresponding divider and the PLL output is a continuous signal at level 0. On reset, each DIV field is cleared, thus the corresponding PLL input clock is stuck at '0'.

The PLL (PLLA or PLLB) allows multiplication of the divider's outputs. The PLL clock signal has a frequency that depends on the respective source signal frequency and on the parameters DIV (DIVA or DIVB) and MUL (MULA or MULB, in the range of 1 to 25). The factor applied to the source signal frequency is  $(MUL + 1)/DIV$ . When MUL is written to '0' or  $DIV = 0$ , the PLL is disabled and its power consumption is saved. Note that there is a delay of two MD\_SLCK clock cycles between the disable command and the real disable of the PLL. Re-enabling the PLL can be performed by writing a value higher than '0' in the MUL field and DIV higher than '0'.

Whenever the PLL is re-enabled or one of its parameters is changed, the LOCK (LOCKA or LOCKB) bit in PMC\_SR is automatically cleared. The values written in the PLLCOUNT field (PLLACOUNT or PLLBCOUNT) in CKGR\_PLLR (CKGR\_PLLAR or CKGR\_PLLBR) are loaded in the PLL counter. The PLL counter then decrements at the speed of MD\_SLCK until it reaches '0'. At this time, PMC\_SR.LOCKA or PMC\_SR.LOCKB is set and can trigger an interrupt to the processor. The user has to load the number of MD\_SLCK cycles required to cover the PLL transient time into the PLLCOUNT field.

To avoid programming the PLL with a multiplication factor that is too high, the user can saturate the multiplication factor value sent to the PLL by setting the PLLA\_MMAX and PLLB\_MMAX field in the PLL Maximum Multiplier Value register (PMC\_PMMR).

It is forbidden to change the MAINCK characteristics (oscillator selection, frequency adjustment of the Main RC oscillator) when:

- MAINCK is selected as the PLLA or PLLB clock source, and
- MCK is sourced from PLLA.

To change the MAINCK characteristics, the user must:

1. Switch the MCK source to MAINCK by writing a '1' to PMC\_MCKR.CSS.
2. Change the Main RC oscillator frequency (MOSCRCF) or oscillator selection (MOSCSEL) in CKGR\_MOR.
3. Wait for MOSCRCS (if frequency changes) or MOSCSELS (if oscillator selection changes) in PMC\_SR.
4. Disable and then enable the PLL.
5. Wait for the LOCK flag in PMC\_SR.
6. Switch back MCK to the PLLA by writing the appropriate value to PMC\_MCKR.CSS.

Here are some typical PLL configurations:

**Table 26-1. PLLA Configuration**

| Fin (MHz) | Fout (MHz) | PMC_PLL_CFG |          |                 | CKGR_PLLAR |               |           |
|-----------|------------|-------------|----------|-----------------|------------|---------------|-----------|
|           |            | SRA[1:0]    | SCA[1:0] | OUTCUR_PLA[3:0] | MULA       | FREQ_VCO[1:0] | DIVA[7:0] |
| 8         | 200        | 0           | 3        | 3               | 24         | 2             | 1         |
| 10        | 180        | 0           | 3        | 3               | 17         | 2             | 1         |
| 12        | 180        | 0           | 3        | 3               | 14         | 2             | 1         |
| 12        | 120        | 0           | 3        | 3               | 9          | 1             | 1         |
| 10        | 120        | 0           | 3        | 3               | 11         | 1             | 1         |
| 10        | 100        | 0           | 3        | 3               | 9          | 1             | 1         |
| 10        | 90         | 0           | 3        | 2               | 8          | 1             | 1         |

**Table 26-2. PLLB Configuration**

| Fin (MHz) | Fout (MHz) | PMC_PLL_CFG |          |                      | CKGR_PLLBR |                    |           |
|-----------|------------|-------------|----------|----------------------|------------|--------------------|-----------|
|           |            | SRB[1:0]    | SCB[1:0] | OUTCUR_PLL<br>B[3:0] | MULB       | FREQ_VCO[1:0]<br>] | DIVB[7:0] |
| 8         | 200        | 0           | 3        | 3                    | 24         | 2                  | 1         |
| 10        | 180        | 0           | 3        | 3                    | 17         | 2                  | 1         |
| 12        | 180        | 0           | 3        | 3                    | 14         | 2                  | 1         |
| 12        | 120        | 0           | 3        | 3                    | 9          | 1                  | 1         |
| 10        | 120        | 0           | 3        | 3                    | 11         | 1                  | 1         |
| 10        | 100        | 0           | 3        | 3                    | 9          | 1                  | 1         |
| 10        | 90         | 0           | 3        | 2                    | 8          | 1                  | 1         |

## 27. Power Management Controller (PMC)

### 27.1 Description

The Power Management Controller (PMC) optimizes power consumption by controlling user peripheral clocks. The PMC enables/disables the clock inputs to many of the peripherals.

The Supply Controller selects the source of TD\_SLCK of the real-time part (RTT/RTC) and the MD\_SLCK of the rest of the System Controller (watchdog, so on) separately. If the two sections are fed by the same clock, the unused oscillator is disabled automatically so that power consumption is optimized.

By default, at start-up, the chip runs out of MCK using the Main RC oscillator running at 4 MHz.

### 27.2 Embedded Characteristics

The Power Management Controller provides the following clocks:

- Master Clock (MCK), programmable from a few hundred Hz to the maximum operating frequency of the device. It is available to the modules running permanently.
- Processor Clock (HCLK)
- Free-running processor Clock (FCLK)
- Cortex-M7 SysTick external clock
- Peripheral Clocks with independent ON/OFF control, provided to the peripherals
- Programmable Clock Outputs (PCKx), selected from the clock generator outputs to drive the device PCK pins
- Generic Clock (GCLK) with controllable division and ON/OFF control, dependent or not on MCK and HCLK, and provided to selected peripherals.

The Power Management Controller also provides the following features on clocks:

- A external Main clock failure detector
- A 32.768 kHz external slow clock frequency monitor
- A frequency counter on external Main clock or Main RC oscillator
- Two embedded RC oscillators with on-the-fly adjustable frequencies

## 27.6 Core and Bus Independent Clocks for Peripherals

Some peripherals can operate while the core, bus and peripheral clock frequencies are modified, thus providing communications at a bit rate which is independent for the core/bus/peripheral clock. This mode of operation is possible by using the internally-generated independent clock sources. See [Peripheral and Generic Clock Controller](#). For a list of peripherals supporting the independent clock (GCLK), refer to table “Peripheral Identifiers”, in section “Peripherals”.

## 27.7 Peripheral and Generic Clock Controller

The PMC controls the clocks of the embedded peripherals by means of the Peripheral Control register (PMC\_PCR). With this register, the user can enable and disable the different clocks used by the peripherals:

- Peripheral clocks (periph\_clk[PID]), routed to every peripheral and derived from the master clock (MCK)
- Generic clocks (GCLK[PID]), routed to selected peripherals only (refer to the Peripheral Identifiers table in section Peripherals). These clocks could be independent of the core and bus clocks (HCLK, MCK and periph\_clk[PID]). They are generated by selection and division of the following sources: RC2CK, MD\_SLCK, MAINCK, PLLBCK, PLLACK and MCK. Refer to the description of each peripheral for the limitation to be applied to GCLK[PID] compared to periph\_clk[PID].

To configure a peripheral's clocks, PMC\_PCR.CMD must be written to '1' and PMC\_PCR.PID must be written with the index of the corresponding peripheral. All other configuration fields must be correctly set.

To read the current clock configuration of a peripheral, PMC\_PCR.CMD must be written to '0' and PMC\_PCR.PID must be written with the index of the corresponding peripheral regardless of the values of other fields. This write does not modify the configuration of the peripheral. The PMC\_PCR can then be read to know the configuration status of the corresponding PID.

The status of the peripheral clock activity can be read in the Peripheral Clock Status registers (PMC\_CSRx).

When a periph\_clk or a GCLK is disabled, it is immediately stopped.

It is forbidden to modify the source or the division ratio of a GCLK when it is in use. It must first be disabled.

To stop a peripheral clock, it is recommended that the system software wait until the peripheral has executed its last programmed operation before disabling the clock. This is to avoid data corruption or erroneous behavior of the system.

The bit number in PMC\_CSRx is the Peripheral Identifier defined at the product level. The bit number corresponds to the interrupt source number assigned to the peripheral.

## 27.8 Free-running Processor Clock

The free-running Processor clock (FCLK) is used for sampling interrupts and clocking debug blocks.

## 27.9 Programmable Clock Output Controller

The PMC controls four signals to be output on the external pins PCKx. Each signal can be independently programmed via the Programmable Clock registers (PMC\_PCKx).

PCKx can be independently selected between MD\_SLCK, MAINCK, PLLACK, PLLBCK and MCK by configuring PMC\_PCKx.CSS. Each output signal can also be divided by 1 to 256 by configuring PMC\_PCKx.PRES.

Each output signal can be enabled and disabled by writing a '1' to the corresponding bits PMC\_SCER.PCKx and PMC\_SCDR.PCKx, respectively. The status of the active programmable output clocks is given in PMC\_SCSR.PCKx.

The status flag `PMC_SR.PCKRDYx` indicates that `PCKx` is actually what has been programmed in registers `PMC_PCKx`.

As the Programmable Clock Controller does not manage with glitch prevention when switching clocks, it is strongly recommended to disable `PCKx` before any configuration change and to re-enable it after the change is performed.

## 27.10 External Main Clock Failure Detection

The external Main clock failure detector monitors the external Main clock against the Slow RC oscillator and provides an automatic switchover of the `MAINCK` source to the Main RC oscillator in case of failure detection.

The failure detector can be enabled or disabled by configuring `CKGR_MOR.CFDEN`. It is also disabled in either of the following cases:

- After a `VDDCORE` reset
- When the external Main clock is disabled (`MOSCXTEN = 0`)

A failure is detected by means of a counter incrementing on the external Main clock output and detection logic is triggered by the Slow RC oscillator which is automatically enabled when `CFDEN = 1`.

The counter is cleared when the Slow RC oscillator clock signal is low and enabled when the signal is high. Thus, the failure detection time is one Slow RC oscillator period. If, during the high level period of the Slow RC oscillator clock signal, less than eight external Main clock clock periods have been counted, then a failure is reported. Note that when enabling the failure detector, up to two cycles of the Slow RC oscillator are needed to detect a failure of the external Main clock.

If a failure of external Main clock is detected, `PMC_SR.CFDEV` and `PMC_SR.FOS` both indicate a failure event. `PMC_SR.CFDEV` is cleared on read of `PMC_SR`, and `PMC_SR.FOS` is cleared by writing a '1' to the `FOCLR` bit in the Fault Output Clear register (`PMC_FOCLR`).

Only `PMC_SR.CFDEV` can generate an interrupt if the corresponding interrupt source is enabled in `PMC_IER`. The current status of the clock failure detection can be read at any time from `PMC_SR.CFDS`.

**Figure 27-2.** Clock Failure Detection Example

Note: Ratio of clock periods is for illustration purposes only.

If the external Main clock is selected as the source clock of `MAINCK` (`CKGR_MOR.MOSCSEL = 1`), and if the `MCK` source is `PLLACK` (`CSS = 2`), a clock failure detection automatically forces `MAINCK` to be the source clock for `MCK`. Then, regardless of the PMC configuration, a clock failure detection automatically forces the Main RC oscillator to be the source clock for `MAINCK`. If the Main RC oscillator is disabled when a clock failure detection occurs, it is automatically re-enabled by the clock failure detection mechanism.

Two Slow RC oscillator clock cycles are necessary to detect and switch from the external Main clock to the Main RC oscillator if the source of `MCK` is `MAINCK`, or three Slow RC oscillator clock cycles if the source of `MCK` is `PLLACK`.

A clock failure detection activates a fault output that is connected to the Pulse Width Modulator (PWM) Controller. With this connection, the PWM controller is able to force its outputs and to protect the driven device, if a clock failure is detected.

## 27.11 32.768 kHz External Slow Clock Frequency Monitor

The frequency of the 32.768 kHz external slow clock can be monitored by means of logic driven by the Main RC oscillator known as a reliable clock source. This function is enabled by configuring the EXT32KFME bit of CKGR\_MOR. Prior to enabling this frequency monitor, the 32.768 kHz external slow clock must be started and its start-up time be elapsed. Refer to details on the Slow clock generator in the section “Supply Controller (SUPC)”.

An error flag (EXT32KERR in PMC\_SR) is asserted when the 32.768 kHz external slow clock frequency is out of the  $\pm 10\%$  nominal frequency value (i.e., 32.768 kHz). The error flag can be cleared only if the frequency monitor is disabled.

The monitored clock frequency is declared invalid if at least 4 consecutive clock period measurement results are over the nominal period  $\pm 10\%$ . Note that modifying the trimming values of the Main RC oscillator (PMC\_OCR1) may impact the monitor accuracy and lead to inappropriate failure detection.

Due to the possible frequency variation of the Main RC oscillator acting as reference clock for the monitor logic, any 32.768 kHz external slow clock deviation over  $\pm 10\%$  of the nominal frequency is systematically reported as an error by means of PMC\_SR.EXT32KERR. Between -1% and -10% and +1% and +10%, the error is not systematically reported.

Thus only a external clock running at 32.768 kHz frequency ensures that the error flag will not be asserted. The permitted drift of the crystal is 10000 ppm (1%), which allows any standard crystal to be used.

If the Main RC oscillator frequency range needs to be changed while the frequency monitor is operating, the monitoring must be stopped prior to change the Main RC oscillator frequency. Then it can be re-enabled as soon as PMC\_SR.MOSCRCS is set.

The error flag can be defined as an interrupt source of the PMC by setting PMC\_IER.EXT32KERR. This flag is also routed to the RSTC and may generate a reset of the device.

## 27.12 CPU Frequency Monitor

The frequency of the processor clock (HCLK) can be monitored through MCK with the Main RC oscillator. This monitoring can only be performed if the MCK frequency is at least 3 times faster than the embedded Main RC oscillator. This function is enabled by writing a '1' to CKGR\_MOR.BCPUNMIC, CKGR\_MOR.BCPURST, or PMC\_IER.CPUMON.

An error on the CPU frequency can lead to a PMC interrupt, an NMIC interrupt or a reset of the system (refer to sections “Non-Maskable Interrupt Controller (NMIC)” and/or “Reset Controller (RSTC)”).

When the corresponding PMC interrupt is enabled, the status of the CPU monitoring can be read on the PMC\_SR.CPUMON. This status is cleared on read.

Once enabled, the monitor continuously counts the number of MCK cycles within 15 cycles of the embedded Main RC oscillator. The result is then compared to threshold values defined in the PMC\_CPULIM register. Two levels of thresholds can be defined: a first couple of values defines thresholds to generate an interrupt and a second couple of values defines thresholds to generate a reset of the system.

**Figure 27-3.** CPU Frequency Monitor Block Diagram

## 27.13 Recommended Programming Sequence

Follow the steps below to program the PMC:

1. If the external Main clock is not required, the PLLA and divider can be directly configured ([Step 6.](#)) else this oscillator must be started ([Step 2.](#)).
2. Enable the Main crystal oscillator by setting CKGR\_MOR.MOSCXTEN. The user can define a start-up time. This can be done by configuring CKGR\_MOR.MOSCXTST. Once this register has been correctly configured, the user must wait for PMC\_SR.MOSCXTS to be set. This can be done either by polling PMC\_SR.MOSCXTS, or by waiting for the interrupt line to be raised if the associated interrupt source (MOSCXTS) has been enabled in PMC\_IER.
3. Switch MAINCK to the external Main clock by setting CKGR\_MOR.MOSCSEL.
4. Wait for PMC\_SR.MOSCSELS to be set to ensure the switch is complete.
5. Check MAINCK frequency:  
This frequency can be measured via CKGR\_MCFR.  
Read CKGR\_MCFR until the MAINFRDY field is set, after which the user can read CKGR\_MCFR.MAINF by performing an additional read. This provides the number of Main clock cycles that have been counted during a period of 16 MD\_SLCK cycles.  
If MAINF = 0, switch MAINCK to the Main RC Oscillator by clearing CKGR\_MOR.MOSCSEL. If MAINF ≠ 0, proceed to [Step 6.](#)
6. Set PLLA and Divider (if not required, proceed to [Step 7.](#)):  
All parameters needed to configure PLLA and the divider are located in CKGR\_PLLAR.  
CKGR\_PLLAR.DIVA is used to control the divider. This parameter can be programmed between 0 and 25. The divider output is divider input divided by DIVA. By default, DIVA is cleared, meaning that the divider and PLLA are turned off. The internal RC filter and the output current are located in PMC\_PLL\_CFG. They are configured depending on the required PLL frequency input and the frequency output to ensure PLL stability.  
CKGR\_PLLAR.MULA is the PLLA multiplier factor. This parameter can be programmed between 0 and 25. If MULA is cleared, PLLA will be turned off, otherwise the PLLA output frequency is PLLA input frequency multiplied by (MULA + 1).  
CKGR\_PLLAR.PLLACOUNT specifies the number of MD\_SLCK cycles before PMC\_SR.LOCKA is set after CKGR\_PLLAR has been written.  
Once CKGR\_PLLAR has been written, the user must wait for PMC\_SR.LOCKA to be set. This can be done either by polling PMC\_SR.LOCKA or by waiting for the interrupt line to be raised if the associated interrupt source (LOCKA) has been enabled in PMC\_IER. All fields in CKGR\_PLLAR can be programmed in a single write operation. If MULA or DIVA is modified, the LOCKA bit goes low

to indicate that PLLA is not yet ready. When PLLA is locked, LOCKA is set again. The user must wait for the LOCKA bit to be set before using the PLLA output clock.

7. Select MCK and HCLK:

MCK and HCLK are configurable via PMC\_MCKR.

CSS is used to select the clock source of MCK and HCLK. By default, the selected clock source is MAINCK.

PRES is used to define the HCLK and MCK prescalers. The user can choose between 1, 2, 4, 8, 16, 32, 64 division factors. Prescaler output is the selected clock source frequency divided by the PRES value.

MDIV is used to define the MCK divider. It is possible to choose between different values (0 or 1). MCK output is the HCLK frequency divided by 1 or 2, depending on the value programmed in MDIV.

By default, MDIV is cleared, which indicates that the HCLK is equal to MCK.

Once the PMC\_MCKR has been written, the user must wait for PMC\_SR.MCKRDY to be set. This can be done either by polling PMC\_SR.MCKRDY or by waiting for the interrupt line to be raised if the associated interrupt source (MCKRDY) has been enabled in PMC\_IER. PMC\_MCKR must not be programmed in a single write operation. The programming sequence for PMC\_MCKR is as follows:

If a new value for PMC\_MCKR.CSS corresponds to any of the available PLL clocks:

- a. Program PMC\_MCKR.PRES.
- b. Wait for PMC\_SR.MCKRDY to be set.
- c. Program PMC\_MCKR.MDIV.
- d. Wait for PMC\_SR.MCKRDY to be set.
- e. Program PMC\_MCKR.CSS.
- f. Wait for PMC\_SR.MCKRDY to be set.

If a new value for PMC\_MCKR.CSS corresponds to MAINCK or MD\_SLCK:

- a. Program PMC\_MCKR.CSS.
- b. Wait for PMC\_SR.MCKRDY to be set.
- c. Program PMC\_MCKR.PRES.
- d. Wait for PMC\_SR.MCKRDY to be set.

If CSS, MDIV or PRES are modified at any stage, the MCKRDY bit goes low to indicate that MCK and HCLK are not yet ready. The user must wait for MCKRDY bit to be set again before using MCK and HCLK.

**Note:** If PLLA clock was selected as MCK and the user decides to modify it by writing a new value into CKGR\_PLLAR, the MCKRDY flag will go low while PLLA is unlocked. Once PLLA is locked again, LOCKA goes high and MCKRDY is set.

While PLLA is unlocked, MCK selection is automatically changed to MD\_SLCK for PLLA. For further information, see [Clock Switching Waveforms](#).

8. Select the Programmable clocks (PCKx):

PCKx are controlled via registers PMC\_SCER, PMC\_SCDR and PMC\_SCSR.

PCKx can be enabled and/or disabled via PMC\_SCER and PMC\_SCDR. Three PCKx can be used. PMC\_SCSR indicates which PCKx is enabled. By default all PCKx are disabled.

PMC\_PCKx registers are used to configure PCKx.

PMC\_PCKx.CSS is used to select the PCKx divider source. Several clock options are available:

- MAINCK
- MD\_SLCK
- MCK

- PLLACK
- PLLBCK

MD\_SLCK is the default clock source.

PMC\_PCKx.PRES is used to control the PCKx prescaler. It is possible to choose between different values (1 to 256). PCKx output is prescaler input divided by PRES. By default, the PRES value is cleared which means that PCKx is equal to Slow clock.

Once PMC\_PCKx has been configured, the corresponding PCKx must be enabled and the user must wait for PMC\_SR.PCKRDYx to be set. This can be done either by polling PMC\_SR.PCKRDYx or by waiting for the interrupt line to be raised if the associated interrupt source (PCKRDYx) has been enabled in PMC\_IER. All parameters in PMC\_PCKx can be programmed in a single write operation.

If the PMC\_PCKx.CSS and PMC\_PCKx.PRES parameters are to be modified, the corresponding PCKx must be disabled first. The parameters can then be modified. Once this has been done, the user must re-enable PCKx and wait for the PCKRDYx bit to be set.

#### 9. Enable the peripheral clocks

Once all of the previous steps have been completed, the peripheral clocks can be enabled and/or disabled via register PMC\_PCR.

## 27.14 Clock Switching Details

### 27.14.1 Master Clock Switching Timings

The tables below give the worst case timings required for MCK to switch from one selected clock to another one. This is in the event that the prescaler is deactivated. When the prescaler is activated, an additional time of 64 clock cycles of the newly selected clock has to be added.

**Table 27-1.** Clock Switching Timings (Worst Case)

| From<br>To | MAINCK                                                                                                                       | MD_SLCK                                                                                           | PLL Clock                                                                       |
|------------|------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| MAINCK     | –                                                                                                                            | $4 \times \text{MD\_SLCK} + 2.5 \times \text{MAINCK}$                                             | $3 \times \text{PLL Clock} + 4 \times \text{MD\_SLCK} + 1 \times \text{MAINCK}$ |
| MD_SLCK    | $0.5 \times \text{MAINCK} + 4.5 \times \text{MD\_SLCK}$                                                                      | –                                                                                                 | $3 \times \text{PLL Clock} + 5 \times \text{MD\_SLCK}$                          |
| PLL Clock  | $0.5 \times \text{MAINCK} + 4 \times \text{MD\_SLCK} + \text{PLLCOUNT} \times \text{MD\_SLCK} + 2.5 \times \text{PLL Clock}$ | $2.5 \times \text{PLL Clock} + 5 \times \text{MD\_SLCK} + \text{PLLCOUNT} \times \text{MD\_SLCK}$ | See table below (Clock Switching Timings between Two PLLs (Worst Case))         |

#### Notes:

1. PLL designates any available PLL of the Clock Generator.
2. PLLCOUNT designates either PLLACOUNT or PLLBCOUNT.

**Table 27-2.** Clock Switching Timings between Two PLLs (Worst Case)

| From<br>To | PLLACK                                                                         | PLLBCK                                                                         |
|------------|--------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| PLLACK     | –                                                                              | $3 \times \text{PLLACK} + 4 \times \text{MD\_SLCK} + 1.5 \times \text{PLLACK}$ |
| PLLBCK     | $3 \times \text{PLLBCK} + 4 \times \text{MD\_SLCK} + 1.5 \times \text{PLLBCK}$ | –                                                                              |

### 27.14.2 Clock Switching Waveforms

In the following figures, Slow Clock designates MD\_SLCK.

**Figure 27-4.** Switch Master Clock (MCK) from Slow Clock to PLLA Clock

**Figure 27-5.** Switch Master Clock (MCK) from Main Clock (MAINCK) to Slow Clock

**Figure 27-6. Change PLLA Programming****Figure 27-7. Programmable Clock Output Programming**

## 27.15 Register Write Protection

To prevent any single software error from corrupting PMC behavior, certain registers in the address space can be write-protected by setting the WPEN bit or the WPITEN bit in the [PMC Write Protection Mode Register](#) (PMC\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the [PMC Write Protection Status Register](#) (PMC\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the PMC\_WPSR.

The following registers are write-protected when the WPEN bit is set in PMC\_WPMR:

- [PMC System Clock Enable Register](#)
- [PMC System Clock Disable Register](#)
- [PMC Clock Generator Main Oscillator Register](#)
- [PMC Clock Generator Main Clock Frequency Register](#)
- [PMC Clock Generator PLLA Register](#)
- [PMC Clock Generator PLLB Register](#)
- [PMC Master Clock Register](#)
- [PMC Programmable Clock Register](#)
- [PMC PLL Configuration Register](#)
- [PMC Oscillator Calibration Register](#)
- [PLL Maximum Multiplier Value Register](#)
- [PMC Oscillator Calibration Register 2](#)

The following interrupt registers are write-protected when the WPITEN bit is set in PMC\_WPMR:

- [PMC Interrupt Enable Register](#)
- [PMC Interrupt Disable Register](#)

## 27.16 Register Summary

| Offset              | Name       | Bit Pos. | 7             | 6            | 5              | 4        | 3         | 2          | 1          | 0        |          |
|---------------------|------------|----------|---------------|--------------|----------------|----------|-----------|------------|------------|----------|----------|

### Bit 28 – BCPUNMIC Bad CPU Clock Interrupt to NMIC Enable

| Value | Description                                                                        |
|-------|------------------------------------------------------------------------------------|
| 0     | A CPU clock failure has no effect on the Non Maskable Interrupt Controller (NMIC). |
| 1     | A CPU clock failure detection sends an interrupt signal to the NMIC.               |

### Bit 27 – BCPURST Bad CPU Clock Reset Enable

| Value | Description                                                                                           |
|-------|-------------------------------------------------------------------------------------------------------|
| 0     | A CPU clock failure detection cannot reset the system.                                                |
| 1     | A CPU clock failure detection can reset the system if the reset controller is configured accordingly. |

### Bit 26 – EXT32KFME 32.768 kHz External Slow Clock Frequency Monitoring Enable

| Value | Description                                                          |
|-------|----------------------------------------------------------------------|
| 0     | The 32.768 kHz external slow clock frequency monitoring is disabled. |
| 1     | The 32.768 kHz external slow clock frequency monitoring is enabled.  |

### Bit 25 – CFDEN Clock Failure Detector Enable

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | The clock failure detector is disabled. |
| 1     | The clock failure detector is enabled.  |

### Bit 24 – MOSCSSEL Main Clock Oscillator Selection

| Value | Description                          |
|-------|--------------------------------------|
| 0     | The Main RC oscillator is selected.  |
| 1     | The external Main clock is selected. |

**Bits 23:16 – KEY[7:0] Write Access Password**

| Value | Name   | Description                                                                             |
|-------|--------|-----------------------------------------------------------------------------------------|
| 0x37  | PASSWD | Writing any other value in this field aborts the write operation.<br>Always reads as 0. |

**Bits 15:8 – MOSCXTST[7:0] External Main Clock Start-up Time**

Specifies the number of MD\_SLCK cycles multiplied by 8 for the external Main clock start-up time.

**Bits 6:4 – MOSCRCF[2:0] Main RC Oscillator Frequency Selection**

At start-up, the Main RC oscillator frequency is 4 MHz.

MOSCRCF must be changed only if MOSCRCS is set in the PMC\_SR. Therefore MOSCRCF and MOSCRCS cannot be changed at the same time.

| Value | Name   | Description                                    |
|-------|--------|------------------------------------------------|
| 0     | 4_MHz  | The Main RC oscillator frequency is at 4 MHz.  |
| 1     | 8_MHz  | The Main RC oscillator frequency is at 8 MHz.  |
| 2     | 10_MHz | The Main RC oscillator frequency is at 10 MHz. |
| 3     | 12_MHz | The Main RC oscillator frequency is at 12 MHz. |

**Bit 3 – MOSCRCS Main RC Oscillator Enable**

When MOSCRCS is set, the MOSCRCS flag is set once the Main RC oscillator start-up time is achieved.

| Value | Description                         |
|-------|-------------------------------------|
| 0     | The Main RC oscillator is disabled. |
| 1     | The Main RC oscillator is enabled.  |

**Bit 1 – MOSCXTBY Main Crystal Oscillator Bypass**

When MOSCXTBY is set, the MOSCXTS flag in PMC\_SR is automatically set.

Clearing MOSCXTEN and MOSCXTBY bits clears the MOSCXTS flag.

When the crystal oscillator bypass is disabled (MOSCXTBY = 0), the MOSCXTS flag must be read at '0' in PMC\_SR before enabling the crystal oscillator (MOSCXTEN = 1).

| Value | Description                                                                                                    |
|-------|----------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                     |
| 1     | The Main crystal oscillator is bypassed. MOSCXTEN must be cleared. An external clock must be connected on XIN. |

**Bit 0 – MOSCXTEN Main Crystal Oscillator Enable**

A crystal must be connected between XIN and XOUT.

When MOSCXTEN is set, the MOSCXTS flag is set once the Main crystal oscillator start-up time is achieved.

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | The Main crystal oscillator is disabled.                          |
| 1     | The Main crystal oscillator is enabled. MOSCXTBY must be cleared. |

## 27.16.5 PMC Clock Generator Main Clock Frequency Register

**Name:** CKGR\_MCFR  
**Offset:** 0x0024  
**Reset:** 0x0001147F  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PMC Write Protection Mode Register](#).

|        |    |    |    |    |    |    |    |      |

|        | MAINF[15:8] |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 1   | 0   | 1   | 0   | 0   |

|        |            |     |     |     |     |     |     |     |
|--------|------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 7          | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | MAINF[7:0] |     |     |     |     |     |     |     |
| Access | R/W        | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0          | 1   | 1   | 1   | 1   | 1   | 1   | 1   |

### Bit 24 – CCSS Counter Clock Source Selection

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | The measured clock of the MAINF counter is the Main RC oscillator.  |
| 1     | The measured clock of the MAINF counter is the external Main clock. |

### Bit 20 – RCMEAS RC Oscillator Frequency Measure (write-only)

The measurement is performed on the main frequency (i.e., not limited to the Main RC oscillator only). If the source of MAINCK is the external Main clock, the restart of measurement may not be required because of the stability of external clocks.

| Value | Description                                                                                                                                     |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                      |
| 1     | Restarts measuring of the frequency of MAINCK. MAINF carries the new frequency as soon as a low-to-high transition occurs on the MAINFRDY flag. |

### Bit 16 – MAINFRDY Main Clock Frequency Measure Ready

To ensure that a correct value is read on the MAINF field, the MAINFRDY flag must be read at '1' then another read access must be performed on the register to get a stable value on the MAINF field.

| Value | Description                                                                                                            |
|-------|------------------------------------------------------------------------------------------------------------------------|
| 0     | MAINF value is not valid or the measured oscillator is disabled or a measure has just been started by means of RCMEAS. |
| 1     | The measured oscillator has been enabled previously and MAINF value is available.                                      |

### Bits 15:0 – MAINF[15:0] Main Clock Frequency

Gives the number of cycles of the clock selected by the bit CCSS within 16 MD\_SLCK periods. To calculate the frequency of the measured clock:

$f_{\text{SELCLK}} = (\text{MAINF} \times f_{\text{MD\_SLCK}})/16$   
where frequency is in MHz.

## 27.16.6 PMC Clock Generator PLLA Register

**Name:** CKGR\_PLLAR  
**Offset:** 0x0028  
**Reset:** 0x00003F00  
**Property:** Read/Write

Possible limitations on PLLA input frequencies and multiplier factors should be checked before using the PMC.

This register can only be written if the WPEN bit is cleared in the [PMC Write Protection Mode Register](#).

Bit 29 must always be set to '1' when programming the CKGR\_PLLAR.

|        |               |     |     |                |     |            |     |     |
|--------|---------------|-----|-----|----------------|-----|------------|-----|-----|
| Bit    | 31            | 30  | 29  | 28             | 27  | 26         | 25  | 24  |

### Bit 29 – ONE Must Be Set to 1

Bit 29 must always be set to '1' when programming CKGR\_PLLAR.

### Bits 26:16 – MULA[10:0] PLLA Multiplier

Unlisted values are forbidden.

| Value      | Description                                                         |
|------------|---------------------------------------------------------------------|
| 0          | The PLLA is disabled (PLLA also disabled if DIVA = 0).              |
| 1 up to 25 | PLLCK frequency is the PLLA input frequency multiplied by MULA + 1. |
| 26 to 56   | Reserved.                                                           |

### Bits 15:14 – FREQ\_VCO[1:0] VCO Frequency Configuratio

| Value | Name | Description                    |
|-------|------|--------------------------------|
| 0     | VCO0 | Frequency range: 40 – 80 MHz   |
| 1     | VCO1 | Frequency range: 70 – 150 MHz  |
| 2     | VCO2 | Frequency range: 125 – 275 MHz |
| 3     | VCO3 | Frequency range: 250 – 450 MHz |

**Bits 13:8 – PLLACOUNT[5:0] PLLA Counter**

Specifies the number of MD\_SLCK cycles before the LOCKA bit is set in PMC\_SR after CKGR\_PLLAR is written.

**Bits 7:0 – DIVA[7:0] PLLA Front End Divider**

| Value  | Name   | Description                                            |
|--------|--------|--------------------------------------------------------|
| 0      | 0      | PLLA is disabled.                                      |
| 1      | BYPASS | Divider is bypassed (divide by 1) and PLLA is enabled. |
| 2–64   | DIV    | Divider output is the selected clock divided by DIVA.  |
| 65–255 | –      | Reserved                                               |

## 27.16.7 PMC Clock Generator PLLB Register

**Name:** CKGR\_PLLBR  
**Offset:** 0x002C  
**Reset:** 0x00003F00  
**Property:** Read/Write

Possible limitations on PLLB input frequencies and multiplier factors should be checked before using the PMC.

This register can only be written if the WPEN bit is cleared in the [PMC Write Protection Mode Register](#).

|        |               |     |                |     |     |            |     |     |
|--------|---------------|-----|----------------|-----|-----|------------|-----|-----|

|        | DIVB[7:0]     |     |                |     |     |            |     |     |
| Access | R/W           | R/W | R/W            | R/W | R/W | R/W        | R/W | R/W |
| Reset  | 0             | 0   | 0              | 0   | 0   | 0          | 0   | 0   |

### Bits 30:29 – SRCB[1:0] PLLB Source Clock Selection

| Value | Name   | Description                         |
|-------|--------|-------------------------------------|
| 0     | MAINCK | MAINCK is the source clock of PLLB. |
| 1     | RC2CK  | RC2CK is the source clock of PLLB.  |
| 2     | RC2CK  | RC2CK is the source clock of PLLB.  |
| 3     | RC2CK  | RC2CK is the source clock of PLLB.  |

### Bits 26:16 – MULB[10:0] PLLB Multiplier

Unlisted values are forbidden.

| Value      | Description                                                         |
|------------|---------------------------------------------------------------------|
| 0          | The PLLB is disabled (PLLB also disabled if DIVB = 0).              |
| 1 up to 25 | PLLCK frequency is the PLLB input frequency multiplied by MULB + 1. |
| 26 to 56   | Reserved.                                                           |

### Bits 15:14 – FREQ\_VCO[1:0] VCO Frequency Configuration

| Value | Name | Description                    |
|-------|------|--------------------------------|
| 0     | VCO0 | Frequency range: 40 – 80 MHz   |
| 1     | VCO1 | Frequency range: 70 – 150 MHz  |
| 2     | VCO2 | Frequency range: 125 – 275 MHz |
| 3     | VCO3 | Frequency range: 250 – 450 MHz |

**Bits 13:8 – PLLBCOUNT[5:0] PLLB Counter**

Specifies the number of MD\_SLCK cycles before the LOCKB bit is set in PMC\_SR after CKGR\_PLLBR is written.

**Bits 7:0 – DIVB[7:0] PLLB Front End Divider**

| Value  | Name   | Description                                            |
|--------|--------|--------------------------------------------------------|
| 0      | 0      | PLLB is disabled.                                      |
| 1      | BYPASS | Divider is bypassed (divide by 1) and PLLB is enabled. |
| 2–64   | DIV    | Divider output is the selected clock divided by DIVB.  |
| 65–255 | –      | Reserved                                               |

### 27.16.8 PMC Master Clock Register

**Name:** PMC\_MCKR  
**Offset:** 0x0030  
**Reset:** 0x00000001  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PMC Write Protection Mode Register](#).

|        |    |     |           |     |    |    |          |      |
|--------|----|-----|-----------|-----|----|----|----------|------|
| Bit    | 31 | 30  | 29        | 28  | 27 | 26 | 25       | 24   |
|        |    |     |           |     |    |    |          |      |

| Access |    | R/W | R/W       | R/W |    |    | R/W      | R/W  |
| Reset  |    | 0   | 0         | 0   |    |    | 0        | 1    |

**Bit 13 – ZERO** Must be set to zero.  
 Bit 13 must always be set to '0' when programming PMC\_MCKR.

**Bit 8 – MDIV** Master Clock Division

| Value | Name     | Description               |
|-------|----------|---------------------------|
| 0     | EQ_PCK   | MCK is FCLK divided by 1. |
| 1     | PCK_DIV2 | MCK is FCLK divided by 2. |

**Bits 6:4 – PRES[2:0]** Processor Clock Prescaler  
 Selected clock divided by PRES

| Value | Name   | Description                  |
|-------|--------|------------------------------|
| 0     | CLK_1  | Selected clock               |
| 1     | CLK_2  | Selected clock divided by 2  |
| 2     | CLK_4  | Selected clock divided by 4  |
| 3     | CLK_8  | Selected clock divided by 8  |
| 4     | CLK_16 | Selected clock divided by 16 |
| 5     | CLK_32 | Selected clock divided by 32 |
| 6     | CLK_64 | Selected clock divided by 64 |
| 7     | –      | Reserved                     |

**Bits 1:0 – CSS[1:0]** Master Clock Source Selection

| Value | Name     | Description         |
|-------|----------|---------------------|
| 0     | SLOW_CLK | MD_SLCK is selected |
| 1     | MAIN_CLK | MAINCK is selected  |
| 2     | PLLA_CLK | PLLACK is selected  |

| Value | Name | Description |
|-------|------|-------------|
| 3     | -    | Reserved    |

### 27.16.9 PMC Programmable Clock Register

**Name:** PMC\_PCKx  
**Offset:** 0x40 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PMC Write Protection Mode Register](#).

|        |           |     |     |     |           |          |     |     |

#### Bits 11:4 – PRES[7:0] Programmable Clock Prescaler

| Value | Description                          |
|-------|--------------------------------------|
| 0–255 | Selected clock is divided by PRES+1. |

#### Bits 2:0 – CSS[2:0] Programmable Clock Source Selection

| Value | Name     | Description            |
|-------|----------|------------------------|
| 0     | SLOW_CLK | MD_SLCK is selected    |
| 1     | MAIN_CLK | MAINCK is selected     |
| 2     | PLLA_CLK | PLLACK is selected     |
| 3     | PLLB_CLK | PLLBACKDIV is selected |
| 4     | MCK      | MCK is selected        |

### 27.16.10 PMC Interrupt Enable Register

**Name:** PMC\_IER  
**Offset:** 0x0060  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [PMC Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Access | W  |    | W  |    |    | W  | W  | W  |
| Reset  | –  |    | –  |    |    | –  | –  | –  |
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
| Access |    |    |    |    | W  | W  | W  | W  |
| Reset  |    |    |    |    | –  | –  | –  | –  |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Access |    |    |    |    | W  | W  | W  | W  |
| Reset  |    |    |    |    | –  | –  | –  | –  |

**Bit 23 – CPUMON** CPU Clock Monitor Interrupt Enable

**Bit 21 – EXT32KERR** 32.768 kHz External Slow Clock Error Interrupt Enable

**Bit 18 – CFDEV** Clock Failure Detector Event Interrupt Enable

**Bit 17 – MOSCRCS** Main RC Oscillator Status Interrupt Enable

**Bit 16 – MOSCSELS** Main Clock Source Oscillator Selection Status Interrupt Enable

**Bits 8, 9, 10, 11 – PCKRDYx** Programmable Clock Ready x Interrupt Enable

**Bit 3 – MCKRDY** Master Clock Ready Interrupt Enable

**Bit 2 – LOCKB** PLLB Lock Interrupt Enable

**Bit 1 – LOCKA** PLLA Lock Interrupt Enable

**Bit 0 – MOSCXTS** External Main Clock Status Interrupt Enable

## 27.16.11 PMC Interrupt Disable Register

**Name:** PMC\_IDR  
**Offset:** 0x0064  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [PMC Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Access | W  |    | W  |    |    | W  | W  | W  |
| Reset  | –  |    | –  |    |    | –  | –  | –  |
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
| Access |    |    |    |    | W  | W  | W  | W  |
| Reset  |    |    |    |    | –  | –  | –  | –  |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Access |    |    |    |    | W  | W  | W  | W  |

**Bit 23 – CPUMON** CPU Clock Monitor Error

This status is cleared on read.

| Value | Description                                                                                                           |
|-------|-----------------------------------------------------------------------------------------------------------------------|
| 0     | The CPU clock is correct or the CPU clock monitor is disabled                                                         |
| 1     | The CPU clock is incorrect or has been incorrect for an elapsed period of time since the monitoring has been enabled. |

**Bit 21 – EXT32KERR** External Slow Clock Error

| Value | Description                                                                                                                                                 |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The frequency of the 32.768 kHz external slow clock is correct (32.768 kHz±1%) or the monitoring is disabled.                                               |
| 1     | The frequency of the 32.768 kHz external Main clock is incorrect or has been incorrect for an elapsed period of time since the monitoring has been enabled. |

**Bit 20 – FOS** Clock Failure Detector Fault Output Status

| Value | Description                                                                                                             |
|-------|-------------------------------------------------------------------------------------------------------------------------|
| 0     | The fault output of the clock failure detector is inactive.                                                             |
| 1     | The fault output of the clock failure detector is active. This status is cleared by writing a '1' to FOCLR in PMC_FOCR. |

**Bit 19 – CFDS** Clock Failure Detector Status

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | A clock failure of the external Main clock is not detected. |
| 1     | A clock failure of the external Main clock is detected.     |

**Bit 18 – CFDEV** Clock Failure Detector Event

| Value | Description                                                                                                 |
|-------|-------------------------------------------------------------------------------------------------------------|
| 0     | No clock failure detection of the external Main clock has occurred since the last read of PMC_SR.           |
| 1     | At least one clock failure detection of the external Main clock has occurred since the last read of PMC_SR. |

**Bit 17 – MOSCRCS Main RC Oscillator Status**

| Value | Description                           |
|-------|---------------------------------------|
| 0     | Main RC oscillator is not stabilized. |
| 1     | Main RC oscillator is stabilized.     |

**Bit 16 – MOSCSELS Main Clock Source Oscillator Selection Status**

| Value | Description               |
|-------|---------------------------|
| 0     | Selection is in progress. |
| 1     | Selection is done.        |

**Bits 8, 9, 10, 11 – PCKRDYx Programmable Clock Ready Status**

| Value | Description                        |
|-------|------------------------------------|
| 0     | Programmable Clock x is not ready. |
| 1     | Programmable Clock x is ready.     |

**Bit 7 – OSCSELS Monitoring Domain Slow Clock Source Oscillator Selection**

| Value | Description                                 |
|-------|---------------------------------------------|
| 0     | Slow RC oscillator is selected.             |
| 1     | 32.768 kHz external slow clock is selected. |

**Bit 3 – MCKRDY Master Clock Status**

| Value | Description                |
|-------|----------------------------|
| 0     | Master Clock is not ready. |
| 1     | Master Clock is ready.     |

**Bit 2 – LOCKB PLLB Lock Status**

| Value | Description        |
|-------|--------------------|
| 0     | PLLB is not locked |
| 1     | PLLB is locked.    |

**Bit 1 – LOCKA PLLA Lock Status**

| Value | Description        |
|-------|--------------------|
| 0     | PLLA is not locked |
| 1     | PLLA is locked.    |

**Bit 0 – MOSCXTS External Main Clock Status**

| Value | Description                            |
|-------|----------------------------------------|
| 0     | External Main clock is not stabilized. |
| 1     | External Main clock is stabilized.     |

### 27.16.13 PMC Interrupt Mask Register

**Name:** PMC\_IMR  
**Offset:** 0x006C  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |        |    |           |    |         |         |         |          |

## Bits 31:30 – SRB[1:0] Internal Filter PLL – Select Internal Resistor Value

| Value | Name       | Description |
|-------|------------|-------------|
| 0     | SR_VAL_24K | 24 Ohms     |
| 1     | SR_VAL_6K  | 6 Ohms      |
| 2     | SR_VAL_3K  | 3 Ohms      |
| 3     | SR_VAL_12K | 12 Ohms     |

## Bits 29:28 – SCB[1:0] Internal Filter PLL – Select Internal Capacitance Value

| Value | Name       | Description |
|-------|------------|-------------|
| 0     | SC_VAL_20p | 20 pF       |
| 1     | SC_VAL_40p | 40 pF       |
| 2     | SC_VAL_30p | 30 pF       |
| 3     | SC_VAL_60p | 60 pF       |

## Bits 19:16 – OUTCUR\_PLLB[3:0] PLLB Output Current

| Value | Name | Description |
|-------|------|-------------|
| 0     | ICP0 | 0.5 mA      |
| 1     | ICP1 | 0.75 mA     |
| 2     | ICP2 | 1 mA        |
| 3     | ICP3 | 1.25 mA     |

## Bits 15:14 – SRA[1:0] Internal Filter PLL – Select Internal Resistor Value

| Value | Name       | Description |
|-------|------------|-------------|
| 0     | SR_VAL_24K | 24 Ohms     |
| 1     | SR_VAL_6K  | 6 Ohms      |

| Value | Name       | Description |
|-------|------------|-------------|
| 2     | SR_VAL_3K  | 3 Ohms      |
| 3     | SR_VAL_12K | 12 Ohms     |

**Bits 13:12 – SCA[1:0] Internal Filter PLL – Select Internal Capacitance Value**

| Value | Name       | Description |
|-------|------------|-------------|
| 0     | SC_VAL_20p | 20 pF       |
| 1     | SC_VAL_40p | 40 pF       |
| 2     | SC_VAL_30p | 30 pF       |
| 3     | SC_VAL_60p | 60 pF       |

**Bits 3:0 – OUTCUR\_PLLA[3:0] PLLA Output Current**

| Value | Name | Description |
|-------|------|-------------|
| 0     | ICP0 | 0.5 mA      |
| 1     | ICP1 | 0.75 mA     |
| 2     | ICP2 | 1 mA        |
| 3     | ICP3 | 1.25 mA     |

## Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                                          |
|----------|--------|------------------------------------------------------------------------------------------------------|
| 0x504D43 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0. |

## Bit 1 – WPITEN Write Protection Interrupt Enable

See [Register Write Protection](#) for the list of registers that can be write-protected.

| Value | Description                                                                                             |
|-------|---------------------------------------------------------------------------------------------------------|
| 0     | Disables the write protection on interrupt registers if WPKEY corresponds to 0x504D43 ("PMC" in ASCII). |
| 1     | Enables the write protection on interrupt registers if WPKEY corresponds to 0x504D43 ("PMC" in ASCII).  |

## Bit 0 – WPEN Write Protection Enable

See [Register Write Protection](#) for the list of registers that can be write-protected.

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | Disables the write protection if WPKEY corresponds to 0x504D43 ("PMC" in ASCII). |
| 1     | Enables the write protection if WPKEY corresponds to 0x504D43 ("PMC" in ASCII).  |

**27.16.17 PMC Write Protection Status Register**

**Name:** PMC\_WPSR  
**Offset:** 0x00E8  
**Reset:** 0x00000000  
**Property:** Read-only

|        |             |    |    |    |    |    |    |      |
|--------|-------------|----|----|----|----|----|----|------|

|        |             |    |    |    |    |    |    |      |
| Access |             |    |    |    |    |    |    |      |
| Reset  |             |    |    |    |    |    |    |      |
| Bit    | 23          | 22 | 21 | 20 | 19 | 18 | 17 | 16   |
|        | WPVSR[15:8] |    |    |    |    |    |    |      |
| Access | R           | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8    |
|        | WPVSR[7:0]  |    |    |    |    |    |    |      |
| Access | R           | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7           | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        |             |    |    |    |    |    |    | WPVS |
| Access |             |    |    |    |    |    |    | R    |
| Reset  |             |    |    |    |    |    |    | 0    |

**Bits 23:8 – WPVSR[15:0] Write Protection Violation Source**

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS Write Protection Violation Status**

| Value | Description                                                                                                                                                                                                       |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protection violation has occurred since the last read of the PMC_WPSR.                                                                                                                                   |
| 1     | A write protection violation has occurred since the last read of the PMC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

## 27.16.18 PMC Peripheral Control Register

**Name:** PMC\_PCR  
**Offset:** 0x010C  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |              |          |        |     |              |     |     |     |

| Access | R/W          | R/W      | R/W    | R/W |              |     |     |     |
| Reset  | 0            | 0        | 0      | 0   |              |     |     |     |
| Bit    | 15           | 14       | 13     | 12  | 11           | 10  | 9   | 8   |
|        |              |          |        | CMD | GCLKCSS[3:0] |     |     |     |
| Access |              |          |        | R/W | R/W          | R/W | R/W | R/W |
| Reset  |              |          |        | 0   | 0            | 0   | 0   | 0   |
| Bit    | 7            | 6        | 5      | 4   | 3            | 2   | 1   | 0   |
|        |              | PID[6:0] |        |     |              |     |     |     |
| Access |              | R/W      | R/W    | R/W | R/W          | R/W | R/W | R/W |
| Reset  |              | 0        | 0      | 0   | 0            | 0   | 0   | 0   |

## Bit 29 – GCLKEN Generic Clock Enable

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | The selected Generic clock is disabled. |
| 1     | The selected Generic clock is enabled.  |

## Bit 28 – EN Enable

| Value | Description                            |
|-------|----------------------------------------|
| 0     | Selected Peripheral clock is disabled. |
| 1     | Selected Peripheral clock is enabled.  |

## Bits 27:20 – GCLKDIV[7:0] Generic Clock Division Ratio

Generic clock is the selected clock period divided by GCLKDIV + 1.

GCLKDIV must not be changed while the peripheral selects GCLKx (e.g., bit rate, etc.).

## Bit 12 – CMD Command

| Value | Description |
|-------|-------------|
| 0     | Read mode.  |
| 1     | Write mode. |

## Bits 11:8 – GCLKCSS[3:0] Generic Clock Source Selection

| Value | Name     | Description         |
|-------|----------|---------------------|
| 0     | SLOW_CLK | MD_SLCK is selected |
| 1     | MAIN_CLK | MAINCK is selected  |
| 2     | PLLA_CLK | PLLACK is selected  |
| 3     | PLLB_CLK | PLLBCK is selected  |
| 4     | MCK_CLK  | MCK is selected     |
| 5     | RC2CK    | RC2CK is selected   |

**Bits 6:0 – PID[6:0] Peripheral ID**

Peripheral ID selection from PID2 to PID127.

“PID2 to PID127” refers to identifiers as defined in section “Peripheral Identifiers”.

**27.16.19 PMC Oscillator Calibration Register**

**Name:** PMC\_OCR1  
**Offset:** 0x0110  
**Reset:** 0x12121212  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PMC Write Protection Mode Register](#).

|        |       |     |            |     |     |     |     |     |
|--------|-------|-----|------------|-----|-----|-----|-----|-----|
| Bit    | 31    | 30  | 29         | 28  | 27  | 26  | 25  | 24  |
|        | SEL12 |     | CAL10[6:0] |     |     |     |     |     |
| Access | R/W   | R/W | R/W        | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0     | 0   | 0          | 1   | 0   | 0   | 1   | 0   |
| Bit    | 23    | 22  | 21         | 20  | 19  | 18  | 17  | 16  |
|        | SEL10 |     | CAL12[6:0] |     |     |     |     |     |
| Access | R/W   | R/W | R/W        | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0     | 0   | 0          | 1   | 0   | 0   | 1   | 0   |
| Bit    | 15    | 14  | 13         | 12  | 11  | 10  | 9   | 8   |
|        | SEL8  |     | CAL8[6:0]  |     |     |     |     |     |
| Access | R/W   | R/W | R/W        | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0     | 0   | 0          | 1   | 0   | 0   | 1   | 0   |
| Bit    | 7     | 6   | 5          | 4   | 3   | 2   | 1   | 0   |
|        | SEL4  |     | CAL4[6:0]  |     |     |     |     |     |
| Access | R/W   | R/W | R/W        | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0     | 0   | 0          | 1   | 0   | 0   | 1   | 0   |

**Bit 31 – SEL12** Selection of Main RC Oscillator Calibration Bits for 12 MHz

| Value | Description                                            |
|-------|--------------------------------------------------------|
| 0     | Factory-determined value stored in Flash memory.       |
| 1     | Value written by user in CAL12 field of this register. |

**Bits 30:24 – CAL10[6:0]** Main RC Oscillator Calibration Bits for 10 MHz

Calibration bits applied to the RC Oscillator when SEL10 is set.

The value read in this register depends on the value of SEL10:

If SEL10 is set to one, the calibration value stored in the Flash memory is read back

If SEL10 is set to zero, the last calibration value written in this field is read back

ftrim10MHZ[2:0] is placed on CAL10[4:2]

ttrim[1:0] is placed on CAL10[1:0]

**Bit 23 – SEL10** Selection of Main RC Oscillator Calibration Bits for 10 MHz

| Value | Description                                            |
|-------|--------------------------------------------------------|
| 0     | Factory-determined value stored in Flash memory.       |
| 1     | Value written by user in CAL10 field of this register. |

**Bits 22:16 – CAL12[6:0]** Main RC Oscillator Calibration Bits for 12 MHz

Calibration bits applied to the RC Oscillator when SEL12 is set.

The value read in this register depends on the value of SEL12:

If SEL12 is set to one, the calibration value stored in the Flash memory is read back

If SEL12 is set to zero, the last calibration value written in this field is read back

ftrim12MHZ[2:0] is placed on CAL12[4:2]

ttrim[1:0] is placed on CAL12[1:0]

**Bit 15 – SEL8** Selection of Main RC Oscillator Calibration Bits for 8 MHz

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | Factory-determined value stored in Flash memory.      |
| 1     | Value written by user in CAL8 field of this register. |

**Bits 14:8 – CAL8[6:0]** Main RC Oscillator Calibration Bits for 8 MHz

Calibration bits applied to the RC Oscillator when SEL8 is set to one.

The value read in this register depends on the value of SEL8:

If SEL8 is set to one, the calibration value stored in the Flash memory is read back

If SEL8 is set to zero, the last calibration value written in this field is read back

ftrim8MHZ[2:0] is placed on CAL8[4:2]

ttrim[1:0] is placed on CAL8[1:0]

**Bit 7 – SEL4** Selection of Main RC Oscillator Calibration Bits for 4 MHz

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | Default value stored in Flash memory.                 |
| 1     | Value written by user in CAL4 field of this register. |

**Bits 6:0 – CAL4[6:0]** Main RC Oscillator Calibration Bits for 4 MHz

Calibration bits applied to the RC Oscillator when SEL4 is set to one.

The value read in this register depends on the value of SEL4:

If SEL4 is set to one, the calibration value stored in the Flash memory is read back

If SEL4 is set to zero, the last calibration value written in this field is read back

ftrim4MHZ[2:0] is placed on CAL4[4:2]

ttrim[1:0] is placed on CAL4[1:0]

## 27.16.20 PLL Maximum Multiplier Value Register

**Name:** PMC\_PMMR  
**Offset:** 0x0130  
**Reset:** 0x1FFF1FFF  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PMC Write Protection Mode Register](#).

|        |                 |     |     |     |     |                  |     |     |

### Bits 26:16 – PLL\_B\_MMAX[10:0] PLLB Maximum Allowed Multiplier Value

Defines the maximum value of multiplication factor that can be sent to PLLB. Any value of the MULB field (see [PMC Clock Generator PLLB Register](#)) above PLL\_B\_MMAX is saturated to PLL\_B\_MMAX. PLL\_B\_MMAX write operation is cancelled in the following cases:

- The value of MULB is currently saturated by PLL\_B\_MMAX.
- The user is trying to write a value of PLL\_B\_MMAX that is smaller than the current value of MULB.

### Bits 10:0 – PLL\_A\_MMAX[10:0] PLLA Maximum Allowed Multiplier Value

Defines the maximum value of multiplication factor that can be sent to PLLA. Any value of the MULA field (see [PMC Clock Generator PLLA Register](#)) above PLL\_A\_MMAX is saturated to PLL\_A\_MMAX. PLL\_A\_MMAX write operation is cancelled in the following cases:

- The value of MULA is currently saturated by PLL\_A\_MMAX.
- The user is trying to write a value of PLL\_A\_MMAX that is smaller than the current value of MULA.

**Bits 31:24 – CPU\_HIGH\_RES[7:0]** CPU Monitoring High Reset Limit  
 Beyond this limit, the CPU frequency monitor generates a reset.

**Bits 23:16 – CPU\_LOW\_RES[7:0]** CPU Monitoring Low RESET Limit  
 Below this limit, the CPU frequency monitor generates a reset.

**Bits 15:8 – CPU\_HIGH\_IT[7:0]** CPU Monitoring High IT Limit  
 Beyond this limit, the CPU frequency monitor generates an interrupt.

**Bits 7:0 – CPU\_LOW\_IT[7:0]** CPU Monitoring Low IT Limit  
 Below this limit, the CPU frequency monitor generates an interrupt.

#### Bits 23:16 – KEY[7:0] Calibration Register Write Key

Always reads as '0'.

| Value | Name   | Description                                                                                                          |
|-------|--------|----------------------------------------------------------------------------------------------------------------------|
| 0x37  | PASSWD | Unlock key to enable writes to calibration registers. Writing any other value to KEY will abort the Write operation. |

#### Bit 8 – EN\_WR\_CALIB Enable Calibration Register Write

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | Disable write of the calibration register for the active frequency. |
| 1     | Enable write of the calibration register for the active frequency.  |

#### Bits 5:4 – OSCRCF[1:0] Second Oscillator Frequency Selection

At start-up, the second RC oscillator frequency is 4 MHz.

| Value | Name   | Description                                      |
|-------|--------|--------------------------------------------------|
| 0     | 4_MHz  | The second RC oscillator frequency is at 4 MHz.  |
| 1     | 8_MHz  | The second RC oscillator frequency is at 8 MHz.  |
| 2     | 10_MHz | The second RC oscillator frequency is at 10 MHz. |
| 3     | 12_MHz | The second RC oscillator frequency is at 12 MHz. |

#### Bit 0 – EN Enable

| Value | Description                          |
|-------|--------------------------------------|
| 0     | The 2nd fast oscillator is disabled. |
| 1     | The 2nd fast oscillator is enabled.  |

**27.16.31 PMC Oscillator Calibration Register 2**

**Name:** PMC\_OCR2  
**Offset:** 0x01B4  
**Reset:** 0x12121212  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PMC Write Protection Mode Register](#).

|        |       |     |            |     |     |     |     |     |
|--------|-------|-----|------------|-----|-----|-----|-----|-----|
| Bit    | 31    | 30  | 29         | 28  | 27  | 26  | 25  | 24  |
|        | SEL10 |     | CAL10[6:0] |     |     |     |     |     |
| Access | R/W   | R/W | R/W        | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0     | 0   | 0          | 1   | 0   | 0   | 1   | 0   |
| Bit    | 23    | 22  | 21         | 20  | 19  | 18  | 17  | 16  |
|        | SEL12 |     | CAL12[6:0] |     |     |     |     |     |
| Access | R/W   | R/W | R/W        | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0     | 0   | 0          | 1   | 0   | 0   | 1   | 0   |
| Bit    | 15    | 14  | 13         | 12  | 11  | 10  | 9   | 8   |
|        | SEL8  |     | CAL8[6:0]  |     |     |     |     |     |
| Access | R/W   | R/W | R/W        | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0     | 0   | 0          | 1   | 0   | 0   | 1   | 0   |
| Bit    | 7     | 6   | 5          | 4   | 3   | 2   | 1   | 0   |
|        | SEL4  |     | CAL4[6:0]  |     |     |     |     |     |
| Access | R/W   | R/W | R/W        | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0     | 0   | 0          | 1   | 0   | 0   | 1   | 0   |

**Bit 31 – SEL10** Selection of Second RC Oscillator Calibration Bits for 10 MHz

| Value | Description                                            |
|-------|--------------------------------------------------------|
| 0     | Factory-determined value stored in Flash memory.       |
| 1     | Value written by user in CAL10 field of this register. |

**Bits 30:24 – CAL10[6:0]** Second RC Oscillator Calibration Bits for 10 MHz

Calibration bits applied to the second RC Oscillator when SEL10 is set.

The value read in this register depends on the value of SEL10:

If SEL10 is set to one, the calibration value stored in the Flash memory is read back

If SEL10 is set to zero, the last calibration value written in this field is read back

ftrim10MHZ[2:0] is placed on CAL10[4:2]

ttrim[1:0] is placed on CAL10[1:0]

**Bit 23 – SEL12** Selection of Second RC Oscillator Calibration Bits for 12 MHz

| Value | Description                                            |
|-------|--------------------------------------------------------|
| 0     | Factory-determined value stored in Flash memory.       |
| 1     | Value written by user in CAL12 field of this register. |

**Bits 22:16 – CAL12[6:0]** Second RC Oscillator Calibration Bits for 12 MHz

Calibration bits applied to the second RC Oscillator when SEL12 is set.

The value read in this register depends on the value of SEL12:

If SEL12 is set to one, the calibration value stored in the Flash memory is read back

If SEL12 is set to zero, the last calibration value written in this field is read back

ftrim12MHZ[2:0] is placed on CAL12[4:2]

ttrim[1:0] is placed on CAL12[1:0]

**Bit 15 – SEL8** Selection of Second RC Oscillator Calibration Bits for 8 MHz

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | Factory-determined value stored in Flash memory.      |
| 1     | Value written by user in CAL8 field of this register. |

**Bits 14:8 – CAL8[6:0]** Second RC Oscillator Calibration Bits for 8 MHz

Calibration bits applied to the second RC Oscillator when SEL8 is set to one.

The value read in this register depends on the value of SEL8:

If SEL8 is set to one, the calibration value stored in the Flash memory is read back

If SEL8 is set to zero, the last calibration value written in this field is read back

ftrim8MHZ[2:0] is placed on CAL8[4:2]

ttrim[1:0] is placed on CAL8[1:0]

**Bit 7 – SEL4** Selection of Second RC Oscillator Calibration Bits for 4 MHz

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | Default value stored in Flash memory.                 |
| 1     | Value written by user in CAL4 field of this register. |

**Bits 6:0 – CAL4[6:0]** Second RC Oscillator Calibration Bits for 4 MHz

Calibration bits applied to the second RC Oscillator when SEL4 is set to one.

The value read in this register depends on the value of SEL4:

If SEL4 is set to one, the calibration value stored in the Flash memory is read back

If SEL4 is set to zero, the last calibration value written in this field is read back

ftrim4MHZ[2:0] is placed on CAL4[4:2]

ttrim[1:0] is placed on CAL4[1:0]

## 28. Parallel Input/Output Controller (PIO)

### 28.1 Description

The Parallel Input/Output Controller (PIO) manages up to 194 fully programmable input/output lines. Each I/O line may be dedicated as a general-purpose I/O or be assigned to a function of an embedded peripheral. This ensures effective optimization of the pins of the product.

Each I/O line of the PIO Controller features are as follows:

- An input change interrupt enabling level change detection on any I/O line
- Rising edge, falling edge, both edge, low-level or high-level detection on any I/O line
- Multi-Output Drive Capability
- Control of the pull-up and pull-down of the I/O line
- Input visibility and output control

The PIO Controller also features a synchronous output providing up to 32 bits of data output in a single write operation.

### 28.2 Embedded Characteristics

- Up to 194 Programmable I/O Lines
- Multiplexing of 4 Peripheral Functions per I/O Line
- For Each I/O Line, Whether Assigned to a Peripheral or Used as General-purpose I/O
  - Input change interrupt
  - Multi-drive option
  - Programmable pull-up/pull-down on each I/O line
  - Pin data status register, supplies visibility of the level on the pin at any time
  - Programmable event: rising edge, falling edge, both edge, low-level or high-level
  - Configuration lock by the connected peripheral
  - Programmable configuration lock (active until next  $V_{DDCORE}$  reset) to protect against further software modifications (intentional or unintentional)
- Register Write Protection Against Unintentional Software Modifications:
  - One configuration bit to enable or disable protection of I/O line settings
  - One configuration bit to enable or disable protection of interrupt settings
- Synchronous Output, Possibility to Set or Clear Simultaneously up to 32 I/O Lines in a Single Write
- Programmable Schmitt Trigger Inputs
- Programmable I/O Drive

## 28.3 Block Diagram

Figure 28-1. Block Diagram

**Notes:**

1.  $x = 6$  (the number of I/O group is 7).
2.  $n$  depends on the number of I/O lines affected to the peripheral input.

## 28.4 Product Dependencies

### 28.4.1 Pin Multiplexing

Each pin is configurable, depending on the product, as either a general-purpose I/O line only, or as an I/O line multiplexed with up to 4 peripheral I/Os. As the multiplexing is hardware defined and thus product-dependent, the hardware designer and programmer must carefully determine the configuration of the PIO Controllers required by their application. When an I/O line is general-purpose only, i.e., not multiplexed with any peripheral I/O, programming of the PIO Controller regarding the assignment to a peripheral has no effect and only the PIO Controller can control how the pin is driven by the product.

### 28.4.2 Power Management

The Power Management Controller (PMC) controls the PIO Controller clock in order to save power. Writing any of the registers of the user interface does not require the PIO Controller clock to be enabled. This means that the configuration of the I/O lines does not require the PIO Controller clock to be enabled.

However, when the clock is disabled, not all of the features of the PIO Controller are available. Note that the input change interrupt, the interrupt modes on a programmable event and the read of the pin level require the clock to be validated.

After a hardware reset, the PIO clock is disabled by default.

The user must configure the PMC before any access to the input line information.

### 28.4.3 Interrupt Generation

For interrupt handling, the PIO Controllers are considered as user peripherals. This means that the PIO Controller interrupt lines are connected among the interrupt sources. The PIO Controller supply one interrupt signal per I/O group. Refer to the PIO Controller peripheral identifier in the product description to identify the interrupt sources dedicated to the PIO Controller. Using the PIO Controller requires the Interrupt Controller to be programmed first.

The PIO Controller interrupt can be generated only if the PIO Controller clock is enabled.

## 28.5 Functional Description

The PIO Controller features up to 194 fully-programmable I/O lines. Most of the control logic associated to each I/O is represented in the figure below, where the I/O line 3 of the PIOB (PB3) is described as an example. In this description each signal shown represents one of up to 194 possible indexes.

Figure 28-2. I/O Line Control Logic

## 28.5.1 I/O Line Configuration Method

The user interface of the PIO Controller provides several sets of registers. Each set of registers interfaces with one I/O group.

**Table 28-1.** I/O Group List

| I/O Group Number | PIO  |
|------------------|------|
| 0                | PIOA |
| 1                | PIOB |
| ...              | ...  |
| 6                | PIOG |

### 28.5.1.1 Programming I/O Line Configuration

The user must first define which I/O line in the group will be targeted by writing a 1 to the corresponding bit in the Mask register (PIO\_MSKRx). Several I/O lines in an I/O group can be configured at the same time by setting the corresponding bits in PIO\_MSKRx. Then, write the Configuration register (PIO\_CFGRx) to apply the configuration to the I/O line(s) defined in PIO\_MSKRx.

### 28.5.1.2 Reading I/O Line Configuration

Reading configuration requires the user to first define which I/O line in the group x will be targeted by writing a 1 to the corresponding bit in PIO\_MSKRx. The value of the targeted I/O line is read in PIO\_CFGRx.

If several bits are set in PIO\_MSKRx, then the read configuration in PIO\_CFGRx is the configuration of the I/O line with the lowest index.

## 28.5.2 Pull-up and Pull-down Resistor Control

Each I/O line is designed with an embedded pull-up resistor and an embedded pull-down resistor.

The pull-up resistor on the I/O line(s) defined in PIO\_MSKRx can be enabled by setting the PUEN bit in PIO\_CFGRx. Clearing the PUEN bit in PIO\_CFGRx disables the pull-up resistor of I/O lines defined in PIO\_MSKRx.

The pull-down resistor on the I/O line(s) defined in PIO\_MSKRx can be enabled by setting the PDEN bit in PIO\_CFGRx. Clearing the PDEN bit in PIO\_CFGRx disables the pull-down resistor of I/O lines defined in PIO\_MSKRx.

If both PUEN and PDEN bit are set in PIO\_CFGRx, only the pull-up resistor is enabled for I/O line(s) defined in PIO\_MSKRx and the PDEN bit is discarded.

Control of the pull-up resistor is possible regardless of the configuration of the I/O line (Input, Output, Open-drain).

For more details concerning pull-up and pull-down configuration, see PIO\_CFGR.

The reset value of PUEN and PDEN bits of each I/O line is defined at the product level and depends on the multiplexing of the device.

## 28.5.3 General-Purpose or Peripheral Function Selection

The PIO Controller provides multiplexing of up to 4 peripheral functions on a single pin. The selection is performed by writing the FUNC field in PIO\_CFGRx. The selected function is applied to the I/O line(s) defined in PIO\_MSKRx.

When FUNC is 0, no peripheral is selected and the General-Purpose PIO (GPIO) mode is selected (in this mode, the I/O line is controlled by the PIO Controller).

When FUNC is not 0, the peripheral selected to control the I/O line depends on the FUNC value.

For more details, see the PIO\_CFGR.

Note that multiplexing of peripheral lines affects both input and output peripheral lines. When a peripheral is not selected on any I/O line, its inputs are assigned with constant default values defined at the product level. The user must ensure that only one I/O line is affected to a peripheral input at a time.

The reset value of the FUNC field of each I/O line is defined at the product level and depends on the multiplexing of the device.

#### 28.5.4 Output Control

When the I/O line is assigned to a peripheral function, i.e., the corresponding FUNC field of the line configuration is not 0, the drive of the I/O line is controlled by the peripheral. According to the FUNC value, the selected peripheral determines whether the pin is driven or not.

When the FUNC field of a I/O line is 0, then the I/O line is set in General-Purpose mode and the I/O line can be configured to be driven by the PIO Controller instead of the peripheral.

If the DIR bit of the I/O line configuration (PIO\_CFGRx) is set (OUTPUT) then the I/O line can be driven by the PIO Controller. The level driven on an I/O line can be determined by writing in the Set Output Data register (PIO\_SODRx) and the Clear Output Data register (PIO\_CODRx). These write operations, respectively, set and clear the Output Data Status register (PIO\_ODSRx), which represents the data driven on the I/O lines. Writing PIO\_ODSRx directly is possible and only affects the I/O line set to 1 in PIO\_MSKRx (see [Synchronous Data Output](#)).

When the DIR bit of the I/O line configuration is at zero, the corresponding I/O line is used as an input only.

The DIR bit has no effect if the corresponding line is assigned to a peripheral function, but writing the DIR bit is managed whether the pin is configured to be controlled by the PIO Controller or assigned to a peripheral function. This enables configuration of the I/O line prior to setting it to be managed by the PIO Controller.

Similarly, writing in PIO\_SODRx and PIO\_CODRx affects PIO\_ODSRx. This is important as it defines the first level driven on the I/O line.

#### 28.5.5 Synchronous Data Output

Clearing one or more PIO line(s) and setting another one or more PIO line(s) synchronously cannot be done by using PIO\_SODRx and PIO\_CODRx. It requires two successive write operations into two different registers. To overcome this, the PIO Controller offers a direct control of PIO outputs by single write access to PIO\_ODSRx. Only I/O lines set to 1 in PIO\_MSKRx are written.

#### 28.5.6 Open-Drain Mode

Each I/O can be independently programmed in Open-Drain mode. This feature permits several drivers to be connected on the I/O line which is driven low only by each device. An external pull-up resistor (or enabling of the internal one) is generally required to guarantee a high level on the line.

The Open-Drain mode is controlled by the OPD bit in the I/O line configuration (PIO\_CFGRx). An I/O line is switched in Open-Drain mode by setting PIO\_CFGRx.OPD. The Open-Drain mode can be selected if the I/O line is not controlled by a peripheral (the FUNC field must be cleared in PIO\_CFGRx).

For more details on the Open-Drain mode, see the PIO\_CFGR.

After reset, the OPD bit of each I/O line is defined at the product level and depends on the multiplexing of the device.

#### 28.5.7 Output Line Timings

The figure below shows how the outputs are driven either by writing PIO\_SODRx or PIO\_CODRx, or by directly writing PIO\_ODSRx. This last case is valid only if the corresponding bit in PIO\_MSKRx is

set. The figure below also shows when the feedback in the Pin Data Status Register (PIO\_PDSRx) is available.

**Figure 28-3. Output Line Timings**

## 28.5.8 Inputs

The level on each I/O line of the I/O group x can be read through PIO\_PDSRx. This register indicates the level of the I/O lines regardless of their configuration, whether uniquely as an input, or driven by the PIO Controller, or driven by a peripheral.

Reading the I/O line levels requires the clock of the PIO Controller to be enabled, otherwise PIO\_PDSRx reads the levels present on the I/O line at the time the clock was disabled.

## 28.5.9 Input Edge/Level Interrupt

Each I/O group can be programmed to generate an interrupt when it detects an edge or a level on an I/O line. The Input Edge/Level interrupts are controlled by writing the Interrupt Enable register (PIO\_IERx) and the Interrupt Disable register (PIO\_IDRx), which enable and disable the input change interrupt respectively by setting and clearing the corresponding bit in the Interrupt Mask register (PIO\_IMRx). As input change detection is possible only by comparing two successive samplings of the input of the I/O line, the PIO Controller clock must be enabled. The Input Change interrupt is available regardless of the configuration of the I/O line, i.e., configured as an input only, controlled by the PIO Controller or assigned to a peripheral function.

Each I/O group can generate an interrupt.

According to the EVTSEL field value in PIO\_CFGRx, the interrupt signal of the I/O group x can be generated on the following occurrence:

- PIO\_CFGRx.EVTSELy = 0: The interrupt signal of the I/O group x is generated on the I/O line y falling edge detection (assuming that PIO\_IMRx[y] = 1).
- PIO\_CFGRx.EVTSELy = 1: The interrupt signal of the I/O group x is generated on the I/O line y rising edge detection (assuming that PIO\_IMRx[y] = 1).
- PIO\_CFGRx.EVTSELy = 2: The interrupt signal of the I/O group x is generated on the I/O line y both rising and falling edge detection (assuming that PIO\_IMRx[y] = 1).
- PIO\_CFGRx.EVTSELy = 3: The interrupt signal of the I/O group x is generated on the I/O line y low level detection (assuming that PIO\_IMRx[y] = 1).
- PIO\_CFGRx.EVTSELy = 4: The interrupt signal of the I/O group x is generated on the I/O line y high level detection (assuming that PIO\_IMRx[y] = 1).

By default, the interrupt can be generated at any time a falling edge is detected on the input.

When an input edge or level is detected on an I/O line, the corresponding bit in the Interrupt Status register (PIO\_ISRx) is set. If the corresponding bit in PIO\_IMRx is set, the PIO Controller interrupt line of the I/O group x is asserted.

When the software reads PIO\_ISRx, all the interrupts of the I/O group x are automatically cleared. This signifies that all the interrupts that are pending when PIO\_ISRx is read must be handled. When an Interrupt is enabled on a “level”, the interrupt is generated as long as the interrupt source is not cleared, even if some read accesses in PIO\_ISRx are performed.

**Figure 28-4.** Event Detector on Input Lines

Example of interrupt generation on following lines:

- Rising edge on the PIO line 0 of the I/O group 0 (PIOA)
- Low-level edge on the PIO line 1 of the I/O group 0 (PIOA)
- Rising edge on the PIO line 2 of the I/O group 0 (PIOA)
- High-level on the PIO line 3 of the I/O group 0 (PIOA)
- Low-level on the PIO line 4 of the I/O group 0 (PIOA)
- High-level on the PIO line 0 of the I/O group 1 (PIOB)
- Falling edge on the PIO line 1 of the I/O group 1 (PIOB)
- Rising edge on the PIO line 2 of the I/O group 1 (PIOB)
- Any edge on the other lines of the I/O group 1 (PIOB)

The table below details the required configuration for this example.

**Table 28-2.** Configuration for Example Interrupt Generation

| Configuration         | Name                                                                                                                                                 |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| PIOA: Interrupt Mode  | Enable interrupt sources for lines 0 to 4 of PIOA by writing 32'h0000_001F in PIO_IER0 (offset 0x20)                                                 |
| PIOA: Event Selection | Configure Rising Edge detection for lines 0 and 2:<br>Write 32'h0000_0005 in PIO_MSKR0 (offset 0x0)<br>Write 32'h0100_0000 in PIO_CFGR0 (offset 0x4) |
|                       | Configure Low Level detection for lines 1 and 4:<br>Write 32'h0000_0012 in PIO_MSKR0 (offset 0x0)<br>Write 32'h0300_0000 in PIO_CFGR0 (offset 0x4)   |
|                       | Configure High Level detection for line 3:<br>Write 32'h0000_0008 in PIO_MSKR0 (offset 0x0)<br>Write 32'h0400_0000 in PIO_CFGR0 (offset 0x4)         |
| PIOB: Interrupt Mode  | Enable interrupt sources for all lines of PIOB by writing 32'hFFFF_FFFF in PIO_IER1 (offset 0x60)                                                    |

| .....continued        |                                                                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Configuration         | Name                                                                                                                                              |
| PIOB: Event Selection | Configure High Level detection for line 0:<br>Write 32'h0000_0001 in PIO_MSKR1 (offset 0x40)<br>Write 32'h0400_0000 in PIO_CFGR1 (offset 0x44)    |
|                       | Configure Falling Edge detection for line 1:<br>Write 32'h0000_0002 in PIO_MSKR1 (offset 0x40)<br>Write 32'h0000_0000 in PIO_CFGR1 (offset 0x44)  |
|                       | Configure Rising Edge detection for line 2:<br>Write 32'h0000_0004 in PIO_MSKR1 (offset 0x40)<br>Write 32'h0100_000 in PIO_CFGR1 (offset 0x44)    |
|                       | Configure Low Level detection for other lines:<br>Write 32'hFFFF_FFF8 in PIO_MSKR1 (offset 0x40)<br>Write 32'h0200_000 in PIO_CFGR1 (offset 0x44) |
|                       |                                                                                                                                                   |

Figure 28-5. Input Change Interrupt Timings When No Additional Interrupt Modes

28.5.10 Interrupt Management

The PIO Controller can drive one interrupt signal per I/O group (see the figure below). Interrupt signals are connected to the interrupt controller of the system.

Figure 28-6. PIO Interrupt Management

28.5.11 I/O Lines Lock

When an I/O line is controlled by a peripheral (particularly the Pulse Width Modulation Controller (PWM)), it can become locked by the action of this peripheral via an input of the PIO Controller. When an I/O line is locked, the following fields in PIO\_CFGRx are locked and cannot be modified:

- FUNC: Peripheral selection cannot be changed when the corresponding I/O line is locked.

- PUEN: Pull-Up configuration cannot be changed when the corresponding I/O line is locked.
- PDEN: Pull-Down configuration cannot be changed when the corresponding I/O line is locked.
- OPD: Open-Drain configuration cannot be changed when the corresponding I/O line is locked.

Writing to one of these fields while the corresponding I/O line is locked will have no effect.

The user can know at anytime which I/O line is locked by reading the Lock Status register (PIO\_LOCKSR). Once an I/O line is locked, the only way to unlock it is to apply a hardware reset to the PIO Controller.

### 28.5.12 Programmable I/O Drive

It is possible to configure the I/O drive for pads PA0 to PG31. The I/O drive of the pad can be programmed by writing PIO\_CFGRxDRVSTR. For details, refer to the section Electrical Characteristics.

### 28.5.13 Programmable Schmitt Trigger

It is possible to configure each input for the Schmitt trigger. The Schmitt trigger can be enabled by setting PIO\_CFGRx.SCHMITT. By default the Schmitt trigger is active.

### 28.5.14 I/O Line Configuration Freeze

#### 28.5.14.1 Software Freeze

Once the I/O line configuration is done, it can be frozen by using the I/O Freeze Configuration register (PIO\_IOFRx) of the corresponding group.

##### 28.5.14.1.1 Physical Freeze

Setting PIO\_IOFRx.FPHY freezes the following fields of the I/O lines defined in PIO\_MSKRx:

- FUNC: I/O Line Function
- DIR: Direction
- PUEN: Pull-Up Enable
- PDEN: Pull-Down Enable
- OPD: Open-Drain
- SCHMITT: Schmitt Trigger
- DRVSTR: Drive Strength

When the physical freeze is currently active on an I/O line, the PCFS flag is set when reading the PIO\_CFGRx of the I/O line.

Only a hardware reset can release fields listed above.

##### 28.5.14.1.2 Interrupt Freeze

Setting PIO\_IOFRx.FINT freezes the EVTSEL field of the I/O lines defined in the PIO\_MSKRx:

When the "Interrupt Freeze" is currently active on an I/O line, the ICFS flag is set when reading the PIO\_CFGRx of the I/O line.

Only a hardware reset can release fields listed above.

### 28.5.15 Register Write Protection

To prevent any single software error from corrupting PIO behavior, certain registers in the address space can be write-protected by setting bits WPEN and WPITEN in the PIO Write Protection Mode Register (PIO\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the PIO Write Protection Status Register (PIO\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the PIO\_WPSR.

The following registers are write-protected when WPEN is set in PIO\_WPMR:

- PIO Mask Register
- PIO Configuration Register
- PIO Slow Clock Divider Debouncing Register

The following registers are write-protected when WPITEN is set in PIO\_WPMR:

- PIO Interrupt Enable Register
- PIO Interrupt Disable Register

## 28.6 I/O Lines Programming Example

The programming example shown in the table below is used to obtain the following configurations:

- PIOA Configuration:
  - 4-bit output port on I/O lines 0 to 3, open-drain, with pull-up resistor
  - Four output signals on I/O lines 4 to 7 (to drive LEDs for example), driven high and low, no pull-up resistor, no pull-down resistor
  - I/O lines 16 to 19 assigned to peripheral A functions with pull-up resistor
  - I/O lines 20 to 23 assigned to peripheral B functions with pull-down resistor
- PIOB Configuration:
  - Four input signals on I/O lines 0 to 3 (to read push button states for example), with pull-up resistors, and input change interrupts
  - Four input signals on I/O lines 12 to 15 to read an external device status (polled, thus no input change interrupt), no pull-up resistor
  - I/O lines 16 to 23 assigned to peripheral B functions with pull-down resistor
  - I/O lines 24 to 27 assigned to peripheral D with Input Change Interrupt, no pull-up resistor and no pull-down resistor

**Table 28-3.** Programming Example

| Action                                                                                                                                     | Register               | Value to be Written |
|--------------------------------------------------------------------------------------------------------------------------------------------|------------------------|---------------------|
| PIOA: 4-bit output port on I/O lines 0 to 3, open-drain, with pull-up resistor                                                             | PIO_MSKR0 (offset 0x0) | 0x0000000F          |

## 28.7 Register Summary

Each I/O line controlled by the PIO Controller is associated with a bit in each of the PIO Controller registers. Each register is 32 bits wide. If a parallel I/O line is not defined, writing to the corresponding bits has no effect. Undefined bits read zero.

| Offset              | Name        | Bit Pos. | 7             | 6     | 5     | 4     | 3     | 2           | 1     | 0     |
|---------------------|-------------|----------|---------------|-------|-------|-------|-------|-------------|-------|-------|

## 28.7.1 PIO Mask Register

**Name:** PIO\_MSKRx  
**Offset:** 0x00 + x\*0x40 [x=0..6]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PIO Write Protection Mode Register](#).

|        |       |       |       |       |       |       |       |       |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – MSKy PIO Line y Mask**

These bits define the I/O lines to be configured when writing the [PIO Configuration Register](#).

0 (DISABLED): Writing the PIO\_CFGRx, PIO\_ODSRx or PIO\_IOFRx does not affect the corresponding I/O line configuration.

1 (ENABLED): Writing the PIO\_CFGRx, PIO\_ODSRx or PIO\_IOFRx updates the corresponding I/O line configuration.

## 28.7.2 PIO Configuration Register

**Name:** PIO\_CFGRx  
**Offset:** 0x04 + x\*0x40 [x=0..6]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PIO Write Protection Mode Register](#).

Writing this register will only affect I/O lines enabled in the PIO\_MSKRx.

### Bit 30 – ICFS Interrupt Configuration Freeze Status (read-only)

This bit gives information about the freeze state of the field EVTSEL of the read I/O line configuration.

0 (NOT\_FROZEN): The field is not frozen and can be written for this I/O line.

1 (FROZEN): The field is frozen and cannot be written for this I/O line. Only a hardware reset can release the field.

### Bit 29 – PCFS Physical Configuration Freeze Status (read-only)

This bit gives information about the freeze state of the following fields of the read I/O line configuration:

- FUNC: I/O Line Function
- DIR: Direction
- PUEN: Pull-Up Enable
- PDEN: Pull-Down Enable
- OPD: Open-Drain
- SCHMITT: Schmitt Trigger
- DRVSTR: Drive Strength

0 (NOT\_FROZEN): The fields are not frozen and can be written for this I/O line.

1 (FROZEN): The fields are frozen and cannot be written for this I/O line. Only a hardware reset can release these fields.

**Bits 26:24 – EVTSEL[2:0] Event Selection**

This field defines the type of event to detect on the I/O lines of the I/O group x according to the [PIO Mask Register](#).

| Value | Name    | Description                           |
|-------|---------|---------------------------------------|
| 0     | FALLING | Event detection on input falling edge |
| 1     | RISING  | Event detection on input rising edge  |
| 2     | BOTH    | Event detection on input both edge    |
| 3     | LOW     | Event detection on low level input    |
| 4     | HIGH    | Event detection on high level input   |
| 5     | –       | Reserved                              |
| 6     | –       | Reserved                              |
| 7     | –       | Reserved                              |

**Bits 18:16 – DRVSTR[2:0] Drive Strength**

This field defines the drive strength of the I/O lines of the I/O group x according to the [PIO Mask Register](#).

| Value | Name    | Description            |
|-------|---------|------------------------|
| 0     | OUT_2m  | Output drive is 2 mA.  |
| 1     | OUT_4m  | Output drive is 4 mA.  |
| 2     | OUT_8m  | Output drive is 8 mA.  |
| 3     | OUT_16m | Output drive is 16 mA. |
| 4     | OUT_24m | Output drive is 24 mA. |
| 5     | OUT_32m | Output drive is 32 mA. |
| 6     | OUT_40m | Output drive is 40 mA. |
| 7     | OUT_48m | Output drive is 48 mA. |

**Bit 15 – SCHMITT Schmitt Trigger**

This bit defines the Schmitt trigger configuration of the I/O lines of the I/O group x according to the [PIO Mask Register](#).

0 (ENABLED): Schmitt trigger is enabled for the selected I/O lines.

1 (DISABLED): Schmitt trigger is disabled for the selected I/O lines.

**Bit 14 – OPD Open Drain**

This bit defines the open drain configuration of the I/O lines of the I/O group x according to the [PIO Mask Register](#).

0 (DISABLED): The open-drain is disabled for the selected I/O lines. I/O lines are driven at high- and low-level.

1 (ENABLED): The open-drain is enabled for the selected I/O lines. I/O lines are driven at low-level only.

**Bit 10 – PDEN Pull-Down Enable**

This bit defines the pull-down configuration of the I/O lines of the I/O group x according to the [PIO Mask Register](#).

PDEN can be written to 1 only if PUEN is written to 0.

0 (DISABLED): Pull-down is disabled for the selected I/O lines.

1 (ENABLED): Pull-down is enabled for the selected I/O lines only if PUEN is 0.

**Bit 9 – PUEN Pull-Up Enable**

This bit defines the pull-up configuration of the I/O lines of the I/O group x according to the [PIO Mask Register](#).

0 (DISABLED): Pull-up is disabled for the selected I/O lines.

1 (ENABLED): Pull-up is enabled for the selected I/O lines.

**Bit 8 – DIR Direction**

This bit defines the direction of the I/O lines of the I/O group x according to the [PIO Mask Register](#).

0 (INPUT): The selected I/O lines are pure inputs.

1 (OUTPUT): The selected I/O lines are enabled in output.

**Bits 2:0 – FUNC[2:0] I/O Line Function**

This field defines the function for I/O lines of the I/O group x according to the [PIO Mask Register](#).

| Value | Name     | Description                                      |
|-------|----------|--------------------------------------------------|
| 0     | GPIO     | Selects the PIO mode for the selected I/O lines. |
| 1     | PERIPH_A | Selects peripheral A for the selected I/O lines. |
| 2     | PERIPH_B | Selects peripheral B for the selected I/O lines. |
| 3     | PERIPH_C | Selects peripheral C for the selected I/O lines. |
| 4     | PERIPH_D | Selects peripheral D for the selected I/O lines. |
| 5     | Reserved | –                                                |
| 6     | Reserved | –                                                |
| 7     | Reserved | –                                                |

### 28.7.3 PIO Pin Data Status Register

**Name:** PIO\_PDSRx  
**Offset:** 0x08 + x\*0x40 [x=0..6]  
**Reset:** 0x00000000  
**Property:** Read-only

Reset value of PIO\_PDSR depends on the level of the I/O lines. Reading the I/O line levels requires the clock of the PIO Controller to be enabled, otherwise PIO\_PDSR reads the levels present on the I/O line at the time the clock was disabled.

| Access | W  | W  | W  | W  | W  | W  | W  | W  |
| Reset  | –  | –  | –  | –  | –  | –  | –  | –  |

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – Px Input Change Interrupt Enable

| Value | Description                                                            |
|-------|------------------------------------------------------------------------|
| 0     | No effect.                                                             |
| 1     | Enables the Input Change interrupt on the I/O line of the I/O group x. |

### 28.7.9 PIO Interrupt Disable Register

**Name:** PIO\_IDRx  
**Offset:** 0x24 + x\*0x40 [x=0..6]  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [PIO Write Protection Mode Register](#).

| Reset  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – Px  
Input Change Interrupt Mask

| Value | Description                                                            |
|-------|------------------------------------------------------------------------|
| 0     | Input Change interrupt is disabled on the I/O line of the I/O group x. |
| 1     | Input Change interrupt is enabled on the I/O line of the I/O group x.  |

### 28.7.11 PIO Interrupt Status Register

**Name:** PIO\_ISRx  
**Offset:** 0x2C + x\*0x40 [x=0..6]  
**Reset:** 0x00000000  
**Property:** Read-only

PIO\_ISR is reset at 0x00000000. However, the first read of the register may read a different value as input changes may have occurred.

| Reset  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – Px Input Change Interrupt Status

| Value | Description                                                                                                               |
|-------|---------------------------------------------------------------------------------------------------------------------------|
| 0     | No Input Change has been detected on the I/O line of the I/O group x since PIO_ISRx was last read or since reset.         |
| 1     | At least one Input Change has been detected on the I/O line of the I/O group since PIO_ISRx was last read or since reset. |

## 28.7.12 PIO I/O Freeze Configuration Register

**Name:** PIO\_IOFRx  
**Offset:** 0x3C + x\*0x40 [x=0..6]  
**Reset:** –  
**Property:** Write-only

Writing this register will only affect I/O lines enabled in the PIO\_MSKRx.

|        |               |    |    |    |    |    |      |      |

| Reset  |               |    |    |    |    |    | –    | –    |

### Bits 31:8 – FRZKEY[23:0] Freeze Key

| Value    | Name   | Description                                                                       |
|----------|--------|-----------------------------------------------------------------------------------|
| 0x494F46 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. |

### Bit 1 – FINT Freeze Interrupt Configuration

Only a hardware reset can reset the FINT bit.

| Value | Description                                                                  |
|-------|------------------------------------------------------------------------------|
| 0     | No effect.                                                                   |
| 1     | Freezes the EVTSEL field if FRZKEY corresponds to 0x494F46 ("IOF" in ASCII): |

### Bit 0 – FPHY Freeze Physical Configuration

Only a hardware reset can reset the FPHY bit.

| Value | Description                                                                                                                                                                                                                                                                                                                                                             |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                                                                                                                                                              |
| 1     | Freezes the following configuration fields if FRZKEY corresponds to 0x494F46 ("IOF" in ASCII): <ul style="list-style-type: none"> <li>• FUNC: I/O Line Function</li> <li>• DIR: Direction</li> <li>• PUEN: Pull-Up Enable</li> <li>• PDEN: Pull-Down Enable</li> <li>• OPD: Open-Drain</li> <li>• SCHMITT: Schmitt Trigger</li> <li>• DRVSTR: Drive Strength</li> </ul> |

28.7.13 PIO Slow Clock Divider Debouncing Register

Name: PIO\_SCDR  
Offset: 0x500  
Reset: 0x00000000  
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the [PIO Write Protection Mode Register](#).

|        |          |     |           |     |     |     |     |     |

| Bit    | 7            | 6  | 5  | 4  | 3  | 2  | 1      | 0    |
|        |              |    |    |    |    |    | WPITEN | WPEN |
| Access |              |    |    |    |    |    | R/W    | R/W  |
| Reset  |              |    |    |    |    |    | 0      | 0    |

## Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                                          |
|----------|--------|------------------------------------------------------------------------------------------------------|
| 0x50494F | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0. |

## Bit 1 – WPITEN Write Protection Interrupt Enable

See [28.5.15. Register Write Protection](#) for the list of registers that can be protected.

| Value | Description                                                                                             |
|-------|---------------------------------------------------------------------------------------------------------|
| 0     | Disables the write protection on interrupt registers if WPKEY corresponds to 0x50494F ("PIO" in ASCII). |
| 1     | Enables the write protection on interrupt registers if WPKEY corresponds to 0x50494F ("PIO" in ASCII).  |

## Bit 0 – WPEN Write Protection Enable

See [28.5.15. Register Write Protection](#) for the list of registers that can be protected.

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | Disables the write protection if WPKEY corresponds to 0x50494F ("PIO" in ASCII). |
| 1     | Enables the write protection if WPKEY corresponds to 0x50494F ("PIO" in ASCII).  |

### 28.7.15 PIO Write Protection Status Register

**Name:** PIO\_WPSR  
**Offset:** 0x5E4  
**Reset:** 0x00000000  
**Property:** Read-only

|        |             |    |    |    |    |    |    |      |
|--------|-------------|----|----|----|----|----|----|------|
| Bit    | 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        |             |    |    |    |    |    |    |      |
| Access |             |    |    |    |    |    |    |      |
| Reset  |             |    |    |    |    |    |    |      |
| Bit    | 23          | 22 | 21 | 20 | 19 | 18 | 17 | 16   |
|        | WPVSR[15:8] |    |    |    |    |    |    |      |
| Access | R           | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8    |
|        | WPVSR[7:0]  |    |    |    |    |    |    |      |
| Access | R           | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7           | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        |             |    |    |    |    |    |    | WPVS |
| Access |             |    |    |    |    |    |    | R    |
| Reset  |             |    |    |    |    |    |    | 0    |

**Bits 23:8 – WPVSR[15:0]** Write Protection Violation Source  
 When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description                                                                                                                                                                                                       |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protection violation has occurred since the last read of the PIO_WPSR.                                                                                                                                   |
| 1     | A write protection violation has occurred since the last read of the PIO_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

## 29. Hardened External Memory Controller (HEMC)

### 29.1 Description

The Hardened External Memory Controller (HEMC) is designed to ensure the successful data transfer between several external devices and the embedded Memory Controller of an ARM-based device dedicated to aerospace applications.

The HEMC features two external memory controllers, a Hardened Static Memory Controller (HSMC) and a Hardened SDRAM Controller (HSDRAMC). These external memory controllers are capable of handling several types of external memory and peripheral devices, such as SRAM, PROM, Flash and SDRAM memories. The HEMC also supports an Hardened Error Correction Code (HECC) to manage data integrity on the external memories.

The flexible width of the memory data bus allows the end user to select between data transfer performance on the memory interface and optimized footprint of the memories.

The HEMC handles data transfers with up to 6 external devices, each assigned to one of the 6 customizable address spaces. Data transfers are performed through a data bus, an external address bus of up to 28 bits, up to 6 chip select lines and several control pins that are generally multiplexed between the different external Memory Controllers.

### 29.2 Embedded Characteristics

- HSMC Controller
  - 8-bit , 16-bit, 32-bit /40-bit /48-bit PROM and Flash memories
  - 8-bit , 16-bit, 32-bit/40-bit /48-bit SRAM memories
- HSDRAMC Controller
  - 16-bit, 32-bit and 40-bit SDRAM Memories
- Memory Size
  - PROM, SRAM up to 1.5 Gbytes
  - SDRAM up to 2 GBytes
- AMBA Compliant
- Read-Modify-Write (RMW)
- Word Burst, Word, Halfword and Byte Transfers
- Embedded Access Protection
  - AMBA read/write and user/superuser access can be accepted or denied by HEMC
- Interrupt Capabilities
- 6 Independent Chip Selects (NCSx [x=0 to 5])
  - NCSx supports any type of memory
  - Configurable NCSx start address
  - NCSx configurable memory sizes
- On-the-fly Hardened Error Correction Code (HECC)

## 29.3 Block Diagram

Figure 29-1. Organization of the HEMC

## 29.4 I/O Lines

The HEMC has interfaces to perform communication between external memories and the internal AMBA 32-bit bus. The signals are detailed in the table below.

Table 29-1. HEMC I/O Lines Description

| Signal Name     | Signal Direction | Signal Width | Signal Polarity | Signal Description                    |
|-----------------|------------------|--------------|-----------------|---------------------------------------|
| <b>HEMC</b>     |                  |              |                 |                                       |
| A[27:0]         | Output           | 28           | –               | Common address line                   |
| D[31:0]         | Input/Output     | 32           | –               | Common data bits                      |
| CB[15:0]        | Input/Output     | 16           | –               | Common check bits                     |
| EXT_CTRL_BUFFER | Output           | 1            | High            | Common external buffer control signal |
| NCS[5:0]        | Output           | 6            | Low             | Common chip select line signals       |
| <b>HSMC</b>     |                  |              |                 |                                       |
| NRD             | Output           | 1            | Low             | HSMC read signal                      |
| NWE             | Output           | 1            | Low             | HSMC write enable signal              |
| NWR[4:0]        | Output           | 5            | Low             | HSMC write byte enable signals        |
| NWAIT           | Input            | 1            | Low             | HSMC external wait signal             |
| <b>HSDRAMC</b>  |                  |              |                 |                                       |
| SDCK            | Output           | 1            | –               | HSDRAMC clock signal                  |
| SDCKE           | Output           | 1            | High            | HSDRAMC clock enable signal           |
| SDNBS[4:0]      | Output           | 5            | Low             | HSDRAMC byte mask signals             |
| SDWE            | Output           | 1            | Low             | HSDRAMC write enable signal           |
| CAS             | Output           | 1            | Low             | HSDRAMC column signal                 |
| RAS             | Output           | 1            | Low             | HSDRAMC row signal                    |
| SDA10           | Output           | 1            | –               | HSDRAMC address 10 line               |
| BA[1:0]         | Output           | 2            | –               | HSDRAMC bank select                   |

## 29.5 Typical Applications

### 29.5.1 Hardware Interface

The HEMC supports PROM, Flash, SRAM and SDRAM memories, with or without ECC.

**Note:** If BCH ECC is selected on a 32bit-mode, the global data width is 48-bit, which is the sum of D[31:0] and CB[15:0].

**Note:** If Hamming ECC is selected on a 32bit-mode, the global data width is 40-bit, which is the sum of D[31:0] and CB[7:0].

**Table 29-2.** Typical Applications Supported – HSMC – 8/16-bit Modes

| HEMC Signal Name | 8-bit Mode<br>Hamming or BCH ECC ON or OFF | 16-bit Mode<br>Hamming or BCH ECC ON or OFF |                           |
|------------------|--------------------------------------------|---------------------------------------------|---------------------------|
|                  | 1 x 8-bit static devices                   | 2 x 8-bit static devices                    | 1 x 16-bit static devices |
| A[27:2]          | A[27:2]                                    | A[26:1]                                     | A[26:1]                   |
| A[1]             | A[1]                                       | A[0]                                        | A[0]                      |
| A[0]             | A[0]                                       | –                                           | –                         |
| D[7:0]           | D[7:0]                                     | D[7:0]                                      | D[7:0]                    |
| D[15:8]          | –                                          | D[7:0]                                      | D[15:8]                   |
| D[23:16]         | –                                          | –                                           | –                         |
| D[31:24]         | –                                          | –                                           | –                         |
| CB[7:0]          | –                                          | –                                           | –                         |
| CB[15:8]         | –                                          | –                                           | –                         |

| NCS[4]           |                                            |                                             |                           |
| NCS[5]           |                                            |                                             |                           |
| NRD              | OE                                         | OE                                          | OE                        |
| NWE              | WE <sup>(2)</sup>                          | –                                           | WE                        |
| NWR[0]           | WE <sup>(2)</sup>                          | WE                                          | BLE <sup>(3)</sup>        |
| NWR[1]           | –                                          | WE                                          | BHE <sup>(3)</sup>        |
| NWR[2]           | –                                          | –                                           | –                         |
| NWR[3]           | –                                          | –                                           | –                         |
| NWR[4]           | –                                          | –                                           | –                         |

**Notes:**

1. CS can be connected to one of the NCS[5:0].
2. WE can be connected either to the global write enable NWE or to the byte write enable signal (NWR[0]).
3. Depending on the model of 16-bit memory used, to allow the memory to be read:
  - BLE shall be connected to AND(NRD, NWR[0]).
  - BHE shall be connected to AND(NRD, NWR[1]).

**Table 29-3.** Typical Applications Supported – HSMC – 32/40/48-bit Mode

| NWR[4]           | –                        | –                         | –                         | WE                                     | WE                                    | WE                                    | WE                                  | –                         | WE                                    | BLE <sup>(3)</sup>                     |

**Notes:**

- CS can be connected to one of the NCS[5:0].
- Depending on the number of WE available (n) on a 32-bit memory:
  - if n=1, the WE signal must be connected to the global write enable NWE.
  - if n=4, each WE signal must be connected to the byte write enable signal (NWR[x]).
- Depending on the model of 16-bit memory used, to allow the memory to be read:
  - BLE shall be connected to AND (NRD, NWR[0])
  - BHE shall be connected to AND (NRD, NWR[1])
  - BLE shall be connected to AND (NRD, NWR[2])
  - BHE shall be connected to AND (NRD, NWR[3])

## 29.6 Functional Description

The HEMC transfers data between the internal AMBA AHB Bus handled by the Bus Matrix and the external memories. It is composed of the following elements:

- HEMC NCSx management, to configure dynamically each NCSx memory area
- HEMC NCSx protection, to accept or reject internal AMBA AHB data transactions
- HSMC controller, to access external PROM/SRAM memories
- HSDRAMC controller, to access external SDRAM memories
- A chip select assignment feature that assigns an AHB address space to the external devices
- A multiplex controller circuit that shares the pins between the different memory controllers
- HECC management, to increase the reliability and to protect the data against radiation issues

All these elements are accessible via end user registers.

**Notes:** For details, refer to the sections:

- Hardened Static Memory Controller (HSMC)
- Hardened SDRAM Controller (HSDRAMC)
- Hardened Error Correction Code (HECC) Controller

## 29.6.1 HEMC NCSx Management

### 29.6.1.1 Overview

The HEMC provides 6 independent NCSx chip selects to manage different memory areas. The memory controller can drive static and dynamic memory devices. The goal of the NCS management block is to configure areas depending on the end user application needs.

### 29.6.1.2 NCSx Memory Area Definition

The figure below illustrates the NCSx memory area definition.

**Figure 29-2.** NCSx Memory Area Definition

$$\text{NCSx Start Address} = 0x6000\_0000 + \text{Offsetx}$$

$$\text{NCSx End Address} = \text{NCSx Start Address} + \text{NCSx Bank Size} - 1$$

#### Restrictions

Attention should be paid on the following points:

- All active NCSx memory areas must be mapped to the processor's "Memories" space.
- The NCSx start address must be defined in such a way as to avoid any overlap between two NCSx memory areas. Otherwise, processor behavior can be unpredictable.
- The minimum size of an NCSx memory area is 16Kbytes.

The MPLAB Harmony configurator has a dedicated interface to help the user to set up the HEMC peripheral.

### 29.6.1.3 Memory Type Selection

Each NCSx Memory Area can support either static (SRAM, PROM, Flash) or dynamic (SDRAMC) memories. The configuration of the memory to be supported is performed through the HEMC\_CR\_NCSx.TYPE register field:

### 29.6.1.4 NCSx Start Address

Each NCSx Memory Area can be mapped anywhere inside the processor's "Memories" space (0x6000\_0000-0xDFFF\_FFFF). The NCSx Start Address is set up through the AHB relative start address. This is done using the HEMC\_CR\_NCSx.ADDBASE register field.

The HEMC\_CR\_NCSx.ADDBASE register fields contain the offset of NCSx Start Address but only limited to the 18 most significant bits. This feature implies that the offset is at minimum a multiple of 16K (0x4000).

### 29.6.1.5 NCSx Bank Size Configuration

Each NCSx Bank Size can support a wide range of configurations.

The NCSx Bank Size configuration is performed through HEMC\_CR\_NCSx.BANKSIZE.

The minimum bank size, whatever the memory type, is 8 KB.

The maximum bank size for a static memory is 256 MB while the maximum bank size for a dynamic memory is 512 MB.

**Note:** For the unused NCSx chip selects, the HEMC\_CR\_NCSx.BANKSIZE register field must be configured as "NOT\_USED" and the HEMC\_CR\_NCSx.ADDBASE register field must have all its bits set to 1 (0X3\_FFFF).

The table below provides the bank size configurations and their associated code.

**Table 29-6.** Allowable Bank Size Values

| Code         | Size     | Comments                                 |
|--------------|----------|------------------------------------------|
| 0b00000      | 8 KB     | —                                        |
| 0b00001      | 16 KB    | —                                        |
| 0b00010      | 32 KB    | —                                        |
| 0b00011      | 64 KB    | —                                        |
| 0b00100      | 128 KB   | —                                        |
| 0b00101      | 256 KB   | —                                        |
| 0b00110      | 512 KB   | —                                        |
| 0b00111      | 1 MB     | —                                        |
| 0b01000      | 2 MB     | —                                        |
| 0b01001      | 4 MB     | —                                        |
| 0b01010      | 8 MB     | —                                        |
| 0b01011      | 16 MB    | —                                        |
| 0b01100      | 32 MB    | —                                        |
| 0b01101      | 64 MB    | —                                        |
| 0b01110      | 128 MB   | —                                        |
| 0b01111      | 256 MB   | —                                        |
| 0b10000      | 512 MB   | Valid for SDRAM Controller only          |
| 0b11111      | NOT_USED | Configuration for a disabled chip select |
| Other values | RESERVED | —                                        |

**Specific case:** Implementation of an 8 KB memory device.

It's possible to implement an 8 KB memory device (HEMC\_CR\_NCSx.BANKSIZE=0b00000) in a NCSx Memory Area but with the following restrictions:

- It's not possible to map another memory device adjacent to an 8 KB memory device in the same the NCSx Memory Area to exploit its full size
- Only 8 KB of the NCSx Memory Area can be used. The rest is lost.

**Figure 29-3. 8 KB Memory Implementation****29.6.1.6 Example**

Here are some examples that illustrate how to set up the HEMC\_CR\_NCSx register.

**a) Implementation of an 8 KB static memory device**

We would like to implement this memory device in the NCS1 Memory Area from absolute address 0x6000\_4000.

Let's define the fields TYPE, BANKSIZE and ADDBASE of the HEMC\_CR\_NCS1 register.

NCS1 Start Address = 0x6000\_4000

BANKSIZE = 0b000000 (8 KB)

TYPE = 0 (Static memory with size < 256 MB)

Offset1 = 0x6000\_4000 – 0x6000\_0000 = 0x0000\_4000

ADDBASE = 18 MSB (Offset1) = 0xb00 0000 0000 0000 0001

HEMC\_CR\_NCS1 = [x][x][x][0000][00\_0000\_0000\_0000\_0001][0][00000][0]

HEMC\_CR\_NCS1 = 0000 0000 0000 0000 0000 0000 1000 0000 (assuming x =0)

HEMC\_CR\_NCS1 = 0x0000\_0080

NCS1 End Address =  $0x6000\_4000 + 0x2000 - 1 = 0x6000\_5FFF$

NCS2 Start Address =  $0x6000\_4000 + 0x4000 = 0x6000\_8000$

**Figure 29-4. 8 KB Memory Implementation Example**

#### b) Implementation of a 1 MB static memory device

We would like to implement this memory device in the NCS3 Memory Area from absolute address 0x6200\_C000.

Let's define the fields TYPE, BANKSIZE and ADDBASE of the HEMC\_CR\_NCS3 register.

NCS3 Start Address = 0x6200\_C000

BANKSIZE = 0b00111 (1 MB)

TYPE = 0 (Static memory with size < 256 MB)

Offset1 =  $0x6200\_C000 - 0x6000\_0000 = 0x0200\_C000$

ADDBASE = 18 MSB (Offset1) = 0b00 0000 1000 0000 0011

HEMC\_CR\_NCS3 = [x][x][x][0000][00 0000 1000 0000 0011][0][00111][0]

HEMC\_CR\_NCS3 = 0000 0000 0000 0100 0000 0001 1000 1110 (assuming x =0)

HEMC\_CR\_NCS3 = 0x0004\_018E

NCS3 End Address =  $0x6200\_C000 + 0x0010\_0000 - 1 = 0x6210\_BFFF$

NCS4 Start Address = 0x6210\_C000

**Figure 29-5. 1 MB Memory Implementation**

### 29.6.1.7 Boot Memory

If the application needs to boot from an external static PROM memory, the following conditions must be met:

- The boot PROM must be connected to NCS0 as this chip select is the only one with boot capability.
- The pins CFG[3-0] must be correctly set up as these pins are read at reset to automatically configure the NCS0 memory area.

Refer to section “3 Signal Description” for further information.

The BOOT memory size defaults to 16 MB as only 24 A[23:0] address lines are available, the remaining four A[27:24] being configured in their GPIO function as CFG[3-0] at BOOT time. Smaller BOOT memory sizes may also be used, including if the ECC options are selected. The smaller BOOT memory will in any case find all of its available address lines being driven when the ECC words are being accessed in 8/16-bit mode and so default to the correct TOP of MEMORY ECC accessing scheme implemented for these modes.

Should smaller than 16 MB BOOT memories be used, the unrequired external address lines may be switched also to their alternate GPIO function under BOOT program control if desired.

Be aware however that before reconfiguration in GPIO these pins in their Address function will be actively driven. Likewise the A[27:24] GPIO pins may be switched after Boot to functional Address lines for other external memory spaces (NCS[5:1]).

**Figure 29-6. Boot Configuration with HECC Controller Active**

### 29.6.1.8 In Range/Out of Range Definition

When an AHB data transfer occurs, the HEMC verifies whether the AHB address requested is inside or outside the NCSx memory areas.

The following figure illustrates the “in range” and the “out of range” definitions for a NCSx memory area.

**Figure 29-7. Out of Range Definition**

If the AHB address requested is in range, the current AHB transaction occurs normally

If the AHB address requested is out of range:

- A flag “Out\_of\_Range” is raised automatically (HEMC\_SR.OUTOFRANGE = ‘1’).
- An interrupt is triggered (HEMC\_ISR. OUTOFRANGE = ‘1’) when it has been enabled (HEMC\_IER. OUTOFRANGE = ‘1’).
- The current AHB transaction is aborted.

## 29.6.2 HEMC NCSx Protection

### 29.6.2.1 Overview

The HEMC embeds a protection feature with the following characteristics:

- Read (RD) or/and Write (WR) accesses are allowed or rejected on a part of each NCSx memory area depending on the HEMC NCSx protection applied on this area.
- User access can be allowed or rejected on a part of each NCSx memory area depending on the HEMC NCSx protection applied on this area.

**Note:** This protection mechanism does not affect Superuser (or privilege) access which is always allowed.

### 29.6.2.2 Memory Area Region Definition

A region is a part of an NCSx memory area. Two regions, named UP and DOWN in this document, make up one NCSx memory area and these regions are separated by the protect limit, as presented below:

**Figure 29-8.** Region in NCSx Memory Area Definition

The protect limit is defined by configuring the SPLITBANKSIZE field in the HEMC\_CRP\_NCSx register. This limit can vary from 8 Kbytes to HEMC\_CR\_NCSx.BANKSIZE.

**Note:** If HEMC\_CRP\_NCSx.SPLITBANKSIZE is equal to HEMC\_CR\_NCSx.BANKSIZE, the region DOWN covers the entire NCS memory area.

### 29.6.2.3 Enabling/Disabling Protection

The protection can be enabled/disabled on each NCSx memory area by setting/clearing PROTECTON bit in the HEMC\_CRP\_NCSx register.

#### 29.6.2.3.1 Access Types

The types of access are:

- Read (RD) access is allowed or rejected in a region if the HEMC\_CRP\_NCSx.RD is set or cleared, respectively.
- Write (WR) access is allowed or rejected in a region if the HEMC\_CRP\_NCSx.WR is set or cleared, respectively.
- User access is allowed or rejected in a region if the HEMC\_CRP\_NCSx.SUPERUSER is cleared or set, respectively.

**Note:** Superuser (Privilege) access is always allowed in a region.

**Note:** HEMC\_CRP\_NCSx.PROTECTON must be set to enable protection.

### 29.6.2.3.2 Master Protection

The protection rules described above can be applied to data coming from specific masters. By configuring HEMC\_CRP\_NCSx.MASTERNUMBER, data coming from masters can be submitted or not to the previous rules.

For the list of masters and their definitions, refer to the section “Bus Matrix”.

### 29.6.2.4 Region Protection

The protection can be applied on the REGION\_DOWN or on the REGION\_UP depending on the configuration of HEMC\_CRP\_NCSx.PROTECTZONE. Refer to the figures below.

**Figure 29-9.** Protection Region Applicability

### 29.6.2.5 Error Flags

When an unwanted AHB access from a specific master is done on an NCSx memory-protected region, (previously configured and enabled), the corresponding error flags are raised automatically.

- A flag RDERRORACCESS raises automatically (HEMC\_SR. RDERRORACCESS = '1') in a case of unwanted Read access.
- A flag WRERRORACCESS raises automatically (HEMC\_SR. WRERRORACCESS = '1') in a case of unwanted Write access.
- A flag USERERRORACCESS raises automatically (HEMC\_SR. USERERRORACCESS = '1') in a case of unwanted User access.

**Note:** Several flags can be raised in case of multiple violations on a protected area (unwanted Read and User access or unwanted Write and User access).

The corresponding interrupt (HEMC\_ISR. RDERRORACCESS) is also raised if this interrupt is previously enabled (HEMC\_IER. RDERRORACCESS).

The corresponding interrupt (HEMC\_ISR. WRERRORACCESS) is also raised if this interrupt is previously enabled (HEMC\_IER. WRERRORACCESS).

The corresponding interrupt (HEMC\_ISR. USERERRORACCESS) is also raised if this interrupt is previously enabled (HEMC\_IER. USERERRORACCESS).

**Note:** Several interrupts are raised if there are multiple violations on a protected area; for example, in the case of unwanted Read and User access or unwanted Write and User access.

### 29.6.3 External Control Buffer Signal

The EXT\_CTRL\_Buffer signal can be used to control the direction pin of a supplementary External Data Bus Buffer devices.

The behavior of this signal is as follows:

- WR HSMC access: NOT(EXT\_CTRL\_BUFFER\_DEFAULT\_STATE)
- RD HSMC access: EXT\_CTRL\_BUFFER\_DEFAULT\_STATE
- WR HSDRAMC access: EXT\_CTRL\_BUFFER\_DEFAULT\_STATE
- RD HSDRAMC access: EXT\_CTRL\_BUFFER\_DEFAULT\_STATE
- NO access: EXT\_CTRL\_BUFFER\_DEFAULT\_STATE

and by default EXT\_CTRL\_BUFFER\_DEFAULT\_STATE is '1'.

The EXT\_CTRL\_BUFFER\_DEFAULT\_STATE value can be changed by configuring HEMC\_CTRL.POL bit field.

- if HEMC\_CTRL.POL is '0' then EXT\_CTRL\_BUFFER\_DEFAULT\_STATE is '1'.
- if HEMC\_CTRL.POL is '1' then EXT\_CTRL\_BUFFER\_DEFAULT\_STATE is '0'.

## 29.7 Register Summary

| Offset              | Name          | Bit Pos. | 7                  | 6          | 5              | 4 | 3 | 2  | 1         | 0           |
|---------------------|---------------|----------|--------------------|------------|----------------|---|---|----|-----------|-------------|

#### Bit 31 – ECC12\_ENABLE BCH ECC Enable

The reset value depends on CFG[3] value at reset.

| Value | Description                                                             |
|-------|-------------------------------------------------------------------------|
| 0     | If Register bit-30 ECC_Enable is also '1' then Hamming ECC is selected. |
| 1     | If Register bit-30 ECC_Enable is also '1' then BCH ECC is selected.     |

#### Bit 30 – ECC\_ENABLE ECC Protection Enable

The reset value depends on CFG[2] value at reset.

| Value | Description         |
|-------|---------------------|
| 0     | ECC is deactivated. |
| 1     | ECC is activated.   |

#### Bit 29 – WRITE\_ECC\_CONF ECC Configuration Protection Enable

| Value | Description                                                                                                                                                     |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Modifying the ECC configuration through this register is not permitted; it can only be done by sampling the states of CFG[2] and CFG[3] when Reset is released. |
| 1     | Modifying the ECC configuration through the register is permitted.                                                                                              |

#### Bits 24:7 – ADDBASE[17:0] Relative Base Address of NCS Area

18-bit MSB address to define the relative base address of the corresponding chip select. (all '1' is the default value, i.e 3\_FFFF, meaning that the current area is not configured).

#### Bit 6 – TYPE Type of Memory Connected

| Value | Name   | Description                      |
|-------|--------|----------------------------------|
| 0     | SMC    | SMC (PROM or SRAM) is connected. |
| 1     | SDRAMC | SDRAMC is connected.             |

**Bits 5:1 – BANKSIZE[4:0] Bank Size**

Bank size by chip select, from 8 Kbytes to 512 Mbytes. Default is 256 Mbytes.

| Value | Name     | Description          |
|-------|----------|----------------------|
| 00000 | 8KB      | 8 Kbytes             |
| 00001 | 16KB     | 16 Kbytes            |
| 00010 | 32KB     | 32 Kbytes            |
| 00011 | 64KB     | 64 Kbytes            |
| 00100 | 128KB    | 128 Kbytes           |
| 00101 | 256KB    | 256 Kbytes           |
| 00110 | 512KB    | 512 Kbytes           |
| 00111 | 1MB      | 1 Mbytes             |
| 01000 | 2MB      | 2 Mbytes             |
| 01001 | 4MB      | 4 Mbytes             |
| 01010 | 8MB      | 8 Mbytes             |
| 01011 | 16MB     | 16 Mbytes            |
| 01100 | 32MB     | 32 Mbytes            |
| 01101 | 64MB     | 64 Mbytes            |
| 01110 | 128MB    | 128 Mbytes           |
| 01111 | 256MB    | 256 Mbytes (Default) |
| 10000 | 512MB    | 512 Mbytes           |
| 11111 | NOT_USED | NCS not configured   |

**Note:** This feature is product dependent, refer to the [29.6.1.5. NCSx Bank Size Configuration](#) section to know which value is supported.

**Bit 0 – ZERO Fixed to 0**

| Value | Description |
|-------|-------------|
| 0     | ZERO        |

### Bit 31 – ECC12\_ENABLE BCH ECC Enable

The reset value depends on CFG[3] value at reset.

| Value | Description                                                             |
|-------|-------------------------------------------------------------------------|
| 0     | If Register bit-30 ECC_Enable is also '1' then Hamming ECC is selected. |
| 1     | If Register bit-30 ECC_Enable is also '1' then BCH ECC is selected.     |

### Bit 30 – ECC\_ENABLE ECC Protection Enable

The reset value depends on CFG[2] value at reset.

| Value | Description         |
|-------|---------------------|
| 0     | ECC is deactivated. |
| 1     | ECC is activated.   |

### Bits 24:7 – ADDBASE[17:0] Relative Base Address of NCS Area

18-bit MSB address to define the relative base address of the corresponding chip select. (all '1' is the default value, i.e 3\_FFFF, meaning that the current area is not configured).

### Bit 6 – TYPE Type of Memory Connected

| Value | Name   | Description                      |
|-------|--------|----------------------------------|
| 0     | SMC    | SMC (PROM or SRAM) is connected. |
| 1     | SDRAMC | SDRAMC is connected.             |

### Bits 5:1 – BANKSIZE[4:0] Bank Size

Bank size by chip select, from 8 Kbytes to 512 Mbytes. Default is 256 Mbytes.

| Value | Name | Description |
|-------|------|-------------|
| 00000 | 8KB  | 8 Kbytes    |
| 00001 | 16KB | 16 Kbytes   |

| Value | Name     | Description          |
|-------|----------|----------------------|
| 00010 | 32KB     | 32 Kbytes            |
| 00011 | 64KB     | 64 Kbytes            |
| 00100 | 128KB    | 128 Kbytes           |
| 00101 | 256KB    | 256 Kbytes           |
| 00110 | 512KB    | 512 Kbytes           |
| 00111 | 1MB      | 1 Mbytes             |
| 01000 | 2MB      | 2 Mbytes             |
| 01001 | 4MB      | 4 Mbytes             |
| 01010 | 8MB      | 8 Mbytes             |
| 01011 | 16MB     | 16 Mbytes            |
| 01100 | 32MB     | 32 Mbytes            |
| 01101 | 64MB     | 64 Mbytes            |
| 01110 | 128MB    | 128 Mbytes           |
| 01111 | 256MB    | 256 Mbytes (Default) |
| 10000 | 512MB    | 512 Mbytes           |
| 11111 | NOT_USED | NCS not configured   |

**Note:** This feature is product dependent, refer to the [29.6.1.5. NCSx Bank Size Configuration](#) section to know which value is supported.

#### Bit 0 – ZERO Fixed to 0

| Value | Description |
|-------|-------------|
| 0     | ZERO        |

29.7.3 HEMC Polarity Control Register

Name: HEMC\_CTRL  
Offset: 0x18  
Reset: 0x00000000  
Property: Read/Write

Bit 0 – POL External Control Buffer Signal Polarity

| Value | Description                                                          |
|-------|----------------------------------------------------------------------|
| 0     | ext_ctrl_buffer is '1' except for HSMC write cycle, where it is '0'  |
| 1     | ext_ctrl_buffer is '0' except for HSMC write cycle, where it is '1'. |

## 29.7.4 HEMC Control Register Protection Chip Select x

**Name:** HEMC\_CRP\_NCSx  
**Offset:** 0x20 + x\*0x04 [x=0..5]  
**Reset:** 0x00000000  
**Property:** Read/Write

**Note:** This register is cleared on read.

|        |    |    |    |    |    |    |           |             |
|--------|----|----|----|----|----|----|-----------|-------------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25        | 24          |
|        |    |    |    |    |    |    | PROTECTON | PROTECTZONE |
| Access |    |    |    |    |    |    | R/W       | R/W         |
| Reset  |    |    |    |    |    |    | 0         | 0           |

|        |                    |     |     |     |     |     |     |           |

| Bit    | 7                 | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | MASTERNUMBER[7:0] |     |     |     |     |     |     |     |
| Access | R/W               | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0                 | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

### Bit 25 – PROTECTON Protection Activation

| Value | Description        |
|-------|--------------------|
| 0     | Protection is OFF. |
| 1     | Protection is ON.  |

### Bit 24 – PROTECTZONE Select Area Protected

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | DOWN is protected, UP is not protected. |
| 1     | DOWN is not protected, UP is protected. |

### Bits 23:19 – SPLITBANKSIZE[4:0] Bank Size Internal Separation

0b00000 to 0b10000: from 8 KBytes to 512 Mbytes with the constraint that SPLITBANKSIZE ≤ CR\_NCS[x].BANKSIZE and CR\_NCS[x].ADDBASE is valid.

### Bit 18 – RD Read Access

| Value | Description              |
|-------|--------------------------|
| 0     | Read access not allowed. |
| 1     | Read access allowed.     |

### Bit 17 – WR Write Access

| Value | Description               |
|-------|---------------------------|
| 0     | Write access not allowed. |
| 1     | Write access allowed.     |

### Bit 16 – SUPERUSER User or Superuser Access

| Value | Description                        |
|-------|------------------------------------|
| 0     | User and Superuser access allowed. |
| 1     | Only Superuser access allowed.     |

**Bits 15:0 – MASTERNUMBER[15:0] Master Number ID**

For each master on the AHB (from M0 to M15) (bit0 = M0...bit15 = M15)

| Value | Description                                               |
|-------|-----------------------------------------------------------|
| 0     | Memory not protected against the master (no restriction). |
| 1     | Memory protected against the master (restriction).        |

29.7.5 HEMC Interrupt Enable Register

Name: HEMC\_IER  
Offset: 0x38  
Reset: -  
Property: Write-only

Bit 4 – USERERRORACCESS User Access Interrupt Enable

| Value | Description                          |
|-------|--------------------------------------|
| 0     | No effect.                           |
| 1     | User error access interrupt enabled. |

Bit 3 – WRERRORACCESS Write Access Interrupt Enable

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Write error access interrupt enabled. |

Bit 2 – RDERRORACCESS Read Access Interrupt Enable

| Value | Description                          |
|-------|--------------------------------------|
| 0     | No effect.                           |
| 1     | Read error access interrupt enabled. |

Bit 1 – OUTOFRANGE Out of Range Interrupt Enable

| Value | Description                     |
|-------|---------------------------------|
| 0     | No effect.                      |
| 1     | Out of range interrupt enabled. |

29.7.6 HEMC Interrupt Disable Register

Name: HEMC\_IDR  
Offset: 0x3C  
Reset: -  
Property: Write-only

Bit 4 – USERERRORACCESS User Access Interrupt Disable

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | User error access interrupt disabled. |

Bit 3 – WRERRORACCESS Write Access Interrupt Disable

| Value | Description                            |
|-------|----------------------------------------|
| 0     | No effect.                             |
| 1     | Write error access interrupt disabled. |

Bit 2 – RDERRORACCESS Read Access Interrupt Disable

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Read error access interrupt disabled. |

Bit 1 – OUTOFRANGE Out of Range Interrupt Disable

| Value | Description                      |
|-------|----------------------------------|
| 0     | No effect.                       |
| 1     | Out of range interrupt disabled. |

29.7.7 HEMC Interrupt Mask Register

Name: HEMC\_IMR  
Offset: 0x40  
Reset: 0x00000000  
Property: Read-only

Bit 4 – USERERRORACCESS User Access Mask Interrupt

| Value | Description                           |
|-------|---------------------------------------|
| 0     | User error access interrupt disabled. |
| 1     | User error access interrupt enabled.  |

Bit 3 – WRERRORACCESS Write Access Error Mask Interrupt

| Value | Description                            |
|-------|----------------------------------------|
| 0     | Write error access interrupt disabled. |
| 1     | Write error access interrupt enabled.  |

Bit 2 – RDERRORACCESS Read Access Error Mask Interrupt

| Value | Description                           |
|-------|---------------------------------------|
| 0     | Read error access interrupt disabled. |
| 1     | Read error access interrupt enabled.  |

Bit 1 – OUTOFRANGE Out of Range Mask Interrupt

| Value | Description                      |
|-------|----------------------------------|
| 0     | Out of range interrupt disabled. |
| 1     | Out of range interrupt enabled.  |

29.7.8 HEMC Interrupt Status Register

Name: HEMC\_ISR  
Offset: 0x44  
Reset: 0x00000000  
Property: Read-only

Bit 4 – USERERRORACCESS User Interrupt Pending

| Value | Description                              |
|-------|------------------------------------------|
| 0     | User error access interrupt not pending. |
| 1     | User error access interrupt pending.     |

Bit 3 – WRERRORACCESS Write Access Interrupt Pending

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | Write error access interrupt not pending. |
| 1     | Write error access interrupt pending.     |

Bit 2 – RDERRORACCESS Read Access Interrupt Pending

| Value | Description                              |
|-------|------------------------------------------|
| 0     | Read error access interrupt not pending. |
| 1     | Read error access interrupt pending.     |

Bit 1 – OUTOFRANGE Out of Range Interrupt Pending

| Value | Description                         |
|-------|-------------------------------------|
| 0     | Out of range interrupt not pending. |
| 1     | Out of range interrupt pending.     |

29.7.9 HEMC Status Register

Name: HEMC\_SR  
Offset: 0x48  
Reset: 0x00000000  
Property: Read-only

**Note:** This register is cleared on read.

Bit 4 – USERERRORACCESS User or Superuser Error Access

| Value | Description                     |
|-------|---------------------------------|
| 0     | User error access not detected. |
| 1     | User error access detected.     |

Bit 3 – WRERRORACCESS Write Access Error

| Value | Description                      |
|-------|----------------------------------|
| 0     | Write error access not detected. |
| 1     | Write error access detected.     |

Bit 2 – RDERRORACCESS Read Access Error

| Value | Description                     |
|-------|---------------------------------|
| 0     | Read error access not detected. |
| 1     | Read error access detected.     |

Bit 1 – OUTOFRANGE Out of Range

| Value | Description                |
|-------|----------------------------|
| 0     | Out of range not detected. |
| 1     | Out of range detected.     |

## 30. Hardened Error Correction Code (HECC) Controller

### 30.1 Description

The Hardened Error Correction Code (HECC) Controller protects data against the effects of radiation. It is embedded in the Hardened External Memory Controller (HEMC).

### 30.2 Embedded Characteristics

- 3 Channels Depending on the Memory Type and the Access Used
- Embedded Hamming Code to Correct One Error and Detect up to Two Errors
- Embedded BCH Code to Correct up to Two Errors and to Detect Three or More Errors
- Interrupt Capabilities
  - One interrupt dedicated to fixable errors
  - One interrupt dedicated to unfixable errors
- Error Counter Available for Statistical Reporting
  - One counter dedicated to fixable errors
  - One counter dedicated to unfixable errors
- Embedded HECC Testing Mode

### 30.3 Block Diagram

Refer to the [29.3. Block Diagram](#) of the HEMC peripheral.

### 30.4 Functional Description

#### 30.4.1 Overview

The HECC comprises:

- Hamming encoder/decoder
- BCH encoder/decoder
- An APB end user interface used to configure:
  - the HECC protection
  - the encoder/decoder type used: (Hamming or BCH)
  - the HECC test mode (independently in read or write mode)
  - the reset of the HECC fixable and unfixable counters
- An APB end user interface for errors status and reporting:
  - Indicates whether fixable errors have been detected and corrected on-the-fly, and quantifies them
  - Indicates whether unfixable errors have been detected and quantifies them
  - The indication can be done either by interruption or by polling
  - Indicates the address and the status (type, size and origin) of the last HECC error detected

#### 30.4.2 Operation

3 Channels are implemented in the HECC module. Each channel is dedicated to a memory type and/or the activation of the read-modify-write (RMW) feature.

- Channel 0 is used when accesses to the HSMC are performed.
- Channel 1 and 2 are used when accesses to the HSDRAMC are performed.

**Note:** When using HSDRAMC, it is mandatory to configure channels 1 and 2.

ECC protection is individually enabled or disabled for each Chip Select by setting or clearing the HEMC\_CR\_NCSx.ECC\_ENABLE bit (  $0 \leq x \leq 5$  ). When enabled, the HECC operates at each access to the memories. However, the HECC detection and correction is performed only on read/fetch accesses, by comparing the HECC checksum stored in memory to the one locally computed from data read.

**Note:**

Upon reset, ECC protection performed on the NCS0 memory area is configured from the value read on external pins CFG2 and CFG3. By driving CFG2 high (resp. low) during Reset, it is possible to enable (resp. disable) the HECC protection. By driving CFG3 high (resp. low), it is possible to select the appropriate encoder/decoder Hamming (resp. BCH).

The default reset configuration can be modified through the HEMC\_CR\_NCS0 register by setting both the HEMC\_CR\_NCS0.ECC12\_ENABLE and HEMC\_CR\_NCS0.ECC\_ENABLE bits. However, the modification is possible if HEMC\_CR\_NCS0.WRITE\_ECC\_CONF is firstly set.

ECC protection performed on the other memory areas (NCSx,  $1 \leq x \leq 5$  ) is configured with the HEMC\_CR\_NCSx.ECC12\_ENABLE and HEMC\_CR\_NCSx.ECC\_ENABLE bits in the corresponding HEMC\_CR\_NCSx registers.

**Note:** When the HECC is enabled on the HEMC area, the corresponding read modify write RMW enable bits in the Mode registers (HSMC\_MODE/HSDRAMC\_MODE) must also be enabled so that the integrity of the HECC checkbits is preserved on sub-word writes.

### 30.4.3 Interrupt Sources

Using the HECC interrupt requires the interrupt controller to be programmed first.

### 30.4.4 Boot Memory

For more information, see [29.6.1.7. Boot Memory](#).

## 30.5 Hamming Code

The Hamming code used is Hamming(39,32). For each 32-bit word, a 7-bit checksum is generated. With this correction code, errors of one bit can be corrected (fixable error) and errors of up to two bits (unfixable errors) can be detected.

### 30.5.1 Write Access

When the processor performs a write access to an HECC protected memory, it also writes the 7-bit HECC checksum on the HECC protected memory. The unused CB pins can be assigned to their alternate functions if desired. If they are not assigned to their alternate functions, the unused checkbits will be driven low on a write operation.

### 30.5.2 Read Access

When the processor performs a read access to an HECC protected memory, it reads data and the associated checksum. The checksum read from the HECC protected memory is compared against the checksum generated by the HECC from the same read data. Any discrepancy yields an error and a syndrome is computed to further qualify the error as a fixable error or unfixable error. Unused Checkbits values are not relevant during read access. The unused CB pins can be assigned to their alternate functions if desired.

### 30.5.3 Fixable Error

The correction of a fixable error is performed on-the-fly inside the processor during the current access and no timing penalty is incurred.

The fixable error event is reported in the Status register (HEMC\_HECC\_SR) and the address of the corresponding error is reported in the Fail Address register (HEMC\_HECC\_FAILAR). If previously enabled, a fixable interrupt is generated.

The fixable error remains in memory until a software-initiated rewrite is performed at the faulty memory location.

To track the number of fixable errors, a fixable error counter is available. It is incremented each time a fixable error is detected and until a counter overflow is detected.

It is possible for the end user to reset the fixable counter using RST\_FIX\_CPT in

[30.9.1. HEMC\\_HECC\\_CRx](#), x=0..2.

### 30.5.4 Unfixable Error

The unfixable error event is reported in the Status register (HEMC\_HECC\_SR) and the address of the corresponding error is reported in the Fail Address register (HEMC\_HECC\_FAILAR). If previously enabled, an unfixable interrupt is generated.

To track the number of unfixable errors, an unfixable error counter is available. It is incremented each time an unfixable error is detected and until a counter overflow is detected.

It is possible for the end user to reset the unfixable counter using RST\_NOFIX\_CPT in

[30.9.1. HEMC\\_HECC\\_CRx](#), x=0..2.

### 30.5.5 Hamming on 8-bit Memories

When Hamming is used, protection is performed as follows on 8-bit memories:

- D[7:0] is used to store/load 32-bit data or fetch instruction in a burst of four accesses.
- D[7:0] is used to store/load checksum with an additional access.

#### 30.5.5.1 Memory Repartition

The protected memory bank is partitioned as follows:

- 80% of the memory bank is available as program or data memory
- 20% of the memory bank is allocated to the HECC checksum

#### 30.5.5.2 HECC Checkbits Address Calculation

The HECC checksum address is defined by the following equation:

$$@ecc = @top\_memory - [ @data - @bottom\_memory ] / 4$$

where

*@ecc* = address of HECC checksum

*@top\_memory* = higher address cover by the memory range

*@bottom\_memory* = lower address cover by the memory range

*@data* = address of data written

**Figure 30-1.** Hamming Protection on 8-bit Memory Organization (example with a memory of 256 MBytes)

### 30.5.6 Hamming on 16-bit Memories

When Hamming is used, protection is performed as follows on 16-bit memories:

- D[15:0] is used to store/load 32-bit data or fetch instruction in a burst of two accesses.
- D[15:0] is used to store/load checksum with an additional access.

#### 30.5.6.1 Memory Repartition

As shown in the figure above, the 16-bit memory is used as follows:

- 80% of the memory bank is available as program or data memory
- 20% of the memory bank is allocated to the HECC checksum

#### 30.5.6.2 HECC Checkbits Address Calculation

The HECC checksum address is defined by the following equation:

$$@ecc = @top\_memory - [ @data - @bottom\_memory ] / 4$$

where

*@ecc* = address of HECC checksum

*@top\_memory* = higher address cover by the memory range

*@bottom\_memory* = lower address cover by the memory range

*@data* = address of data written

**Figure 30-2.** Hamming Protection on 16-bit Memory Organization (example with a memory of 256 MBytes)

### 30.5.7 Hamming on 32-bit Memories

When Hamming is used, protection is performed as follows on 32-bit memories:

- D[31:0] is used to store/load 32-bit data or fetch instruction , in a single access
- CB[7:0] is used to store/load checksum synchronously with the D[31:0] transfer

#### 30.5.7.1 Memory Repartition

The 32-bit memory is used as follows:

- 100% of the memory bank is available as program or data memory

#### 30.5.7.2 HECC Checkbits Address Calculation

In this case, the HECC address is the same as the data address.

## 30.6 BCH Code

The BCH code used here is BCH(44,32,2). For each 32-bit word, a 12-bit checksum is generated. With this correcting code, an error of up to two bits, or fixable error, can be corrected. Errors of three bits, or unfixable errors, can be detected.

### 30.6.1 Write Access

When the processor performs a write access to an HECC protected memory, it also writes the 12-bit HECC checksum into the HECC protected memory. Unused CB pins can be assigned to their alternate functions if desired. If they are not assigned to their alternate functions, the unused checkbits will be driven low on a write operation.

### 30.6.2 Read Access

When the processor performs a read access to an HECC protected memory, it reads data and the associated checksum. The checksum read from the HECC protected memory is compared against the checksum generated by the HECC from the same read data. Any discrepancy yields an error and a syndrome is computed to further qualify the error as a fixable error or unfixable error. Unused Checkbits values are not relevant during read access. The unused CB pins can be assigned to their alternate functions if desired.

### 30.6.3 Fixable Error

The correction of a fixable error is performed on-the-fly inside the processor during the current access and no timing penalty is incurred.

The fixable error event is reported in the Status register (HEMC\_HECC\_SR) and the address of the corresponding error is reported in the Fail Address register (HEMC\_HECC\_FAILAR). If previously enabled, a fixable interrupt is generated.

The fixable error remains in memory until a software-initiated rewrite is performed at the faulty memory location.

To track the number of fixable errors, a fixable error counter is available. It is incremented each time a fixable error is detected and until a counter overflow is detected.

It is possible for the end user to reset the fixable counter using RST\_FIX\_CPT in [30.9.1. HEMC\\_HECC\\_CRx](#), x=0..2.

### 30.6.4 Unfixable Error

The unfixable error event is reported in the Status register (HEMC\_HECC\_SR) and the address of the corresponding error is reported in the Fail Address register (HEMC\_HECC\_FAILAR). If previously enabled, an unfixable interrupt is generated.

To track the number of unfixable errors, an unfixable error counter is available. It is incremented each time an unfixable error is detected and until a counter overflow is detected.

It is possible for the end user to reset the unfixable counter using RST\_NOFIX\_CPT in [30.9.1. HEMC\\_HECC\\_CRx](#), x=0..2.

### 30.6.5 BCH on 8-bit Memories

When BCH is used, protection is performed as follows on an 8-bit memory:

- D[7:0] is used to store/load 32-bit data or fetch instruction in a burst of four accesses.
- D[7:0] is used to store/load checksum with an additional burst of two accesses.

#### 30.6.5.1 Memory Repartition

The protected memory bank is partitioned as follows:

- 66% of the memory bank is available as program or data memory
- 33% of the memory bank is allocated to the HECC checksum

#### 30.6.5.2 HECC Checkbits Address Calculation

The HECC checksum address is defined by the following equation:

$$@ecc = @top\_memory - ([@data - @bottom\_memory] / 2 + 1)$$

where

*@ecc=address of HECC checksum*

*@top\_memory = higher address cover by the memory range*

*@bottom\_memory = lower address cover by the memory range*

*@data = address of data written*

**Figure 30-3.** BCH Protection on 8-bit Memory Organization (example with a memory of 256 MBytes)

### 30.6.6 BCH on 16-bit Memories

When BCH is used, protection is performed as follows on 16-bit memory:

- D[15:0] is used to store/load 32-bit data or fetch instruction in a burst of two accesses.
- D[15:0] is used to store/load checksum with one additional access.

#### 30.6.6.1 Memory Repartition

As shown in the figure above, the protected memory bank is partitioned as follows:

- 66% of the memory bank is available as program or data memory
- 33% of the memory bank is allocated to the HECC checksum

#### 30.6.6.2 HECC Checkbits Address Calculation

The HECC checksum address is defined by the following equation:

$$@ecc = @top\_memory - ([@data - @bottom\_memory] / 2 + 1)$$

where

*@ecc=address of HECC checksum*

*@top\_memory = higher address cover by the memory range*

*@bottom\_memory = lower address cover by the memory range*

*@data = address of data written*

**Figure 30-4.** BCH Protection on 16-bit Memory Organization (example with a memory of 256 MBytes)

### 30.6.7 BCH on 32-bit Memories

When BCH is used, protection is performed as follows on 32-bit memory:

- D[31:0] is used to store/load 32-bit data or fetch instruction, in a single access
- CB[15:0] is used to store/load the checksum synchronously with the D[31:0] transfer

#### 30.6.7.1 Memory Repartition

Therefore, the 32-bit memory is used as follows:

- 100% of the memory bank is available as program and data memory

#### 30.6.7.2 HECC Checkbits Address Calculation

In this case, the HECC address is the same as the data address.

## 30.7 HECC Testing

Operation of the HECC can be bypassed for testing purposes and is controlled in the Control register (30.9.1. HEMC\_HECC\_CRx, x = 0..2 ). Each channel has its own test mode activation and set up.

### 30.7.1 Write Test

When HECC write bypass is enabled ( [30.9.1. HEMC\\_HECC\\_CRx.TEST\\_MODE\\_WR](#),  $x=0..2$ ), the test checksum ( [30.9.2. HEMC\\_HECC\\_TESTCBx.TCB1](#),  $x=0..2$ ) replaces the HECC generated checksum during a data store on the corresponding channel.

### 30.7.2 Read Test

When the HECC read diagnostic is enabled ([30.9.1. HEMC\\_HECC\\_CRx.TEST\\_MODE\\_RD](#) =1,  $x=0..2$ ), the test checksum ([30.9.2. HEMC\\_HECC\\_TESTCBx.TCB1](#),  $x=0..2$ ) is updated with the read checksum during a data load or an instruction fetch on the corresponding channel.

**Note:** The HECC test routine must be executed entirely from the instruction cache (when activated) or from an area without the HECC activated and different from the one being accessed. Otherwise, the checksum read during instruction fetch will overwrite those from the area to be tested.

## 30.8 HECC Restrictions

When HECC is used to protect HSMC accesses, either the BCH or Hamming code may be selected.

When HECC is used to protect HSDRAMC accesses, only Hamming code may be selected.

As a consequence:

- Hamming or BCH code may be used for channel 0
- Hamming Code is used for channel 1
- Hamming Code is used for channel 2

## 30.9 Register Summary

| Offset                  | Name               | Bit Pos. | 7              | 6              | 5             | 4           | 3    | 2            | 1            | 0         |
|-------------------------|--------------------|----------|----------------|----------------|---------------|-------------|------|--------------|--------------|-----------|
| 0x00<br>...<br>0xFF     | Reserved           |          |                |                |               |             |      |              |              |           |

### 30.9.1 HECC Control Register x

**Name:** HEMC\_HECC\_CRx  
**Offset:** 0x0100 + x\*0x04 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 5 – RST\_NOFIX\_CPT** Reset the Unfixable Error Counter  
 This bit automatically returns to '0' once the operation is done.

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | No effect.                              |
| 1     | Resets the ECC unfixable error counter. |

**Bit 4 – RST\_FIX\_CPT** Reset the Fixable Error Counter  
 This bit automatically returns to '0' once the operation is done.

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Resets the ECC fixable error counter. |

**Bit 2 – TEST\_MODE\_WR** Test Mode of ECC Protection - Write Mode  
 The ENABLE bit must be enabled to use TEST\_MODE\_WR.

| Value | Description                     |
|-------|---------------------------------|
| 0     | Write test mode is deactivated. |
| 1     | Write test mode is activated.   |

**Bit 1 – TEST\_MODE\_RD** Test Mode of ECC Protection - Read Mode  
 The ENABLE bit must be enabled to use TEST\_MODE\_RD.

| Value | Description                    |
|-------|--------------------------------|
| 0     | Read test mode is deactivated. |
| 1     | Read test mode is activated.   |

30.9.2 HECC Test Mode Register x

**Name:** HEMC\_HECC\_TESTCBx  
**Offset:** 0x0140 + x\*0x04 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |            |     |     |     |     |     |     |     |
|--------|------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31         | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |            |     |     |     |     |     |     |     |
| Access |            |     |     |     |     |     |     |     |
| Reset  |            |     |     |     |     |     |     |     |
| Bit    | 23         | 22  | 21  | 20  | 19  | 18  | 17  | 16  |

| Access |            |     |     |     |     |     |     |     |
| Reset  |            |     |     |     |     |     |     |     |
| Bit    | 15         | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | TCB1[15:8] |     |     |     |     |     |     |     |
| Access | R/W        | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0          | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7          | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | TCB1[7:0]  |     |     |     |     |     |     |     |
| Access | R/W        | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0          | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 15:0 – TCB1[15:0]** Test Check Bit (8- or 16-bit)  
Check bit for test purposes.  
When Hamming is selected, only TCB1[7:0] is used.  
When BCH is selected, TCB1[15:0] is used.

### 30.9.3 HECC Status Register

**Name:** HEMC\_HECC\_SR  
**Offset:** 0x180  
**Reset:** 0x00000000  
**Property:** Read-only

**Note:** The register is clear on read.

|        |    |    |    |    |      |    |          |    |
|--------|----|----|----|----|------|----|----------|----|

| Bit    | 15         | 14 | 13 | 12             | 11 | 10 | 9 | 8         |
|        | OVER_NOFIX |    |    | CPT_NOFIX[4:0] |    |    |   | MEM_NOFIX |
| Access | R          | R  | R  | R              | R  | R  |   | R         |
| Reset  | 0          | 0  | 0  | 0              | 0  | 0  |   | 0         |

|        |          |   |   |              |   |   |   |         |
|--------|----------|---|---|--------------|---|---|---|---------|
| Bit    | 7        | 6 | 5 | 4            | 3 | 2 | 1 | 0       |
|        | OVER_FIX |   |   | CPT_FIX[4:0] |   |   |   | MEM_FIX |
| Access | R        | R | R | R            | R | R |   | R       |
| Reset  | 0        | 0 | 0 | 0            | 0 | 0 |   | 0       |

#### Bit 27 – TYPE Write or Read Access

| Value | Description        |
|-------|--------------------|
| 0     | Write access.      |
| 1     | Read/fetch access. |

#### Bits 26:24 – HES[2:0] Hardware Error Size

Identifies the size of the failed access.  
 000=8-bit, 001=16-bit, 010=32-bit access failure.

#### Bit 15 – OVER\_NOFIX Counter Overflow

| Value | Description                                                        |
|-------|--------------------------------------------------------------------|
| 0     | No overflow has occurred since the last read on unfixable counter. |
| 1     | An overflow has occurred since the last read on unfixable counter. |

#### Bits 14:10 – CPT\_NOFIX[4:0] 5-bit Counter

Counts the total number of unfixable errors detected on all channels since the counter was last reset through RST\_NOFIX\_CPT.

#### Bit 8 – MEM\_NOFIX Unfixable Error Status

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No unfixable error detected.          |
| 1     | An unfixable error has been detected. |

#### Bit 7 – OVER\_FIX Counter Overflow

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No overflow has occurred since the last read. |

| Value | Description                                   |
|-------|-----------------------------------------------|
| 1     | An overflow has occurred since the last read. |

**Bits 6:2 – CPT\_FIX[4:0]** 5-bit Counter

Counts the total number of fixable errors detected on all channels since the counter was last reset  
RST\_FIX\_CPT

**Bit 0 – MEM\_FIX** Fixable Error Status

A fixable error has been detected.

| Value | Description                        |
|-------|------------------------------------|
| 0     | No fixable error detected.         |
| 1     | A fixable error has been detected. |

30.9.4 HECC Interrupt Enable Register

**Name:** HEMC\_HECC\_IER  
**Offset:** 0x184  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

- 0: No effect.
- 1: Enables the corresponding interrupt.

|        |    |    |    |    |    |    |           |         |
|--------|----|----|----|----|----|----|-----------|---------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25        | 24      |
|        |    |    |    |    |    |    |           |         |
| Access |    |    |    |    |    |    |           |         |
| Reset  |    |    |    |    |    |    |           |         |
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17        | 16      |
|        |    |    |    |    |    |    |           |         |
| Access |    |    |    |    |    |    |           |         |
| Reset  |    |    |    |    |    |    |           |         |
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9         | 8       |
|        |    |    |    |    |    |    |           |         |
| Access |    |    |    |    |    |    |           |         |
| Reset  |    |    |    |    |    |    |           |         |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2  | 1         | 0       |
|        |    |    |    |    |    |    | MEM_NOFIX | MEM_FIX |
| Access |    |    |    |    |    |    | W         | W       |
| Reset  |    |    |    |    |    |    | –         | –       |

Bit 1 – MEM\_NOFIX Unfixable Error

Bit 0 – MEM\_FIX Fixable Error

30.9.5 HECC Interrupt Disable Register

**Name:** HEMC\_HECC\_IDR  
**Offset:** 0x188  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

- 0: No effect.
- 1: Disables the corresponding interrupt.

|        |    |    |    |    |    |    |           |         |
|--------|----|----|----|----|----|----|-----------|---------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25        | 24      |
|        |    |    |    |    |    |    |           |         |
| Access |    |    |    |    |    |    |           |         |
| Reset  |    |    |    |    |    |    |           |         |
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17        | 16      |
|        |    |    |    |    |    |    |           |         |
| Access |    |    |    |    |    |    |           |         |
| Reset  |    |    |    |    |    |    |           |         |
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9         | 8       |
|        |    |    |    |    |    |    |           |         |
| Access |    |    |    |    |    |    |           |         |
| Reset  |    |    |    |    |    |    |           |         |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2  | 1         | 0       |
|        |    |    |    |    |    |    | MEM_NOFIX | MEM_FIX |
| Access |    |    |    |    |    |    | W         | W       |
| Reset  |    |    |    |    |    |    | –         | –       |

Bit 1 – MEM\_NOFIX Unfixable Error

Bit 0 – MEM\_FIX Fixable Error

30.9.6 HECC Interrupt Mask Register

**Name:** HEMC\_HECC\_IMR  
**Offset:** 0x18C  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

|        |    |    |    |    |    |    |           |         |
|--------|----|----|----|----|----|----|-----------|---------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25        | 24      |
|        |    |    |    |    |    |    |           |         |
| Access |    |    |    |    |    |    |           |         |
| Reset  |    |    |    |    |    |    |           |         |
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17        | 16      |
|        |    |    |    |    |    |    |           |         |
| Access |    |    |    |    |    |    |           |         |
| Reset  |    |    |    |    |    |    |           |         |

 The address of the faulty data detected when a fixable or unfixable error occurs.

## 31. Hardened Static Memory Controller (HSMC)

### 31.1 Description

The Hardened External Memory Controller (HEMC) is designed to ensure the successful data transfer between several external devices and the ARM-based microcontroller. The Hardened Static Memory Controller (HSMC) is part of the HEMC.

The HSMC handles several types of external memory and peripheral devices, such as SRAM, PROM, EEPROM, LCD Module, NOR Flash.

The HSMC generates the signals that control the access to the external memory devices or peripheral devices. It has 6 chip selects, a 28-bit address bus and a configurable 8-, 16- or 32-bit data bus. Separate read and write control signals allow for direct memory and peripheral interfacing. Read and write signal waveforms are fully adjustable.

The HSMC can manage wait requests from external devices to extend the current access.

### 31.2 Embedded Characteristics

- Customizable Address Space per Chip Select
- 8-, 16-, 32-bit Data Bus + additional checkbits Bus
- Word, Halfword, Byte Transfers
- Byte Write Lines
- Programmable Setup, Pulse And Hold Time for Read Signals per Chip Select
- Programmable Setup, Pulse And Hold Time for Write Signals per Chip Select
- External Wait Request

### 31.3 I/O Lines Description

The I/O line definition is presented in the [29. Hardened External Memory Controller \(HEMC\)](#) section.

### 31.4 Product Dependencies

#### 31.4.1 I/O Lines

The pins used for interfacing the HSMC are multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the HSMC pins to their peripheral function. If I/O lines of the HSMC are not used by the application, they can be used for other purposes by the PIO Controller.

#### 31.4.2 Power Management

The HSMC is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the HSMC clock via the HEMC clock.

### 31.5 Connection to External Devices

#### 31.5.1 Data Bus Width

A data bus width of 8-, 16- or 32 bits is available for each chip select. This option is controlled by the bit DBW in the Mode register (HSMC\_MODE) for the corresponding chip select.

#### 31.5.2 Read and Write Access: Byte Access Supported

During a read access, all 32 bits are read and controlled by the read signal (NRD).

During a write access, all 32 bits or BYTE elements of the word (byte0, byte1, byte2 and/or byte3) can be written by using the following signals:

- NWR[4:0] signals are used to access one byte or several bytes in write mode.
    - NWR[0] controls D[0:7]
    - NWR[1] controls D[8:15]
    - NWR[2] controls D[16:23]
    - NWR[3] controls D[24:31]
- Note:** NWR[4] has the same behavior as NWR[0].

- NWE signal is used to access the whole word in write mode

## 31.6 Read, Write and Read-Modify-Write Single Access

In the following sections:

- NWE represents either the NWE signal or one of the byte write lines (NWR0 to NWR4), if these are applicable to this product. NWR0 to NWR4 have the same timings and protocol as NWE.
- D[X:0] represents D[31:0], D[15:0], D[7:0] depending on data bus width selected. They all have the same timings.
- A[W:0] represents A[27:0]

Moreover, if HECC is activated in 32-bit mode:

- CB[Y:0] represents CB[15:0] or CB[7:0], depending on the HECC selected. It is not represented in the following figures, but CB[Y:0] has the same timing as D[X:0].

Similarly, NCSx represents one of the NCS[0..5] chip select lines.

### 31.6.1 Read Waveforms

The read cycle is shown in the following figure.

The read cycle starts with the address being driven on the memory address bus.

**Figure 31-1.** Standard Read Cycle

#### 31.6.1.1 NRD Waveform

The NRD signal is characterized by a setup timing, pulse width, and hold timing.

- **nrd\_setup**—NRD setup time is defined as the setup of address before the NRD falling edge
- **nrd\_pulse**—NRD pulse length is the time between NRD falling edge and NRD rising edge
- **nrd\_hold**—NRD hold time is defined as the hold time of address after the NRD rising edge

### 31.6.1.2 NCS Waveform

The NCS signal can be divided into a setup time, pulse length, and hold time:

- `ncs_rd_setup`—NCS setup time is defined as the setup time of address before the NCS falling edge
- `ncs_rd_pulse`—NCS pulse length is the time between NCS falling edge and NCS rising edge
- `ncs_rd_hold`—NCS hold time is defined as the hold time of address after the NCS rising edge

### 31.6.2 Read Cycle

The `NRD_CYCLE` time is defined as the total duration of the read cycle, i.e., from the time where address is set on the address bus to the point where address may change. The total read cycle time is defined as:

$$\text{NRD\_CYCLE} = \text{NRD\_SETUP} + \text{NRD\_PULSE} + \text{NRD\_HOLD},$$

as well as

$$\text{NRD\_CYCLE} = \text{NCS\_RD\_SETUP} + \text{NCS\_RD\_PULSE} + \text{NCS\_RD\_HOLD}$$

All NRD and NCS timings are defined separately for each chip select as an integer number of Master Clock cycles. The `NRD_CYCLE` field is common to both the NRD and NCS signals, thus the timing period is of the same duration.

`NRD_CYCLE`, `NRD_SETUP`, and `NRD_PULSE` implicitly define the `NRD_HOLD` value as:

$$\text{NRD\_HOLD} = \text{NRD\_CYCLE} - \text{NRD\_SETUP} - \text{NRD\_PULSE}$$

`NRD_CYCLE`, `NCS_RD_SETUP`, and `NCS_RD_PULSE` implicitly define the `NCS_RD_HOLD` value as:

$$\text{NCS\_RD\_HOLD} = \text{NRD\_CYCLE} - \text{NCS\_RD\_SETUP} - \text{NCS\_RD\_PULSE}$$

### 31.6.3 Null Delay Setup and Hold

If null setup and hold parameters are programmed for NRD and/or NCS, NRD and NCS remain active continuously in case of consecutive read cycles in the same memory. See the following figure.

**Figure 31-2.** No Setup, No Hold on NRD and NCS Read Signals

Figure 31-4. HSMC\_MODE.READ\_MODE = 0: Data is Sampled by HSMC on the Rising Edge of NCS

31.6.6 Write Waveforms

The write protocol is similar to the read protocol. It is depicted in the figure that follows. The write cycle starts with the address being driven on the memory address bus.

- In 32-bit mode, the single access presented below is referenced ‘1 x WR 32 bits’ in this document.
- In 16-bit mode, the single access presented below is referenced ‘1 x WR 16 bits’ in this document.
- In 8-bit mode, the single access presented below is referenced ‘1 x WR 8 bits’ in this document.

Figure 31-5. Write Cycle

31.6.6.1 NWE Waveforms

The NWE signal is characterized by a setup timing, a pulse width and a hold timing.

- NWE\_SETUP—the NWE setup time is defined as the setup of address and data before the NWE falling edge;
- NWE\_PULSE—the NWE pulse length is the time between NWE falling edge and NWE rising edge;
- NWE\_HOLD—the NWE hold time is defined as the hold time of address and data after the NWE rising edge.

### 31.6.6.2 NCS Waveforms

The NCS signal waveforms in write operation are not the same as those applied in read operations, but are separately defined:

- ncs\_wr\_setup—The NCS setup time is defined as the setup time of address before the NCS falling edge
- ncs\_wr\_pulse—The NCS pulse length is the time between NCS falling edge and NCS rising edge
- ncs\_wr\_hold—The NCS hold time is defined as the hold time of address after the NCS rising edge

### 31.6.7 Write Cycle

The write\_cycle time is defined as the total duration of the write cycle; that is, from the time where address is driven on the address bus to the point where address may change. The total write cycle time is defined as:

$$\text{NWE\_CYCLE} = \text{NWE\_SETUP} + \text{NWE\_PULSE} + \text{NWE\_HOLD},$$

as well as

$$\text{NWE\_CYCLE} = \text{NCS\_WR\_SETUP} + \text{NCS\_WR\_PULSE} + \text{NCS\_WR\_HOLD}$$

All NWE and NCS (write) timings are defined separately for each chip select as an integer number of Master Clock cycles. The NWE\_CYCLE field is common to both the NWE and NCS signals, thus the timing period is of the same duration.

NWE\_CYCLE, NWE\_SETUP, and NWE\_PULSE implicitly define the NWE\_HOLD value as:

$$\text{NWE\_HOLD} = \text{NWE\_CYCLE} - \text{NWE\_SETUP} - \text{NWE\_PULSE}$$

NWE\_CYCLE, NCS\_WR\_SETUP, and NCS\_WR\_PULSE implicitly define the NCS\_WR\_HOLD value as:

$$\text{NCS\_WR\_HOLD} = \text{NWE\_CYCLE} - \text{NCS\_WR\_SETUP} - \text{NCS\_WR\_PULSE}$$

### 31.6.8 Null Delay Setup and Hold

If null setup parameters are programmed for NWE and/or NCS, NWE and/or NCS remain active continuously in case of consecutive write cycles in the same memory (see the following figure). However, for devices that perform write operations on the rising edge of NWE or NCS, either a setup or a hold must be programmed.

**Figure 31-6.** Null Setup and Hold Values of NCS and NWE in Write Cycle

### 31.6.9 Null Pulse

Programming null pulse is not permitted. Pulse must be at least set to 1. A null value leads to unpredictable behavior.

### 31.6.10 Write Mode

The bit WRITE\_MODE in the HSMC\_MODE register of the corresponding chip select indicates which signal controls the write operation.

#### 31.6.10.1 Write is Controlled by NWE (HSMC.MODE.WRITE\_MODE = 1):

The following figure shows the waveforms of a write operation with HSMC\_MODE.WRITE\_MODE set. The data is put on the bus during the pulse and hold steps of the NWE signal. The internal data buffers are switched to Output mode after the NWE\_SETUP time, and until the end of the write cycle, regardless of the programmed waveform on NCS.

**Figure 31-7.** HSMC\_MODE.WRITE\_MODE = 1. Write Operation is Controlled by NWE**31.6.10.2 Write is Controlled by NCS (HSMC.MODE.WRITE\_MODE = 0)**

The following figure shows the waveforms of a write operation with HSMC\_MODE.WRITE\_MODE cleared. The data is put on the bus during the pulse and hold steps of the NCS signal. The internal data buffers are switched to Output mode after the NCS\_WR\_SETUP time, and until the end of the write cycle, regardless of the programmed waveform on NWE.

**Figure 31-8.** WRITE\_MODE = 0. Write Operation is Controlled by NCS**31.6.11 Read Modify Write (RMW) Waveform**

Instead of writing a specific byte of a word, the user can send request to the processor to perform a Read Modify Write access. It reads the whole 32-bit word, then modifies it, then writes back the whole 32-bit word.

**Note:** RMW (HSMC\_MODE.RMW\_ENABLE) is activated to ensure data integrity when HECC (HECC\_CR.ECC\_ENABLE) is activated.

Therefore, the waveform observed for such an access is the concatenation of [Figure 31-1](#) and [Figure 31-5](#), depending on the bus width and the HECC activation:

- In 32-bit mode, HECC OFF: 1 x RD 32 bits followed by 1 x WR 32 bits.
- In 32-bit mode, HECC ON: 1 x RD (32 + ECC) bits followed by 1 x WR (32 + ECC) bits.
- In 16-bit mode, HECC OFF: 2 x RD 16 bits followed by 2 x WR 16 bits.

- In 16-bit mode, HECC ON, Hamming or BCH: 2 x RD 16 bits + 1 x RD 16 bits followed by 2 x WR 16 bits + 1 x WR 16 bit.
- In 8-bit mode, HECC OFF: 4 x RD 8 bits followed by 4 x WR 8 bits.
- In 8-bit mode, HECC ON, Hamming code selected: 4 x RD 8 bits + 1 x RD 8 bits followed by 4 x WR 8 bits + 1 x WR 8 bits.
- In 8-bit mode, HECC ON, BCH code selected: 4 x RD 8 bits + 2 x RD 8 bits followed by 4 x WR 8 bits + 2 x WR 8 bits.

For more information, see the following, in the [30. Hardened Error Correction Code \(HECC\) Controller](#) section:

- Hamming code, write access
- Hamming code, read access
- BCH code, write access
- BCH code, read access

### 31.7 Register Write Protection

To prevent any single software error that may corrupt HSMC behavior, the registers listed below can be write-protected by setting the WPEN bit in the HSMC Write Protection Mode register (HSMC\_WPMR).

If a write access in a write-protected register is detected, the WPVS flag in the HSMC Write Protection Status register (HSMC\_WPSR) is set and the field WPVSR indicates in which register the write access has been attempted.

The WPVS flag is automatically cleared after reading the HSMC\_WPSR.

The following registers can be write-protected:

- HSMC Setup Register
- HSMC Pulse Register
- HSMC Cycle Register
- HSMC Mode Register

### 31.8 Coding Timing Parameters

All timing parameters are defined for one chip select and are grouped together in one register according to their type.

The HSMC\_SETUP register groups the definition of all setup parameters:

- NRD\_SETUP
- NCS\_RD\_SETUP
- NWE\_SETUP
- NCS\_WR\_SETUP

The HSMC\_PULSE register groups the definition of all pulse parameters:

- NRD\_PULSE
- NCS\_RD\_PULSE
- NWE\_PULSE
- NCS\_WR\_PULSE

The HSMC\_CYCLE register groups the definition of all cycle parameters:

- NRD\_CYCLE

- NWE\_CYCLE

The following table shows how the timing parameters are coded and their permitted range.

**Table 31-1.** Coding and Range of Timing Parameters

| Coded Value | Number of Bits | Effective Value                                    | Permitted Range |                                                          |
|-------------|----------------|----------------------------------------------------|-----------------|----------------------------------------------------------|
|             |                |                                                    | Coded Value     | Effective Value                                          |
| setup [5:0] | 6              | $128 \times \text{setup}[5] + \text{setup}[4:0]$   | $0 \leq 31$     | $0 \leq 128+31$                                          |
| pulse [6:0] | 7              | $256 \times \text{pulse}[6] + \text{pulse}[5:0]$   | $0 \leq 63$     | $0 \leq 256+63$                                          |
| cycle [8:0] | 9              | $256 \times \text{cycle}[8:7] + \text{cycle}[6:0]$ | $0 \leq 127$    | $0 \leq 256+127$<br>$0 \leq 512+127$<br>$0 \leq 768+127$ |

### 31.9 Usage Restriction

**Note:** The HSMC does not check the validity of the user-programmed parameters. If the sum of SETUP and PULSE parameters is larger than the corresponding CYCLE parameter, this leads to unpredictable behavior of the HSMC.

- For read operations:  
Note that the NRD and NCS signals remain subject to naturally device varying I/O propagation delays. In order to ensure that the order of the appearance of the signals on the bus is that desired, non-null SETUP and CYCLE values should be programmed into the corresponding registers. Null values can result in unwanted skew between NRD and NCS signals. At least one set up and one hold shall be programmed.
- For write operations:  
If a null hold value is programmed on NWE, the HSMC can guarantee a positive hold of address and NCS signal after the rising edge of NWE. This is true for HSMC\_MODE.WRITE\_MODE = 1 only.
- For read and write operations:  
A null value for pulse parameters is forbidden and may lead to unpredictable behavior.  
In read and write cycles, the setup and hold time parameters are defined in reference to the address bus. For external devices that require setup and hold time between NCS and NRD signals (read), or between NCS and NWE signals (write), these setup and hold times must be converted into setup and hold times in reference to the address bus.

### 31.10 Read/Write Accesses Use Cases

The HSMC can be configured in 8-, 16-, 32-bit mode, in order to access different widths of memories, with or without ECC.

**Note:** When HECC protection is activated in 32-bit mode and Hamming code is selected, the HSMC has a total data size of 40 bits.

**Note:** When HECC protection is activated in 32-bit mode and BCH code is selected, the HSMC has a total data size of 48 bits.

It is a 32-bit processor, so the following AMBA requests can be received by HSMC that are listed here:

- Write 8-bit (WR\_byte), Write 16-bit (WR\_half\_word), Write 32-bit (WR\_word), Write n x 32-bit (WR\_n\_word)
- Read 8-bit (RD\_byte), Read 16-bit (RD\_half\_word), Read 32-bit (RD\_word), Read n x 32-bit (RD\_n\_word)

Therefore, this implies that different memory accesses are visible on the external memory interface, depending on the AMBA requests and the following options:

- Memory width
- HECC ON/OFF

- RMW ON/OFF

**Note:** HECC ON implies the activation of RMW, to ensure data integrity.

In the following sections, (//) means that the data are sent in parallel synchronously whereas (+) means that checksum are sent after data with additional cycles.

### 31.10.1 32-bit Mode

#### 31.10.1.1 HECC Protection Deactivated (32-bit mode)

The table below sums up the different accesses on the external memory interface depending on the AMBA request, when 32-bit mode is selected and HECC protection is de-activated.

**Table 31-2.** Memory Access – 32-bit Mode – HECC OFF

| AMBA Request            | HSMC [32-bit]<br>[HECC OFF]<br>[RMW OFF] | HSMC [32-bit]<br>[HECC OFF]<br>[RMW ON] |
|-------------------------|------------------------------------------|-----------------------------------------|
| RD_byte<br>RD_half_word | 1x RD 32 bits                            | 1x RD 32 bits                           |
| WR_byte<br>WR_half_word | 1x WR 32 bits <sup>(1)</sup>             | (RMW) <sup>(2)</sup>                    |
| RD_word                 | 1x RD 32 bits                            | 1x RD 32 bits                           |
| WR_word                 | 1x WR 32 bits                            | 1x WR 32 bits                           |
| RD_n_word               | n x RD 32 bits                           | n x RD 32 bits                          |
| WR_n_word               | n x WR 32 bits                           | n x WR 32 bits                          |

**Notes:**

1. Only the affected bytes are written depending the usage of the NWR[4:0] write byte enable signals.
2. (RMW)= 1x RD 32-bits then 1x WR 32 bits cycles

#### 31.10.1.2 HECC Protection Activated

The following table summarizes the different accesses on the external memory interface, depending on the AMBA request received, when 32-bit mode is selected and HECC protection is activated.

The following table provides different ECC codes, but refer to the [30. Hardened Error Correction Code \(HECC\) Controller](#) section to verify which ECC code is/codes are applied on the product.

**Table 31-3.** Memory Access – 32-bit Mode – HECC ON

| AMBA request            | HSMC [32-bit]<br>[HECC ON – Hamming]<br>[RMW ON]<br>[data][sequence][checksum] | HSMC [32-bit]<br>[HECC ON – BCH]<br>[RMW ON]<br>[data][sequence][checksum] |
|-------------------------|--------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| RD_byte<br>RD_half_word | (1x RD 32 bits) (//) (1 x RD 8 bits)                                           | (1x RD 32 bits) (//) (1 x RD 16 bits)                                      |
| WR_byte<br>WR_half_word | (RMW_ECCON8) <sup>(1)</sup>                                                    | (RMW_ECCON16) <sup>(1)</sup>                                               |
| RD_word                 | (1x RD 32 bits) (//) (1 x RD 8 bits)                                           | (1x RD 32 bits) (//) (1 x RD 16 bits)                                      |
| WR_word                 | (1x WR 32 bits) (//) (1 x WR 8 bits)                                           | (1x WR 32 bits) (//) (1 x WR 16 bits)                                      |
| RD_n_word               | nx [(1 x RD 32 bits) (//) (1 x RD 8 bits)]                                     | nx [(1 x RD 32 bits) (//) (1 x RD 16 bits)]                                |
| WR_n_word               | nx [(1 x WR 32 bits) (//) (1 x WR 8 bits)]                                     | nx[(1 x WR 32 bits) (//) (1 x WR 16 bits)]                                 |

**Note:**

1. (RMW\_HECCONn)= [(1x RD 32 bits) (/) (1 x RD 8 bits) then [(1x WR 32 bits) (/) (1 x WR n bits)]. RMW\_ECCONn, for sub-word writes, the whole 32-bit word is read (corrected) then the whole 32-bit word is re-written with the modified bytes and then check bits.

**31.10.2 16-bit Mode****31.10.2.1 HECC Protection Deactivated**

The following table sums up the different accesses visible on the external memory interface depending on the AMBA request, when 16-bit mode is selected and HECC protection is deactivated.

**Table 31-4.** Memory Access – 16-bit Mode – HECC OFF

| AMBA Request            | HSMC[16-bit]<br>[HECC OFF]<br>[RMW OFF] | HSMC[16-bit]<br>[HECC OFF]<br>[RMW ON] |
|-------------------------|-----------------------------------------|----------------------------------------|
| RD_byte<br>RD_half_word | 1x RD 16 bits                           | 1x RD 16 bits                          |
| WR_byte<br>WR_half_word | 1 x WR 16 bits <sup>(1)</sup>           | (RMW) <sup>(2)</sup>                   |
| RD_word                 | 2 x RD 16 bits                          | 2 x RD 16 bits                         |
| WR_word                 | 2 x WR 16 bits                          | 2 x WR 16 bits                         |
| RD_n_word               | nx [2 x RD 16 bits]                     | nx [2 x RD 16 bits]                    |
| WR_n_word               | nx [2 x WR 16 bits]                     | nx [2 x WR 16 bits]                    |

**Notes:**

1. Only the affected bytes are written depending on the usage of the NWR[4:0] write byte enable signals.
2. (RMW)= [(2x RD 16 bits) then [(2x WR 16 bits).

**31.10.2.2 HECC Protection Activated**

The following table sums up the different accesses on the external memory interface depending on the AMBA request, when 16-bit mode is selected and HECC protection is activated.

The following table provides different ECC codes, but refer to the [30. Hardened Error Correction Code \(HECC\) Controller](#) section to verify which ECC code is/ codes are applied on the product.

**Table 31-5.** Memory Access – 16-bit Mode – HECC ON

| AMBA request            | HSMC[16-bit]<br>[HECC ON – Hamming]<br>[RMW ON]<br>[data][sequence][checksum] | HSMC [16-bit]<br>[HECC ON – BCH]<br>[RMW ON]<br>[data][sequence][checksum] |
|-------------------------|-------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| RD_byte<br>RD_half_word | (2 x RD 16 bits) (+) (1 x RD 16 bits)                                         | (2 x RD 16 bits) (+) (1 x RD 16 bits)                                      |
| WR_byte<br>WR_half_word | (RMW_ECCON) <sup>(1)</sup>                                                    | (RMW_ECCON) <sup>(1)</sup>                                                 |
| RD_word                 | (2 x RD 16 bits) (+) (1 x RD 16 bits)                                         | (2 x RD 16 bits) (+) (1 x RD 16 bits)                                      |
| WR_word                 | [(2 x WR 16 bits) (+) (1 x WR 16 bits)]                                       | [(2 x WR 16 bits) (+) (1 x WR 16 bits)]                                    |
| RD_n_word               | nx [(2 x RD 16 bits) (+) (1 x RD 16 bits)]                                    | n x [(2 x RD 16 bits) (+) (1 x RD 16 bits)]                                |
| WR_n_word               | nx [(2 x WR 16 bits) (+) (1 x WR 16 bits)]                                    | nx [(2 x WR 16 bits) (+) (1 x WR 16 bits)]                                 |

**Note:**

1. (RMW\_ECCON) = [(2x RD 16 bits) (+) (1 x RD 16 bits) then [(2x WR 16 bits) (+) (1 x WR 16 bits)].

**31.10.3 8-bit Mode****31.10.3.1 HECC Protection Deactivated**

The table below sums up the different accesses on external memory interface, depending on the AMBA requests received, when the 8-bit mode is selected and HECC protection is deactivated.

**Table 31-6.** Memory Access – 8-bit mode – HECC OFF

| AMBA request | HSMC[8-bit]<br>[HECC OFF]<br>[RMW OFF] | HSMC[8-bit]<br>[HECC OFF]<br>[RMW ON] |
|--------------|----------------------------------------|---------------------------------------|
| RD_byte      | 1 x RD 8 bits                          | 1 x RD 8 bits                         |
| WR_byte      | 1 x WR 8 bits                          | RMW <sup>(1)</sup>                    |
| RD_half_word | 2 x RD 8 bits                          | 2 x RD 8 bits                         |
| WR_half_word | 2 x WR 8 bits <sup>(1)</sup>           | RMW <sup>(1)</sup>                    |
| RD_word      | 4 x RD 8 bits                          | 4 x RD 8 bits                         |
| WR_word      | 4 x WR 8 bits                          | 4 x WR 8 bits                         |
| RD_n_word    | n x [4 x RD 8 bits]                    | n x [4 x RD 8 bits]                   |
| WR_n_word    | n x [4 x WR 8 bits]                    | n x [4 x WR 8 bits]                   |

**Note:**

1. (RMW)=(4x RD 8 bits) then (4x WR 8 bits).

**31.10.3.2 HECC Protection Activated**

The following table sums up the different accesses on external memory interface, depending on the AMBA requests received, when 8-bit mode is selected and the HECC protection is activated.

The following table presents different ECC codes, but refer to the [30. Hardened Error Correction Code \(HECC\) Controller](#) section to verify which ECC codes are applied on the product.

**Table 31-7.** Memory Access – 8-bit mode – HECC ON

| AMBA request | HSMC[8-bit]<br>[HECC ON – Hamming]<br>[RMW ON]<br>[data][sequence][checksum] | HSMC[8-bit]<br>[HECC ON – BCH]<br>[RMW ON]<br>[data][sequence][checksum] |
|--------------|------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| RD_byte      | (4 x RD 8 bits) (+) (1x RD 8 bits) <sup>(1)</sup>                            | (4 x RD 8 bits) (+) (2x RD 8 bits) <sup>(1)</sup>                        |
| RD_half_word |                                                                              |                                                                          |
| WR_byte      | RMW_ECCON8 <sup>(2)</sup>                                                    | RMW_ECCON16 <sup>(3)</sup>                                               |
| WR_half_word |                                                                              |                                                                          |
| RD_word      | (4 x RD 8 bits) (+) (1x RD 8 bits) <sup>(1)</sup>                            | (4 x RD 8 bits) (+) (2x RD 8 bits) <sup>(1)</sup>                        |
| WR_word      | (4 x WR 8 bits) (+) (1x WR 8 bits) <sup>(1)</sup>                            | (4 x WR 8 bits) (+) (2x WR 8 bits) <sup>(1)</sup>                        |
| RD_n_word    | n x [(4 x RD 8 bits) (+) (1 x RD 8 bits)] <sup>(1)</sup>                     | n x [(4 x RD 8 bits) (+) (2 x RD 8 bits)] <sup>(1)</sup>                 |
| WR_n_word    | n x [(4 x WR 8 bits) (+) (1 x WR 8 bits)] <sup>(1)</sup>                     | n x [(4 x WR 8 bits) (+) (2 x WR 8 bits)] <sup>(1)</sup>                 |

**Notes:**

1. The NCS and the control signals are not rising between the consecutive RD 8 bits (or WR 8 bits) access.
2. (RMW\_HECCON8)= [(4 x RD 8 bits) (+) (1 x RD 8 bits) then [(4 x WR 8 bits) (+) (1 x WR 8 bits)].
3. (RMW\_HECCON16)= [(4 x RD 8 bits) (+) (2 x RD 8 bits) then [(4 x WR 8 bits) (+) (2 x WR 8 bits)].

## 31.11 Automatic Wait States

Under certain circumstances, the HSMC automatically inserts idle cycles between accesses to avoid bus contention or operation conflict.

### 31.11.1 Chip Select Wait States

The HSMC always inserts an idle cycle between two transfers on separate Chip Selects. This idle cycle ensures that there is no bus contention between the deactivation of one device and the activation of the next one.

During Chip Select Wait state, all control lines are turned inactive: NWR, NCSx, NRD lines are all set to 1.

The following figure illustrates a Chip Select Wait state between access on Chip Select 0 and Chip Select 1.

**Figure 31-9.** Chip Select Wait State between a Read Access on NCS0 and a Write Access on NCS1

### 31.11.2 Early Read Wait State

In some cases, the HSMC inserts a wait state cycle between a write access and a read access to allow time for the write cycle to end before the subsequent read cycle begins. This wait state is not generated in addition to a chip select wait state. The early read cycle thus only occurs between a write and read access to the same memory device (same chip select).

An early read wait state is automatically inserted if at least one of the following conditions is valid:

- if the write controlling signal has no hold time and the read controlling signal has no setup time (Figure 31-10).

- in NCS Write controlled mode (HSMC\_MODE.WRITE\_MODE = 0), if there is no hold timing on the NCS signal and the NCS\_RD\_SETUP parameter is set to 0, regardless of the Read mode (Figure 31-11). The write operation must end with a NCS rising edge. Without an Early Read Wait State, the write operation could not complete properly.
- in NWE controlled mode (HSMC\_MODE.WRITE\_MODE = 1) and if there is no hold timing (NWE\_HOLD = 0), the feedback of the write control signal is used to control address, data, and chip select lines. If the external write control signal is not inactivated as expected due to load capacitances, an Early Read Wait State is inserted and address, data and control signals are maintained one more cycle. See Figure 31-12.

**Figure 31-10.** Early Read Wait State: Write with No Hold Followed by Read with No Setup

**Figure 31-11.** Early Read Wait State: NCS-controlled write with no hold followed by a read with no NCS setup

**Figure 31-12. Early Read Wait State: NWE-controlled write with no hold followed by a read with one set-up cycle**

### 31.11.3 Reload User Configuration Wait State

The user may change any of the configuration parameters by writing the HSMC user interface.

When detecting that a new user configuration has been written in the user interface, the HSMC inserts a wait state before starting the next access. This “reload user configuration wait state” is used by the HSMC to load the new set of parameters to apply to next accesses.

The reload configuration wait state is not applied in addition to the chip select wait state. If accesses before and after re-programming the user interface are made to different devices (chip selects), then one single chip select wait state is applied.

On the other hand, if accesses before and after writing the user interface are made to the same device, a reload configuration wait state is inserted, even if the change does not concern the current chip select.

#### 31.11.3.1 User Procedure

To insert a reload configuration wait state, the HSMC detects a write access to any HSMC\_MODE register of the user interface. If the user only modifies timing registers (HSMC\_SETUP, HSMC\_PULSE, HSMC\_CYCLE registers) in the user interface, he must validate the modification by writing the HSMC\_MODE, even if no change was made on the mode parameters.

The user must not change the configuration parameters of an HSMC chip select (Setup, Pulse, Cycle, Mode) if accesses are performed on this CS during the modification. Any change of the chip select parameters, while fetching the code from a memory connected on this CS, may lead to unpredictable behavior. The instructions used to modify the parameters of an HSMC chip select can be executed from the internal RAM or from a memory connected to another CS.

### 31.11.4 Read to Write Wait State

Due to an internal mechanism, a wait cycle is always inserted between consecutive read and write HSMC accesses.

This wait cycle is referred to as a read to write wait state in this document.

This wait cycle is applied in addition to chip select and reload user configuration wait states when they are to be inserted. See [Figure 31-9](#).

## 31.12 External Wait

Any access can be extended by an external device using the NWAIT input signal of the HSMC. The HSMC\_MODE.EXNW\_MODE field on the corresponding chip select must be set to either “10” (Frozen mode) or “11” (Ready mode). When HSMC\_MODE.EXNW\_MODE is set to “00” (disabled), the NWAIT signal is simply ignored on the corresponding chip select. The NWAIT signal delays the read or write operation in regards to the read or write controlling signal, depending on the Read and Write modes of the corresponding chip select.

### 31.12.1 Restriction

**Important:**

When HSMC\_MODE.EXNW\_MODE is enabled, it is mandatory to program at least one hold cycle for the read/write controlling signal.

The NWAIT signal is assumed to be a response of the external device to the read/write request of the HSMC. Then NWAIT is examined by the HSMC only in the pulse state of the read or write controlling signal. The assertion of the NWAIT signal outside the expected period has no impact on HSMC behavior.

### 31.12.2 Frozen Mode

When the external device asserts the NWAIT signal (active low), and after internal synchronization of this signal, the HSMC state is frozen, i.e., HSMC internal counters are frozen, and all control signals remain unchanged. When the resynchronized NWAIT signal is deasserted, the HSMC completes the access, resuming the access from the point where it was stopped. See [Figure 31-13](#). This mode must be selected when the external device uses the NWAIT signal to delay the access and to freeze the HSMC.

The assertion of the NWAIT signal outside the expected period is ignored as illustrated in [Figure 31-14](#).

Figure 31-13. Write Access with NWAIT Assertion in Frozen Mode (HSMC\_MODE.EXNW\_MODE = 10)

Figure 31-14. Read Access with NWAIT Assertion in Frozen Mode (HSMC\_MODE.EXNW\_MODE = 10)

### 31.12.3 Ready Mode

In Ready mode (HSMC\_MODE.EXNW\_MODE = 11), the HSMC behaves as follows. Normally, the HSMC begins the access by down counting the setup and pulse counters of the read/write controlling signal. In the last cycle of the pulse phase, the resynchronized NWAIT signal is examined.

If asserted, the HSMC suspends the access as shown in the figures below. After deassertion, the access is completed: the hold step of the access is performed.

This mode must be selected when the external device uses deassertion of the NWAIT signal to indicate its ability to complete the read or write operation.

If the NWAIT signal is deasserted before the end of the pulse, or asserted after the end of the pulse of the controlling read/write signal, it has no impact on the access length as shown in Figure 31-16.

**Figure 31-15.** NWAIT Assertion in Write Access: Ready Mode (HSMC\_MODE.EXNW\_MODE = 11)

**Figure 31-16. NWAIT Assertion in Read Access: Ready Mode (HSMC\_MODE.EXNW\_MODE = 11)**

### 31.12.4 NWAIT Latency and Read/Write Timings

There may be a latency between the assertion of the read/write controlling signal and the assertion of the NWAIT signal by the device. The programmed pulse length of the read/write controlling signal must be at least equal to this latency plus the 2 cycles of resynchronization + one cycle. Otherwise, the HSMC may enter the hold state of the access without detecting the NWAIT signal assertion. This is true in Frozen mode as well as in Ready mode. This is illustrated in the following figure.

When HSMC\_MODE.EXNW\_MODE is enabled (ready or frozen), the user must program a pulse length of the read and write controlling signal of at least:

Minimal pulse length = NWAIT latency + 2 resynchronization cycles + 1 cycle

Figure 31-17. NWAIT Latency

## 31.13 Register Summary

| Offset | Name        | Bit Pos. | 7 | 6 | 5                 | 4 | 3 | 2          | 1          | 0            |

#### Bits 29:24 – NCS\_RD\_SETUP[5:0] NCS Setup Length in READ Access

In read access, the NCS signal setup length is defined as:

$$\text{NCS setup length} = (128 * \text{NCS\_RD\_SETUP}[5] + \text{NCS\_RD\_SETUP}[4:0]) \text{ clock cycles}$$

#### Bits 21:16 – NRD\_SETUP[5:0] NRD Setup Length

The NRD signal setup length is defined in clock cycles as:

$$\text{NRD setup length} = (128 * \text{NRD\_SETUP}[5] + \text{NRD\_SETUP}[4:0]) \text{ clock cycles}$$

#### Bits 13:8 – NCS\_WR\_SETUP[5:0] NCS Setup Length in WRITE Access

In write access, the NCS signal setup length is defined as:

$$\text{NCS setup length} = (128 * \text{NCS\_WR\_SETUP}[5] + \text{NCS\_WR\_SETUP}[4:0]) \text{ clock cycles}$$

#### Bits 5:0 – NWE\_SETUP[5:0] NWE Setup Length

The NWE signal setup length is defined as:

$$\text{NWE setup length} = (128 * \text{NWE\_SETUP}[5] + \text{NWE\_SETUP}[4:0]) \text{ clock cycles}$$

### 31.13.2 HSMC Pulse Register n

**Name:** HSMC\_PULSEn  
**Offset:** 0x04 + n\*0x10 [n=0..5]  
**Reset:** 0x2C2E2E2C  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [31.13.5. HSMC\\_WPMR](#).

|        |                   |     |     |     |     |     |     |     |
|--------|-------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31                | 30  | 29  | 28  | 27  | 26  | 25  | 24  |

| Bit    | 23                | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | NRD_PULSE[6:0]    |     |     |     |     |     |     |     |
| Access |                   | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |                   | 0   | 1   | 0   | 1   | 1   | 1   | 0   |
| Bit    | 15                | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | NCS_WR_PULSE[6:0] |     |     |     |     |     |     |     |
| Access |                   | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |                   | 0   | 1   | 0   | 1   | 1   | 1   | 0   |
| Bit    | 7                 | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | NWE_PULSE[6:0]    |     |     |     |     |     |     |     |
| Access |                   | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |                   | 0   | 1   | 0   | 1   | 1   | 0   | 0   |

#### Bits 30:24 – NCS\_RD\_PULSE[6:0] NCS Pulse Length in READ Access

In standard read access, the NCS signal pulse length is defined as:

$\text{NCS pulse length} = (256 * \text{NCS\_RD\_PULSE}[6] + \text{NCS\_RD\_PULSE}[5:0]) \text{ clock cycles}$

The NCS pulse length must be at least 1 clock cycle.

In Page mode read access, the NCS\_RD\_PULSE parameter defines the duration of the first access to one page.

#### Bits 22:16 – NRD\_PULSE[6:0] NRD Pulse Length

In standard read access, the NRD signal pulse length is defined in clock cycles as:

$\text{NRD pulse length} = (256 * \text{NRD\_PULSE}[6] + \text{NRD\_PULSE}[5:0]) \text{ clock cycles}$

The NRD pulse length must be at least 1 clock cycle.

In Page mode read access, the NRD\_PULSE parameter defines the duration of the subsequent accesses in the page.

#### Bits 14:8 – NCS\_WR\_PULSE[6:0] NCS Pulse Length in WRITE Access

In write access, the NCS signal pulse length is defined as:

$\text{NCS pulse length} = (256 * \text{NCS\_WR\_PULSE}[6] + \text{NCS\_WR\_PULSE}[5:0]) \text{ clock cycles}$

The NCS pulse length must be at least 1 clock cycle.

#### Bits 6:0 – NWE\_PULSE[6:0] NWE Pulse Length

The NWE signal pulse length is defined as:

$\text{NWE pulse length} = (256 * \text{NWE\_PULSE}[6] + \text{NWE\_PULSE}[5:0]) \text{ clock cycles}$

The NWE pulse length must be at least 1 clock cycle.

### 31.13.3 HSMC Cycle Register n

**Name:** HSMC\_CYCLEn  
**Offset:** 0x08 + n\*0x10 [n=0..5]  
**Reset:** 0x00300030  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [31.13.5. HSMC\\_WPMR](#).

|        |     |     |     |     |     |     |     |                |
|--------|-----|-----|-----|-----|-----|-----|-----|----------------|
| Bit    | 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24             |
|        |     |     |     |     |     |     |     | NRD_CYCLE[8]   |
| Access |     |     |     |     |     |     |     | R/W            |
| Reset  |     |     |     |     |     |     |     | 0              |
| Bit    | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16             |
|        |     |     |     |     |     |     |     | NRD_CYCLE[7:0] |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W            |
| Reset  | 0   | 0   | 1   | 1   | 0   | 0   | 0   | 0              |
| Bit    | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8              |
|        |     |     |     |     |     |     |     | NWE_CYCLE[8]   |
| Access |     |     |     |     |     |     |     | R/W            |
| Reset  |     |     |     |     |     |     |     | 0              |
| Bit    | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0              |
|        |     |     |     |     |     |     |     | NWE_CYCLE[7:0] |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W            |
| Reset  | 0   | 0   | 1   | 1   | 0   | 0   | 0   | 0              |

#### Bits 24:16 – NRD\_CYCLE[8:0] Total Read Cycle Length

The total read cycle length is the total duration in clock cycles of the read cycle. It is equal to the sum of the setup, pulse and hold steps of the NRD and NCS signals. It is defined as:  
 Read cycle length = (NRD\_CYCLE[8:7]\*256 + NRD\_CYCLE[6:0]) clock cycles

#### Bits 8:0 – NWE\_CYCLE[8:0] Total Write Cycle Length

The total write cycle length is the total duration in clock cycles of the write cycle. It is equal to the sum of the setup, pulse and hold steps of the NWE and NCS signals. It is defined as:  
 Write cycle length = (NWE\_CYCLE[8:7]\*256 + NWE\_CYCLE[6:0]) clock cycles

### 31.13.4 HSMC Mode Register n

**Name:** HSMC\_MODEn  
**Offset:** 0x0C + n\*0x10 [n=0..5]  
**Reset:** 0x00000202  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [31.13.5. HSMC\\_WPMR](#).

The user must confirm the HSMC configuration by writing any one of the HSMC\_MODE registers.

|        |    |    |                |     |    |           |            |           |
|--------|----|----|----------------|-----|----|-----------|------------|-----------|
| Bit    | 31 | 30 | 29             | 28  | 27 | 26        | 25         | 24        |

| Reset  |    |    |                |     |    |           |            |           |
| Bit    | 23 | 22 | 21             | 20  | 19 | 18        | 17         | 16        |
| Access |    |    |                |     |    |           |            |           |
| Reset  |    |    |                |     |    |           |            |           |
| Bit    | 15 | 14 | 13             | 12  | 11 | 10        | 9          | 8         |
| Access |    |    |                |     |    |           | DBW[1:0]   |           |
| Reset  |    |    |                |     |    |           | R/W        | R/W       |
|        |    |    |                |     |    |           | 1          | 0         |
| Bit    | 7  | 6  | 5              | 4   | 3  | 2         | 1          | 0         |
| Access |    |    | EXNW_MODE[1:0] |     |    | RMW_ENABL | WRITE_MODE | READ_MODE |
| Reset  |    |    | R/W            | R/W |    | R/W       | R/W        | R/W       |
|        |    |    | 0              | 0   |    | 0         | 1          | 0         |

#### Bits 9:8 – DBW[1:0] Data Bus Width

| Value | Name     | Description     |
|-------|----------|-----------------|
| 0     | 8_BIT    | 8-bit data bus  |
| 1     | 16_BIT   | 16-bit data bus |
| 2     | 32_BIT   | 32-bit data bus |
| 3     | Reserved | Reserved        |

#### Bits 5:4 – EXNW\_MODE[1:0] NWAIT Mode

The NWAIT signal is used to extend the current read or write signal. It is only taken into account during the pulse phase of the read and write controlling signal. When the use of NWAIT is enabled, at least one cycle hold duration must be programmed for the read and write controlling signal.

| Value | Name     | Description                                                                                                                                                                                                                                                             |
|-------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | DISABLED | Disabled-The NWAIT input signal is ignored on the corresponding chip select.                                                                                                                                                                                            |
| 1     | –        | Reserved                                                                                                                                                                                                                                                                |
| 2     | FROZEN   | Frozen Mode-If asserted, the NWAIT signal freezes the current read or write cycle. After deassertion, the read/write cycle is resumed from the point where it was stopped.                                                                                              |
| 3     | READY    | Ready Mode-The NWAIT signal indicates the availability of the external device at the end of the pulse of the controlling read or write signal, to complete the access. If high, the access normally completes. If low, the access is extended until NWAIT returns high. |

#### Bit 2 – RMW\_ENABLE Read Modify Write Enable

**Note:** RMW must be enabled when the HECC is enabled.

| Value | Description                    |
|-------|--------------------------------|
| 0     | Read Modify Write is disabled. |
| 1     | Read Modify Write is enabled.  |

**Bit 1 – WRITE\_MODE Write Mode**

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | The write operation is controlled by the NCS signal. |
| 1     | The write operation is controlled by the NWE signal. |

**Bit 0 – READ\_MODE Read Mode**

| Value | Description                                         |
|-------|-----------------------------------------------------|
| 0     | The read operation is controlled by the NCS signal. |
| 1     | The read operation is controlled by the NRD signal. |

### 31.13.5 HSMC Write Protection Mode Register

**Name:** HSMC\_WPMR  
**Offset:** 0x70  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |              |    |    |    |    |    |    |      |

| Bit    | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        |              |    |    |    |    |    |    | WPEN |
| Access |              |    |    |    |    |    |    | R/W  |
| Reset  |              |    |    |    |    |    |    | 0    |

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                                          |
|----------|--------|------------------------------------------------------------------------------------------------------|
| 0x534D43 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0. |

#### Bit 0 – WPEN Write Protect Enable

See [31.7. Register Write Protection](#) for the list of registers that can be write-protected.

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | Disables the write protection if WPKEY corresponds to 0x534D43 ("SMC" in ASCII). |
| 1     | Enables the write protection if WPKEY corresponds to 0x534D43 ("SMC" in ASCII).  |

### 31.13.6 HSMC Write Protection Status Register

**Name:** HSMC\_WPSR  
**Offset:** 0x74  
**Reset:** 0x00000000  
**Property:** Read-only

**Note:** This register is cleared on read.

|        |             |    |    |    |    |    |    |      |
|--------|-------------|----|----|----|----|----|----|------|
| Bit    | 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        |             |    |    |    |    |    |    |      |
| Access |             |    |    |    |    |    |    |      |
| Reset  |             |    |    |    |    |    |    |      |
| Bit    | 23          | 22 | 21 | 20 | 19 | 18 | 17 | 16   |
|        | WPVSR[15:8] |    |    |    |    |    |    |      |
| Access | R           | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8    |
|        | WPVSR[7:0]  |    |    |    |    |    |    |      |
| Access | R           | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7           | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        |             |    |    |    |    |    |    | WPVS |
| Access |             |    |    |    |    |    |    | R    |
| Reset  |             |    |    |    |    |    |    | 0    |

**Bits 23:8 – WPVSR[15:0]** Write Protection Violation Source  
 When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description                                                                                                                                                                                                                 |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protection violation has occurred since the last read of the HSMC_WPSR register.                                                                                                                                   |
| 1     | A write protection violation has occurred since the last read of the HSMC_WPSR register. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

## 32. Hardened SDRAM Controller (HSDRAMC)

### 32.1 Description

The Hardened SDRAM Controller (HSDRAMC) is part of the Hardened External Memory Controller (HEMC). The HEMC is designed to ensure the successful data transfer between several external devices and the ARM-based microcontroller.

The HSDRAMC extends the memory capabilities of a chip by providing the interface to external 16-bit and 32-bit SDRAM devices. The page size supports ranges from 2048 to 8192 and the number of columns from 256 to 4096. It supports byte (8-bit), half-word (16-bit) and word (32-bit) accesses.

The HSDRAMC supports a read or write burst length of one location. It keeps track of the active row in each bank, thus maximizing SDRAM performance, e.g., the application may be placed in one bank and data in the other banks. For optimized performance, it is advisable to avoid accessing different rows in the same bank.

The HSDRAMC supports a CAS latency of 1, 2 or 3 and optimizes the read access depending on the frequency.

### 32.2 Embedded Characteristics

- Customizable Address Space per Chip Select (from 8 Kbytes to 512 Mbytes)
- Numerous Configurations Supported
  - 2K, 4K, 8K, 16K row address memory parts
  - SDRAM with four internal banks
  - SDRAM with 16-bit and 32-bit data paths
- Word, Halfword, Byte Transfers
- Programming Facilities
  - Automatic Page break when memory boundary has been reached
  - Multibank ping-pong access
  - Timing parameters specified by software
  - Automatic refresh operation, refresh rate is programmable
- Error Detection
  - HECC protection can be enabled /disabled: Hamming code implemented
  - Refresh error interrupt
- HSDRAM Power-up Initialization by Software
- CAS Latency of 1, 2, 3 Supported
- Auto Precharge Command Not Used

### 32.3 I/O Lines Description

Table 32-1. I/O Lines

| Signal Name    | Signal Direction | Signal Width | Signal Polarity | Signal Description    |
|----------------|------------------|--------------|-----------------|-----------------------|
| <b>Address</b> |                  |              |                 |                       |
| A[13:0]        | Out              | 14           |                 | Address Bit           |
| SDA10          | Out              | 1            |                 | SDRAM Address 10 Line |
| <b>Data</b>    |                  |              |                 |                       |
| D[31:0]        | In/Out           | 32           |                 | Data Bits             |

.....continued

| Signal Name             | Signal Direction | Signal Width | Signal Polarity | Signal Description                            |
|-------------------------|------------------|--------------|-----------------|-----------------------------------------------|
| CB[7:0]                 | In/Out           | 8            |                 | Check Bits                                    |
| <b>Controls/ Status</b> |                  |              |                 |                                               |
| NCS[5:0]                | Out              | 6            | Low             | Chip Select Lines Signals <sup>see Note</sup> |
| BA[1:0]                 | Out              | 1            |                 | HSDRAM Bank Address Signals                   |
| SDNBS[4:0]              | Out              | 5            | Low             | HSDRAM Byte Mask Signals                      |
| SDNWE                   | Out              | 1            | Low             | HSDRAM Write Enable Signal                    |
| NCAS                    | Out              | 1            | low             | HSDRAM Column Signals                         |
| NRAS                    | Out              | 1            | low             | HSDRAM Row Signals                            |
| SDCK                    | Out              | 1            |                 | HSDRAM Clock Signal                           |
| SDCKE                   | Out              | 1            | High            | HSDRAM Clock Enable Signal                    |

**Note:** For details, refer to the section "Hardened Embedded Memory Controller (HEMC)".

## 32.4 Software Interface/SDRAM Organization, Address Mapping

The HSDRAM address space is organized into banks, rows, and columns. The HSDRAMC allows mapping different memory types according to the values set in the Configuration register (HSDRAMC\_CR).

The HSDRAMC makes the SDRAM device access protocol transparent to the user.

The tables below illustrate the SDRAM device memory mapping seen by the user in correlation with the device structure. Various configurations are illustrated.

### 32.4.1 SDRAM Address Mapping for 32-bit Memory Data Bus Width

**Table 32-2.** SDRAM Configuration Mapping: 2K Rows, 256/512/1024/2048/4096 Columns

| CPU Address Line |    |    |    |    |    |         |    |           |         |           |           |    |    |    |    |    |    |              |    |              |             |   |   |   |        |   |        |        |   |   |   |
|------------------|----|----|----|----|----|---------|----|-----------|---------|-----------|-----------|----|----|----|----|----|----|--------------|----|--------------|-------------|---|---|---|--------|---|--------|--------|---|---|---|
| 31               | 30 | 29 | 28 | 27 | 26 | 25      | 24 | 23        | 22      | 21        | 20        | 19 | 18 | 17 | 16 | 15 | 14 | 13           | 12 | 11           | 10          | 9 | 8 | 7 | 6      | 5 | 4      | 3      | 2 | 1 | 0 |
|                  |    |    |    |    |    |         |    |           | BK[1:0] |           | Row[10:0] |    |    |    |    |    |    |              |    |              | Column[7:0] |   |   |   |        |   |        | M[1:0] |   |   |   |
|                  |    |    |    |    |    |         |    | BK[1:0]   |         | Row[10:0] |           |    |    |    |    |    |    |              |    | Column[8:0]  |             |   |   |   |        |   | M[1:0] |        |   |   |   |
|                  |    |    |    |    |    |         |    | BK[1:0]   |         | Row[10:0] |           |    |    |    |    |    |    |              |    | Column[9:0]  |             |   |   |   |        |   | M[1:0] |        |   |   |   |
|                  |    |    |    |    |    |         |    | BK[1:0]   |         | Row[10:0] |           |    |    |    |    |    |    |              |    | Column[10:0] |             |   |   |   |        |   | M[1:0] |        |   |   |   |
|                  |    |    |    |    |    | BK[1:0] |    | Row[10:0] |         |           |           |    |    |    |    |    |    | Column[11:0] |    |              |             |   |   |   | M[1:0] |   |        |        |   |   |   |

|  |  |  |         |            |              |              |        |
|--|--|--|---------|------------|--------------|--------------|--------|
|  |  |  |         | BK[1:0]    | Row [12:0]   | Column[9:0]  | M[1:0] |
|  |  |  |         | BK[1:0]    | Row [12:0]   | Column[10:0] | M[1:0] |
|  |  |  | BK[1:0] | Row [12:0] | Column[11:0] | M[1:0]       |        |

**Table 32-5. SDRAM Configuration Mapping: 16K Rows, 256/512/1024/2048/4096 Columns**

| CPU Address Line |    |    |    |    |    |         |    |    |            |    |    |    |    |    |    |    |    |    |    |              |    |   |   |   |   |   |        |   |   |   |   |
|------------------|----|----|----|----|----|---------|----|----|------------|----|----|----|----|----|----|----|----|----|----|--------------|----|---|---|---|---|---|--------|---|---|---|---|
| 31               | 30 | 29 | 28 | 27 | 26 | 25      | 24 | 23 | 22         | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11           | 10 | 9 | 8 | 7 | 6 | 5 | 4      | 3 | 2 | 1 | 0 |
|                  |    |    |    |    |    | BK[1:0] |    |    | Row [13:0] |    |    |    |    |    |    |    |    |    |    | Column[7:0]  |    |   |   |   |   |   | M[1:0] |   |   |   |   |
|                  |    |    |    |    |    | BK[1:0] |    |    | Row [13:0] |    |    |    |    |    |    |    |    |    |    | Column[8:0]  |    |   |   |   |   |   | M[1:0] |   |   |   |   |
|                  |    |    |    |    |    | BK[1:0] |    |    | Row [13:0] |    |    |    |    |    |    |    |    |    |    | Column[9:0]  |    |   |   |   |   |   | M[1:0] |   |   |   |   |
|                  |    |    |    |    |    | BK[1:0] |    |    | Row [13:0] |    |    |    |    |    |    |    |    |    |    | Column[10:0] |    |   |   |   |   |   | M[1:0] |   |   |   |   |
|                  |    |    |    |    |    | BK[1:0] |    |    | Row [13:0] |    |    |    |    |    |    |    |    |    |    | Column[11:0] |    |   |   |   |   |   | M[1:0] |   |   |   |   |

**Notes:**

1.  $M[1:0]$  is the byte address inside a 32-bit word.
2.  $Bk[1] = BA1$ ,  $Bk[0] = BA0$ .

### 32.4.2 SDRAM Address Mapping for 16-bit Memory Data Bus Width

**Table 32-6. SDRAM Configuration Mapping: 2K Rows, 256/512/1024/2048/4096 Columns**

| CPU Address Line |    |    |    |    |         |         |           |           |         |           |           |           |    |    |    |    |              |              |    |             |             |             |   |      |      |   |      |      |      |   |   |
|------------------|----|----|----|----|---------|---------|-----------|-----------|---------|-----------|-----------|-----------|----|----|----|----|--------------|--------------|----|-------------|-------------|-------------|---|------|------|---|------|------|------|---|---|
| 31               | 30 | 29 | 28 | 27 | 26      | 25      | 24        | 23        | 22      | 21        | 20        | 19        | 18 | 17 | 16 | 15 | 14           | 13           | 12 | 11          | 10          | 9           | 8 | 7    | 6    | 5 | 4    | 3    | 2    | 1 | 0 |
|                  |    |    |    |    |         |         |           |           |         | BK[1:0]   |           | Row[10:0] |    |    |    |    |              |              |    |             |             | Column[7:0] |   |      |      |   |      |      | M[0] |   |   |
|                  |    |    |    |    |         |         |           |           | BK[1:0] |           | Row[10:0] |           |    |    |    |    |              |              |    |             | Column[8:0] |             |   |      |      |   |      | M[0] |      |   |   |
|                  |    |    |    |    |         |         |           | BK[1:0]   |         | Row[10:0] |           |           |    |    |    |    |              |              |    | Column[9:0] |             |             |   |      |      |   | M[0] |      |      |   |   |
|                  |    |    |    |    |         | BK[1:0] |           | Row[10:0] |         |           |           |           |    |    |    |    |              | Column[10:0] |    |             |             |             |   |      | M[0] |   |      |      |      |   |   |
|                  |    |    |    |    | BK[1:0] |         | Row[10:0] |           |         |           |           |           |    |    |    |    | Column[11:0] |              |    |             |             |             |   | M[0] |      |   |      |      |      |   |   |

|  |  |  |  |  | BK[1:0] | Row[13:0] | Column[8:0]  | M[0] |
|  |  |  |  |  | BK[1:0] | Row[13:0] | Column[9:0]  | M[0] |
|  |  |  |  |  | BK[1:0] | Row[13:0] | Column[10:0] | M[0] |
|  |  |  |  |  | BK[1:0] | Row[13:0] | Column[11:0] | M[0] |

**Notes:**

1. M0 is the byte address inside a 16-bit half-word.
2. Bk[1] = BA1, Bk[0] = BA0.

## 32.5 Product Dependencies

### 32.5.1 I/O Lines

The pins used for interfacing the HSDRAMC are multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the HSDRAMC pins to their peripheral function. If I/O lines of the HSDRAMC are not used by the application, they can be used for other purposes by the PIO Controller.

### 32.5.2 Power Management

The HSDRAMC is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the HSDRAMC clock.

The HSDRAM clock on pin SDCK is output as soon as the first access to the HSDRAM is made during the initialization phase.

The HSDRAMC clock must respect the following range:

- HSDRAMC\_Min=MCK
- HSDRAMC\_Max=2 \* MCK

## 32.6 Interrupt Sources

The HSDRAMC interrupt is ORed internally to the HEMC interrupt. To enable it, ensure that the HEMC interrupt line is enabled.

## 32.7 Functional Description

### 32.7.1 SDRAM Device Initialization

The initialization sequence is generated by software. The sequence to initialize SDRAM devices is the following:

1. Set the SDRAM features in the HSDRAMC\_CR and HSDRAMC\_SDR: asynchronous timings (TRC, TRAS, etc.), number of columns, number of rows, CAS latency, RMW feature and data bus width. Set UNAL bit in HSDRAMC\_CFR1.
2. A pause of at least 200  $\mu$ s must be observed before a signal toggle.
3. <sup>(1)</sup> A NOP command is issued to the SDRAM devices. The application must write a 1 to the MODE field in the Mode register (HSDRAMC\_MR). Read the HSDRAMC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any SDRAM address.
4. An All Banks Precharge command is issued to the SDRAM. The application must write a 2 to the MODE field in the HSDRAMC\_MR. Read the HSDRAMC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any SDRAM address.
5. Eight autorefresh (CBR) cycles are provided. The application must set the MODE field to 4 in the HSDRAMC\_MR. Read the HSDRAMC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any SDRAM location eight times.

6. A Mode Register set (MRS) cycle is issued to program the parameters of the SDRAM, in particular CAS latency and burst length. The application must write a 3 to the MODE field in the HSDRAMC\_MR. Read the HSDRAMC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the SDRAM. The write address must be chosen so that BA[1:0] are set to 0. For example, with a 16-bit 128 MB SDRAM (12 rows, 9 columns, 4 banks) bank address, the SDRAM write access should be done at the starting address of memory (0x7000\_0000 as example)
7. The application must go into Normal mode. Configure MODE to 0 in the HSDRAMC\_MR. Read the HSDRAMC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access at any location in the SDRAM.
8. Write the refresh rate into the COUNT field in the Refresh Timer register (HSDRAMC\_TR). (Refresh rate = delay between refresh cycles). The SDRAM device requires a refresh every 15.625  $\mu$ s or 7.81  $\mu$ s. With a 100 MHz frequency, the Refresh Timer register must be set with the value 1562 (15.625  $\mu$ s x 100 MHz) or 781 (7.81  $\mu$ s x 100 MHz).  
After initialization, the SDRAM devices are fully functional.

**Note:**

1. The instructions stated in Step 3 of the initialization process must be respected to make sure the subsequent commands issued by the HSDRAMC are taken into account.

**Figure 32-1.** HSDRAM Device Initialization Sequence

### 32.7.2 Write Cycle

The HSDRAMC allows burst access or single access. In both cases, the HSDRAMC keeps track of the active row in each bank, thus maximizing performance. To initiate a burst access, the HSDRAMC uses the transfer type signal provided by the master requesting the access. If the next access is a sequential write access, writing to the SDRAM device is carried out. If the next access is a write-sequential access, but the current access is to a boundary page, or if the next access is in another row, then the HSDRAMC generates a precharge command, activates the new row and initiates a write command. To comply with SDRAM timing parameters, additional clock cycles are inserted between precharge and active commands ( $t_{RP}$ ), and between active and write commands

( $t_{RCD}$ ). For the definition of these timing parameters, refer to the HSDRAMC Configuration Registers (HSDRAMC\_CR and HSDRAMC\_SDR).

**Figure 32-2.** Write Burst SDRAM Access (16-bit/32-bit mode)

**Notes:**

1. When HECC is ON, the CB buses are active (CB length is 8 in the case of Hamming).
2. In the case of 16-bit mode, D[31:0] is replaced by D[15:0].

### 32.7.3 Read Cycle

The HSDRAMC allows burst access, incremental burst of unspecified length or single access. In all cases, the HSDRAMC keeps track of the active row in each bank, thus maximizing performance of the SDRAM. If row and bank addresses do not match the previous row/bank address, then the HSDRAMC automatically generates a precharge command, activates the new row and starts the read command. To comply with the SDRAM timing parameters, additional clock cycles on SDCK are inserted between precharge and active commands ( $t_{RP}$ ), and between active and read commands ( $t_{RCD}$ ). These two parameters are set in the HSDRAMC\_SDR. After a read command, additional wait states are generated to comply with the CAS latency (1, 2 or 3 clock delays specified in the HSDRAMC\_CR).

For a single access or an incremented burst of unspecified length, the HSDRAMC anticipates the next access. While the last value of the column is returned by the HSDRAMC on the bus, the HSDRAMC anticipates the read to the next column and thus anticipates the CAS latency. This reduces the effect of the CAS latency on the internal bus.

For burst access of specified length (4, 8, 16 words), access is not anticipated. This case leads to the best performance. If the burst is broken (border, Busy mode, etc.), the next access is handled as an incrementing burst of unspecified length.

**Figure 32-3.** Read Burst SDRAM Access (16/32-bit mode)**Notes:**

1. When HECC is ON, the CB buses are active (CB length is 8 in the case of Hamming).
2. In the case of 16-bit Mode, D[31:0] is replaced by D[15:0].

**32.7.4 Border Management**

When the memory row boundary has been reached, an automatic page break is inserted. In this case, the HSDRAMC generates a precharge command, activates the new row and initiates a read or write command. To comply with SDRAM timing parameters, an additional clock cycle is inserted between the precharge and the active command ( $t_{RP}$ ) and between the active and the read command ( $t_{RCD}$ ). Refer to the figure below.

**Figure 32-4.** Read Burst with Boundary Row Access

### 32.7.5 SDRAM Controller Refresh Cycles

An autorefresh command is used to refresh the SDRAM device. Refresh addresses are generated internally by the SDRAM device and incremented after each autorefresh automatically. The HSDRAMC generates these autorefresh commands periodically. An internal timer is loaded with the value in HSDRAMC\_TR that indicates the number of clock cycles between refresh cycles. A refresh error interrupt is generated when the previous autorefresh command did not perform. It is acknowledged by reading the Interrupt Status register (HSDRAMC\_ISR). When the HSDRAMC initiates a refresh of the SDRAM device, internal memory accesses are not delayed. However, if the processor tries to access the SDRAM, the slave indicates that the device is busy and the master is held by a wait signal. Refer to the figure below.

**Figure 32-5.** Refresh Cycle Followed by a Read Access

## 32.8 Read/Write Access Use Cases

The following external accesses are visible depending on the HSDRAMC configuration and the different AMBA requests.

HSDRAMC configurations are as follows:

- Data bus width mode selected (16-bit or 32-bit)
- The activation or the de-activation of the HECC and the selection of the Error Correction Code (HECC) applied (Hamming)
- The activation or de-activation of the RMW feature

The AMBA requests on the 32-bit processor are as follows:

- Write 8 bits (WR\_byte), Write 16 bits (WR\_half\_word), Write 32 bits (WR\_word), Write n x 32 bits (WR\_n\_word)
- Read 8 bits (RD\_byte), Read 16 bits (RD\_half\_word), Read 32 bits (RD\_word), Read n x 32 bits (RD\_n\_word)

### 32.8.1 32-bit Mode

#### 32.8.1.1 Single RD 32-bit Access

The figure below presents a single 32-bit read access in the case of a 32-bit wide data bus and with or without ECC. This is referred to as 'RD Burst of 1 x 32 bits' in this document.

Figure 32-6. RD Burst 1 x 32 bits – 32 bits wide, HECC OFF/ON

**Note:** When HECC is ON, the CB buses are active (CB length is 8 in the case of Hamming). Otherwise, they are not active.

32.8.1.2 Single WR 32-bit Access

The figure below presents a single 32-bit write access in the case of a 32-bit wide data bus and with or without ECC. This is referred to as 'WR Burst of 1 x 32 bits' in this document.

Figure 32-7. WR burst 1 x 32 bits – 32 bits wide, HECC OFF/ON

**Note:** When HECC is ON, the CB buses are active (CB length is 8 in case of Hamming). Otherwise, they are not active.

### 32.8.1.3 HECC Protection Deactivated (32-bit mode)

The table below summarizes the different accesses visible on the external memory interface depending on the AMBA request, when 32-bit mode is selected and HECC protection is de-activated.

- RD Burst of 1 x 32 bits refers to [Figure 32-6](#) without CB signals
- RD Burst of n x 32 bits refers to [Figure 32-3](#) without CB signals
- WR Burst of 1 x 32 bits refers to [Figure 32-7](#) without CB signals
- WR Burst of n x 32 bits refers to [Figure 32-2](#) without CB signals

**Table 32-10.** Memory Access – 32-bit Mode – HECC OFF

| AMBA Request            | [HSDRAMC] [32-bit]<br>[HECC OFF]<br>[RMW OFF] | [HSDRAMC] [32-bit]<br>[HECC OFF]<br>[RMW ON] |
|-------------------------|-----------------------------------------------|----------------------------------------------|
| RD_byte<br>RD_half_word | RD Burst of 1 x 32 bits <sup>(1)</sup>        | RD Burst of 1 x 32 bits <sup>(1)</sup>       |
| WR_byte<br>WR_half_word | WR Burst of 1 x 32 bits <sup>(1)</sup>        | (RMW) <sup>(2)</sup>                         |
| RD_n_word (n≥1)         | RD Burst of n x 32 bits                       | RD Burst of n x 32 bits                      |
| WR_n_word (n≥1)         | WR Burst of n x 32 bits                       | WR Burst of n x 32 bits                      |

**Notes:**

- SDNBS [4:0] will be used in order to access only significant bytes.
- (RMW)=[(1 x RD burst of 1x 32 bits) then [(1x WR burst of 1 x 32 bits)].

**32.8.1.4 HECC Protection Activated (40-bit Mode, resp. 48-bit Mode)**

The table below summarizes the different access visible on the external memory interface, depending on the AMBA request received, when 32-bit mode is selected and the HECC protection is activated.

- (RD Burst of 1 x 32 bits) (//) (RD Burst of 1 x 8 bits) refers to [Figure 32-6](#) with CB 8 signals used
- (RD Burst of 1 x 32 bits) (//) (RD Burst of 1 x 16 bits) refers to [Figure 32-6](#) with CB 16 signals used
- (RD Burst of n x 32 bits) (//) (RD Burst of n x 8) bits refers to [Figure 32-3](#) with CB 8 signals used
- (RD Burst of n x 32 bits) (//) (RD Burst of n x 16 bits) refers to [Figure 32-3](#) with CB 16 signals used
- (WR Burst of 1 x 32 bits) (//) (WR Burst of 1 x 8 bits) refers to [Figure 32-7](#) with CB 8 signals used
- (WR Burst of 1 x 32 bits) (//) (WR Burst of 1 x 16 bits) refers to [Figure 32-7](#) with CB 16 signals used
- (WR Burst of n x 32 bits) (//) (WR Burst of n x 8 bits) refers to [Figure 32-2](#) with CB 8 signals used
- (WR Burst of n x 32 bits) (//) (WR Burst of n x 16 bits) refers to [Figure 32-2](#) with CB 16 signals used

**Table 32-11.** Memory Access – 32-bit Mode – HECC ON

| AMBA Request            | HSDRAMC [32-bit]<br>[HECC ON – Hamming]<br>[RMW ON]<br>[data][sequence][checksum] |
|-------------------------|-----------------------------------------------------------------------------------|
| RD_byte<br>RD_half_word | (RD Burst of 1 x 32 bits) (//) (RD Burst of 1 x 8 bits)                           |
| WR_byte<br>WR_half_word | (RMW_ECCON8) <sup>(1)</sup>                                                       |
| RD_n_word ((n≥1))       | n x [(RD Burst of 1 x 32 bits) (//) (RD Burst of 1 x 8 bits)]                     |
| WR_n_word ((n≥1))       | (WR Burst of n x 32 bits) (//) (WR Burst of n x 8 bits)                           |

**Note:**

- (RMW\_ECCON8)= [(RD Burst of 1 x 32 bits) (//) (RD Burst of 1 x 8 bits)]+ [(WR Burst of 1 x 32 bits) (//) (WR Burst of 1 x 8 bits)]

32.8.2 16-bit Mode

32.8.2.1 Single RD 32-bit Access

Figure 32-8. RD burst 1 x 32 bits – 16 bits wide, HECC OFF

Figure 32-9. RD burst 1 x 32 bits – 16 bits wide, HECC ON

32.8.2.2 Single WR 32-bit Access

Figure 32-10. WR Burst 1 x 32 bits – 16 bits wide, HECC OFF

Figure 32-11. WR Burst 1 x 32 bits – 16 bits wide, HECC ON

32.8.2.3 HECC Protection Deactivated

The following figures present the unitary waveforms used to constitute the whole access performed.

Figure 32-12. RD Burst of 1 x 16 bits

Figure 32-13. RD Burst of 2n x 16 bits

Figure 32-14. WR Burst of 1 x 16 bits

Figure 32-15. WR Burst of 2n x 16 bits

The table below summarizes the different accesses visible on the external memory interface depending on the AMBA request, when 16-bit mode is selected and HECC protection is deactivated.

- RD Burst of 1 x 16 bits refers to [Figure 32-12](#)

- RD Burst of 2n x 16 bits refers to [Figure 32-13](#)
- WR Burst of 1 x 16 bits refers to [Figure 32-14](#)
- WR Burst of 2n x 16 bits refers to [Figure 32-15](#)

**Table 32-12.** Memory Access – 16-bit Mode – HECC OFF

| AMBA Request     | HSDRAMC [16-bit]<br>[HECC OFF]<br>[RMW OFF] | HSDRAMC [16-bit]<br>[HECC OFF]<br>[RMW ON] |
|------------------|---------------------------------------------|--------------------------------------------|
| RD_byte          | (RD Burst of 1 x 16 bits) (1)               | (RD Burst of 1 x 16 bits)                  |
| WR_byte          | (WR Burst of 1 x 16 bits) (1)               | (RMW) (2)                                  |
| RD_half_word     | (RD Burst of 1 x 16 bits)                   | (RD Burst of 1 x 16 bits)                  |
| WR_half_word     | (WR Burst of 1 x 16 bits)                   | (RMW) (2)                                  |
| RD_n_word, (n≥1) | (RD Burst of 2n x 16 bits)                  | (RD Burst of 2n x 16 bits)                 |
| WR_n_word, (n≥1) | (WR Burst of 2n x 16 bits)                  | (WR Burst of 2n x 16 bits)                 |

**Notes:**

1. SDNBS [4:0] will be used in order to access only significant bytes.
2. (RMW)= [(RD Burst of 2 x 16 bits) then [(WR Burst of 2 x 16 bits)]].

**32.8.2.4 HECC Protection Activated**

The table below summarizes the different accesses visible on the external memory interface depending on the AMBA request, when 16-bit mode is selected and HECC protection is activated.

- (RD Burst of 2 x 16 bits) (+) (RD Burst of 1 x 16 bits) refers to [Figure 32-9](#)
- (WR Burst of 2 x 16 bits) (+) (WR Burst of 1 x 16 bits) refers to [Figure 32-11](#)

**Table 32-13.** Memory Access – 16-bit Mode – HECC ON

| AMBA Request            | HSDRAMC [16-bit]<br>[HECC ON – Hamming]<br>[RMW ON]<br>[data][sequence][checksum] |
|-------------------------|-----------------------------------------------------------------------------------|
| RD_byte<br>RD_half_word | (RD Burst of 2 x 16 bits) (+) (RD Burst of 1 x 16 bits)                           |
| WR_byte<br>WR_half_word | (RMW_ECCON) <sup>(1)</sup>                                                        |
| RD_n_word (n≥1)         | n x [(RD Burst of 2 x 16 bits) (+) (RD Burst of 1 x 16 bits)]                     |
| WR_n_word (n≥1)         | n x [(WR Burst of 2 x 16 bits) (+) (WR Burst of 1 x 16 bits)]                     |

**Note:**

1. (RMW\_ECCON)= [(RD Burst of 2 x 16 bits) (+) (RD Burst of 1 x 16 bits) then (WR Burst of 2 x 16 bits) (+) (WR Burst of 1 x 16 bits)]

**32.9 Register Write Protection**

To prevent any single software error from corrupting HSDRAMC behavior, some registers in the address space can be write-protected by setting the WPEN bit in the HSDRAMC Write Protection Mode Register (HSDRAMC\_WPMR). If a write access to a write-protected register is detected, the WPVS flag in the HSDRAMC Write Protection Status Register (HSDRAMC\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the HSDRAMC\_WPSR. The following registers can be write-protected:

- HSDRAMC Mode Register
- HSDRAMC Refresh Timer Register
- HSDRAMC Configuration Registers
- HSDRAMC High-Speed Register
- HSDRAMC Memory Device Register
- HSDRAMC Configuration Register 1

## 32.10 Register Summary

| Offset | Name         | Bit Pos. | 7             | 6 | 5  | 4       | 3           | 2         | 1   | 0    |
|--------|--------------|----------|---------------|---|----|---------|-------------|-----------|-----|------|
| 0x00   | HSDRAMC_MR   | 7:0      |               |   |    |         |             | MODE[2:0] |     |      |
|        |              | 15:8     |               |   |    |         |             |           |     |      |
|        |              | 23:16    |               |   |    |         |             |           |     |      |
|        |              | 31:24    |               |   |    |         |             |           |     |      |
| 0x04   | HSDRAMC_TR   | 7:0      | COUNT[7:0]    |   |    |         |             |           |     |      |

### 32.10.1 HSDRAMC Mode Register

**Name:** HSDRAMC\_MR  
**Offset:** 0x0000  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SDRAMC Write Protection Mode Register](#).

#### Bits 2:0 – MODE[2:0] SDRAMC Command Mode

This field defines the command issued by the SDRAMC when the SDRAM device is accessed.

| Value | Name               | Description                                                                                                                                                                                                                                                                                                                                 |
|-------|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | NORMAL             | Normal mode. Any access to the SDRAM is decoded normally. To activate this mode, the command must be followed by a write to the SDRAM.                                                                                                                                                                                                      |
| 1     | NOP                | The HSDRAMC issues a NOP command when the SDRAM device is accessed regardless of the cycle. To activate this mode, the command must be followed by a write to the SDRAM.                                                                                                                                                                    |
| 2     | ALLBANKS_PRECHARGE | The SDRAMC issues an “All Banks Precharge” command when the SDRAM device is accessed regardless of the cycle. To activate this mode, the command must be followed by a write to the SDRAM.                                                                                                                                                  |
| 3     | LOAD_MODEREG       | The HSDRAMC issues a “Load Mode Register” command when the SDRAM device is accessed regardless of the cycle. To activate this mode, the command must be followed by a write to the SDRAM.                                                                                                                                                   |
| 4     | AUTO_REFRESH       | The HSDRAMC issues an “Autorefresh” Command when the SDRAM device is accessed regardless of the cycle. Previously, an “All Banks Precharge” command must be issued. To activate this mode, the command must be followed by a write to the SDRAM.                                                                                            |
| 5     | EXT_LOAD_MODEREG   | The HSDRAMC issues an “Extended Load Mode Register” command when the SDRAM device is accessed regardless of the cycle. To activate this mode, the “Extended Load Mode Register” command must be followed by a write to the SDRAM. The write in the SDRAM must be done in the appropriate bank; most low-power SDRAM devices use the bank 1. |
| 6–7   | -                  | reserved                                                                                                                                                                                                                                                                                                                                    |

### 32.10.2 HSDRAMC Refresh Timer Register

**Name:** HSDRAMC\_TR  
**Offset:** 0x0004  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SDRAMC Write Protection Mode Register](#).

|        |            |     |     |     |             |     |     |     |
|--------|------------|-----|-----|-----|-------------|-----|-----|-----|
| Bit    | 31         | 30  | 29  | 28  | 27          | 26  | 25  | 24  |
|        |            |     |     |     |             |     |     |     |
| Access |            |     |     |     |             |     |     |     |
| Reset  |            |     |     |     |             |     |     |     |
| Bit    | 23         | 22  | 21  | 20  | 19          | 18  | 17  | 16  |
|        |            |     |     |     |             |     |     |     |
| Access |            |     |     |     |             |     |     |     |
| Reset  |            |     |     |     |             |     |     |     |
| Bit    | 15         | 14  | 13  | 12  | 11          | 10  | 9   | 8   |
|        |            |     |     |     | COUNT[11:8] |     |     |     |
| Access |            |     |     |     | R/W         | R/W | R/W | R/W |
| Reset  |            |     |     |     | 0           | 0   | 0   | 0   |
| Bit    | 7          | 6   | 5   | 4   | 3           | 2   | 1   | 0   |
|        | COUNT[7:0] |     |     |     |             |     |     |     |
| Access | R/W        | R/W | R/W | R/W | R/W         | R/W | R/W | R/W |
| Reset  | 0          | 0   | 0   | 0   | 0           | 0   | 0   | 0   |

**Bits 11:0 – COUNT[11:0]** HSDRAMC Refresh Timer Count

This 12-bit field is loaded into a timer that generates the refresh pulse. Each time the refresh pulse is generated, a refresh burst is initiated. The SDRAM device requires a refresh every 15.625  $\mu$ s or 7.81  $\mu$ s. With a 100 MHz frequency, the Refresh Timer Counter Register must be set with the value 1562 (15.625  $\mu$ s x 100 MHz) or 781 (7.81  $\mu$ s x 100 MHz).

To refresh the SDRAM device, this 12-bit field must be written. If this condition is not satisfied, no refresh command is issued and no refresh of the SDRAM device is carried out.

### 32.10.3 HSDRAMC Configuration Register

**Name:** HSDRAMC\_CR  
**Offset:** 0x0008  
**Reset:** 0x000000C0  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SDRAMC Write Protection Mode Register](#).

|        |          |     |     |         |     |         |     |     |
|--------|----------|-----|-----|---------|-----|---------|-----|-----|
| Bit    | 31       | 30  | 29  | 28      | 27  | 26      | 25  | 24  |
|        |          |     |     |         |     |         |     |     |
| Access |          |     |     |         |     |         |     |     |
| Reset  |          |     |     |         |     |         |     |     |
| Bit    | 23       | 22  | 21  | 20      | 19  | 18      | 17  | 16  |
|        |          |     |     |         |     |         |     |     |
| Access |          |     |     |         |     |         |     |     |
| Reset  |          |     |     |         |     |         |     |     |
| Bit    | 15       | 14  | 13  | 12      | 11  | 10      | 9   | 8   |
|        |          |     |     |         |     |         | RMW | DBW |
| Access |          |     |     |         |     |         | R/W | R/W |
| Reset  |          |     |     |         |     |         | 0   | 0   |
| Bit    | 7        | 6   | 5   | 4       | 3   | 2       | 1   | 0   |
|        | CAS[1:0] |     | NB  | NR[1:0] |     | NC[2:0] |     |     |
| Access | R/W      | R/W | R/W | R/W     | R/W | R/W     | R/W | R/W |
| Reset  | 1        | 1   | 0   | 0       | 0   | 0       | 0   | 0   |

#### Bit 9 – RMW Read Modify Write

| Value | Description      |
|-------|------------------|
| 0     | RMW is disabled. |
| 1     | RMW is enabled.  |

#### Bit 8 – DBW Data Bus Width

Reset value is 16 bits.

| Value | Description                |
|-------|----------------------------|
| 0     | Data bus width is 32 bits. |
| 1     | Data bus width is 16 bits. |

#### Bits 7:6 – CAS[1:0] CAS Latency

Reset value is two cycles. In the HSDRAMC, only a CAS latency of one, two and three cycles are managed.

| Value | Name     | Description     |
|-------|----------|-----------------|
| 0     | Reserved | –               |
| 1     | LATENCY1 | 1 cycle latency |
| 2     | LATENCY2 | 2 cycle latency |
| 3     | LATENCY3 | 3 cycle latency |

#### Bit 5 – NB Number of Banks

Reset value is two banks.

| Value | Name  | Description |
|-------|-------|-------------|
| 0     | BANK2 | 2 banks     |
| 1     | BANK4 | 4 banks     |

**Bits 4:3 – NR[1:0] Number of Row Bits**

Reset value is 11 row bits.

| Value | Name     | Description                                       |
|-------|----------|---------------------------------------------------|
| 0     | ROW11    | 11 bits to define the row number, up to 2048 rows |
| 1     | ROW12    | 12 bits to define the row number, up to 4096 rows |
| 2     | ROW13    | 13 bits to define the row number, up to 8192 rows |
| 3     | Reserved | –                                                 |

**Bits 2:0 – NC[2:0] Number of Column Bits**

Reset value is 8 column bits.

| Value | Name  | Description                                             |
|-------|-------|---------------------------------------------------------|
| 0     | COL8  | 8 bits to define the column number, up to 256 columns   |
| 1     | COL9  | 9 bits to define the column number, up to 512 columns   |
| 2     | COL10 | 10 bits to define the column number, up to 1024 columns |
| 3     | COL11 | 11 bits to define the column number, up to 2048 columns |
| 4     | COL12 | 12 bits to define the column number, up to 4096 columns |

### 32.10.4 HSDRAMC Setup Delay Register

**Name:** HSDRAMC\_SDR  
**Offset:** 0x000C  
**Reset:** 0x00852372  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SDRAMC Write Protection Mode Register](#).

|        |               |     |     |     |           |     |     |     |
|--------|---------------|-----|-----|-----|-----------|-----|-----|-----|
| Bit    | 31            | 30  | 29  | 28  | 27        | 26  | 25  | 24  |
| Access |               |     |     |     |           |     |     |     |
| Reset  |               |     |     |     |           |     |     |     |
| Bit    | 23            | 22  | 21  | 20  | 19        | 18  | 17  | 16  |
|        | TXSR[3:0]     |     |     |     | TRAS[3:0] |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W       | R/W | R/W | R/W |
| Reset  | 1             | 0   | 0   | 0   | 0         | 1   | 0   | 1   |
| Bit    | 15            | 14  | 13  | 12  | 11        | 10  | 9   | 8   |
|        | TRCD[3:0]     |     |     |     | TRP[3:0]  |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W       | R/W | R/W | R/W |
| Reset  | 0             | 0   | 1   | 0   | 0         | 0   | 1   | 1   |
| Bit    | 7             | 6   | 5   | 4   | 3         | 2   | 1   | 0   |
|        | TRC_TRFC[3:0] |     |     |     | TWR[3:0]  |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W       | R/W | R/W | R/W |
| Reset  | 0             | 1   | 1   | 1   | 0         | 0   | 1   | 0   |

#### Bits 23:20 – TXSR[3:0] Exit Self-Refresh to Active Delay

Reset value is eight cycles.

This field defines the delay between SCKE set high and an Activate Command in number of cycles. Number of cycles is between 0 and 15.

#### Bits 19:16 – TRAS[3:0] Active to Precharge Delay

Reset value is five cycles.

This field defines the delay between an Activate Command and a Precharge Command in number of cycles. Number of cycles is between 0 and 15.

#### Bits 15:12 – TRCD[3:0] Row to Column Delay

Reset value is two cycles.

This field defines the delay between an Activate Command and a Read/Write Command in number of cycles. Number of cycles is between 0 and 15.

#### Bits 11:8 – TRP[3:0] Row Precharge Delay

Reset value is three cycles.

This field defines the delay between a Precharge Command and another Command in number of cycles. Number of cycles is between 0 and 15.

#### Bits 7:4 – TRC\_TRFC[3:0] Row Cycle Delay and Row Refresh Cycle

Reset value is seven cycles.

This field defines two timings:

- the delay ( $t_{RFC}$ ) between two Refresh commands and between a Refresh command and an Activate command
  - and the delay ( $t_{RC}$ ) between two Active commands in number of cycles.
- The number of cycles is between 0 and 15. The end user must program  $\max \{t_{RC}, t_{RFC}\}$ .

**Bits 3:0 – TWR[3:0] Write Recovery Delay**

Reset value is two cycles.

This field defines the Write Recovery Time in number of cycles. Number of cycles is between 0 and 15.

32.10.5 HSDRAMC High-Speed Register

**Name:** HSDRAMC\_HSR  
**Offset:** 0x0010  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [HSDRAMC Write Protection Mode Register](#).

Bit 0 – DA Decode Cycle Enable

A decode cycle can be added on the addresses as soon as a non-sequential access is performed on the AHB bus.  
The addition of the decode cycle allows the HSDRAMC to gain time to access the SDRAM memory.

| Value | Description               |
|-------|---------------------------|
| 0     | Decode cycle is disabled. |
| 1     | Decode cycle is enabled.  |

32.10.6 HSDRAMC Interrupt Enable Register

Name: HSDRAMC\_IER  
Offset: 0x0014  
Reset: -  
Property: Write-only

Bit 0 – RES Refresh Error Interrupt Enable

| Value | Description                          |
|-------|--------------------------------------|
| 0     | No effect.                           |
| 1     | Enables the refresh error interrupt. |

32.10.7 HSDRAMC Interrupt Disable Register

Name: HSDRAMC\_IDR  
Offset: 0x0018  
Reset: -  
Property: Write-only

Bit 0 – RES Refresh Error Interrupt Disable

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Disables the refresh error interrupt. |

32.10.8 HSDRAMC Interrupt Mask Register

Name: HSDRAMC\_IMR  
Offset: 0x001C  
Reset: 0x00000000  
Property: Read-only

Bit 0 – RES Refresh Error Interrupt Mask

| Value | Description                              |
|-------|------------------------------------------|
| 0     | The refresh error interrupt is disabled. |
| 1     | The refresh error interrupt is enabled.  |

32.10.9 HSDRAMC Interrupt Status Register

Name: HSDRAMC\_ISR  
Offset: 0x0020  
Reset: 0x00000000  
Property: Read-only

Bit 0 – RES Refresh Error Status (cleared on read)

| Value | Description                                                          |
|-------|----------------------------------------------------------------------|
| 0     | No refresh error has been detected since the register was last read. |
| 1     | A refresh error has been detected since the register was last read.  |

### 32.10.10 HSDRAMC Configuration Register 1

**Name:** HSDRAMC\_CFR1  
**Offset:** 0x0024  
**Reset:** 0x00000002  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [HSDRAMC Write Protection Mode Register](#).

#### Bit 8 – UNAL Support Unaligned Access

This mode is enabled with masters which have an AXI interface.

| Value | Name        | Description                        |
|-------|-------------|------------------------------------|
| 0     | UNSUPPORTED | Unaligned access is not supported. |
| 1     | SUPPORTED   | Unaligned access is supported.     |

#### Bits 3:0 – TMRD[3:0] Load Mode Register Command to Active or Refresh Command

Reset value is 2 cycles.

This field defines the delay between a “Load Mode Register” command and an active or refresh command in number of cycles. Number of cycles is between 0 and 15.

### 32.10.11 HSDRAMC Write Protection Mode Register

**Name:** HSDRAMC\_WPMR  
**Offset:** 0x0028  
**Reset:** 0x00000000  
**Property:** Read/Write

|        | WPVSR[7:0] |    |    |    |    |    |    |      |
| Access | R          | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7          | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        |            |    |    |    |    |    |    | WPVS |
| Access |            |    |    |    |    |    |    | R    |
| Reset  |            |    |    |    |    |    |    | 0    |

**Bits 15:8 – WPVSR[7:0]** Write Protection Violation Source  
When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description                                                                                                                                                                                                           |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protection violation has occurred since the last read of the HSDRAMC_WPSR.                                                                                                                                   |
| 1     | A write protection violation has occurred since the last read of the HSDRAMC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

## 33. Special Function Registers (SFR)

### 33.1 Description

Special Function Registers (SFR) manage specific aspects of the functionality not controlled elsewhere.

### 33.2 Embedded Characteristics

- 32-bit Special Function Registers control specific behavior of the product

33.3 Register Summary

| Offset              | Name     | Bit Pos. | 7                  | 6 | 5 | 4 | 3 | 2 | 1 | 0    |
|---------------------|----------|----------|--------------------|---|---|---|---|---|---|------|
| 0x00<br>...<br>0x9F | Reserved |          |                    |   |   |   |   |   |   |      |
| 0xA0                | SFR_CAN0 | 7:0      |                    |   |   |   |   |   |   |      |
|                     |          | 15:8     |                    |   |   |   |   |   |   |      |
|                     |          | 23:16    | EXT_MEM_ADDR[7:0]  |   |   |   |   |   |   |      |
|                     |          | 31:24    | EXT_MEM_ADDR[15:8] |   |   |   |   |   |   |      |
| 0xA4                | SFR_CAN1 | 7:0      |                    |   |   |   |   |   |   |      |
|                     |          | 15:8     |                    |   |   |   |   |   |   |      |
|                     |          | 23:16    | EXT_MEM_ADDR[7:0]  |   |   |   |   |   |   |      |
|                     |          | 31:24    | EXT_MEM_ADDR[15:8] |   |   |   |   |   |   |      |
| 0xA8<br>...<br>0xE3 | Reserved |          |                    |   |   |   |   |   |   |      |
| 0xE4                | SFR_WPMR | 7:0      |                    |   |   |   |   |   |   | WPEN |
|                     |          | 15:8     | WPKEY[7:0]         |   |   |   |   |   |   |      |
|                     |          | 23:16    | WPKEY[15:8]        |   |   |   |   |   |   |      |
|                     |          | 31:24    | WPKEY[23:16]       |   |   |   |   |   |   |      |

### 33.3.1 CAN0 MSB Address Register

**Name:** SFR\_CAN0  
**Offset:** 0xA0  
**Reset:** 0x20000000  
**Property:** Read/Write

|        |                    |     |     |     |     |     |     |     |
|--------|--------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31                 | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | EXT_MEM_ADDR[15:8] |     |     |     |     |     |     |     |
| Access | R/W                | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0                  | 0   | 1   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 23                 | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | EXT_MEM_ADDR[7:0]  |     |     |     |     |     |     |     |
| Access | R/W                | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0                  | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15                 | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        |                    |     |     |     |     |     |     |     |
| Access |                    |     |     |     |     |     |     |     |
| Reset  |                    |     |     |     |     |     |     |     |
| Bit    | 7                  | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        |                    |     |     |     |     |     |     |     |
| Access |                    |     |     |     |     |     |     |     |
| Reset  |                    |     |     |     |     |     |     |     |

**Bits 31:16 – EXT\_MEM\_ADDR[15:0]** MSB Base Address  
 Gives the 16-bit MSB of the CAN0 MSB base address. The 16-bit LSB must be programmed in the CAN0 user interface.

33.3.2 CAN1 MSB Address Register

Name: SFR\_CAN1  
Offset: 0xA4  
Reset: 0x20000000  
Property: Read/Write

|        |                    |     |     |     |     |     |     |     |
|--------|--------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31                 | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | EXT_MEM_ADDR[15:8] |     |     |     |     |     |     |     |
| Access | R/W                | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0                  | 0   | 1   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 23                 | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | EXT_MEM_ADDR[7:0]  |     |     |     |     |     |     |     |
| Access | R/W                | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0                  | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15                 | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        |                    |     |     |     |     |     |     |     |
| Access |                    |     |     |     |     |     |     |     |
| Reset  |                    |     |     |     |     |     |     |     |
| Bit    | 7                  | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        |                    |     |     |     |     |     |     |     |
| Access |                    |     |     |     |     |     |     |     |
| Reset  |                    |     |     |     |     |     |     |     |

**Bits 31:16 – EXT\_MEM\_ADDR[15:0]** MSB Base Address  
Gives the 16-bit MSB of the CAN1 MSB base address. The 16-bit LSB must be programmed in the CAN1 user interface.

### 33.3.3 SFR Write Protection Mode Register

**Name:** SFR\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |              |     |     |     |     |     |     |      |
|--------|--------------|-----|-----|-----|-----|-----|-----|------|
| Bit    | 31           | 30  | 29  | 28  | 27  | 26  | 25  | 24   |
|        | WPKEY[23:16] |     |     |     |     |     |     |      |
| Access | R/W          | R/W | R/W | R/W | R/W | R/W | R/W | R/W  |
| Reset  | 0            | 0   | 0   | 0   | 0   | 0   | 0   | 0    |
| Bit    | 23           | 22  | 21  | 20  | 19  | 18  | 17  | 16   |
|        | WPKEY[15:8]  |     |     |     |     |     |     |      |
| Access | R/W          | R/W | R/W | R/W | R/W | R/W | R/W | R/W  |
| Reset  | 0            | 0   | 0   | 0   | 0   | 0   | 0   | 0    |
| Bit    | 15           | 14  | 13  | 12  | 11  | 10  | 9   | 8    |
|        | WPKEY[7:0]   |     |     |     |     |     |     |      |
| Access | R/W          | R/W | R/W | R/W | R/W | R/W | R/W | R/W  |
| Reset  | 0            | 0   | 0   | 0   | 0   | 0   | 0   | 0    |
| Bit    | 7            | 6   | 5   | 4   | 3   | 2   | 1   | 0    |
|        |              |     |     |     |     |     |     | WPEN |
| Access |              |     |     |     |     |     |     | R/W  |
| Reset  |              |     |     |     |     |     |     | 0    |

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                                             |
|----------|--------|---------------------------------------------------------------------------------------------------------|
| 0x534652 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit.<br>Always reads as 0. |

#### Bit 0 – WPEN Write Protection Enable

| Value | Description                                                                                                                       |
|-------|-----------------------------------------------------------------------------------------------------------------------------------|
| 0     | Disables the write protection if WPKEY value corresponds to 0x534652 ("SFR" in ASCII).                                            |
| 1     | Enables the write protection if WPKEY value corresponds to 0x534652 ("SFR" in ASCII).<br>Note: All registers are write-protected. |

## 34. DMA Controller (XDMAC)

### 34.1 Description

The DMA Controller (XDMAC) is a AHB-protocol central direct memory access controller. It performs peripheral data transfer and memory move operations over one or two bus ports through the unidirectional communication channel. Each channel is fully programmable and provides both peripheral or memory-to-memory transfers. The channel features are configurable at implementation.

### 34.2 Embedded Characteristics

- 2 System Bus Master Interfaces
- 32 DMA Channels
- 44 Hardware Requests
- 4.125 Kbytes Embedded FIFO
- Supports Peripheral-to-Memory, Memory-to-Peripheral, or Memory-to-Memory Transfer Operations
- Peripheral DMA Operation Runs on Bytes (8-bit), Half-Word (16-bit) and Word (32-bit)
- Memory DMA Operation Runs on Bytes (8 bit), Half-Word (16-bit) and Word (32 -bit)
- Supports Hardware and Software Initiated Transfers
- Supports Linked List Operations
- Supports Incrementing or Fixed Addressing Mode
- Supports Programmable Independent Data Striding for Source and Destination
- Supports Programmable Independent Microblock Striding for Source and Destination
- Configurable Priority Group and Arbitration Policy
- Programmable AHB Burst Length
- Configuration Interface on Peripheral Bus
- XDMAC Architecture Includes Multiport FIFO
- Supports Multiple View Channel Descriptor
- Automatic Flush of Channel Trailing Bytes
- Automatic Coarse-Grain and Fine-Grain Clock Gating
- Hardware Acceleration of Memset Pattern

### 34.3 Block Diagram

Figure 34-1. XDMAC Block Diagram

### 34.4 Functional Description

#### 34.4.1 Basic Definitions

**Source Peripheral:** Slave device, memory mapped on the interconnection network, from where the XDMAC reads data. The source peripheral teams up with a destination peripheral to form a channel. A data read operation is scheduled when the peripheral transfer request is asserted.

**Destination Peripheral:** Slave device, memory mapped on the interconnection network, to which the XDMAC writes. A write data operation is scheduled when the peripheral transfer request is asserted.

**Channel:** The data movement between source and destination creates a logical channel.

**Stride:** Number of address locations between successive elements/data measured in bytes.

**Transfer Type:** The transfer is hardware-synchronized when it is paced by the peripheral hardware request, otherwise the transfer is self-triggered (memory to memory transfer).

#### 34.4.2 Transfer Hierarchy Diagram

**XDMAC Master Transfer:** The Master Transfer is composed of a linked list of blocks. The channel address, control and configuration registers can be modified at the inter block boundary. The descriptor structure modifies the channel registers conditionally. Interrupts can be generated on a per block basis or when the end of linked list event occurs.

**XDMAC Block:** An XDMAC block is composed of a programmable number of microblocks. The channel configuration registers remain unchanged at the inter microblock boundary. The source and destination addresses are conditionally updated with a programmable signed number.

**XDMAC Microblock:** The microblock is composed of a programmable number of data. The channel configuration registers remain unchanged at the data boundary. The data address may be fixed (a FIFO location, a peripheral transmit or receive register), incrementing (a memory-mapped area) by a programmable signed number.

**XDMAC Burst and Incomplete Burst:** In order to improve the overall performance when accessing dynamic external memory, burst access is mandatory. Each data of the microblock is considered as a part of a memory burst. The programmable burst value indicates the largest memory burst allowed on a per channel basis. When the microblock length is not an integral multiple of the burst size, an incomplete burst is performed to read or write the last trailing bytes.

**XDMAC Chunk and Incomplete Chunk:** When a peripheral synchronized transfer is activated, the microblock splits into a number of data chunks. The chunk size is programmable. The larger the chunk is, the better the performance is. When the transfer size is not a multiple of the chunk size, the last chunk may be incomplete.

**Figure 34-2.** XDMAC Memory Transfer Hierarchy

**Figure 34-3.** XDAMC Peripheral Transfer Hierarchy

### 34.4.3 Peripheral Synchronized Transfer

A peripheral hardware request interface is used to control the pace of the chunk transfer. When a peripheral is ready to transmit or receive a chunk of data, it asserts its request line and the DMA Controller transfers a data to or from the memory to the peripheral.

#### 34.4.3.1 Software Triggered Synchronized Transfer

The Peripheral hardware request can be software controlled using the SWREQ field of the XDMAC Global Channel Software Request Register (XDMAC\_GSWR). The peripheral synchronized transfer is paced using a processor write access in the XDMAC\_GSWR. Each bit of that register triggers a transfer request. The XDMAC Global Channel Software Request Status Register (XDMAC\_GSWS) indicates the status of the request; when set, the request is still pending.

### 34.4.4 XDMAC Transfer Software Operation

#### Note:

When a memory-to-memory transfer is performed, configure the field XDMAC\_CCx.PERID (where 'x' is the index of the channel used for transfer) to an unused peripheral ID (refer to table "Peripheral Identifiers").

#### 34.4.4.1 Single Block Transfer With Single Microblock

1. Read the XDMAC Global Channel Status Register (XDMAC\_GS) to select a free channel.
2. Clear the pending Interrupt Status bit(s) by reading the selected XDMAC Channel x Interrupt Status Register (XDMAC\_CISx).
3. Write the XDMAC Channel x Source Address Register (XDMAC\_CSAx) for channel x.
4. Write the XDMAC Channel x Destination Address Register (XDMAC\_CDAx) for channel x.
5. Program field UBLLEN in the XDMAC Channel x Microblock Control Register (XDMAC\_CUBCx) with the number of data.
6. Program the XDMAC Channel x Configuration Register (XDMAC\_CCx):
  - a. Clear XDMAC\_CCx.TYPE for a memory-to-memory transfer, otherwise set this bit.
  - b. Configure XDMAC\_CCx.MBSIZE to the memory burst size used.
  - c. Configure XDMAC\_CCx.SAM and DAM to Memory Addressing mode.

- d. Configure XDMAC\_CCx.DSYNC to select the peripheral transfer direction.
  - e. Set XDMAC\_CCx.PROT to activate a privileged channel.
  - f. Configure XDMAC\_CCx.CSIZE to configure the channel chunk size (only relevant for peripheral synchronized transfer).
  - g. Configure XDMAC\_CCx.DWIDTH to configure the transfer data width.
  - h. Configure XDMAC\_CCx.SIF, XDMAC\_CCx.DIF to configure the master interface used to read data and write data, respectively.
  - i. Configure XDMAC\_CCx.PERID to select the active hardware request line (only relevant for a peripheral synchronized transfer).
  - j. Set XDMAC\_CCx.SWREQ to use a software request (only relevant for a peripheral synchronized transfer).
7. Clear the following five registers:
    - XDMAC Channel x Next Descriptor Control Register (XDMAC\_CNDCx)
    - XDMAC Channel x Block Control Register (XDMAC\_CBCx)
    - XDMAC Channel x Data Stride Memory Set Pattern Register (XDMAC\_CDS\_MSPx)
    - XDMAC Channel x Source Microblock Stride Register (XDMAC\_CSUSx)
    - XDMAC Channel x Destination Microblock Stride Register (XDMAC\_CDUSx)

This indicates that the linked list is disabled, there is only one block and striding is disabled.
  8. Enable the Microblock interrupt by writing a '1' to bit BIE in the XDMAC Channel x Interrupt Enable Register (XDMAC\_CIEx). Enable the Channel x Interrupt Enable bit by writing a '1' to bit IEx in the XDMAC Global Interrupt Enable Register (XDMAC\_GIE).
  9. Enable channel x by writing a '1' to bit ENx in the XDMAC Global Channel Enable Register (XDMAC\_GE). XDMAC\_GS.STx (XDMAC Channel x Status bit) is set by hardware.
  10. Once completed, the DMA channel sets XDMAC\_CISx.BIS (End of Block Interrupt Status bit) and generates an interrupt. XDMAC\_GS.STx is cleared by hardware. The software can either wait for an interrupt or poll the channel status bit.

#### 34.4.4.2 Single Block Transfer With Multiple Microblock

1. Read the XDMAC\_GS register to choose a free channel.
2. Clear the pending Interrupt Status bit by reading the chosen XDMAC\_CISx register.
3. Write the XDMAC\_CSAx register for channel x.
4. Write the XDMAC\_CDAx register for channel x.
5. Program XDMAC\_CUBCx.UBLEN with the number of data.
6. Program XDMAC\_CCx register (see ["Single Block Transfer With Single Microblock"](#)).
7. Program XDMAC\_CBCx.BLEN with the number of microblocks of data.
8. Clear the following registers:
  - XDMAC\_CNDCx
  - XDMAC\_CDS\_MSPx
  - XDMAC\_CSUSx XDMAC\_CDUSx

This indicates that the linked list is disabled and striding is disabled.
9. Enable the Block interrupt by writing a '1' to XDMAC\_CIEx.BIE, enable the Channel x Interrupt Enable bit by writing a '1' to XDMAC\_GIEx.IEx.
10. Enable channel x by writing a '1' to the XDMAC\_GE.ENx. XDMAC\_GS.STx is set by hardware.

11. Once completed, the DMA channel sets XDMAC\_CISx.BIS (End of Block Interrupt Status bit) and generates an interrupt. XDMAC\_GS.STx is cleared by hardware. The software can either wait for an interrupt or poll the channel status bit.

### 34.4.4.3 Master Transfer

1. Read the XDMAC\_GS register to choose a free channel.
2. Clear the pending Interrupt Status bit by reading the chosen XDMAC\_CISx register.
3. Build a linked list of transfer descriptors in memory. The descriptor view is programmable on a per descriptor basis. The linked list items structure must be word aligned. MBR\_UBC.NDE must be configured to 0 in the last descriptor to terminate the list.
4. Configure field NDA in the XDMAC Channel x Next Descriptor Address Register (XDMAC\_CNDAx) with the first descriptor address and bit XDMAC\_CNDAx.NDAIF with the master interface identifier.
5. Configure the XDMAC\_CNDCx register:
  - a. Set XDMAC\_CNDCx.NDE to enable the descriptor fetch.
  - b. Set XDMAC\_CNDCx.NDSUP to update the source address at the descriptor fetch time, otherwise clear this bit.
  - c. Set XDMAC\_CNDCx.NDDUP to update the destination address at the descriptor fetch time, otherwise clear this bit.
  - d. Configure XDMAC\_CNDCx.NDVIEW to define the length of the first descriptor.
6. Enable the End of Linked List interrupt by writing a '1' to XDMAC\_CIEx.LIE.
7. Enable channel x by writing a '1' to XDMAC\_GE.ENx. XDMAC\_GS.STx is set by hardware.
8. Once completed, the DMA channel sets XDMAC\_CISx.BIS (End of Block Interrupt Status bit) and generates an interrupt. XDMAC\_GS.STx is cleared by hardware. The software can either wait for an interrupt or poll the channel status bit.

### 34.4.4.4 Disabling A Channel Before Transfer Completion

Under normal operation, the software enables a channel by writing a '1' to XDMAC\_GE.ENx, then the hardware disables a channel on transfer completion by clearing bit XDMAC\_GS.STx. To disable a channel, write a '1' to bit XDMAC\_GD.DIx and poll the XDMAC\_GS register.

## 34.5 Linked List Descriptor Operation

### 34.5.1 Linked List Descriptor View

#### 34.5.1.1 Channel Next Descriptor View 0–3 Structures

**Table 34-1.** Channel Next Descriptor View 0–3 Structures

| Channel Next Descriptor | Offset         | Structure member               | Name    |
|-------------------------|----------------|--------------------------------|---------|
| View 0 Structure        | DSCR_ADDR+0x00 | Next Descriptor Address Member | MBR_NDA |

#### Bits 28:27 – NVIEW[1:0] Next Descriptor View

| Value | Name | Description            |
|-------|------|------------------------|
| 0     | NDV0 | Next Descriptor View 0 |
| 1     | NDV1 | Next Descriptor View 1 |
| 2     | NDV2 | Next Descriptor View 2 |
| 3     | NDV3 | Next Descriptor View 3 |

#### Bit 26 – NDEN Next Descriptor Destination Update

| Value | Description                                                          |
|-------|----------------------------------------------------------------------|
| 0     | Destination parameters remain unchanged.                             |
| 1     | Destination parameters are updated when the descriptor is retrieved. |

#### Bit 25 – NSEN Next Descriptor Source Update

| Value | Description                                                     |
|-------|-----------------------------------------------------------------|
| 0     | Source parameters remain unchanged.                             |
| 1     | Source parameters are updated when the descriptor is retrieved. |

#### Bit 24 – NDE Next Descriptor Enable

| Value | Description                   |
|-------|-------------------------------|
| 0     | Descriptor fetch is disabled. |
| 1     | Descriptor fetch is enabled.  |

#### Bits 23:0 – UBLLEN[23:0] Microblock Length

This field indicates the number of data in the microblock. The microblock contains UBLLEN data.

## 34.6 XDMAC Maintenance Software Operations

### 34.6.1 Disabling a Channel

A disable channel request occurs when a write operation is performed in the XDMAC\_GD register. If the channel is source peripheral synchronized (bit XDMAC\_CCx.TYPE is set and bit XDMAC\_CCx.DSYNC is cleared), then pending bytes (bytes located in the FIFO) are written to memory and bit XDMAC\_CISx.DIS is set. If the channel is not source peripheral synchronized, the current channel transaction (read or write) is terminated and XDMAC\_CISx.DIS is set. XDMAC\_GS.STx is cleared by hardware when the current transfer is completed. The channel is no longer active and can be reused.

### 34.6.2 Suspending a Channel

A disable channel request occurs when a write operation is performed in the XDMAC\_GD register. If the channel is source peripheral synchronized (bit XDMAC\_CCx.TYPE is set and bit XDMAC\_CCx.DSYNC is cleared), then pending bytes (bytes located in the FIFO) are written to memory and bit XDMAC\_CISx.DIS is set. If the channel is not source peripheral synchronized, the current channel transaction (read or write) is terminated and XDMAC\_CISx.DIS is set. XDMAC\_GS.STx is cleared by hardware when the current transfer is completed. The channel is no longer active and can be reused.

### 34.6.3 Flushing a Channel

A FIFO flush command is issued by writing to the XDMAC\_SWF register. The content of the FIFO is written to memory. XDMAC\_CISx.FIS (End of Flush Interrupt Status bit) is set when the last byte is successfully transferred to memory. The channel is not disabled. The flush operation is not blocking, meaning that read operation can be scheduled during the flush write operation. The flush operation is only relevant for peripheral to memory transfer where pending peripheral bytes are buffered into the channel FIFO.

### 34.6.4 Maintenance Operation Priority

#### 34.6.4.1 Disable Operation Priority

- When a disable request occurs on a suspended channel, the XDMAC\_GWS.WSx (Channel x Write Suspend bit) is cleared. If the transfer is source peripheral synchronized, the pending bytes are drained to memory. The bit XDMAC\_CISx.DIS is set.
- When a disable request follows a flush request, if the flush last transaction is not yet scheduled, the flush request is discarded and the disable procedure is applied. Bit XDMAC\_CISx.FIS is not set. Bit XDMAC\_CISx.DIS is set when the disable request is completed. If the flush request transaction is already scheduled, the XDMAC\_CISx.FIS is set. XDMAC\_CISx.DIS is also set when the disable request is completed.

#### 34.6.4.2 Flush Operation Priority

- When a flush request occurs on a suspended channel, if there are pending bytes in the FIFO, they are written out to memory, XDMAC\_CISx.FIS is set. If the FIFO is empty, XDMAC\_CISx.FIS is also set.
- If the flush operation is performed after a disable request, the flush command is ignored. XDMAC\_CISx.FIS is not set.

#### 34.6.4.3 Suspend Operation Priority

If the suspend operation is performed after a disable request, the write suspend operation is ignored.

## 34.7 XDMAC Software Requirements

- Write operations to channel registers are not performed in an active channel after the channel is enabled. If any channel parameters must be reprogrammed, this can only be done after disabling the XDMAC channel.
- XDMAC\_CSx and XDMAC\_CDx channel registers must be programmed with a byte, half-word or word aligned address depending on the Channel x Data Width field (DWIDTH) of the XDMAC Channel x Configuration Register. When a memory-to-peripheral transfer is performed, the XDMAC\_CSx address register has no alignment requirement.
- When a memory-to-memory transfer is performed, configure the field XDMAC\_CCx.PERID (where 'x' is the index of the channel used for the transfer) to an unused peripheral ID (refer to table "Peripheral Identifiers").
- When XDMAC\_CC.INITD is set to 0, XDMAC\_CUBC.UBLEN and XDMAC\_CNDA.NDA field values are unreliable when the descriptor is being updated. The following procedure applies to get the buffer descriptor identifier and the residual bytes:

```

Read XDMAC_CNDAx.NDA (nda0)
Read XDMAC_CCx.INITD (initd0)
Read XDMAC_CCx.INITD (initd0)
Read XDMAC_CUBCx.UBLEN (ublen)
Read XDMAC_CCx.INITD (initd1)
Read XDMAC_CNDAx.NDA (nda1)
If (nda0 == nda1 && initd0 == 1 && initd1 == 1).
Then the ublen is correct, the buffer id is nda.
Else retry

```

See the figure below.

- Each DMA channel can be configured in either Privileged or User mode independently. When a DMA channel is secure, its configuration registers cannot be modified by user software. The configuration registers of a privileged channel are read as zero by user software and the read-only registers are also read as zero.

**Figure 34-4. INITD Timing Diagram**

## 34.8 Register Summary

| Offset | Name        | Bit Pos. | 7             | 6           | 5     | 4          | 3       | 2         | 1         | 0        |
|--------|-------------|----------|---------------|-------------|-------|------------|---------|-----------|-----------|----------|
| 0x00   | XDMAC_GTYPE | 7:0      | FIFO_SZ[2:0]  |             |       | NB_CH[4:0] |         |           |           |          |
|        |             | 15:8     | FIFO_SZ[10:3] |             |       |            |         |           |           |          |
|        |             | 23:16    |               | NB_REQ[6:0] |       |            |         |           |           |          |
|        |             | 31:24    |               |             |       |            |         |           |           |          |
| 0x04   | XDMAC_GCFG  | 7:0      |               |             |       |            | CGDISIF | CGDISFIFO | CGDISPIPE | CGDISREG |
|        |             | 15:8     |               |             |       |            |         |           |           | BXKBEN   |
|        |             | 23:16    |               |             |       |            |         |           |           |          |
|        |             | 31:24    |               |             |       |            |         |           |           |          |

| Access |    |    |    |    |          |           |           | BXKBEN   |
| Reset  |    |    |    |    |          |           |           | R/W<br>0 |
| Bit    | 7  | 6  | 5  | 4  | 3        | 2         | 1         | 0        |
| Access |    |    |    |    | CGDISIF  | CGDISFIFO | CGDISPIPE | CGDISREG |
| Reset  |    |    |    |    | R/W<br>0 | R/W<br>0  | R/W<br>0  | R/W<br>0 |

#### Bit 8 – BXKBEN Boundary X Kilobyte Enable

| Value | Description                                                                                                                            |
|-------|----------------------------------------------------------------------------------------------------------------------------------------|
| 0     | XDMAC generates a non-sequential attribute on the system bus when address crosses the 1-Kilobyte boundary with a burst access.         |
| 1     | XDMAC does not generate a non-sequential attribute on the system bus when address crosses the 1-Kilobyte boundary with a burst access. |

#### Bit 3 – CGDISIF Bus Interface Clock Gating Disable

| Value | Description                                                          |
|-------|----------------------------------------------------------------------|
| 0     | The automatic clock gating is enabled for the system bus interface.  |
| 1     | The automatic clock gating is disabled for the system bus interface. |

#### Bit 2 – CGDISFIFO FIFO Clock Gating Disable

| Value | Description                                               |
|-------|-----------------------------------------------------------|
| 0     | The automatic clock gating is enabled for the main FIFO.  |
| 1     | The automatic clock gating is disabled for the main FIFO. |

#### Bit 1 – CGDISPIPE Pipeline Clock Gating Disable

| Value | Description                                                   |
|-------|---------------------------------------------------------------|
| 0     | The automatic clock gating is enabled for the main pipeline.  |
| 1     | The automatic clock gating is disabled for the main pipeline. |

#### Bit 0 – CGDISREG Configuration Registers Clock Gating Disable

| Value | Description                                                             |
|-------|-------------------------------------------------------------------------|
| 0     | The automatic clock gating is enabled for the configuration registers.  |
| 1     | The automatic clock gating is disabled for the configuration registers. |

### 34.8.3 XDMAC Global Weighted Arbiter Configuration Register

**Name:** XDMAC\_GWAC  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |          |     |     |     |          |     |     |     |
|--------|----------|-----|-----|-----|----------|-----|-----|-----|
| Bit    | 31       | 30  | 29  | 28  | 27       | 26  | 25  | 24  |

#### Bits 15:12 – PW3[3:0] Pool Weight 3

This field indicates the weight of pool 3 in the arbitration scheme of the DMA scheduler.

#### Bits 11:8 – PW2[3:0] Pool Weight 2

This field indicates the weight of pool 2 in the arbitration scheme of the DMA scheduler.

#### Bits 7:4 – PW1[3:0] Pool Weight 1

This field indicates the weight of pool 1 in the arbitration scheme of the DMA scheduler.

#### Bits 3:0 – PW0[3:0] Pool Weight 0

This field indicates the weight of pool 0 in the arbitration scheme of the DMA scheduler.

### 34.8.4 XDMAC Global Interrupt Enable Register

**Name:** XDMAC\_GIE  
**Offset:** 0x0C  
**Reset:** –

#### Bit 6 – ROIE Request Overflow Error Interrupt Enable

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | No effect.                                |
| 1     | Enables request overflow error interrupt. |

#### Bit 5 – WBIE Write Bus Error Interrupt Enable

| Value | Description                        |
|-------|------------------------------------|
| 0     | No effect.                         |
| 1     | Enables write bus error interrupt. |

#### Bit 4 – RBIE Read Bus Error Interrupt Enable

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No effect.                        |
| 1     | Enables read bus error interrupt. |

#### Bit 3 – FIE End of Flush Interrupt Enable

| Value | Description                     |
|-------|---------------------------------|
| 0     | No effect.                      |
| 1     | Enables end of flush interrupt. |

#### Bit 2 – DIE End of Disable Interrupt Enable

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No effect.                        |
| 1     | Enables end of disable interrupt. |

#### Bit 1 – LIE End of Linked List Interrupt Enable

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Enables end of linked list interrupt. |

**Bit 0 – BIE** End of Block Interrupt Enable

| Value | Description                     |
|-------|---------------------------------|
| 0     | No effect.                      |
| 1     | Enables end of block interrupt. |

### 34.8.19 XDMAC Channel x Interrupt Disable Register [x = 0..31]

**Name:** XDMAC\_CID  
**Offset:** 0x54 + n\*0x40 [n=0..31]  
**Reset:** –  
**Property:** Write-only

#### Bit 6 – ROID Request Overflow Error Interrupt Disable

| Value | Description                                |
|-------|--------------------------------------------|
| 0     | No effect.                                 |
| 1     | Disables request overflow error interrupt. |

#### Bit 5 – WBEID Write Bus Error Interrupt Disable

| Value | Description                   |
|-------|-------------------------------|
| 0     | No effect.                    |
| 1     | Disables bus error interrupt. |

#### Bit 4 – RBEID Read Bus Error Interrupt Disable

| Value | Description                   |
|-------|-------------------------------|
| 0     | No effect.                    |
| 1     | Disables bus error interrupt. |

#### Bit 3 – FID End of Flush Interrupt Disable

| Value | Description                      |
|-------|----------------------------------|
| 0     | No effect.                       |
| 1     | Disables end of flush interrupt. |

#### Bit 2 – DID End of Disable Interrupt Disable

| Value | Description                        |
|-------|------------------------------------|
| 0     | No effect.                         |
| 1     | Disables end of disable interrupt. |

#### Bit 1 – LID End of Linked List Interrupt Disable

| Value | Description                            |
|-------|----------------------------------------|
| 0     | No effect.                             |
| 1     | Disables end of linked list interrupt. |

#### Bit 0 – BID End of Block Interrupt Disable

| Value | Description                      |
|-------|----------------------------------|
| 0     | No effect.                       |
| 1     | Disables end of block interrupt. |

### 34.8.20 XDMAC Channel x Interrupt Mask Register [x = 0..31]

**Name:** XDMAC\_CIM  
**Offset:** 0x58 + n\*0x40 [n=0..31]  
**Reset:** 0x00000000

| Reset  |   | 0    | 0     | 0     | 0   | 0   | 0   | 0   |

#### Bit 6 – ROIS Request Overflow Error Interrupt Status

| Value | Description                                                                                                               |
|-------|---------------------------------------------------------------------------------------------------------------------------|
| 0     | Overflow condition has not occurred.                                                                                      |
| 1     | Overflow condition has occurred at least once. (This information is only relevant for peripheral synchronized transfers.) |

#### Bit 5 – WBEIS Write Bus Error Interrupt Status

| Value | Description                                                                                            |
|-------|--------------------------------------------------------------------------------------------------------|
| 0     | Write bus error condition has not occurred.                                                            |
| 1     | At least one bus error has been detected in a write access since the last read of the Status register. |

#### Bit 4 – RBEIS Read Bus Error Interrupt Status

| Value | Description                                                                                           |
|-------|-------------------------------------------------------------------------------------------------------|
| 0     | Read bus error condition has not occurred.                                                            |
| 1     | At least one bus error has been detected in a read access since the last read of the Status register. |

#### Bit 3 – FIS End of Flush Interrupt Status

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 0     | End of flush condition has not occurred.                                        |
| 1     | End of flush condition has occurred since the last read of the Status register. |

#### Bit 2 – DIS End of Disable Interrupt Status

| Value | Description                                                                       |
|-------|-----------------------------------------------------------------------------------|
| 0     | End of disable condition has not occurred.                                        |
| 1     | End of disable condition has occurred since the last read of the Status register. |

#### Bit 1 – LIS End of Linked List Interrupt Status

| Value | Description                                                                           |
|-------|---------------------------------------------------------------------------------------|
| 0     | End of linked list condition has not occurred.                                        |
| 1     | End of linked list condition has occurred since the last read of the Status register. |

**Bit 0 – BIS** End of Block Interrupt Status

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 0     | End of block interrupt has not occurred.                                        |
| 1     | End of block interrupt has occurred since the last read of the Status register. |

#### Bits 31:2 – NDA[29:0] Channel x Next Descriptor Address

The 30-bit width of the NDA field represents the next descriptor address range 31:2. The descriptor is word-aligned and the two least significant register bits 1:0 are ignored.

#### Bit 0 – NDAIF Channel x Next Descriptor Interface

| Value | Description                                                     |
|-------|-----------------------------------------------------------------|
| 0     | The channel descriptor is retrieved through system interface 0. |
| 1     | The channel descriptor is retrieved through system interface 1. |

### 34.8.25 XDMAC Channel x Next Descriptor Control Register [x = 0..31]

**Name:** XDMAC\_CNDC  
**Offset:** 0x6C + n\*0x40 [n=0..31]  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 4:3 – NDVIEW[1:0] Channel x Next Descriptor View

| Value | Name | Description            |
|-------|------|------------------------|
| 0     | NDV0 | Next Descriptor View 0 |
| 1     | NDV1 | Next Descriptor View 1 |
| 2     | NDV2 | Next Descriptor View 2 |
| 3     | NDV3 | Next Descriptor View 3 |

#### Bit 2 – NDDUP Channel x Next Descriptor Destination Update

| Value | Name                 | Description                                                          |
|-------|----------------------|----------------------------------------------------------------------|
| 0     | DST_PARAMS_UNCHANGED | Destination parameters remain unchanged.                             |
| 1     | DST_PARAMS_UPDATED   | Destination parameters are updated when the descriptor is retrieved. |

#### Bit 1 – NDSUP Channel x Next Descriptor Source Update

| Value | Name                 | Description                                                     |
|-------|----------------------|-----------------------------------------------------------------|
| 0     | SRC_PARAMS_UNCHANGED | Source parameters remain unchanged.                             |
| 1     | SRC_PARAMS_UPDATED   | Source parameters are updated when the descriptor is retrieved. |

#### Bit 0 – NDE Channel x Next Descriptor Enable

| Value | Name           | Description                   |
|-------|----------------|-------------------------------|
| 0     | DSCR_FETCH_DIS | Descriptor fetch is disabled. |
| 1     | DSCR_FETCH_EN  | Descriptor fetch is enabled.  |

34.8.26 XDMAC Channel x Microblock Control Register [x = 0..31]

**Name:** XDMAC\_CUBC  
**Offset:** 0x70 + n\*0x40 [n=0..31]  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 23:0 – UBLEN[23:0] Channel x Microblock Length**  
 This field indicates the number of data in the microblock. The microblock contains UBLEN data.

34.8.27 XDMAC Channel x Block Control Register [x = 0..31]

Name: XDMAC\_CBC  
Offset: 0x74 + n\*0x40 [n=0..31]  
Reset: 0x00000000  
Property: Read/Write

|        |           |     |     |     |            |     |     |     |
|--------|-----------|-----|-----|-----|------------|-----|-----|-----|

| Access | R/W        | R/W   | R/W   | R/W         |          | R/W         | R/W      | R/W  |
| Reset  | 0          | 0     | 0     | 0           |          | 0           | 0        | 0    |

#### Bits 30:24 – PERID[6:0] Channel x Peripheral Hardware Request Line Identifier

This field contains the peripheral hardware request line identifier. PERID refers to identifiers defined in [12.2. XDMAC Peripheral Connections](#).

**Note:** When a memory-to-memory transfer is performed, configure PERID to an unused peripheral ID (refer to table “Peripheral Identifiers”).

#### Bit 23 – WRIP Write in Progress

| Value | Name        | Description                             |
|-------|-------------|-----------------------------------------|
| 0     | DONE        | No active write transaction on the bus. |
| 1     | IN_PROGRESS | A write transaction is in progress.     |

#### Bit 22 – RDIP Read in Progress

| Value | Name        | Description                            |
|-------|-------------|----------------------------------------|
| 0     | DONE        | No active read transaction on the bus. |
| 1     | IN_PROGRESS | A read transaction is in progress.     |

#### Bit 21 – INITD Channel Initialization Done

When set to 0, XDMAC\_CUBC.UBLEN and XDMAC\_CNDA.NDA field values are unreliable each time a descriptor is being updated. See [34.7. XDMAC Software Requirements](#).

| Value | Name        | Description                            |
|-------|-------------|----------------------------------------|
| 0     | IN_PROGRESS | Channel initialization is in progress. |
| 1     | TERMINATED  | Channel initialization is completed.   |

#### Bits 19:18 – DAM[1:0] Channel x Destination Addressing Mode

| Value | Name           | Description                                                                      |
|-------|----------------|----------------------------------------------------------------------------------|
| 0     | FIXED_AM       | The address remains unchanged.                                                   |
| 1     | INCREMENTED_AM | The addressing mode is incremented (the increment size is set to the data size). |

| Value | Name      | Description                                                                                               |
|-------|-----------|-----------------------------------------------------------------------------------------------------------|
| 2     | UBS_AM    | The microblock stride is added at the microblock boundary.                                                |
| 3     | UBS_DS_AM | The microblock stride is added at the microblock boundary; the data stride is added at the data boundary. |

#### Bits 17:16 – SAM[1:0] Channel x Source Addressing Mode

| Value | Name           | Description                                                                                               |
|-------|----------------|-----------------------------------------------------------------------------------------------------------|
| 0     | FIXED_AM       | The address remains unchanged.                                                                            |
| 1     | INCREMENTED_AM | The addressing mode is incremented (the increment size is set to the data size).                          |
| 2     | UBS_AM         | The microblock stride is added at the microblock boundary.                                                |
| 3     | UBS_DS_AM      | The microblock stride is added at the microblock boundary, the data stride is added at the data boundary. |

#### Bit 14 – DIF Channel x Destination Interface Identifier

| Value | Name    | Description                                         |
|-------|---------|-----------------------------------------------------|
| 0     | AHB_IF0 | The data is written through system bus interface 0. |
| 1     | AHB_IF1 | The data is written through system bus interface 1. |

#### Bit 13 – SIF Channel x Source Interface Identifier

| Value | Name    | Description                                      |
|-------|---------|--------------------------------------------------|
| 0     | AHB_IF0 | The data is read through system bus interface 0. |
| 1     | AHB_IF1 | The data is read through system bus interface 1. |

#### Bits 12:11 – DWIDTH[1:0] Channel x Data Width

| Value | Name     | Description                     |
|-------|----------|---------------------------------|
| 0     | BYTE     | The data size is set to 8 bits  |
| 1     | HALFWORD | The data size is set to 16 bits |
| 2     | WORD     | The data size is set to 32 bits |

#### Bits 10:8 – CSIZE[2:0] Channel x Chunk Size

| Value | Name   | Description         |
|-------|--------|---------------------|
| 0     | CHK_1  | 1 data transferred  |
| 1     | CHK_2  | 2 data transferred  |
| 2     | CHK_4  | 4 data transferred  |
| 3     | CHK_8  | 8 data transferred  |
| 4     | CHK_16 | 16 data transferred |

#### Bit 7 – MEMSET Channel x Fill Block of Memory

| Value | Name        | Description                                                                                                                  |
|-------|-------------|------------------------------------------------------------------------------------------------------------------------------|
| 0     | NORMAL_MODE | Memset is not activated.                                                                                                     |
| 1     | HW_MODE     | Sets the block of memory pointed by DA field to the specified value. This operation is performed on 8-, 16- or 32-bit basis. |

#### Bit 6 – SWREQ Channel x Software Request Trigger

| Value | Name          | Description                                                        |
|-------|---------------|--------------------------------------------------------------------|
| 0     | HWR_CONNECTED | Hardware request line is connected to the peripheral request line. |
| 1     | SWR_CONNECTED | Software request is connected to the peripheral request line.      |

#### Bit 5 – PROT Channel x Protection

When a descriptor is loaded, the PROT bit cannot be modified. If PROT=0 for a channel, the configuration and status registers of this channel cannot be modified by non-privileged software.

| Value | Name       | Description                   |
|-------|------------|-------------------------------|
| 0     | PRIVILEGED | Channel uses Privileged mode. |
| 1     | USER       | Channel uses User mode.       |

#### Bit 4 – DSYNC Channel x Synchronization

| Value | Name    | Description                   |
|-------|---------|-------------------------------|
| 0     | PER2MEM | Peripheral-to-memory transfer |
| 1     | MEM2PER | Memory-to-peripheral transfer |

**Bits 2:1 – MBSIZE[1:0] Channel x Memory Burst Size**

| Value | Name    | Description                              |
|-------|---------|------------------------------------------|
| 0     | SINGLE  | The memory burst size is set to one.     |
| 1     | FOUR    | The memory burst size is set to four.    |
| 2     | EIGHT   | The memory burst size is set to eight.   |
| 3     | SIXTEEN | The memory burst size is set to sixteen. |

**Bit 0 – TYPE Channel x Transfer Type**

| Value | Name     | Description                                                               |
|-------|----------|---------------------------------------------------------------------------|
| 0     | MEM_TRAN | Self-triggered mode (memory-to-memory transfer)                           |
| 1     | PER_TRAN | Synchronized mode (peripheral-to-memory or memory-to-peripheral transfer) |

**34.8.29 XDMAC Channel x Data Stride Memory Set Pattern Register [x = 0..31]**

**Name:** XDMAC\_CDS\_MSP  
**Offset:** 0x7C + n\*0x40 [n=0..31]

**Bits 31:16 – DDS\_MSP[15:0] Channel x Destination Data Stride or Memory Set Pattern**

When XDMAC\_CCx.MEMSET = 0, this field indicates the destination data stride.

Number of bytes for the data stride of channel x (two's complement). If the field is set to zero the data is contiguous.

The DDS\_MSP field is only relevant when XDMAC\_CCx.SAM=UBS\_DS\_AM.

When XDMAC\_CCx.MEMSET = 1, this field indicates the memory set pattern.

**Bits 15:0 – SDS\_MSP[15:0] Channel x Source Data Stride or Memory Set Pattern**

When XDMAC\_CCx.MEMSET = 0, this field indicates the source data stride.

Number of bytes for the data stride of channel x (two's complement). If the field is set to zero the data is contiguous.

The SDS\_MSP field is only relevant when XDMAC\_CCx.SAM=UBS\_DS\_AM.

When XDMAC\_CCx.MEMSET = 1, this field indicates the memory set pattern.

| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 23:0 – DUBS[23:0] Channel x Destination Microblock Stride

Number of bytes for the microblock stride for channel x (two's complement). If the field is set to zero the data is contiguous.

The DUBS field is only relevant when XDMAC\_CCx.SAM=UBS\_AM or XDMAC\_CCx.SAM=UBS\_DS\_AM.

## 35. 1553 Interface (1553)

### 35.1 Description

The 1553 link is an interface commonly used in space applications. It features one nominal bus and one redundant bus to obtain reliable transfers and it is capable of carrying out data transfers at a bit rate of 1 Mbits/sec. A typical network is made of a Bus Controller (BC), a Bus Monitor (BM) and up to 31 Remote Terminals (RT).

The 1553 interface embeds two of the three configurations, Bus Controller and Remote Terminal, as defined in the MIL-STD-1553B standard.

### 35.2 Embedded Characteristics

- Compliant to MIL-STD-1553B Standard
- Bus Controller and Remote Terminal Configurations Available
- 1553 Data Rate: 1 Mbits/sec
- Command and Data Transactions Available
- Data Transaction: BC to RT, RT to BC, and RT to RT
- Secure Link with a Redundant Interface
- Harris transceiver compliant

### 35.3 Block Diagram

Figure 35-1. Block Diagram

A typical 1553 network topology is presented in the figure below.

Figure 35-2. Network Diagram

## 35.4 Pin List

Table 35-1. Pin List

| Pin Name | Description                                               | Type   |
|----------|-----------------------------------------------------------|--------|
| ARXINP   | Nominal reception line (from transceiver)                 | Input  |
| ARXINN   | Complemented nominal reception line (from transceiver)    | Input  |
| BRXINP   | Redundant reception line (from transceiver)               | Input  |
| BRXIXN   | Complemented redundant reception line (from transceiver)  | Input  |
| ATXOUTP  | Nominal transmission line (to transceiver)                | Output |
| ATXOUTN  | Complemented nominal transmission line (to transceiver)   | Output |
| BTXOUTP  | Redundant transmission line (to transceiver)              | Output |
| BTXOUTN  | Complemented redundant transmission line (to transceiver) | Output |

## 35.5 IP1553 Dependencies

### 35.5.1 I/O Lines

There are no dependencies regarding PIO muxing.

### 35.5.2 Power Management

The 1553 is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the 1553 clock.

The 1553 peripheral must have a 12 MHz input frequency on peripheral GCLK to comply with 1553 protocol (1Mbit/s baud rate).

The MCK clock frequency should be at least twice the GCLK frequency.

### 35.5.3 Interrupt Sources

The 1553 has an interrupt line connected to the interrupt controller. Handling the 1553 interrupt requires programming the interrupt controller before configuring the 1553.

## 35.6 Functional Description

### 35.6.1 Modes of Operation

The 1553 device can be used as either of the following:

- Bus Controller (BC)
- Remote Terminal (RT)

Three types of transactions can be performed on the 1553 network at a data rate of 1 Mbits/s:

- Command frames (from BC to RT)

- Status frames (from RT to BC)
- Data frames (from BC to RT, RT to BC, or RT to RT)

The BC always initiates transactions on the 1553 network by sending command frames. It also performs data frames.

The RT acknowledges the command frames by sending back a status frame. It also performs data frames.

The BC can be part of the transfer (BC to RT, RT to BC, or RT to RT) or can only arbitrate the data transfer (RT to RT).

The different 1553 transactions are summarized in the following figure.

**Figure 35-3.** 1553 Frames

## 35.6.2 Memory Interface

Each device has dedicated buffers to receive or transmit data.

Data, which are transferred from and to the 1553 link by packets, are stored in a 2-Kbyte 1553 RX buffer and an 2-Kbyte 1553 TX buffer. These buffers are located either in internal or external memory.

### 35.6.2.1 1553 RX Buffer Structure

The following figure describes the 1553 RX buffer and its management.

**Figure 35-4. 1553 Rx Buffer**

**Note:** Buffers 0 and 31 are never used for data purposes (see the 1553 protocol for details).

The 1553 RX buffer consists of 32 buffers. Each buffer can store up to 64 bytes of data (32 \* 16 bits data), which is the maximum amount of data transferred during a 1553 transaction.

### 35.6.2.2 1553 RX Buffer Management

Three registers are used to control the 1553 RX buffer:

- IP1553\_ARR—used to set the base address of the 1553 RX buffer.
- IP1553\_RXBSR—used to indicate the state of the buffer ('1': empty, '0': full)
- IP1553\_RXBAER—used to notify if errors are detected in the buffer ('1': errors, '0': no error). See the section "Error Detection" for details.

### 35.6.2.3 1553 RX Buffer Setup

To set up the 1553 RX buffer, follow the steps below:

1. Specify the base address register of the 1553 RX buffer in the IP1553\_ARR register.
2. Reset the content of the 32 buffers.
3. Clear the error register in reception: IP1553\_RXBAER.
4. Set the status of each buffer in the IP1553\_RXBSR register to '1' to indicate that it is ready to receive data.
5. Enable the 1553 transfer.

### 35.6.2.4 1553 TX Buffer Structure

The following figure describes the 1553 TX buffer and its management.

**Figure 35-5. 1553 Tx Buffer**

**Note:** Buffers 0 and 31 are never used (see 1553 protocol for details).

The 1553 TX buffer consists of 32 buffers. Each buffer can store up to 64 bytes of data (32 \* 16 bits data), which is the maximum amount of data transferred during a 1553 single transfer.

### 35.6.2.5 1553 TX Buffer Management

Three registers are used to control the 1553 TX buffer:

- IP1553\_ARW—used to set the base address of the 1553 TX buffer.
- IP1553\_TXBSR—used to indicate the state of the buffer ('0': empty, '1': data ready to send)
- IP1553\_TXBAER— used to notify if errors are detected in the buffer ('1': errors, '0': no error). See the section "Error Detection" for details.

### 35.6.2.6 1553 TX Buffer Setup

To set up the 1553 TX buffer, follow the steps below:

1. Specify the base address register of the 1553 TX buffer in the IP1553\_ARW register.
2. Clear the error register in transmission: IP1553\_TXBAER.
3. Set the status of each buffer in the IP1553\_TXBSR register to '0' to indicate that it is free.
4. Fill the buffer with the data to send.
5. Set the IP1553\_TXBSR register to '1' for the corresponding buffer to indicate that data are ready to send.
6. Enable the 1553 transfer.

### 35.6.3 Bus Controller (BC) Mode

Two registers are used to generate the command frames:

- IP1553\_CMDR1—relative to the receiver device.
- IP1553\_CMDR2—relative to the transmitter device.

The register IP1553\_CMDR3 is used to configure the 1553 transaction:

- IP1553\_CMDR3.BUS—defines the bus used
- IP1553\_CMDR3.BCE—defines if the product is the emitter of data or not
- IP1553\_CMDR3.BCR—defines if the product is the receiver of data or not
- IP1553\_CMDR3.ER—defines if the transfer initiated is a command transfer or a data transfer. It shall be the last to be written

**Note:** The IP1553 can be configured as neither emitter nor receiver. In this case, an RT to RT transfer is performed.

One register is used to store the status frames:

- IP1553\_CTRL1—stores the value of the first status word received during the 1553 transaction. The register stores also the value of the second status word received during the 1553 transaction.

### 35.6.3.1 Data Frame Transfer

Three configurations are possible for a data frame transfer:

#### **BC is considered as transmitter and RT1 as receiver**

Commands are sent from BC to RT1 via BC IP1553\_CMDR1 register.

Data are sent from BC to RT1 from TX buffer n to RX buffer m.

Once all data have been transmitted, the status is updated in return depending whether Broadcast mode is enabled or not.

**Figure 35-6.** Data Frame Transfer: BC as Transmitter and RT1 as Receiver

#### **RT1 is considered as transmitter and BC as receiver**

Commands are sent from RT1 to BC via the register IP1553\_CMDR2.

Status is sent to from RT1 to BC in returns and stored in IP1553\_CTRL1.IP1553DATA1.

Data are sent from RT1 to BC from TX buffer n to RX buffer m.

Once all data have been transmitted, the status is updated in return.

**Figure 35-7. Data Frame Transfer: RT1 as Transmitter and BC as Receiver**

**RT1 is considered as transmitter and RT2 as receiver**

Commands are sent to RT2 via IP1553\_CMDR1 register and to RT1 via the register IP1553\_CMDR2.

Status is sent to from RT1 to BC in returns and stored in IP1553\_CTRL1.1553DATA1.

Data are sent from RT1 to RT2 from TX buffer n to RX buffer m.

Status is sent to from RT1 and RT2 to BC in return and stored in IP1553\_CTRL1.1553DATA2 if Broadcast mode is not enabled.

**Figure 35-8.** Data Frame Transfer: RT1 as transmitter and RT2 as Receiver

### 35.6.3.2 Command Frame Transfer

Three configurations are possible for a command frame transfer:

#### **Command mode does not include data**

The command is sent via the register IP1553\_CMDR1.

Status is collected via IP1553\_CTRL1.1553DATA1, if Broadcast mode is not enabled.

**Figure 35-9.** Command Frame Transfer: Without Data

#### **Command mode includes data to be sent to the receiver**

The command is sent via the register IP1553\_CMDR1.

Data is sent via the register IP1553\_CMDR2.

Status is collected via IP1553\_CTRL1.1553DATA1, if Broadcast mode is not enabled.

**Figure 35-10.** Command Frame Transfer: Data sent to Receiver

### **Command mode includes data to be sent by the receiver**

The command is sent via the register IP1553\_CMDR1.

Status is collected via IP1553\_CTRL1.1553DATA1.

Data is sent via the register IP1553\_CMDR2.

Status is collected via IP1553\_CTRL1.1553DATA1 if Broadcast mode is not enabled.

Data is collected via IP1553\_CTRL1.1553DATA2 and the IRQ register is updated accordingly.

**Figure 35-11.** Command Frame Transfer: Data sent by Receiver

## 35.6.4 Remote Terminal (RT) Mode

### 35.6.4.1 Status Transfer

When configured in RT mode, the 1553 features a specific behavior depending on the command received from the 1553 network. In any case, it sends a status word in return for the command word previously sent.

After 4  $\mu$ sec, the 1553 status word is automatically sent to the 1553 Bus Controller.

**Table 35-2.** 1553 Commands List

| 1553 Command Name                  | Consequence                                                                                                                      | 1553 Status Word                                                                                                    |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Dynamic Bus control                | IP1553_ISR.DBR=1 <sup>(1)</sup>                                                                                                  | Dynamic Bus control acceptance OK                                                                                   |
|                                    | IP1553_ISR.DBR=0 <sup>(2)</sup>                                                                                                  | Dynamic Bus control acceptance KO                                                                                   |
| Synchronize without data word      | IP1553_ISR.SWD=1                                                                                                                 | Status=OK                                                                                                           |
| Synchronize with data word         | IP1553_ISR.SDR=1                                                                                                                 |                                                                                                                     |
|                                    | IP1553_CTRL1. IP1553DATA1=Data                                                                                                   | Status=OK                                                                                                           |
| Transmit status word               | NA                                                                                                                               | Status= response to the last command previously sent (except for transmit status word or transmit last status word) |
| Initiate self test                 | IP1553_ISR.STR=1                                                                                                                 | Status=OK                                                                                                           |

|                                    |                                                                                                                                  |                                                                                                                     |
| Receive command <sup>(2)</sup>     | After the reception of all data:<br>IP1553_ISR.EMT=1<br>IP1553_RXBSR.REn=0                                                       | Status OK                                                                                                           |
|                                    | If an error appears:<br>Buffer busy: IP1553_ISR.MTE=1<br>IP1553_RXBSR.RERn=1<br>During the reception of data:<br>IP1553_ISR.TE=1 | Status KO + send an invalid command                                                                                 |

**Notes:**

1. IP1553\_CR.BEC shall be equal to 1.
2. IP1553\_CR.BEC shall be equal to 0.

In both cases, an interrupt is generated if it has been previously enabled.

**35.6.4.2 Broadcast Commands**

A command received with a remote terminal address field equal to 0b11111 is considered as a broadcast command. The same operations are realized as described in the section "[Status Transfer](#)". The differences are listed in the following table.

**Table 35-3.** 1553 Commands List – Broadcast Mode

| 1553 Command Name                  | Specificity of Broadcast Command | Status Word   |                   |
|------------------------------------|----------------------------------|---------------|-------------------|
|                                    |                                  | Broadcast Bit | Message Error Bit |
| Dynamic Bus control                | Not allowed                      | 0b'1'         | 0b'1'             |
| Transmit status word               | Command discards/No status sent  | Same          | Same              |
| Initiate self test                 | No status sent                   | 0b'1'         | 0b'0'             |
| Transmitter shutdown               | No status sent                   | 0b'1'         | 0b'0'             |
| Override transmitter shutdown      | No status sent                   | 0b'1'         | 0b'0'             |
| Inhibit terminal flag bit          | No status sent                   | 0b'1'         | 0b'0'             |
| Override inhibit terminal flag bit | No status sent                   | 0b'1'         | 0b'0'             |
| Reset remote terminal              | No status sent                   | 0b'0'         | 0b'0'             |
| Transmit vector word               | Not allowed                      | 0b'1'         | 0b'1'             |
| Synchronize without/with data word | No status sent                   | 0b'1'         | 0b'0'             |
| Transmit last command              | Command discards/No status sent  | Same          | Same              |
| Transmit BIT word                  | Not allowed                      | 0b'1'         | 0b'1'             |
| Transmitter shutdown               | Command discards/No status sent  | Same          | Same              |
| Override transmitter shutdown      | Command discards/No status sent  | Same          | Same              |
| Transmit command                   | Not allowed                      | 0b'1'         | 0b'1'             |
| Receive command                    | No status sent                   | 0b'1'         | 0b'0'             |

**35.6.5 Error Detection**

The 1553 in RT or BC mode can detect different errors at different levels (physical and frame). In each case, a specific bit is set and an interrupt is generated when the corresponding interruption is previously enabled.

**Table 35-4.** Error List

| Error Type                                              | BC/RT | Behavior           |
|---------------------------------------------------------|-------|--------------------|
| Manchester code error                                   | All   | IP1553_ISR.TE='1'  |
|                                                         |       | IP1553_ISR.TCE='1' |
| Parity error                                            | All   | IP1553_ISR.TE='1'  |
|                                                         |       | IP1553_ISR.TPE='1' |
| Type of data error                                      | All   | IP1553_ISR.TE='1'  |
|                                                         |       | IP1553_ISR.TDE='1' |
| Time out error                                          | All   | IP1553_ISR.TE='1'  |
|                                                         |       | IP1553_ISR.TTE='1' |
| Error in number of word detected (not a time out error) | All   | IP1553_ISR.TE='1'  |
|                                                         |       | IP1553_ISR.TWE='1' |

.....continued

| Error Type                   | BC/RT | Behavior                                                                                                            |
|------------------------------|-------|---------------------------------------------------------------------------------------------------------------------|
| Illegal command              | RT    | IP1553_ISR.TE='1'<br>Status frame has the message bit error set to '1'. (in broadcast mode, no status is sent back) |
| Invalid command (see Note 1) | RT    | IP1553_ISR.TE='1'. Status frame has the message bit error set to '1'.                                               |
| Illegal request (see Note 2) | BC    | IP1553_ISR.TE='1' or IP1553_ISR.ITR='1'                                                                             |

**Notes:**

1. An invalid command is a command with a valid command word but for which one or more data words are not compliant with parity, Manchester encoding, bit number, and sync field, or word number test.
2. A mode command transfer request is illegal when mode command word is not defined or defined as reserved in the 1553 standard.  
A data transfer request is illegal in any of the following cases:
  - IP1553\_CMDR1.TR = '0'
  - The terminal address is set to '11111'
  - IP1553\_CMDR2.TR = '1'

### 35.6.6 1553 Interface Setup

To configure the 1553 network, the user must select the bus A or B for transfer:

- IP1553\_CMDR3.BUS='0' for bus A
- IP1553\_CMDR3.BUS='1' for bus B

The interruptions must be enabled to see the status of the various transactions.

#### 35.6.6.1 Configuration in BC Mode

To configure the 1553 interface in BC mode, perform the steps:

1. Set IP1553\_CR.PT='1' to configure the terminal as a Bus Controller
2. Define the command frame to be sent:
  - IP1553\_CMDR1 relative to data receiver device
  - IP1553\_CMDR2 relative to data transmitter device
3. If data are to be sent:
  - Specify the base address of the 1553 TX buffer in the register IP1553\_ARW
  - Place the data to send in the 1553 TX buffer n
  - Set the 1553 TX buffer n status (IP1553\_TXBSR) to data ready to send  
**Note:** To send 32 word count, datawordcount shall be equal to 0.
4. If data are to be received:
  - Specify the base address of the 1553 RX buffer in the register IP1553\_ARR
  - Set the 1553 RX buffer n status (IP1553\_RXBSR) to free to receive data  
**Note:** To receive 32 word count, datawordcount shall be equal to 0.
5. Specify that the BC device is a data emitter, a data transmitter or none:
  - IP1553\_CMDR3.BCE='1' is a data emitter
  - IP1553\_CMDR3.BCR='1' is a data transmitter
  - IP1553\_CMDR3.BCE='0' and IP1553\_CMDR3.BCR='0' for none
6. Specify that the BC device is a data emitter, a data transmitter or none:

- IP1553\_CMDR3.BCE='1' is a data emitter
  - IP1553\_CMDR3.BCR='1' is a data transmitter
  - IP1553\_CMDR3.BCE='0' and IP1553\_CMDR3.BCR='0' for none
7. Enable the transfer by specifying whether it is a data transfer or a command transfer:
- IP1553\_CMDR3.ER='0' for a data transfer
  - IP1553\_CMDR3.ER='1' for a command transfer
- Note:** The register shall be written one time.

### 35.6.6.2 Configuration in RT Mode

To configure the device in RT mode, follow the steps below:

1. Set IP1553\_CR.PT='0' to configure the terminal as a Remote Terminal.
2. Specify the address of the remote device by configuring IP1553\_CR.TA=0b'xxxxx'. (A soft reset shall be performed to update the change of BC or RT mode.)
3. If data are to be sent:
  - Specify the base address of the 1553 TX buffer in the register IP1553\_ARW.
  - Place the data to send in the 1553 TX buffer n.
  - Set the 1553 TX buffer n status (IP1553\_TXBSR) to data ready to send.
4. If data are to be received:
  - Specify the base address of the 1553 RX buffer in the register IP1553\_ARR.
  - Set the 1553 RX buffer n status (IP1553\_RXBSR) to free to receive data.

It should then receive the frame from the 1553 network.

## 35.7 Register Summary

| Offset              | Name         | Bit Pos. | 7                     | 6   | 5           | 4                  | 3                     | 2   | 1                 | 0   |
|---------------------|--------------|----------|-----------------------|-----|-------------|--------------------|-----------------------|-----|-------------------|-----|
| 0x00                | IP1553_CR    | 7:0      | SC                    | TC  | TA[4:0]     |                    |                       |     |                   | PT  |
|                     |              | 15:8     |                       |     |             |                    | RST                   | BEC | SRC               | BC  |
|                     |              | 23:16    |                       |     |             |                    |                       |     |                   |     |
|                     |              | 31:24    |                       |     |             |                    |                       |     |                   |     |

### 35.7.1 Configuration Register

**Name:** IP1553\_CR  
**Offset:** 0x00  
**Reset:** 0x00000401  
**Property:** Read/Write

|        |     |     |         |     |     |     |     |     |
|--------|-----|-----|---------|-----|-----|-----|-----|-----|
| Bit    | 31  | 30  | 29      | 28  | 27  | 26  | 25  | 24  |
| Access |     |     |         |     |     |     |     |     |
| Reset  |     |     |         |     |     |     |     |     |
| Bit    | 23  | 22  | 21      | 20  | 19  | 18  | 17  | 16  |
| Access |     |     |         |     |     |     |     |     |
| Reset  |     |     |         |     |     |     |     |     |
| Bit    | 15  | 14  | 13      | 12  | 11  | 10  | 9   | 8   |
| Access |     |     |         |     | RST | BEC | SRC | BC  |
| Reset  |     |     |         |     | R/W | R/W | R/W | R/W |
|        |     |     |         |     | 0   | 1   | 0   | 0   |
| Bit    | 7   | 6   | 5       | 4   | 3   | 2   | 1   | 0   |
| Access | SC  | TC  | TA[4:0] |     |     |     |     | PT  |
| Reset  | R/W | R/W | R/W     | R/W | R/W | R/W | R/W | R/W |
|        | 0   | 0   | 0       | 0   | 0   | 0   | 0   | 1   |

#### Bit 11 – RST Soft Reset

RST is used when changing the functioning mode from BC to RT, or from RT to BC, or any time a reset is needed.

| Value | Description      |
|-------|------------------|
| 1     | Resets the 1553. |

#### Bit 10 – BEC BcEnableCmd

When the terminal receives a valid Dynamic Bus Control mode command, it checks the BcEnableCmd and accepts/rejects the control. The acceptance/rejection is indicated in the Dynamic Bus Control bit of the status word which is sent in response to the mode command.

| Value | Description                           |
|-------|---------------------------------------|
| 0     | The terminal rejects the bus control. |
| 1     | The terminal accepts the bus control. |

#### Bit 9 – SRC SREQBitCmd

Indicates the value of the Service Request bit to be returned in status word transfers.

#### Bit 8 – BC BusyBitCmd

Indicates the value of the busy bit to be returned in status word transfers.

| Value | Description                                                                                                    |
|-------|----------------------------------------------------------------------------------------------------------------|
| 1     | Inhibits the transmission of the data words in response to a transmit command and its corresponding interrupt. |

#### Bit 7 – SC SSBtCmd

Indicates the value of the Subsystem Flag bit to be returned in status word transfers.

**Bit 6 – TC TRBitCmd**

Indicates the value of the T/F bit to be returned in status word transfers.

**Note:** This bit is used by the terminal to claim that it is the default terminal (value '1'). It should be equal to '0' otherwise.

After reception of a valid 'Inhibit T/F Bit' command:

- the TRBitCmd is masked
- the T/F bit is maintained at logic level '0'

After reception of a valid 'Override Inhibit T/F bit':

- the TRBitCmd is unmasked
- the content of the T/F bit is application dependent and is not defined by the standard

**Bits 5:1 – TA[4:0] TermAddressConf**

Address of the remote terminal on the 1553 bus.

'00000' and '11111' are reserved by the protocol and shall never be used

**Bit 0 – PT POTermConf**

Configuration of the terminal after a hardware reset of the 1553.

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | Configures the terminal as a Remote Terminal.                |
| 1     | Configures the terminal as a Bus Controller. (default state) |

## 35.7.2 Command Register 1

**Name:** IP1553\_CMDR1  
**Offset:** 0xC  
**Reset:** 0x00000000  
**Property:** Write-only

Command Register 1 is only used in BC mode. It is used with Command Register 2 and Command Register 3 in order to initiate a transfer on the 1553 bus.

These commands are relative to the receiver terminal.

|        |                   |    |    |                    |    |     |                   |    |
|--------|-------------------|----|----|--------------------|----|-----|-------------------|----|
| Bit    | 31                | 30 | 29 | 28                 | 27 | 26  | 25                | 24 |
|        |                   |    |    |                    |    |     |                   |    |
| Access |                   |    |    |                    |    |     |                   |    |
| Reset  |                   |    |    |                    |    |     |                   |    |
| Bit    | 23                | 22 | 21 | 20                 | 19 | 18  | 17                | 16 |
|        |                   |    |    |                    |    |     |                   |    |
| Access |                   |    |    |                    |    |     |                   |    |
| Reset  |                   |    |    |                    |    |     |                   |    |
| Bit    | 15                | 14 | 13 | 12                 | 11 | 10  | 9                 | 8  |
|        | RTADDRESS[4:0]    |    |    |                    |    | T_R | RTSUBADDRESS[4:3] |    |
| Access | W                 | W  | W  | W                  | W  | W   | W                 | W  |
| Reset  | 0                 | 0  | 0  | 0                  | 0  | 0   | 0                 | 0  |
| Bit    | 7                 | 6  | 5  | 4                  | 3  | 2   | 1                 | 0  |
|        | RTSUBADDRESS[2:0] |    |    | DATAWORDCOUNT[4:0] |    |     |                   |    |
| Access | W                 | W  | W  | W                  | W  | W   | W                 | W  |
| Reset  | 0                 | 0  | 0  | 0                  | 0  | 0   | 0                 | 0  |

### Bits 15:11 – RTADDRESS[4:0] RT Address

RTADDRESS is the command if it is relevant.

RTADDRESS is the address of the receiver of the data.

### Bit 10 – T\_R T/R

Data transfer: Field T\_R is equal to '0'.

Command mode: Relies on the command itself.

### Bits 9:5 – RTSUBADDRESS[4:0] RT SUBADDRESS

When RTSUBADDRESS=0x0 or 0x1F: Data word count is a mode code.

Other cases: RTSUBADDRESS is the sub-address inside the receiver of the data

### Bits 4:0 – DATAWORDCOUNT[4:0] Data Word Count

When RTSUBADDRESS equals 0x'0' or 0x'1F': DATAWORDCOUNT is the mode code.

**Note:** Command word relative to the receiver terminal.

Other cases: DATAWORDCOUNT is the amount of data to be transferred.

### 35.7.3 Command Register 2

**Name:** IP1553\_CMDR2  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Write-only

Command Register 2 is only used in BC mode. It is used with Command Register 1 and Command Register 3 in order to initiate a transfer on the 1553 bus Command word.

These commands are relative to the transmitter terminal.

|        |                   |    |    |                    |    |     |                   |    |
|--------|-------------------|----|----|--------------------|----|-----|-------------------|----|
| Bit    | 31                | 30 | 29 | 28                 | 27 | 26  | 25                | 24 |
| Access |                   |    |    |                    |    |     |                   |    |
| Reset  |                   |    |    |                    |    |     |                   |    |
| Bit    | 23                | 22 | 21 | 20                 | 19 | 18  | 17                | 16 |
| Access |                   |    |    |                    |    |     |                   |    |
| Reset  |                   |    |    |                    |    |     |                   |    |
| Bit    | 15                | 14 | 13 | 12                 | 11 | 10  | 9                 | 8  |
|        | RTADDRESS[4:0]    |    |    |                    |    | T_R | RTSUBADDRESS[4:3] |    |
| Access | W                 | W  | W  | W                  | W  | W   | W                 | W  |
| Reset  | 0                 | 0  | 0  | 0                  | 0  | 0   | 0                 | 0  |
| Bit    | 7                 | 6  | 5  | 4                  | 3  | 2   | 1                 | 0  |
|        | RTSUBADDRESS[2:0] |    |    | DATAWORDCOUNT[4:0] |    |     |                   |    |
| Access | W                 | W  | W  | W                  | W  | W   | W                 | W  |
| Reset  | 0                 | 0  | 0  | 0                  | 0  | 0   | 0                 | 0  |

**Bits 15:11 – RTADDRESS[4:0] RT Address**

RTADDRESS is the command parameter (bits 15 to 11) if relevant.

RTADDRESS is the address of the sender of the data.

**Bit 10 – T\_R R/T**

Data transfer is RT to RT: Field T\_R is equal to '1'.

Command mode: Relies on the command itself (bit 10).

**Bits 9:5 – RTSUBADDRESS[4:0] RT SUBADDRESS**

RTSUBADDRESS is the command parameter (bits 9 to 5) if relevant.

RTSUBADDRESS is the sub-address inside the sender of the data.

**Bits 4:0 – DATAWORDCOUNT[4:0] Data Word Count**

DATAWORDCOUNT is the amount of data to be transferred, or the command parameter (bits 4 to 0) if relevant.

### 35.7.4 Command Register 3

**Name:** IP1553\_CMDR3  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Write-only

Command Register 3 is only used in BC mode. It is used with Command Register 1 and Command Register 2 in order to initiate a transfer on the 1553 bus

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |   |   |    |     |     |     |
|--------|---|---|---|---|----|-----|-----|-----|
| Bit    | 7 | 6 | 5 | 4 | 3  | 2   | 1   | 0   |
|        |   |   |   |   | ER | BCR | BCE | BUS |
| Access |   |   |   |   | W  | W   | W   | W   |
| Reset  |   |   |   |   | 0  | 0   | 0   | 0   |

#### Bit 3 – ER Data Or Command Transfer

It is permitted to have both BCR and BCE set to '0'. This corresponds to an RT-to-RT transfer, where the bus controller is neither transmitter nor receiver.

It is illegal to have both BCR and BCE set to '1' since a BC cannot be emitter and receiver at the same time.

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | Initiates a data transfer on the bus.         |
| 1     | Initiates a mode command transfer on the bus. |

#### Bit 2 – BCR 1553 Receiver

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | Indicates that the product is not the receiver of the data. |
| 1     | Indicates that the product is the receiver of the data.     |

#### Bit 1 – BCE 1553 Emitter

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 0     | Indicates that the product is not the emitter of the data. |
| 1     | Indicates that the product is the emitter of the data.     |

#### Bit 0 – BUS Bus Used

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | Indicates that the transfer uses BUS A. |
| 1     | Indicates that the transfer uses BUS B. |

### 35.7.5 BIT Register

**Name:** IP1553\_BITR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Write-only

This register is only used in RT mode. The BIT register is used to store the built-in self test results. It contains the value to be sent by the terminal in response to a 'Transmit Built-In Test' command

|        |                 |    |    |    |    |    |    |    |
|--------|-----------------|----|----|----|----|----|----|----|
| Bit    | 31              | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |                 |    |    |    |    |    |    |    |
| Access |                 |    |    |    |    |    |    |    |
| Reset  |                 |    |    |    |    |    |    |    |
| Bit    | 23              | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |                 |    |    |    |    |    |    |    |

| Reset  |                 |    |    |    |    |    |    |    |
| Bit    | 15              | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | TOBITWORD[15:8] |    |    |    |    |    |    |    |
| Access | W               | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0               | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7               | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | TOBITWORD[7:0]  |    |    |    |    |    |    |    |
| Access | W               | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0               | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 15:0 – TOBITWORD[15:0] To Bit Word

The register stores the data used in Built-In Test mode.

### 35.7.6 Vector Word Register

**Name:** IP1553\_VWR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Write-only

This register is only used in RT mode. The Vector Word register stores the value to be sent by the terminal in response to a 'Transmit Vector Word' command. Refer to the section "Broadcast Commands".

|        |                    |    |    |    |    |    |    |    |
|--------|--------------------|----|----|----|----|----|----|----|
| Bit    | 31                 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |                    |    |    |    |    |    |    |    |
| Access |                    |    |    |    |    |    |    |    |
| Reset  |                    |    |    |    |    |    |    |    |
| Bit    | 23                 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |                    |    |    |    |    |    |    |    |
| Access |                    |    |    |    |    |    |    |    |
| Reset  |                    |    |    |    |    |    |    |    |
| Bit    | 15                 | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | TOVECTORWORD[15:8] |    |    |    |    |    |    |    |
| Access | W                  | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0                  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

|        | TOVECTORWORD[7:0]  |    |    |    |    |    |    |    |
| Access | W                  | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0                  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 15:0 – TOVECTORWORD[15:0] To Vector Word

The register stores the data used in Vector Word mode.

### 35.7.7 IRQ Mask Enable Register

**Name:** IP1553\_IER  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Write-only

The bits can be set individually by writing a '1' in the corresponding position of the IRQ Mask Enable register. See the section "IRQ Status Register" for more details.

### 35.7.8 IRQ Mask Disable Register

**Name:** IP1553\_IDR  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Write-only

The bits can be reset individually by writing a '1' in the corresponding position of the IRQ Mask Disable Register. See the section "IRQ Status Register" for more details.

### 35.7.9 IRQ Mask register

**Name:** IP1553\_IMR  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read-only

The IRQ Mask Register content can be read at address 0x0028. Each bit corresponds to an interrupt source. See the section “IRQ Status Register” for more details.

### 35.7.10 IRQ Status Register

**Name:** IP1553\_ISR  
**Offset:** 0x2C  
**Reset:** 0x00000000  
**Property:** Read Only

The IRQ Status register is used to report the end of transfers and errors that are detected on the bus during operation. The use of the different bits of this register are presented in detail in the functional description of the block. All of the interrupts are active high.

**Note:** The register is clear on read.

#### Bit 24 – IPB IPBusy

This signal is only useful in BC mode.

**Note:** The register is clear on read.

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 1     | Indicates that the macrocell does not accept a new command. |

#### Bit 23 – OTF OvInhibitTermFlagReq

| Value | Description                                                                    |
|-------|--------------------------------------------------------------------------------|
| 1     | Indicates that a valid 'Override Inhibit Terminal Flag bit' has been received. |

#### Bit 22 – ITF InhibitTermFlagReq

| Value | Description                                                           |
|-------|-----------------------------------------------------------------------|
| 1     | Indicates that a valid 'Inhibit Terminal Flag bit' has been received. |

#### Bit 21 – RRT ResetRTReq

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 1     | Indicates that a valid 'Reset Remote Terminal' has been received. |

#### Bit 20 – SWD SyncWithoutDataReq

| Value | Description                                                               |
|-------|---------------------------------------------------------------------------|
| 1     | Indicates that a valid 'Synchronize Without Data Word' has been received. |

#### Bit 19 – SDR SyncWithDataReq

| Value | Description                                                                                                               |
|-------|---------------------------------------------------------------------------------------------------------------------------|
| 1     | Indicates that a valid 'Synchronize With Data Word' has been received. The data is then available on the IP1553Data1 bus. |

#### Bit 18 – OSR OvTranShutdownReq

| Value | Description                                                                        |
|-------|------------------------------------------------------------------------------------|
| 1     | Indicates that a valid 'Override Selected Transmitter Shutdown' has been received. |

#### Bit 17 – TSR TranShutdownReq

| Value | Description                                                               |
|-------|---------------------------------------------------------------------------|
| 1     | Indicates that a valid 'Selected Transmitter Shutdown' has been received. |

#### Bit 16 – STR InitSelfTestReq

| Value | Description                                                    |
|-------|----------------------------------------------------------------|
| 1     | Indicates that a valid 'Initiate Self-Test' has been received. |

#### Bit 15 – DBR DynamicBusContReq

| Value | Description                                                                                                                       |
|-------|-----------------------------------------------------------------------------------------------------------------------------------|
| 1     | Indicates that a valid 'Dynamic Bus Control' has been received. The level of the BCEnableCmd signal has no effect on this signal. |

#### Bit 14 – TVR TransVecWordReq

| Value | Description                                                      |
|-------|------------------------------------------------------------------|
| 1     | Indicates that a valid 'Transmit Vector Word' has been received. |

#### Bit 13 – ITR IllegalTransferReq

| Value | Description                                                                                                     |
|-------|-----------------------------------------------------------------------------------------------------------------|
| 1     | Indicates that the transfer which has been commanded via the command IF is not legal and will not be performed. |

#### Bit 12 – BE BuflFErr

| Value | Description                                                                                                                   |
|-------|-------------------------------------------------------------------------------------------------------------------------------|
| 1     | Indicates that a data word transmission has been stopped because data have not been provided in time on the Buffer interface. |

#### Bit 11 – TWE TransWordCounterErr

| Value | Description                                                                                      |
|-------|--------------------------------------------------------------------------------------------------|
| 1     | Indicates that the number of words received does not correspond to the number of words expected. |

#### Bit 10 – TTE TransTimeOutErr

| Value | Description                                                                                                     |
|-------|-----------------------------------------------------------------------------------------------------------------|
| 1     | Indicates the response time of the addressed terminal is greater than expected or that the response is missing. |

#### Bit 9 – TDE TransDataTypeErr

| Value | Description                                                                                   |
|-------|-----------------------------------------------------------------------------------------------|
| 1     | Indicates that a data word has been received when a command word was expected and vice-versa. |

#### Bit 8 – TPE TransParityErr

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 1     | Indicates that a parity error has been detected on a received word. |

#### Bit 7 – TCE TransCodingErr

| Value | Description                                                                                |
|-------|--------------------------------------------------------------------------------------------|
| 1     | Indicates that a Manchester code error has been detected on a word that has been received. |

#### Bit 6 – TE TransErr

| Value | Description                                                                                         |
|-------|-----------------------------------------------------------------------------------------------------|
| 1     | Indicates that an error has occurred during processing of the reception, transmission, or transfer. |

#### Bits 5:4 – ETRANS[1:0] EndTransfer

When set to 0b'00', 0b'01' or 0b'10', this signal indicates that the data or mode command transfer has ended:

- 0b'00': No status word has been received.
- 0b'01': Indicates that one status word has been received and is available in IP1553\_CTRL1.IP1553DATA1.
- 0b'10': Indicates that two status words have been received and are available in IP1553\_CTRL1.IP1553DATA1 and IP1553\_CTRL1.IP1553DATA2.
- 0b'11': Not used.

#### Bit 3 – ETX EndTransmission

| Value | Description                                   |
|-------|-----------------------------------------------|
| 1     | Indicates that a data transmission has ended. |

#### Bit 2 – ERX End reception

| Value | Description                               |
|-------|-------------------------------------------|
| 1     | Indicates that a data reception is ended. |

#### Bit 1 – MTE MemTransferErr

| Value | Description                                              |
|-------|----------------------------------------------------------|
| 1     | Indicates that a R/W memory transfer error has occurred. |

#### Bit 0 – EMT EndMemTransfer

| Value | Description                                         |
|-------|-----------------------------------------------------|
| 1     | Indicates that a R/W memory transfer has succeeded. |

| Reset  | 0                 | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 31:16 – IP1553DATA2[15:0] IP1553 Data Value 2

In BC mode, this bus gives the value of the second status word received during the exchange of data words.

#### Bits 15:0 – IP1553DATA1[15:0] IP1553 Data Value 1

In RT mode, this bus gives the value of the data word received in a 'Synchronize with Data Word' mode command.

In BC mode, this bus gives the value of the first status word received during the exchange of a mode command or of data words.

| Access | R/W                   | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0                     | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7                     | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | REG_ADDR_APB_R[7:0]   |     |     |     |     |     |     |     |
| Access | R/W                   | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0                     | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 31:0 – REG\_ADDR\_APB\_R[31:0] RX Base Address**  
Stores the memory base address for RX.

### 35.7.16 Rx Buffer Status Register

**Name:** IP1553\_RXBSR  
**Offset:** 0x44  
**Reset:** 0x00000000  
**Property:** Read/Write

This 32-bit register indicates for each of the 32 Rx Buffers whether they are free to receive data or not.

|        |      |      |      |      |      |      |      |      |
|--------|------|------|------|------|------|------|------|------|
| Bit    | 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   |
|        | RE31 | RE30 | RE29 | RE28 | RE27 | RE26 | RE25 | RE24 |
| Access | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  |
| Reset  | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    |

|        |      |      |      |      |      |      |      |      |
|--------|------|------|------|------|------|------|------|------|
| Bit    | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
|        | RE23 | RE22 | RE21 | RE20 | RE19 | RE18 | RE17 | RE16 |
| Access | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  |
| Reset  | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    |

|        |      |      |      |      |      |      |     |     |
|--------|------|------|------|------|------|------|-----|-----|
| Bit    | 15   | 14   | 13   | 12   | 11   | 10   | 9   | 8   |
|        | RE15 | RE14 | RE13 | RE12 | RE11 | RE10 | RE9 | RE8 |
| Access | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  | R/W | R/W |
| Reset  | 0    | 0    | 0    | 0    | 0    | 0    | 0   | 0   |

|        |     |     |     |     |     |     |     |     |
|--------|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | RE7 | RE6 | RE5 | RE4 | RE3 | RE2 | RE1 | RE0 |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – REx Receive Buffer x

| Value | Description                                                          |
|-------|----------------------------------------------------------------------|
| 0     | Receive Buffer X is full. Writing a '0' is has no effect.            |
| 1     | Receive Buffer X is empty. Writing a '1' to REx sets the bit to '1'. |

### 35.7.17 Rx Buffer Access Error Register

**Name:** IP1553\_RXBAER  
**Offset:** 0x48  
**Reset:** 0x00000000  
**Property:** Read/Write

This 32-bit register indicates for each of the 32 Rx Buffers whether an access has failed because the buffer was busy.

|        |       |       |       |       |       |       |       |       |
|--------|-------|-------|-------|-------|-------|-------|-------|-------|
| Bit    | 31    | 30    | 29    | 28    | 27    | 26    | 25    | 24    |
|        | RER31 | RER30 | RER29 | RER28 | RER27 | RER26 | RER25 | RER24 |
| Access | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   |
| Reset  | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     |

|        |       |       |       |       |       |       |       |       |
|--------|-------|-------|-------|-------|-------|-------|-------|-------|
| Bit    | 23    | 22    | 21    | 20    | 19    | 18    | 17    | 16    |
|        | RER23 | RER22 | RER21 | RER20 | RER19 | RER18 | RER17 | RER16 |
| Access | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   |
| Reset  | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     |

|        |       |       |       |       |       |       |      |      |
|--------|-------|-------|-------|-------|-------|-------|------|------|
| Bit    | 15    | 14    | 13    | 12    | 11    | 10    | 9    | 8    |
|        | RER15 | RER14 | RER13 | RER12 | RER11 | RER10 | RER9 | RER8 |
| Access | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   | R/W  | R/W  |
| Reset  | 0     | 0     | 0     | 0     | 0     | 0     | 0    | 0    |

|        |      |      |      |      |      |      |      |      |
|--------|------|------|------|------|------|------|------|------|
| Bit    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
|        | RER7 | RER6 | RER5 | RER4 | RER3 | RER2 | RER1 | RER0 |
| Access | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  |
| Reset  | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    |

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – RERx Receive Error x

| Value | Description                                                                       |
|-------|-----------------------------------------------------------------------------------|
| 0     | No receive error detected for Buffer X. Writing a '0' has no effect.              |
| 1     | Receive error detected for Buffer X. Writing a '1' to RERx resets the bit to '0'. |

### 35.7.18 Tx Buffer Status Register

**Name:** IP1553\_TXBSR  
**Offset:** 0x4C  
**Reset:** 0x00000000  
**Property:** Read/Write

This 32-bit register indicates for each of the 32 Tx Buffers whether they are free to transmit data or not.

|        |      |      |      |      |      |      |      |      |
|--------|------|------|------|------|------|------|------|------|
| Bit    | 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   |
|        | TF31 | TF30 | TF29 | TF28 | TF27 | TF26 | TF25 | TF24 |
| Access | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  |
| Reset  | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    |

|        |      |      |      |      |      |      |      |      |
|--------|------|------|------|------|------|------|------|------|
| Bit    | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
|        | TF23 | TF22 | TF21 | TF20 | TF19 | TF18 | TF17 | TF16 |
| Access | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  |
| Reset  | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    |

|        |      |      |      |      |      |      |     |     |
|--------|------|------|------|------|------|------|-----|-----|
| Bit    | 15   | 14   | 13   | 12   | 11   | 10   | 9   | 8   |
|        | TF15 | TF14 | TF13 | TF12 | TF11 | TF10 | TF9 | TF8 |
| Access | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  | R/W | R/W |
| Reset  | 0    | 0    | 0    | 0    | 0    | 0    | 0   | 0   |

|        |     |     |     |     |     |     |     |     |
|--------|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | TF7 | TF6 | TF5 | TF4 | TF3 | TF2 | TF1 | TF0 |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – TFX Transmit Buffer x

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | Transmit Buffer X is empty. Writing a '0' has no effect.                         |
| 1     | Transmit Buffer X is ready to be sent. Writing a '1' to TFX sets the bit to '1'. |

### 35.7.19 Tx Buffer Access Error Register

**Name:** IP1553\_TXBAER  
**Offset:** 0x50  
**Reset:** 0x00000000  
**Property:** Read/Write

This 32-bit register indicates for each of the 32 Tx Buffers whether an access has failed because the corresponding buffer was empty.

|        |       |       |       |       |       |       |       |       |
|--------|-------|-------|-------|-------|-------|-------|-------|-------|
| Bit    | 31    | 30    | 29    | 28    | 27    | 26    | 25    | 24    |
|        | TER31 | TER30 | TER29 | TER28 | TER27 | TER26 | TER25 | TER24 |
| Access | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   |
| Reset  | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     |

|        |       |       |       |       |       |       |       |       |
|--------|-------|-------|-------|-------|-------|-------|-------|-------|
| Bit    | 23    | 22    | 21    | 20    | 19    | 18    | 17    | 16    |
|        | TER23 | TER22 | TER21 | TER20 | TER19 | TER18 | TER17 | TER16 |
| Access | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   |
| Reset  | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     |

|        |       |       |       |       |       |       |      |      |
|--------|-------|-------|-------|-------|-------|-------|------|------|
| Bit    | 15    | 14    | 13    | 12    | 11    | 10    | 9    | 8    |
|        | TER15 | TER14 | TER13 | TER12 | TER11 | TER10 | TER9 | TER8 |
| Access | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   | R/W  | R/W  |
| Reset  | 0     | 0     | 0     | 0     | 0     | 0     | 0    | 0    |

|        |      |      |      |      |      |      |      |      |
|--------|------|------|------|------|------|------|------|------|
| Bit    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
|        | TER7 | TER6 | TER5 | TER4 | TER3 | TER2 | TER1 | TER0 |
| Access | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  |
| Reset  | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    |

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – TERx Transmit Error x

| Value | Description                                                                             |
|-------|-----------------------------------------------------------------------------------------|
| 0     | No buffer access error detected for Buffer X. Writing a '0' has no effect.              |
| 1     | Buffer access error detected for Buffer X. Writing a '1' to TERx resets the bit to '0'. |

## 36. SpaceWire (SpW)

### 36.1 Description

The SpaceWire (SpW) module is used in aerospace applications as a means of communication. The SpW module performs the interface between the SpaceWire network and AHB transactions. An embedded router is included in the SpW module to perform the mapping between the two SpaceWire links connected to the SpaceWire network and one transmitter packet (Tx), one receiver packet (Rx) and one Remote Memory Access Protocol (RMAP) block connected to the internal AHB network.

The SpW module provides support for transmission of any type of protocol or data structure using SpaceWire packets. It has hardware support for logical addressing to different receivers, for execution of incoming RMAP commands, and for reception/generation of Escape Characters (Broadcast Codes) and Time Codes.

### 36.2 Embedded Characteristics

- Compliant with ECSS standards ECSS-E-ST-50-12C, ECSS-E-ST-50-51C, ECSS-E-ST-50-52C, and ECSS-E-ST-50-53C
- SpaceWire Links: LVDS supported
- Two SpaceWire Interfaces up to 200 Mbits/s each
- One Packet Receive block (Rx), one Packet Transmit block (Tx) and one RMAP Block connected to the AHB Interface
- One SpaceWire Router to Transmit/Receive the SpaceWire Packets from Rx, Tx and RMAP blocks to SpaceWire Link
- Fallback Scheme implemented
- Support for RMAP Protocol (ECSS-E-ST-52)
- Support for CCSDS Packet Transfer Protocol (ECSS-E-ST-53)
- SpaceWire D capabilities
- Support for Reception/Generation of Escape Characters (Broadcast Codes) and Time Codes

### 36.3 Reference Documents

The SpaceWire (SpW) standard is described in the following documents:

- ECSS-E-ST-50-12C describes the links, nodes, routers and networks
- ECSS-E-ST-50-51C describes the SpW protocol identification
- ECSS-E-ST-50-52C describes the RMAP protocol
- ECSS-E-ST-50-53C describes the CCSDS protocol

## 36.4 Block Diagram

Figure 36-1. Block Diagram

## 36.5 Product Dependencies

### 36.5.1 I/O Lines

The following are the signal description for Space Wire peripherals:

Table 36-1. Signal Description

| Space Wire Link Name | Signals Name | Signals Definition                          |
|----------------------|--------------|---------------------------------------------|
| Space Wire Link 1    | SPWDINP0     | Space Wire Data Input 0 ( LVDS Positive)    |
|                      | SPWDINN0     | Space Wire Data Input 0 ( LVDS Negative)    |
|                      | SPWSINP0     | Space Wire Strobe Input 0 ( LVDS Positive)  |
|                      | SPWSINN0     | Space Wire Strobe Input 0 ( LVDS Negative)  |
|                      | SPWDOUTP0    | Space Wire Data Output 0 ( LVDS Positive)   |
|                      | SPWDOUTN0    | Space Wire Data Output 0 ( LVDS Negative)   |
|                      | SPWSOUTP0    | Space Wire Strobe Output 0 ( LVDS Positive) |
|                      | SPWSOUTN0    | Space Wire Strobe Output 0 ( LVDS Negative) |
|                      | SPWREF0      | Space Wire Reference 0                      |

.....continued

| Space Wire Link Name | Signals Name | Signals Definition                          |
|----------------------|--------------|---------------------------------------------|
| Space Wire Link 2    | SPWDINP1     | Space Wire Data Input 1 ( LVDS Positive)    |
|                      | SPWDINN1     | Space Wire Data Input 1 ( LVDS Negative)    |
|                      | SPWSINP1     | Space Wire Strobe Input 1 ( LVDS Positive)  |
|                      | SPWSINN1     | Space Wire Strobe Input 1 ( LVDS Negative)  |
|                      | SPWDOUTP1    | Space Wire Data Output 1 ( LVDS Positive)   |
|                      | SPWDOUTN1    | Space Wire Data Output 1 ( LVDS Negative)   |
|                      | SPWSOUTP1    | Space Wire Strobe Output 1 ( LVDS Positive) |
|                      | SPWSOUTN1    | Space Wire Strobe Output 1 ( LVDS Negative) |
|                      | SPWREF1      | Space Wire Reference 1                      |

### 36.5.2 Power Management

The SpW is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the SpW clock and the timetick clock if required.

On transmission, the SpaceWire bitrate is defined from the GCLK clock frequency (see the [Speed Link](#) section for more details). The GLCK frequency must be less than or equal to twice the MCK clock frequency; that is,  $GCLK \leq 2 * MCK$

On reception, the SpaceWire bitrate is linked to the MCK clock frequency. The bit rate must be less than or equal to four times MCK; that is,  $RX\_SpaceWire\_bitrate \leq 4 * MCK$ .

### 36.5.3 Interrupt Sources

The SpW interrupt lines are connected to the interrupt controller. Using the SpW interrupts requires the interrupt controller to be programmed first. The SpW interrupts are generated only if the corresponding bit has been enabled in the SPW\_PKTRX1, SPW\_PKTTX1, SPW\_TCH or SPW\_LINKx interrupt mask registers. For more information, refer to the [36.7.7. Interrupts](#) section.

### 36.5.4 Synchronization Inputs from RTC

The Space Wire and the RTC are internally connected to:

- Control Space Wire transmission/reception on specific event
- Have a Pulse Per Second (PPS) clock for the Time Code Handler block

The events (Event[5:0]) are connected to all PktTx, PktRx and TCH blocks. They can be used to trigger the following actions:

- Start of send lists in PktTx
- Activate receive buffer in PktRx
- Time-code transmission in Time Code Handler

The Event [0] is connected to RTCOUT0.

The Event [1] is connected to RTCOUT1.

**Note:** Event [2], Event [3], Event [4], Event [5] are not used.

The PPS signal is used by Time Code Handler and is internally connected to RTCOUT1. PPS is an input pulse that is expected to be a system Pulse Per Second (PPS). RTCOUT1 must be configured in Pulse mode when PPS is used.

## 36.6 SpaceWire Protocol

The reference documents listed above detail the different protocols supported over SpaceWire links.

The figure below presents the SpaceWire protocol, split into four categories:

- Router byte
- Header
- Data
- End Of Packet (EOP)

**Figure 36-2.** SpaceWire Packet: Protocol Format Supported

Each part has the following function:

- Router bytes describe the path of a space wire packet
- Headers describes the protocol to used, the logical address targeted, etc.
- Data contains effective data to transmit/receive over SpaceWire
- EOP indicates the End Of Packet

## 36.7 Functional Description

The SpW module comprises:

- Two SpaceWire links
- A packet transmit (TX1)
- A packet receive (RX1)
- A router block to redirect SpaceWire packets from a source (SpaceWire link, RMAP, transmitter) to a destination (SpaceWire link, RMAP, receiver)
- An RMAP block to support the SpaceWire RMAP protocol
- A TCH block to support SpaceWire time-coded frames

### 36.7.1 SpaceWire Link

#### 36.7.1.1 Speed Link

To be compliant with the SpaceWire standard, the initial bit rate of a SpaceWire link is 10 Mbits/s. Hence, the SpaceWire peripheral clock (SpWCLK), coming from the PMC, must be internally adapted to respect this constraint, by adjusting the ratio in SPW\_LINKx\_CLKDIV.TXINITDIV.

As soon as the SpaceWire connection link is established, the SpaceWire speed link can be increased up to 200 Mbits/s. To do so, the SpaceWire peripheral clock (SpWCLK) must be adjusted by adapting the ratio in SPW\_LINKx\_CLKDIV.TXOPERDIV.

The SpaceWire bit rates (initial and operational) are calculated from the following formulas:

$$\text{SpWInitbitrate} = (\text{SpWCLK}) / (0.5 (\text{TXINITDIV} + 1))$$

$$\text{SpWOperbitrate} = (\text{SpWCLK}) / (0.5 (\text{TXOPERDIV} + 1))$$

### 36.7.1.2 SpaceWire Link Configuration

After reset, the SpaceWire link is configured in Autostart mode. The SpaceWire link is configured using the register SPW\_LINKx\_CFG.

- If link disable is set, the link goes from run state to errorstate state.
- If autostart is set, the link remains in ready state until NULL are received.
- If link start is set, the link proceeds to started state.

Refer to the figure *State diagram for SpaceWire link interface*, available in ECSS-E-ST-50-12C (31 July 2008), for more details.

### 36.7.1.3 Link Status

The status of the SpaceWire CODEC link state is visible via SPWLINK\_STATUS register.

### 36.7.1.4 Link Error Interrupts

The SpaceWire link block has three sets of interrupt registers:

- SpaceWire Link Pending Interrupt registers (SPW\_LINKx\_PI\_RM, SPW\_LINKx\_PI\_R, SPW\_LINKx\_PI\_C, SPW\_LINKx\_PI\_RCS and SPW\_LINKx\_PI\_RCM) contain interrupts for the SpaceWire CODEC errors, configurable escape character, EEP transmitted/received and if a packet was aborted before fully transmitted.
- SpaceWire Distributed Interrupt Pending Interrupt registers (SPW\_LINKx\_DISTINTPI\_RM, SPW\_LINKx\_DISTINTPI\_RCM, SPW\_LINKx\_DISTINTPI\_R, SPW\_LINKx\_DISTINTPI\_C, SPW\_LINKx\_DISTINTPI\_RCS) contain interrupts for SpaceWire distributed interrupts. An incoming escape character with the three MSB set to "100" is interpreted as a distributed interrupt. The remaining five bits represent the interrupt number.
- SpaceWire Distributed Interrupt Acknowledge Pending Interrupt registers (SPW\_LINKx\_DISTACKPI\_RM, SPW\_LINKx\_DISTACKPI\_RCM, SPW\_LINKx\_DISTACKPI\_R, SPW\_LINKx\_DISTACKPI\_C, SPW\_LINKx\_DISTACKPI\_RCS) contain interrupts for SpaceWire distributed interrupt acknowledge. An incoming escape character with the three MSB set to "101" is interpreted as a distributed interrupt acknowledge. The remaining five bits represent the interrupt acknowledge number.

For details on set-up and use, refer to the [36.8. Register Summary](#).

## 36.7.2 Embedded SpaceWire Router

The embedded SpaceWire router has the following functionalities:

- directs the SpaceWire packet from source to destination
- maps the logical address to physical one, in the case of SpaceWire packets using logical address

### 36.7.2.1 Sources

The different sources available, and their associated numbers, are listed below.

**Table 36-2.** Source Available and Associated Number

| Address | Type of Address   |
|---------|-------------------|
| 0       | RMAP 1            |
| 1       | SpW Link 1        |
| 2       | SpW Link 2        |
| 3-8     | Reserved          |
| 9       | Pkt Transmitter 1 |
| 10-17   | Reserved          |

**Figure 36-3.** Source and Physical Address

### 36.7.2.2 Destinations

The different destinations available, and their associated physical addresses, are listed below.

**Table 36-3.** Destination Number and Associated Physical Addresses

| Path/Physical Address | Destination    |
|-----------------------|----------------|
| 0                     | Unused         |
| 1                     | SpW Link 1     |
| 2                     | SpW Link 2     |
| 3-8                   | Reserved       |
| 9                     | Pkt Receiver 1 |
| 10-16                 | Reserved       |
| 17                    | RMAP 1         |
| 18-31                 | Unused         |

**Figure 36-4.** Destination and Physical Address

### 36.7.2.3 Logical to Physical Addressing Mapping

Logical and physical address ranges are defined as follows:

**Table 36-4.** Address Repartition

| Address | Type of Address         |
|---------|-------------------------|
| 0       | Disable logical address |

.....continued

| Address | Type of Address                                             |
|---------|-------------------------------------------------------------|
| 1-30    | Physical address or path (only 1-2, 9,17 used in this case) |
| 31      | Loopback for SpW link 1-2                                   |
| 32-255  | Logical address                                             |

SpaceWire packets can contain logical addresses instead of physical paths. To correctly direct such a SpaceWire packet, a logical to physical mapping must be defined first.

This is done by configuring `SPW_ROUTER_TABLE[logicaladdnb]`.

- `SPW_ROUTER_TABLE[logicaladdnb].ADDR` maps the logical address “logicaladdnb” to the physical one.
- `SPW_ROUTER_TABLE[logicaladdnb].DELHEAD` defines if router bytes are kept or deleted when the SpaceWire packet is passed on.

Then, the logical address must be authorized. For that, `SPW_ROUTER_CFG.LAENA` must be set.

#### Notes:

1. logicaladdnb is in the range from 32 to 255.
2. It is recommended to write the table with all zeroes before configuring the router in order to obtain a correct initialization.

### 36.7.2.4 Fallback Routing

If `SPW_ROUTER_CFG.FALLBACK` is set, an alternative destination can be picked if the addressed destination is unavailable. If the physical port N is unavailable (SpW link not running), the fallback is selected as follows:

- for an odd port, select N+1
- for an even port, select N-1

If the fallback port is unavailable, it is treated and reported as an illegal address.

Fallback is only applicable when using logical addressing. Path addressing is unaffected by fallback.

### 36.7.2.5 Timeout

If a timeout event is detected, the SpaceWire router destination is automatically flushed. The physical address is visible in the `SPW_ROUTER_TIMEOUT` register. The register is locked until it has been read by the user.

The timeout is enabled by default. To disable it, `SPW_ROUTER_CFG.DISTIMEOUT` must be set.

### 36.7.2.6 Error Router Information

If a routed packet has an illegal destination, the packet is discarded.

Error routing information is visible in the dedicated register `SPW_ROUTER_STS`.

When errors occur, it is possible to visualize in the `SPW_ROUTER_STS` register:

- the number of packets dropped in `SPW_ROUTER_STS.COUNT`
- the source of the first dropped packet in `SPW_ROUTER_STS.SOURCE`
- the router byte of the first packet dropped in `SPW_ROUTER_STS.BYTE`
- the destination of the first packet dropped in `SPW_ROUTER_STS.DEST`

## 36.7.3 Packet Transmit

### 36.7.3.1 Overview

Space Wire packets are transmitted by the packet transmitter and the router blocks to the Space Wire network.

### 36.7.3.2 Transmit (TX) Packet

SpaceWire packets are sent over send list, which are made of send list entries.

**Figure 36-5.** Send List Overview

Each send list entry has a status field, a routing field, a header, and a data field:

- Status field indicates:
  - If the entry has to be taken into account or not (Skip bitfield)
  - The type of packet to be transferred (Entry bitfield)
  - On which event, the send list starts to transfer packets (start bitfield)
  - the CRC attached to the data (DCRC bitfield)
  - The timeout value for this entry. (timeout bitfield)
- The Timeout field in the Send List Entry, if not set to '0' (disabled), activates a 19-bit timer which starts counting upon the start of transmission of the corresponding SpaceWire packet. Should the timer expire before the transmitter successfully terminates the sending list operation, then the SPW\_PKTXX1\_STATUS.PREV[2:0] field in the SAMRH71 will flag ABORTEDTIMEOUT value as status. The Timeout Counter is driven by the user selected SpaceWire TimeTick GCLK setting via the Power Management Controller Instance ID 66, see Peripheral Identifiers section, so the user is free to select the appropriate ticks period for the counter. By default from reset the SpaceWire TimeTick is not clocked in the SAMRH71 and should be user configured before the function is selected.

- Routing field indicates the path to use for all the packets contained in the send list. (RB1-RB8 bitfields)
- Header and data fields indicate the following:
  - The start address where the header information is stored and its corresponding size (HSize and HAddr bitfields)
  - The start address where the data are stored and their corresponding size (DSize and DAddr)

A send list entry has the following overview and definition:

**Table 36-5.** Send List Entry Definition

| 32-bit Word | Bit Number |       |    |  |         |      |    |    |         |  |  |       |         |    |  |  |     |  |  |  |      |  |  |  |       |  |   |   |  |  |  |  |  |  |
|-------------|------------|-------|----|--|---------|------|----|----|---------|--|--|-------|---------|----|--|--|-----|--|--|--|------|--|--|--|-------|--|---|---|--|--|--|--|--|--|
|             | 31         | 30    | 29 |  | 27      |      | 24 | 23 |         |  |  | 18    | 16      | 15 |  |  |     |  |  |  |      |  |  |  |       |  | 8 | 7 |  |  |  |  |  |  |
| 0           | Skip       | Entry | -  |  | RSize   |      |    | -  |         |  |  | Start |         |    |  |  |     |  |  |  |      |  |  |  |       |  |   |   |  |  |  |  |  |  |
| 1           | RB1        |       |    |  |         |      |    |    | RB2     |  |  |       |         |    |  |  | RB3 |  |  |  |      |  |  |  | RB4   |  |   |   |  |  |  |  |  |  |
| 2           | RB5        |       |    |  |         |      |    |    | RB6     |  |  |       |         |    |  |  | RB7 |  |  |  |      |  |  |  | RB8   |  |   |   |  |  |  |  |  |  |
| 3           | -          |       |    |  | EscMask |      |    |    | EscChar |  |  |       |         |    |  |  | -   |  |  |  | HCrc |  |  |  | HSize |  |   |   |  |  |  |  |  |  |
| 4           | HAddr      |       |    |  |         |      |    |    |         |  |  |       |         |    |  |  |     |  |  |  |      |  |  |  |       |  |   |   |  |  |  |  |  |  |
| 5           | -          |       |    |  |         | DCRC |    |    | DSize   |  |  |       |         |    |  |  |     |  |  |  |      |  |  |  |       |  |   |   |  |  |  |  |  |  |
| 6           | DAddr      |       |    |  |         |      |    |    |         |  |  |       |         |    |  |  |     |  |  |  |      |  |  |  |       |  |   |   |  |  |  |  |  |  |
| 7           | -          |       |    |  |         |      |    |    |         |  |  |       | Timeout |    |  |  |     |  |  |  |      |  |  |  |       |  |   |   |  |  |  |  |  |  |

**Table 36-6.** Send List Entry: Field Description

| Field   | Definition       | Size | Value  | Description                                                     |
|---------|------------------|------|--------|-----------------------------------------------------------------|
| Skip    | Skip             | 1    | 0      | Use this entry.                                                 |
|         |                  |      | 1      | Skip this entry. All other fields are ignored.                  |
| Entry   | Entry Type       | 2    | 0      | Packet Data                                                     |
|         |                  |      | 1      | Escape Character                                                |
|         |                  |      | others | Invalid                                                         |
| RSize   | Router Byte Size | 4    | 0-8    | Number of Router Bytes to prepend to packet.                    |
|         |                  |      | others | Invalid                                                         |
| Start   | Start Time       | 19   | Any    | Delay from send list start. Time Unit is environment dependent. |
| RB1     | Router Byte 1    | 8    | Any    | Byte 1 to prepend, if used.                                     |
| RB2     | Router Byte 2    | 8    | Any    | Byte 2 to prepend, if used.                                     |
| RB3     | Router Byte 3    | 8    | Any    | Byte 3 to prepend, if used.                                     |
| RB4     | Router Byte 4    | 8    | Any    | Byte 4 to prepend, if used.                                     |
| RB5     | Router Byte 5    | 8    | Any    | Byte 5 to prepend, if used.                                     |
| RB6     | Router Byte 6    | 8    | Any    | Byte 6 to prepend, if used.                                     |
| RB7     | Router Byte 7    | 8    | Any    | Byte 7 to prepend, if used.                                     |
| RB8     | Router Byte 8    | 8    | Any    | Byte 8 to prepend, if used.                                     |
| EscMask | Escape Char Mask | 4    | Any    | Defines where to send Escape Character.                         |
| EscChar | Escape Char      | 8    | Any    | Escape Character to send if Entry Type is Escape Char.          |
| HCrc    | Header Crc       | 1    | 0      | Send as is.                                                     |
|         |                  |      | 1      | Calculate CRC and attach at end.                                |
| HSize   | Header Size      | 8    | Any    | Header Size, in bytes                                           |
| HAddr   | Header Addr      | 32   | Any    | Header Start Address                                            |
| DCrc    | Data Crc         | 1    | 0      | Send as is                                                      |
|         |                  |      | 1      | Calculate CRC and attach at end                                 |
| DSize   | Data Size        | 24   | Any    | Data Size, in bytes                                             |

.....continued

| Field   | Definition | Size | Value  | Description                                                      |
|---------|------------|------|--------|------------------------------------------------------------------|
| DAddr   | Data Addr  | 32   | Any    | Data Start Address                                               |
| Timeout | Timeout    | 19   | 0      | No Timeout                                                       |
|         |            |      | others | Abort send list if time from send list start exceeds this value. |

Each transmit Packet is able to transmit escape characters on up to two links. The table below shows how the EscMask bits in a Send List Entry map to links for each transmit packet.

**Table 36-7.** EscMask Bit-link Definition

| PktTx | EscMask(3) | EscMask(2) | EscMask(1) | EscMask(0) |
|-------|------------|------------|------------|------------|
| Tx1   | Link 1     | Link 2     | Not used   | Not used   |

### 36.7.3.3 Send List State

Send lists go through the three states—NEXT, CURRENT and PREVIOUS—during its life cycle:

The following flowchart illustrates the life cycle of a send list.

**Figure 36-6.** Send List Life Cycle

#### 36.7.3.3.1 NEXT Send List State

The NEXT send list state is divided in two:

- **ARMED:** Definition of the packet to transfer is performed in this state. For configuration details, refer to [36.7.3.3.4. Send List Initialization](#). Once the start condition has been detected, the send list proceeds to PENDING.

- **PENDING:** Waiting phase

This transition and waiting phase is terminated when the configured start condition is fulfilled. In this case, the CURRENT send list state is reached.

The possible START conditions are the follows:

- Event (code 0): start if any bit in value matches with incoming event. For event definition, refer to [36.5.4. Synchronization Inputs from RTC](#)
- Immediately (code 1): start immediately.
- Time Code 1 (code 2): start if current time code in Time Code Handler 1 is equal to value.

- Time Code 2 (code 3): not used.

### 36.7.3.3.2 CURRENT Send List State

The CURRENT send list state is divided in two:

- **ACTIVATED** : The CURRENT send list is effectively sent over the Space Wire network. When the CURRENT list is completely sent or interrupted, DEACTIVATED is reached.
- **DEACTIVATED**: The data transfer to the router block is finished or interrupted. When a de-Act interrupt is detected, the CURRENT send list state is changed to PREVIOUS send list state.

### 36.7.3.3.3 PREVIOUS Send List State

The PREVIOUS send list state is divided in two:

- **DEACTIVATED**: Until SPW\_PKTTX1\_STATUS is written, the status is locked and any following send lists cannot be deactivated. SPW\_PKTTX1\_STATUS must be written with any dummy data to unlock the send list.
- **UNLOCKED**: the status is unlocked, the NEXT send list could reach the CURRENT. DEACTIVATED state.

### 36.7.3.3.4 Send List Initialization

Send list initialization is performed during the NEXT send list state.

To initialize a send list:

1. The start address of the send list must be indicated in the SPW\_PKTTX1\_NXTSENDADDR register.
2. The number of send list entries contained in the sendlist must be indicated in the SPW\_PKTTX1\_NXTSENDCFG register.
3. The destination path must be indicated either in the SPW\_PKTTX1\_NXTSENDROUT register or in the send list entry (R1 –R8). If the router byte is indicated: In the SPW\_PKTTX1\_NXTSENDROUT register, the router bytes are the same for all send list entries. Directly in the send list entry (R1 –R8), the router bytes are specific to the send list entry.
4. The number of send list entries contained in the send list must be indicated in the SPW\_PKTTX1\_NXTSENDCFG register.
5. The starting condition to transmit the send list must be written in the SPW\_PKTTX1\_NXTSENDCFG register.

Each send list entry must be filled as follows:

- **Status and configuration**
  - Skip bit: If one, the send list entry is ignored.
  - Entry: Indicates if dat or specific character are sent.
  - Start: Delay before sending the send list; this is defined by the START bitfield of the [SPW\\_PKTTX1\\_NXTSENDCFG](#) register.
  - EscChar and EscMask : Specific if escape characters are sent. EscChar defines which escape character to send, and the EscMask: defines which interface should receive it.
  - Timeout: Timeout to abort the send list transfer after a certain period.
- **Router bytes configuration**
  - Rsize and RB1-8: Number of router bytes used in the send list and the router bytes (i.e., path of the SpaceWire packet to send).

**Note:** Up to four router bytes can be specified in the SPW\_PKTTX1\_NXTSENDROUT register. These bytes are the start of each packet in the send list.

**Note:** Up to eight router bytes can be specified directly in the Send List Entry. These bytes are the next part of the packet.

- **Header**
  - HCRC: Add or not a CRC at the end of the header part for reliability
  - Hsize: Size in bytes of the header part
  - Haddr: Starting address of the header part, stored in memory
- **Data**
  - DCRC: Add or not a CRC at the end of the data part for reliability
  - Dsize: Size in bytes of the data part
  - Ddaddr: Starting address of the data part, stored in memory

The header and data parts are set up with an address and a length defining a buffer in memory. These parts also may add the CRC byte after each block. Note that an added CRC is not included in Hsize or Dsize. The CRC is to support RMAP.

### 36.7.3.4 CURRENT Send List Parameters

The router bytes of the current send list are visible in the SPW\_PKTTX1\_CURSENDROUT register.

The starting address of the current send list is visible in the SPW\_PKTTX1\_CURSENDADDR register.

The number of the current send list entry is visible in the SPW\_PKTTX1\_CURSENDCFG register.

It is possible to abort any on-going transfer by setting the bit SPW\_PKTTX1\_CURSENDCFG.ABORT.

#### 36.7.3.4.1 CURRENT Send List Status

The status of the CURRENT send list is visible in the SPW\_PKTTX1\_STATUS register.

The origin of the PREVIOUS send list deactivated is also visible in this register.

#### 36.7.3.4.2 Abort a Send List

There are two ways to abort a send list transfer:

- To stop the transfer immediately: Set the bit SPW\_PKTTX1\_CURSENDCFG.ABORT.
- To stop the transfer at the next packet boundary: Write all zeroes in the field SPW\_PKTTX1\_CURSENDCFG.LEN.

### 36.7.3.5 Transmitter Interruptions

If previously enabled (SPW\_PKTTX1\_IM register), interruptions can be launched when a send list is activated or deactivated, and when EEP or EOP are sent. All the interruptions are pending on the SPW\_PKTTX1\_PI register.

### 36.7.3.6 Reset Transmitter

The packet transmitter is reset by software by writing the correct pattern in SPW\_PKTTX1\_SWRESET.

## 36.7.4 Packet Received

### 36.7.4.1 Overview

Each receiver can receive SpaceWire packets if the routing mechanism is set up to reach them, that is, if the logical address or logical path is correctly set.

Packets received are stored in the Receive buffers, and can be divided over buffers if necessary.

### 36.7.4.2 Received Packet

The received packets are divided into two fields:

- The first field is for packet data, where incoming data is stored.
- The second field is for packet information such as length, receive time and status.

For details, refer to the following tables.

**Table 36-8.** Packet Receive Structure Definition

| 32-bit Word | Bit number |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

**Table 36-9.** Packet Receive Field Definition

| Field | Definition | Size | Value | Description                                                                           |
|-------|------------|------|-------|---------------------------------------------------------------------------------------|
| Crc   | Crc        | 8    | Any   | 8 bit CRC calculated over all packet bytes                                            |
| Split | Split      | 1    | Any   | Packet is split, and continues in next entry/buffer                                   |
| Cont  | Continued  | 1    | Any   | Packet is continued from previous                                                     |
| EEP   | Eep        | 1    | Any   | Error End of Packet                                                                   |
| EOP   | Eop        | 1    | Any   | End of Packet                                                                         |
| DAddr | Data Addr  | 32   | Any   | Start Address of received packet. Will always be word aligned.                        |
| DSize | Data Size  | 24   | Any   | Length of received packet, in bytes                                                   |
| Etime | End Time   | 19   | Any   | Time at end of packet, from receive buffer start. Time Unit is environment dependent. |

### 36.7.4.3 Receive Buffers State

The packet receiver handles three independent storage areas for received packets, called receive buffers. The three states are called NEXT, CURRENT and PREVIOUS.

The following flowchart presents the receive buffer states during its life cycle.

**Figure 36-7.** Receive Buffers Life Cycle

#### 36.7.4.3.1 NEXT Buffer State

The NEXT buffer state is divided in two:

- **ARMED:** The registers are initialized with buffer information (starting address, length and starting condition). For more details, refer to the section [36.7.4.4. Receive Buffers Setup](#). Once the start condition has been detected, the receive buffer goes to PENDING.
- **PENDING:** Waiting phase.  
This transition and waiting phase is terminated when the start condition is fulfilled. In this case, the CURRENT state is reached.

### 36.7.4.3.2 CURRENT Buffer State

The CURRENT buffer state is divided in two:

- **ACTIVATED:** The Receive buffer collects space packets received from the SpaceWire network. It will stay in this mode unless:
  - The CURRENT receive buffer (information) is full and the previous one is not locked
  - the CURRENT receive buffer (data) is full and the previous one is not locked. In this case, the on-going packet is split.
  - a split request is received and the PREVIOUS one is not locked
  - the starting condition of the next buffer is matched and the PREVIOUS receive buffer is not locked
  - the user requests an abort of the current reception (SPW\_PKTRX1\_CURBUF\_CFG registers)

#### Notes:

- When a packet is split, the first one is marked as 'split' and the second one is marked as 'continue'.
- All the information is passing through the NEXT register to the CURRENT one.
- **DEACTIVATED:** This transition and waiting phase is terminated when PREVIOUS receive buffer is free.

Depending on the SPW\_PKTRX1\_CFG register, the incoming data could be stalled or discarded.

### 36.7.4.3.3 PREVIOUS Buffer State

The PREVIOUS buffer state is divided in two:

- **LOCKED:** The data collected can be read. For that, the SPW\_PKTRX1\_PREVBUFSTS.CNT indicates how many received packet info entries have been written in memory. It will remain here until SPW\_PKTRX1\_PREVBUFSTS is read.
- **UNLOCKED:** When the PREVIOUS receive buffer is UNLOCKED, the next CURRENT receive buffer could reaches the PREVIOUS state.

**Note:** All the information contains in CURRENT buffer registers is transferred to the PREVIOUS buffer registers.

### 36.7.4.3.4 Status Buffer

The status and the number of packets received of a CURRENT receive buffer are read in the SPW\_PKTRX1\_STATUS register.

The status and the number of packets received of a PREVIOUS receive buffer are read in the SPW\_PKTRX1\_PREVBUFSTS register.

### 36.7.4.4 Receive Buffers Setup

To correctly initialize the receive buffer, while it is in NEXT buffer state, the following steps must be performed:

- The starting address of the buffer which contains the received data is written in the SPW\_PKTRX1\_NXTBUFDATAADDR register. Starting address must be word-aligned.
- The length of the buffer which contains the received data is written in the SPW\_PKTRX1\_NXTBUFDATALEN register. When setting the data buffer length, each expected packet size should be rounded up to word size.

- The starting address of the buffer which contains the received packet information is written in the SPW\_PKTRX1\_NXTBUFPKTADDR register. Starting address must be word-aligned.
- The number of received packet information is written in the SPW\_PKTRX1\_NXTBUFCFG register.
- The starting condition of the buffer is written in the SPW\_PKTRX1\_NXTBUFCFG register.
- The split condition activation of the buffer is written in the SPW\_PKTRX1\_NXTBUFCFG register.

**Note:** All receive buffers must be word-aligned.

The table below indicates the possible conditions to start the receive buffer, that is, become NEXT to CURRENT receive buffer state.

**Table 36-10.** Possible Starting Modes

| Start | Mode        | Description                                                                                                                                   |
|-------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Event       | Start if any bit in Value matches an incoming event. For event definition, refer to <a href="#">36.5.4. Synchronization Inputs from RTC</a> . |
| 1     | Immediately | Start immediately                                                                                                                             |
| 2     | Time Code 1 | Start if current time code in Time Code Handler 1 is equal to Value                                                                           |
| 3     | Time Code 2 | Not used                                                                                                                                      |
| 4     | Later       | Start if Current Buffer is deactivated, e.g. by becoming full                                                                                 |

**Note:** When the NEXT receive buffer is activated (becomes the CURRENT receive buffer), all starting conditions in the NEXT receive buffer are cleared).

#### 36.7.4.5 Packet CRC

For each packet received, a CRC is calculated over the incoming bytes and stored in the Receive Packet Info structure for the packet. The CRC uses the same algorithm as RMAP. When calculating CRC over a complete RMAP packet (header, header CRC, data and data CRC), the result must be '0' if no errors have been detected.

If a packet is split, the first entry will show the CRC up to that point. The CRC in the continued entry will be over the entire packet.

#### 36.7.4.6 Receiver Interruptions

Interruptions can be pending on SPW\_PKTRX1\_PI registers if they are previously enabled (SPW\_PKTRX1\_IM registers):

- to have an overview of the receive buffer state (ACTIVATED or DEACTIVATED)
- to detect the EEP or EOP character
- to detect if an incoming packet is discarded

#### 36.7.4.7 Reset Receiver

The packet receiver can be reset by software by writing the correct pattern in SPW\_PKTRX1\_SWRESET.

### 36.7.5 RMAP

#### 36.7.5.1 Overview

The RMAP Handler services incoming RMAP commands in hardware.

SpaceWire packets addressed to RMAP are interpreted according to the packet's Protocol ID.

RMAP packets are handled according to the RMAP standard. The table below lists the supported RMAP features.

**Table 36-11.** Supported RMAP Features

| Feature                   | Command                                                                |
|---------------------------|------------------------------------------------------------------------|
| Command Codes supported   | 3, 9, 11                                                               |
| Target Logical Address    | Must be 0xFE or RMAP's configured LA                                   |
| Key field value           | Defined by SPW_RMAPx_CONFIG.DESTKEY                                    |
| Single Address commands   | Not supported, only sequential is supported. (Increment bit must be 1) |
| Read and Write commands   | Supported                                                              |
| Read-Modify-Write command | Not supported                                                          |
| Write with reply          | Supported                                                              |
| Verified write            | Not supported (Verify data bit must be 0)                              |
| Reply address             | Supported up to 12 bytes.                                              |

If a RMAP Handler is accessed from a SpW Link in the same group, it will automatically add a path router byte to route the reply back to the same link.

### 36.7.5.2 RMAP Setup

To correctly activate the RMAP protocol and accept the RMAP frames, the user must:

- enable the RMAP access by setting SPW\_RMAP\_CFG.RMAPENA.
- configure the target logical address in SPW\_RMAP\_CFG.TLA to accept the RMAP frame with this logical address.
- configure the destination key in SPW\_RMAP\_CFG.DESTKEY to accept the RMAP command which contains this value.

### 36.7.5.3 RMAP Status

The error information from RMAP is visible in the SPW\_RMAP\_STS register.

If valid but set, the corresponding error (incoherent CRC, non-matching TLA, Destination key error, etc.) can be retrieved.

## 36.7.6 Time Code

### 36.7.6.1 Overview

The time code handler (TCH1) receives and transmits time codes over multiple SpaceWire interfaces. It operates either in Master mode where it is the source of time codes, or in Slave mode where it is driven by incoming time codes. In Slave mode it can also act as a repeater and redistribute the time codes over other interfaces.

Time codes range from 0–63, are auto-incrementing and wrap around. A valid time code is defined as being equal to SPW\_TCH\_LASTTIMECODE.VALUE + 1 modulo 64. Since any incoming time code updates the register, only the first of multiple equal incoming time codes will be valid.

Note that the hardware does not differentiate between Master and Slave modes. In some special cases, they can be mixed by configuring sources in both SPW\_TCH\_CFGLISTEN and SPW\_TCH\_CFG.EVENT.

The TCH1 is connected to all SpW Link Handlers, and thus can drive or listen to any subset of links.

**Figure 36-8.** Time Code Handler Block

The TCH1 sends Time Synchronization events with the current time code to all Packet Transmitters and Packet Receivers to be used for transmission start.

The time code sources used are RTCOUT0/1 signals. They are internally connected to the SpaceWire block.

The table below shows the mapping between SpW links and the bits in SPW\_TCH\_CFGLISTEN and SPW\_TCH\_CFGSEND registers.

**Table 36-12.** Mapping between SpaceWire Link and TCH1 Configuration

| Register Bit | 1 | 0 |
|--------------|---|---|
| Link         | 2 | 1 |

## 36.7.6.2 Operation/Usage

### 36.7.6.2.1 Master Mode

To run in Master mode, the following set-up must be done:

- Clear SPW\_TCH\_CFGLISTEN.
- Configure SPW\_TCH\_CFGSEND so that all interfaces where time codes should be transmitted are selected.
- Configure SPW\_TCH\_CFG.EVENT to select the event source (RTCOUT0/1 signals) that drives the time codes.

It is possible to run Master mode manually from software without an event source by setting SPW\_TCH\_LASTTIMECODE.SEND each time a time code should be sent.

### Selecting Time Code

Each configured event SPW\_TCH\_LASTTIMECODE.VALUE will be increased by 1 (modulo 64) and then transmitted.

To select Time Code N to be transmitted, write N-1 to SPW\_TCH\_LASTTIMECODE.VALUE before the configured event.

### Synchronized Time Code Loop

To keep the full time code loop synchronized to an event (RTCOUT0/1), the SPW\_TCH\_CFGRESTART register can be set up to regularly set the time code value.

The events that can be used to trigger this are the same events as in the SPW\_TCH\_CFG.EVENT field. The SPW\_TCH\_CFGRESTART register also has an additional RTCOUT0/1 event which a system can connect to some source not shared by the Event sources.

When the configure event triggers, there is a delay of 2–3 SpWclk pulses, after which SPW\_TCH\_CFGRESTART.VALUE is copied to SPW\_TCH\_LASTTIMECODE.VALUE. This delay is to ensure that the Master mode trigger occurs before the Restart trigger if both have the same source or sources close in time.

If SPW\_TCH\_CFGRESTART.ONESHOT is set, this will only occur once. This can be used to prepare a change to SPW\_TCH\_LASTTIMECODE.VALUE with fewer timing constraints.

#### 36.7.6.2.2 Slave Mode

To run in Slave mode, set up the following:

- The SPW\_TCH\_CFGLISTEN register must enable all SpW links where time codes may come from.
- The SPW\_TCH\_CFG register must be cleared.

If this is a pure slave node in a system, the SPW\_TCH\_CFGSEND register should be cleared. If this is used as a router/repeater, the SPW\_TCH\_CFGSEND register should select all interfaces where time codes should be retransmitted.

#### 36.7.6.2.3 Watchdog

A watchdog notification can be set up to detect whether a time code arrives in the expected time window. This is typically only used in Slave mode.

To be notified about a time code coming too early, set up the SPW\_TCH\_CFGWD.EARLY register. If a time code arrives before that, the EARLYWD interrupt is set.

To be notified about a time code coming too late, set up the SPW\_TCH\_CFGWD.LATE register. If no time code has arrived by then, the LATEWD interrupt is set.

The watchdogs are reset when a valid time code is received, and only valid time codes are considered by the watchdog.

#### 36.7.6.2.4 Notifications

To react on any valid time code, the TIMECODE interrupt can be used. This is used for both Master and Slave modes.

Use the SPW\_TCH\_CFGTCEVENT register to setup a trigger on specific timecode(s). For any bit set in SPW\_TCH\_CFGTCEVENT.MASK the corresponding bit in the time code and SPW\_TCH\_CFGTCEVENT.VALUE must be equal. When this triggers it gives the TCEVENT interrupt.

### 36.7.7 Interrupts

Interrupts are available to indicate the following events:

On the packet receiver side:

- the activation/deactivation of receive buffer
- an incoming character (EOP/EEP) detected
- an incoming packet discarded.

On the packet transmitter side:

- the activation/deactivation of a send list
- an incoming character (EOP/EEP) sent

On the TCH block:

- an early/late watchdog event triggered,
- a time code arrived,
- time synchronization event detected,
- a tc event detected

On each SpW link:

- incoming escape character which matches with ESCEVENT1 or 2
- a transmit packet discarded
- EEP received
- EEP transmitted
- the link state status
- link interface errors (credit error, ESC error, parity error, disconnection error)

### 36.7.7.1 Interrupt Register Access Definition

Each Pending Interrupt register has multiple access types to affect it in different ways. Each access type is set at a specific address.

Each Mask Interrupt register has multiple access types to affect it on different ways. Each access type is set at a specific address.

The following table describes the access types possible and the effect of reading and writing on them.

**Table 36-13.** Access Types

| Register Name     | Access Type | Read                                                                 | Write                            |
|-------------------|-------------|----------------------------------------------------------------------|----------------------------------|
| Pending Interrupt | RM          | Read Pending Interrupt register<br>Read Mask Interrupt register      | –                                |
|                   | RCM         | Read Pending Interrupt register and clear Pending Interrupt register | –                                |
|                   | R           | Read Pending Interrupt register                                      | –                                |
|                   | RCS         | Read and clear Interrupt register                                    | Set Pending Interrupt register   |
|                   | C           | –                                                                    | Clear Pending Interrupt register |
| Mask Interrupt    | R/W         | Read Mask Interrupt register                                         | Write Mask Interrupt register    |
|                   | S           | –                                                                    | Set Mask Interrupt               |
|                   | C           | –                                                                    | Clear Mask Interrupt             |

**Note:** The pending interrupt can be forced for testing purposes by writing the Pending Interrupt register to '1'.

### 36.7.7.2 Interrupt Usage

The interrupts must be configured before using them.

To do so, the corresponding bit must be set in the SPW\_PKTRX1, SPW\_PKTTX1, SPW\_TCH or SPW\_LINKx Interrupt Mask registers.

When an interrupt is detected:

- The block origin of the interruption is found by reading the SpaceWire group Irq status 1 or 2 registers (SPW\_GROUP\_IRQSTS1 and SPW\_GROUP\_IRQSTS2).
- More detail of the origin is then available by reading the SPW\_PKTRX1, SPW\_PKTTX1, SPW\_TCH or SPW\_LINKx Pending Interrupt registers where the corresponding bit is pending.

There are several ways to clear a pending interrupt:

- Read and clear the Pending Interrupt register (access type RCM).
- Write to '0' (Clear) the corresponding Pending Interrupt register. (access type C).

## 36.8 Register Summary

| Offset              | Name                    | Bit Pos. | 7          | 6      | 5        | 4           | 3     | 2          | 1         | 0         |
|---------------------|-------------------------|----------|------------|--------|----------|-------------|-------|------------|-----------|-----------|
| 0x00                | SPW_ROUTER_STS          | 7:0      |            |        |          | DEST[4:0]   |       |            |           |           |
|                     |                         | 15:8     |            |        |          | SOURCE[4:0] |       |            |           |           |
|                     |                         | 23:16    | BYTE[7:0]  |        |          |             |       |            |           |           |
|                     |                         | 31:24    | COUNT[7:0] |        |          |             |       |            |           |           |
| 0x04                | SPW_ROUTER_CFG          | 7:0      |            |        |          |             |       | DISTIMEOUT | FALLBACK  | LAENA     |
|                     |                         | 15:8     |            |        |          |             |       |            |           |           |
|                     |                         | 23:16    |            |        |          |             |       |            |           |           |
|                     |                         | 31:24    |            |        |          |             |       |            |           |           |
| 0x08                | SPW_ROUTER_TIME<br>OUT  | 7:0      |            |        |          | ADDR[4:0]   |       |            |           |           |
|                     |                         | 15:8     |            |        |          |             |       |            |           |           |
|                     |                         | 23:16    |            |        |          |             |       |            |           |           |
|                     |                         | 31:24    | LOCKED     |        |          |             |       |            |           |           |
| 0x0C<br>...<br>0x7F | Reserved                |          |            |        |          |             |       |            |           |           |
| 0x80                | SPW_ROUTER_TABL<br>E 32 | 7:0      |            |        |          | ADDR[4:0]   |       |            |           |           |
|                     |                         | 15:8     |            |        |          |             |       |            |           | DELHEAD   |
|                     |                         | 23:16    |            |        |          |             |       |            |           |           |
|                     |                         | 31:24    |            |        |          |             |       |            |           |           |

| Reset  |            |    |    | 0           | 0  | 0  | 0  | 0  |

**Bits 31:24 – COUNT[7:0]** Packet Count  
Number of dropped packets. Saturates at max.

**Bits 23:16 – BYTE[7:0]** Router byte  
Router byte of first dropped packet.

**Bits 12:8 – SOURCE[4:0]** Source Address  
Source of first dropped packet.

**Bits 4:0 – DEST[4:0]** Destination Address  
Destination from table of first dropped packet.

## 36.8.2 SpW Router Config

**Name:** SPW\_ROUTER\_CFG  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |    |    |    |    |            |          |       |

| Reset  |    |    |    |    |    |            |          |       |
| Bit    | 15 | 14 | 13 | 12 | 11 | 10         | 9        | 8     |
|        |    |    |    |    |    |            |          |       |
| Access |    |    |    |    |    |            |          |       |
| Reset  |    |    |    |    |    |            |          |       |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2          | 1        | 0     |
|        |    |    |    |    |    | DISTIMEOUT | FALLBACK | LAENA |
| Access |    |    |    |    |    | R/W        | R/W      | R     |
| Reset  |    |    |    |    |    | 0          | 0        | 0     |

### Bit 2 – DISTIMEOUT Disable Timeout

| Value | Description      |
|-------|------------------|
| 1     | Disable timeout. |

### Bit 1 – FALLBACK Fallback Routing

| Value | Description              |
|-------|--------------------------|
| 1     | Enable fallback routing. |

### Bit 0 – LAENA LA Routing Enable

| Value | Description                     |
|-------|---------------------------------|
| 1     | Enable logical address routing. |

### 36.8.3 SpW Router Timeout

**Name:** SPW\_ROUTER\_TIMEOUT  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read-only

**Note:** This register is cleared on read.

|        |        |    |    |           |    |    |    |    |

|        |        |    |    | ADDR[4:0] |    |    |    |    |
| Access |        |    |    | R         | R  | R  | R  | R  |
| Reset  |        |    |    | 0         | 0  | 0  | 0  | 0  |

#### Bit 31 – LOCKED Locked

| Value | Description             |
|-------|-------------------------|
| 1     | A timeout has occurred. |

#### Bits 4:0 – ADDR[4:0] Physical Address Identifies destination that stalled.

36.8.4 SpW Router Table x

**Name:** SPW\_ROUTER\_TABLEx  
**Offset:** 0x80 + (x- 32)\*0x04 [x= 32..255]  
**Reset:** 0x00000000  
**Property:** Read/Write

**Note:** There are 224 instances of this register in the user interface.

Bit 8 – DELHEAD Delete Header Byte

| Value | Description                                   |
|-------|-----------------------------------------------|
| 1     | Discard router byte for this logical address. |

Bits 4:0 – ADDR[4:0] Address

| Value  | Description                |
|--------|----------------------------|
| 0      | Logical address is unused. |
| 1-18   | Physical address.          |
| Others | Invalid                    |

**36.8.5 SpW Link x Pending Read Masked Interrupt**

**Name:** SPW\_LINKx\_PI\_RM  
**Offset:**  $0x0400 + (x-1)*0x80$  [x=1..2]  
**Reset:** 0x00000000  
**Property:** Read-only

|        |         |        |          |           |       |        |           |           |

| Bit    | 7       | 6      | 5        | 4         | 3     | 2      | 1         | 0         |
| Access | DISCARD | EEPREC | EEPTRANS | LINKABORT | CRERR | ESCERR | PARERR    | DISERR    |
| Reset  | R/W     | R/W    | R/W      | R/W       | R/W   | R/W    | R/W       | R         |
|        | 0       | 0      | 0        | 0         | 0     | 0      | 0         | 0         |

**Bit 9 – ESCEVENT1** Escape Event 1

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 1     | Incoming Escape Character matched SPW_LINKx_EscCharEvent1. |

**Bit 8 – ESCEVENT2** Escape Event 2

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 1     | Incoming Escape Character matched SPW_LINKx_EscCharEvent2. |

**Bit 7 – DISCARD** Discard

| Value | Description                |
|-------|----------------------------|
| 1     | Transmit packet discarded. |

**Bit 6 – EEPREC** EEP Received

| Value | Description   |
|-------|---------------|
| 1     | EEP received. |

**Bit 5 – EEPTRANS** EEP Transmitted

| Value | Description                                                                                                                         |
|-------|-------------------------------------------------------------------------------------------------------------------------------------|
| 1     | EEP transmitted. If the link is not running it might not have been transmitted on the link, just passed the interface to the codec. |

**Bit 4 – LINKABORT** LinkAbort

| Value | Description                                                                |
|-------|----------------------------------------------------------------------------|
| 1     | SpW Link x Status.LinkState has made a transition from Run to Error Reset. |

**Bit 3 – CRERR** CrErr

| Value | Description                           |
|-------|---------------------------------------|
| 1     | Link interface credit error detected. |

**Bit 2 – ESCERR ESCErr**

| Value | Description                        |
|-------|------------------------------------|
| 1     | Link interface ESC error detected. |

**Bit 1 – PARERR ParErr**

| Value | Description                           |
|-------|---------------------------------------|
| 1     | Link interface parity error detected. |

**Bit 0 – DISERR DisErr**

| Value | Description                                  |
|-------|----------------------------------------------|
| 1     | Link interface disconnection error detected. |

### 36.8.6 SpW Link x Pending Read and Clear Masked Interrupt

**Name:** SPW\_LINKx\_PI\_RCM

#### Bit 7 – DISCARD Discard

| Value | Description                |
|-------|----------------------------|
| 1     | Transmit packet discarded. |

#### Bit 6 – EEPREC EEP Received

| Value | Description   |
|-------|---------------|
| 1     | EEP received. |

#### Bit 5 – EEPTRANS EEP Transmitted

| Value | Description                                                                                                                         |
|-------|-------------------------------------------------------------------------------------------------------------------------------------|
| 1     | EEP transmitted. If the link is not running it might not have been transmitted on the link, just passed the interface to the codec. |

#### Bit 4 – LINKABORT LinkAbort

| Value | Description                                                               |
|-------|---------------------------------------------------------------------------|
| 1     | SPW_LINKx_STATUS.LINKSTATE has made a transition from Run to Error Reset. |

#### Bit 3 – CRERR CrErr

| Value | Description                           |
|-------|---------------------------------------|
| 1     | Link interface credit error detected. |

**Bit 2 – ESCERR ESCErr**

| Value | Description                        |
|-------|------------------------------------|
| 1     | Link interface ESC error detected. |

**Bit 1 – PARERR ParErr**

| Value | Description                           |
|-------|---------------------------------------|
| 1     | Link interface parity error detected. |

**Bit 0 – DISERR DisErr**

| Value | Description                                  |
|-------|----------------------------------------------|
| 1     | Link interface disconnection error detected. |

### 36.8.7 SpW Link x Pending Read Interrupt

**Name:** SPW\_LINKx\_PI\_R  
**Offset:** 0x0408 + (x-1)\*0x80 [x=1..2]  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bit 9 – ESCEVENT1 Escape Event 1

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 1     | Incoming Escape Character matched SPW_LINKx_ESCCHAREVENT1. |

#### Bit 8 – ESCEVENT2 Escape Event 2

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 1     | Incoming Escape Character matched SPW_LINKx_ESCCHAREVENT2. |

#### Bit 7 – DISCARD Discard

| Value | Description                |
|-------|----------------------------|
| 1     | Transmit packet discarded. |

#### Bit 6 – EEPREC EEP Received

| Value | Description   |
|-------|---------------|
| 1     | EEP received. |

#### Bit 5 – EEPTRANS EEP Transmitted

| Value | Description                                                                                                                         |
|-------|-------------------------------------------------------------------------------------------------------------------------------------|
| 1     | EEP transmitted. If the link is not running it might not have been transmitted on the link, just passed the interface to the codec. |

#### Bit 4 – LINKABORT LinkAbort

| Value | Description                                                               |
|-------|---------------------------------------------------------------------------|
| 1     | SPW_LINKx_STATUS.LINKSTATE has made a transition from Run to Error Reset. |

#### Bit 3 – CRERR CrErr

| Value | Description                           |
|-------|---------------------------------------|
| 1     | Link interface credit error detected. |

#### Bit 2 – ESCERR ESCErr

| Value | Description                        |
|-------|------------------------------------|
| 1     | Link interface ESC error detected. |

#### Bit 1 – PARERR ParErr

| Value | Description                           |
|-------|---------------------------------------|
| 1     | Link interface parity error detected. |

#### Bit 0 – DISERR DisErr

| Value | Description                                  |
|-------|----------------------------------------------|
| 1     | Link interface disconnection error detected. |

### 36.8.8 SpW Link x Pending Read and Clear Interrupt

**Name:** SPW\_LINKx\_PI\_RCS

#### Bit 9 – ESCEVENT1 Escape Event 1

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 1     | Incoming Escape Character matched SPW_LINKx_ESCCHAREVENT1. |

#### Bit 8 – ESCEVENT2 Escape Event 2

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 1     | Incoming Escape Character matched SPW_LINKx_ESCCHAREVENT2. |

#### Bit 7 – DISCARD Discard

| Value | Description                |
|-------|----------------------------|
| 1     | Transmit packet discarded. |

#### Bit 6 – EEPREC EEP Received

| Value | Description   |
|-------|---------------|
| 1     | EEP received. |

#### Bit 5 – EEPTRANS EEP Transmitted

| Value | Description                                                                                                                         |
|-------|-------------------------------------------------------------------------------------------------------------------------------------|
| 1     | EEP transmitted. If the link is not running it might not have been transmitted on the link, just passed the interface to the codec. |

#### Bit 4 – LINKABORT LinkAbort

| Value | Description                                                               |
|-------|---------------------------------------------------------------------------|
| 1     | SPW_LINKx_STATUS.LINKSTATE has made a transition from Run to Error Reset. |

#### Bit 3 – CRERR CrErr

| Value | Description                           |
|-------|---------------------------------------|
| 1     | Link interface credit error detected. |

**Bit 2 – ESCERR ESCErr**

| Value | Description                        |
|-------|------------------------------------|
| 1     | Link interface ESC error detected. |

**Bit 1 – PARERR ParErr**

| Value | Description                           |
|-------|---------------------------------------|
| 1     | Link interface parity error detected. |

**Bit 0 – DISERR DisErr**

| Value | Description                                  |
|-------|----------------------------------------------|
| 1     | Link interface disconnection error detected. |

### 36.8.9 SpW Link x Interrupt Mask

**Name:** SPW\_LINKx\_IM

#### Bit 9 – ESCEVENT1 Escape Event 1

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 1     | Incoming Escape Character matched SPW_LINKx_ESCCHAREVENT1. |

#### Bit 8 – ESCEVENT2 Escape Event 2

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 1     | Incoming Escape Character matched SPW_LINKx_ESCCHAREVENT2. |

#### Bit 7 – DISCARD Discard

| Value | Description                |
|-------|----------------------------|
| 1     | Transmit packet discarded. |

#### Bit 6 – EEPREC EEP Received

| Value | Description  |
|-------|--------------|
| 1     | EEP received |

#### Bit 5 – EEPTRANS EEP Transmitted

| Value | Description                                                                                                                         |
|-------|-------------------------------------------------------------------------------------------------------------------------------------|
| 1     | EEP transmitted. If the link is not running it might not have been transmitted on the link, just passed the interface to the codec. |

#### Bit 4 – LINKABORT LinkAbort

| Value | Description                                                               |
|-------|---------------------------------------------------------------------------|
| 1     | SPW_LINKx_STATUS.LINKSTATE has made a transition from Run to Error Reset. |

#### Bit 3 – CRERR CrErr

| Value | Description                           |
|-------|---------------------------------------|
| 1     | Link interface credit error detected. |

**Bit 2 – ESCERR ESCErr**

| Value | Description                        |
|-------|------------------------------------|
| 1     | Link interface ESC error detected. |

**Bit 1 – PARERR ParErr**

| Value | Description                           |
|-------|---------------------------------------|
| 1     | Link interface parity error detected. |

**Bit 0 – DISERR DisErr**

| Value | Description                                  |
|-------|----------------------------------------------|
| 1     | Link interface disconnection error detected. |

| Access | W       | W      | W        | W         | W     | W      | W      | W      |
| Reset  | 0       | 0      | 0        | 0         | 0     | 0      | 0      | 0      |

**Bit 9 – ESCEVENT1** Escape Event 1

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 1     | Incoming Escape Character matched SPW_LINKx_ESCCHAREVENT1. |

**Bit 8 – ESCEVENT2** Escape Event 2

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 1     | Incoming Escape Character matched SPW_LINKx_ESCCHAREVENT2. |

**Bit 7 – DISCARD** Discard

| Value | Description                |
|-------|----------------------------|
| 1     | Transmit packet discarded. |

**Bit 6 – EEPREC** EEP Received

| Value | Description   |
|-------|---------------|
| 1     | EEP received. |

**Bit 5 – EEPTRANS** EEP Transmitted

| Value | Description                                                                                                                         |
|-------|-------------------------------------------------------------------------------------------------------------------------------------|
| 1     | EEP transmitted. If the link is not running it might not have been transmitted on the link, just passed the interface to the codec. |

**Bit 4 – LINKABORT** LinkAbort

| Value | Description                                                               |
|-------|---------------------------------------------------------------------------|
| 1     | SPW_LINKx_STATUS.LINKSTATE has made a transition from Run to Error Reset. |

**Bit 3 – CRERR** CrErr

| Value | Description                           |
|-------|---------------------------------------|
| 1     | Link interface credit error detected. |

#### Bit 2 – ESCERR ESCErr

| Value | Description                        |
|-------|------------------------------------|
| 1     | Link interface ESC error detected. |

#### Bit 1 – PARERR ParErr

| Value | Description                           |
|-------|---------------------------------------|
| 1     | Link interface parity error detected. |

#### Bit 0 – DISERR DisErr

| Value | Description                                  |
|-------|----------------------------------------------|
| 1     | Link interface disconnection error detected. |

**36.8.11 SpW Link x Interrupt Set Mask**

**Name:** SPW\_LINKx\_IM\_S  
**Offset:**  $0x0418 + (x-1)*0x80$  [x=1..2]  
**Reset:** 0x00000000  
**Property:** Write-only

**Bit 9 – ESCEVENT1** Escape Event 1

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 1     | Incoming Escape Character matched SPW_LINKx_ESCCHAREVENT1. |

**Bit 8 – ESCEVENT2** Escape Event 2

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 1     | Incoming Escape Character matched SPW_LINKx_ESCCHAREVENT2. |

**Bit 7 – DISCARD** Discard

| Value | Description                |
|-------|----------------------------|
| 1     | Transmit packet discarded. |

**Bit 6 – EEPREC** EEP Received

| Value | Description   |
|-------|---------------|
| 1     | EEP received. |

**Bit 5 – EEPTRANS** EEP Transmitted

| Value | Description                                                                                                                         |
|-------|-------------------------------------------------------------------------------------------------------------------------------------|
| 1     | EEP transmitted. If the link is not running it might not have been transmitted on the link, just passed the interface to the codec. |

**Bit 4 – LINKABORT** LinkAbort

| Value | Description                                                               |
|-------|---------------------------------------------------------------------------|
| 1     | SPW_LINKx_STATUS.LINKSTATE has made a transition from Run to Error Reset. |

**Bit 3 – CRERR** CrErr

| Value | Description                           |
|-------|---------------------------------------|
| 1     | Link interface credit error detected. |

#### Bit 2 – ESCERR ESCErr

| Value | Description                        |
