|-------|------------------------------------|
| 1     | Link interface ESC error detected. |

#### Bit 1 – PARERR ParErr

| Value | Description                           |
|-------|---------------------------------------|
| 1     | Link interface parity error detected. |

#### Bit 0 – DISERR DisErr

| Value | Description                                  |
|-------|----------------------------------------------|
| 1     | Link interface disconnection error detected. |

### 36.8.12 SpW Link x Interrupt Clear Mask

**Name:** SPW\_LINKx\_IM\_C  
**Offset:** 0x041C + (x-1)\*0x80 [x=1..2]  
**Reset:** 0x00000000  
**Property:** Write-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|

|        |    |    |    |    |    |    | ESCEVENT1 | ESCEVENT2 |
| Access |    |    |    |    |    |    | W         | W         |
| Reset  |    |    |    |    |    |    | 0         | 0         |

|        |         |        |          |           |       |        |        |        |
|--------|---------|--------|----------|-----------|-------|--------|--------|--------|
| Bit    | 7       | 6      | 5        | 4         | 3     | 2      | 1      | 0      |
|        | DISCARD | EEPREC | EEPTRANS | LINKABORT | CRERR | ESCERR | PARERR | DISERR |
| Access | W       | W      | W        | W         | W     | W      | W      | W      |
| Reset  | 0       | 0      | 0        | 0         | 0     | 0      | 0      | 0      |

#### Bit 9 – ESCEVENT1 Escape Event 1

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 1     | Incoming Escape Character matched SPW_LINKx_ESCCHAREVENT1. |

#### Bit 8 – ESCEVENT2 Escape Event 2

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 1     | Incoming Escape Character matched SPW_LINKx_ESCCHAREVENT2. |

#### Bit 7 – DISCARD Discard

| Value | Description                |
|-------|----------------------------|
| 1     | Transmit packet discarded. |

#### Bit 6 – EEPREC EEP Received

| Value | Description   |
|-------|---------------|
| 1     | EEP received. |

#### Bit 5 – EEPTRANS EEP Transmitted

| Value | Description                                                                                                                         |
|-------|-------------------------------------------------------------------------------------------------------------------------------------|
| 1     | EEP transmitted. If the link is not running it might not have been transmitted on the link, just passed the interface to the codec. |

#### Bit 4 – LINKABORT LinkAbort

| Value | Description                                                               |
|-------|---------------------------------------------------------------------------|
| 1     | SPW_LINKx_STATUS.LINKSTATE has made a transition from Run to Error Reset. |

#### Bit 3 – CRERR CrErr

| Value | Description                           |
|-------|---------------------------------------|
| 1     | Link interface credit error detected. |

**Bit 2 – ESCERR ESCErr**

| Value | Description                        |
|-------|------------------------------------|
| 1     | Link interface ESC error detected. |

**Bit 1 – PARERR ParErr**

| Value | Description                           |
|-------|---------------------------------------|
| 1     | Link interface parity error detected. |

**Bit 0 – DISERR DisErr**

| Value | Description                                  |
|-------|----------------------------------------------|
| 1     | Link interface disconnection error detected. |

### 36.8.13 SpW Link x Config

**Name:** SPW\_LINKx\_CFG  
**Offset:** 0x0420 + (x-1)\*0x80 [x=1..2]  
**Reset:** 0x00000002  
**Property:** Read/Write

#### Bits 1:0 – COMMAND[1:0] Command

| Value | Name         | Description                                                                     |
|-------|--------------|---------------------------------------------------------------------------------|
| 0     | Link Disable | The link proceeds directly to the ErrorReset state when reaching the Run state. |
| 1     | No command   | State is not actively changed.                                                  |
| 2     | Auto Start   | The Codec waits in state Ready until the first NULL character is received.      |
| 3     | Link Start   | SpaceWire link can proceed to Started state.                                    |

### 36.8.14 SpW Link x Clock Division

**Name:** SPW\_LINKx\_CLKDIV  
**Offset:** 0x0424 + (x-1)\*0x80 [x=1..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |    |    |                |     |     |     |     |
|--------|----|----|----|----------------|-----|-----|-----|-----|
| Bit    | 31 | 30 | 29 | 28             | 27  | 26  | 25  | 24  |
|        |    |    |    |                |     |     |     |     |
| Access |    |    |    |                |     |     |     |     |
| Reset  |    |    |    |                |     |     |     |     |
| Bit    | 23 | 22 | 21 | 20             | 19  | 18  | 17  | 16  |
|        |    |    |    | TXINITDIV[4:0] |     |     |     |     |
| Access |    |    |    | R/W            | R/W | R/W | R/W | R/W |
| Reset  |    |    |    | 0              | 0   | 0   | 0   | 0   |
| Bit    | 15 | 14 | 13 | 12             | 11  | 10  | 9   | 8   |
|        |    |    |    |                |     |     |     |     |
| Access |    |    |    |                |     |     |     |     |
| Reset  |    |    |    |                |     |     |     |     |
| Bit    | 7  | 6  | 5  | 4              | 3   | 2   | 1   | 0   |
|        |    |    |    | TXOPERDIV[4:0] |     |     |     |     |
| Access |    |    |    | R/W            | R/W | R/W | R/W | R/W |
| Reset  |    |    |    | 0              | 0   | 0   | 0   | 0   |

#### Bits 20:16 – TXINITDIV[4:0] TxInitDiv

The initial transmitter signalling bitrate is  $\text{SpwClk} / (0.5 \times (\text{TxInitDiv} + 1))$ .

#### Bits 4:0 – TXOPERDIV[4:0] TxOperDiv

The operating transmitter signalling bitrate is  $\text{SpwClk} / (0.5 \times (\text{TxOperDiv} + 1))$   
(Double Data Rate).

**36.8.15 SpW Link x Status**

**Name:** SPW\_LINKx\_STATUS  
**Offset:** 0x0428 + (x-1)\*0x80 [x=1..2]  
**Reset:** 0x00710002  
**Property:** Read-only

| Reset  | 0             | 0 | 0 | 0 |   | 0              | 1 | 0 |

**Bit 25 – SEEN5 SEEN5**

| Value | Description     |
|-------|-----------------|
| 1     | State Run seen. |

**Bit 24 – SEEN4 SEEN4**

| Value | Description            |
|-------|------------------------|
| 1     | State Connecting seen. |

**Bit 23 – SEEN3 SEEN3**

| Value | Description         |
|-------|---------------------|
| 1     | State Started seen. |

**Bit 22 – SEEN2 SEEN2**

| Value | Description       |
|-------|-------------------|
| 1     | State Ready seen. |

**Bit 21 – SEEN1 SEEN1**

| Value | Description           |
|-------|-----------------------|
| 1     | State ErrorWait seen. |

**Bit 20 – SEEN0 SEEN0**

| Value | Description            |
|-------|------------------------|
| 1     | State ErrorReset seen. |

**Bit 19 – GOTNCHAR GotNChar**

| Value | Description           |
|-------|-----------------------|
| 1     | Receiver got N-chars. |

#### Bit 18 – GOTFCT GotFCT

| Value | Description       |
|-------|-------------------|
| 1     | Receiver got FCT. |

#### Bit 17 – GOTNULL GotNull

| Value | Description        |
|-------|--------------------|
| 1     | Receiver got NULL. |

#### Bit 16 – TXEMPTY TxEmpty

| Value | Description                       |
|-------|-----------------------------------|
| 0     | The transmit buffer is not empty. |
| 1     | The transmit buffer is empty.     |

#### Bits 8:4 – TXDEFDIV[4:0] TxDefDiv

The strapped reset value for transmitter bitrates.

#### Bits 2:0 – LINKSTATE[2:0] LinkState

| Value | Name       | Description                                  |
|-------|------------|----------------------------------------------|
| 0     | ERRORRESET | CODEC link state machine in ErrorReset state |
| 1     | ERRORWAIT  | CODEC link state machine in ErrorWait state  |
| 2     | READY      | CODEC link state machine in Ready state      |
| 3     | STARTED    | CODEC link state machine in Started state    |
| 4     | CONNECTING | CODEC link state machine in Connecting state |
| 5     | RUN        | CODEC link state machine in Run state        |

### 36.8.16 SpW Link x Software Reset

**Name:** SPW\_LINKx\_SWRESET  
**Offset:** 0x042C + (x-1)\*0x80 [x=1..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |                |     |     |     |     |     |     |     |

#### Bit 4 – ACT Activated

**Note:** The content of the register is automatically ANDed with the corresponding masked register to obtain the masked information directly.

| Value | Description                |
|-------|----------------------------|
| 1     | Received buffer activated. |

#### Bit 3 – DISCARD Packet Discard

| Value | Description                       |
|-------|-----------------------------------|
| 1     | An incoming packet was discarded. |

#### Bit 2 – EEP EEP Seen

| Value | Description               |
|-------|---------------------------|
| 1     | An incoming EEP detected. |

#### Bit 1 – EOP EOP Seen

| Value | Description               |
|-------|---------------------------|
| 1     | An incoming EOP detected. |

#### Bit 0 – DEACT Deactivated

| Value | Description                  |
|-------|------------------------------|
| 1     | Received buffer deactivated. |

### 36.8.38 SpW PkTRx 1 Pending Read and Clear Masked Interrupt

**Name:** SPW\_PKTRX1\_PI\_RCM  
**Offset:** 0x0804  
**Reset:** 0x00000000  
**Property:** Read-only

**Note:** This register is cleared on read.

**Note:** The register contents are automatically ANDed with the corresponding masked register to obtain the masked information directly.

| 1     | Received buffer activated. |

#### Bit 3 – DISCARD Packet Discard

| Value | Description                       |
|-------|-----------------------------------|
| 1     | An incoming packet was discarded. |

#### Bit 2 – EEP EEP seen

| Value | Description               |
|-------|---------------------------|
| 1     | An incoming EEP detected. |

#### Bit 1 – EOP EOP seen

| Value | Description               |
|-------|---------------------------|
| 1     | An incoming EOP detected. |

#### Bit 0 – DEACT Deactivated

| Value | Description                 |
|-------|-----------------------------|
| 1     | Received buffer deactivated |

|        |     |     |     |     |     |     |     | MAXCNT[7:0] |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W         |
| Reset  | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0           |

**Bit 30 – SPLIT** Split Pkt

Select how Start may switch buffers.

| Value | Description                                                           |
|-------|-----------------------------------------------------------------------|
| 0     | No effect.                                                            |
| 1     | If a start condition is met, split any ongoing packet and deactivate. |

**Bits 24:22 – START[2:0]** Start Mode

| Value | Name       | Description                                                                 |
|-------|------------|-----------------------------------------------------------------------------|
| 0     | STARTEVENT | Start if any bit in Start Value matches an incoming event                   |
| 1     | STARTNOW   | Start immediately. Request a deactivation on next packet boundary.          |
| 2     | STARTTCH1  | Start if Start Value matches an incoming Time Code from Time Code Handler 1 |
| 3     | Reserved   | Reserved                                                                    |
| 4     | STARTLATER | Start when current buffer is deactivated (e.g., by buffer becoming full).   |

**Bits 21:16 – VALUE[5:0]** Start Value

Activate on matching Start Value. The interpretation depends on the START field.

**Bits 15:0 – MAXCNT[15:0]** Max Count

Next Buffer Packet Length, measured in number of packets, i.e. entries of 16 bytes. If MaxCnt is zero, the entire register is cleared.

### 36.8.51 SpW PkTRx 1 Current Buffer Data Address

**Bit 31 – LOCKED** Locked

| Value | Description                                               |
|-------|-----------------------------------------------------------|
| 1     | Previous buffer is locked. This bit is cleared when read. |

**Bit 19 – DMAERR** DMA Error

| Value | Description                    |
|-------|--------------------------------|
| 1     | DMA Error during packet write. |

**Bit 18 – FULLD** Buffer Data Full

| Value | Description                          |
|-------|--------------------------------------|
| 1     | Receive Buffer data has become full. |

**Bit 17 – FULLI** Buffer Info Full

| Value | Description                                 |
|-------|---------------------------------------------|
| 1     | Receive Buffer information has become full. |

**Bit 16 – EEP** EEP seen

| Value | Description                              |
|-------|------------------------------------------|
| 1     | An incoming EEP detected in this buffer. |

**Bits 15:0 – CNT[15:0]** Count

Number of packets received in previous buffer, i.e. number of Receive Packet Info entries stored.

| Reset  |    |    |    |    | 0   | 0   | 0   | 0     |

#### Bit 3 – EEP EEP Sent

Note: the content of the register is automatically ANDed with the corresponding masked register to obtain directly the masked information

| Value | Description                                              |
|-------|----------------------------------------------------------|
| 1     | An EEP was sent, i.e., an outgoing packet was discarded. |

#### Bit 2 – EOP EOP Sent

| Value | Description      |
|-------|------------------|
| 1     | An EOP was sent. |

#### Bit 1 – ACT Activated

| Value | Description          |
|-------|----------------------|
| 1     | Send List activated. |

#### Bit 0 – DEACT Deactivated

| Value | Description            |
|-------|------------------------|
| 1     | Send List deactivated. |

### 36.8.59 SpW PktTx 1 Pending Read and Clear Masked Interrupt

**Name:** SPW\_PKTTX1\_PI\_RCM  
**Offset:** 0x0C04  
**Reset:** 0x00000000  
**Property:** Read-only

**Note:** This register is cleared on read.

**Note:** The register contents are automatically ANDed with the corresponding masked register to obtain the masked information directly.

| Bit    | 7 | 6 | 5 | 4 | 3   | 2   | 1   | 0     |
|        |   |   |   |   | EEP | EOP | ACT | DEACT |
| Access |   |   |   |   | W   | W   | W   | W     |
| Reset  |   |   |   |   | 0   | 0   | 0   | 0     |

#### Bit 3 – EEP EEP Sent

| Value | Description                                              |
|-------|----------------------------------------------------------|
| 1     | An EEP was sent, i.e., an outgoing packet was discarded. |

#### Bit 2 – EOP EOP sent

| Value | Description      |
|-------|------------------|
| 1     | An EOP was sent. |

#### Bit 1 – ACT Activated

| Value | Description          |
|-------|----------------------|
| 1     | Send List activated. |

#### Bit 0 – DEACT Deactivated

| Value | Description            |
|-------|------------------------|
| 1     | Send List deactivated. |

| Bit    | 15 | 14 | 13 | 12 | 11    | 10        | 9   | 8   |
|        |    |    |    |    |       |           |     |     |
| Access |    |    |    |    |       |           |     |     |
| Reset  |    |    |    |    |       |           |     |     |
| Bit    | 7  | 6  | 5  | 4  | 3     | 2         | 1   | 0   |
|        |    |    |    |    | DEACT | PENDING   | ACT | ARM |
| Access |    |    |    |    | R/W   | R/W       | R/W | R/W |
| Reset  |    |    |    |    | 0     | 0         | 0   | 0   |

### Bits 18:16 – PREV[2:0] Previous

Describes status of last deactivated send list. This is set simultaneously with the Deact interrupt. The field is locked when non-zero, and any active send list will not be able to deactivate. Writing any value to this register clears the PREV field.

| Value  | Name           | Description                         |
|--------|----------------|-------------------------------------|
| 0      | NOINFO         | No information. Field not locked.   |
| 1      | LASTSENDLISTOK | Last send list fully done           |
| 2      | ABORTEDMEMERR  | Aborted due to memory access error. |
| 3      | ABORTEDNEWSD   | Aborted by new send list.           |
| 4      | ABORTEDUSERCMD | Aborted by direct user command.     |
| 5      | ABORTEDTIMEOUT | Aborted by timeout.                 |
| others | OTHERS         | INVALID                             |

### Bit 3 – DEACT Deactivating

| Value | Description                               |
|-------|-------------------------------------------|
| 1     | Current Send list is ready to deactivate. |

### Bit 2 – PENDING Pending

| Value | Description                |
|-------|----------------------------|
| 1     | Next Send list is pending. |

### Bit 1 – ACT Active

| Value | Description               |
|-------|---------------------------|
| 1     | Current Send list active. |

### Bit 0 – ARM Armed

| Value | Description           |
|-------|-----------------------|
| 1     | Next Send list armed. |

### 36.8.67 SpW PkTx 1 Next Send List Router Bytes

**Name:** SPW\_PKTTX1\_NXTSENDROUT

#### Bit 16 – RMAPENA RMAP Enable

| Value | Description                  |
|-------|------------------------------|
| 0     | Disable Access to this RMAP. |
| 1     | Enable Access to this RMAP.  |

#### Bits 15:8 – TLA[7:0] Address

Target Logical Address. Any incoming RMAP command must have a TLA matching this value, or TLA = 0xFE, in order to be accepted.

#### Bits 7:0 – DESTKEY[7:0] DestKey

RMAP Destination Key. Any incoming RMAP command must have a matching Destination Key in order to be accepted. If not, the complete packet is rejected during header check.

| Value | Name            | Description                                                                                                                            |
|-------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------|
| 0     | NOERROR         | No error detected.                                                                                                                     |
| 1     | DMAERROR        | Error while DMA accessing the internal bus, e.g., illegal address.                                                                     |
| 2     | RMAPERROR       | Unused RMAP command according to [RMAP].                                                                                               |
| 3     | DESTKEYERROR    | Destination key error.                                                                                                                 |
| 4     | DATAERCERROR    | Data CRC error.                                                                                                                        |
| 5     | EOPERROR        | Early EOP in header or data, i.e., EOP has been received with less data than expected from the RMAP command header.                    |
| 6     | CARGOERROR      | Cargo too large. Late EOP or EEP in data, i.e., EOP/EEP has been received with more data than expected from the RMAP command header.   |
| 7     | EEPERROR        | Early EEP in data for RMAP commands. EEP has been received with less data or exactly as much as expected from the RMAP command header. |
| 10    | CMDERROR        | Authorization error:<br>Invalid or unsupported command.                                                                                |
| 12    | TLAERROR        | Non-matching Target Logical Address.                                                                                                   |
| 16    | HEADERCRCERROR  | Incorrect header CRC.                                                                                                                  |
| 17    | PROTOCOLIDERROR | Protocol Identifier not supported.                                                                                                     |
| 18    | REPLYADDERROR   | Unsupported reply address length.                                                                                                      |

| Reset  |         |     |            |     |     |     |     |     |
| Bit    | 15      | 14  | 13         | 12  | 11  | 10  | 9   | 8   |
| Access | ONESHOT | PPS | EVENT[5:0] |     |     |     |     |     |
| Reset  | R/W     | R/W | R/W        | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0       | 0   | 0          | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7       | 6   | 5          | 4   | 3   | 2   | 1   | 0   |
| Access |         |     | VALUE[5:0] |     |     |     |     |     |
| Reset  |         |     | R/W        | R/W | R/W | R/W | R/W | R/W |
| Reset  |         |     | 0          | 0   | 0   | 0   | 0   | 0   |

#### Bit 15 – ONESHOT One Shot

| Value | Description                               |
|-------|-------------------------------------------|
| 1     | Clears this register after restart event. |

#### Bit 14 – PPS Pps

| Value | Description                                 |
|-------|---------------------------------------------|
| 1     | Uses Pps input as event source for restart. |

#### Bits 13:8 – EVENT[5:0] Event

Uses Event input as event source for restart.

| Description |                       |
|-------------|-----------------------|
| Event [5:0] | Internal Signal Event |
| Bit 0       | RTCOU0                |
| Bit 1       | RTCOU1                |
| Bit 2       | Reserved              |
| Bit 3       | Reserved              |
| Bit 4       | Reserved              |

#### Bits 5:0 – VALUE[5:0] Value

Time Code value to set at restart event.

| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 15:8 – UNCORR[7:0]** Uncorrectable Error  
 An uncorrectable error has been detected.

**Bits 7:0 – CORR[7:0]** Correction Count  
 Number of EDAC corrections made. Saturates at max.

## 37. Ethernet MAC (GMAC)

### 37.1 Description

The Ethernet MAC (GMAC) module implements a 10/100 Mbps Ethernet MAC compatible with the IEEE 802.3 standard. The GMAC can operate in either half or full duplex mode at all supported speeds. The [GMAC Network Configuration Register](#) is used to select the speed, duplex mode and interface type (MII, RMII).

### 37.2 Embedded Characteristics

- Compatible with IEEE Standard 802.3
- 10, 100 Mbps Operation
- Full and Half Duplex Operation at all Supported Speeds of Operation
- Statistics Counter Registers for RMON/MIB
- MII/RMII Interface to the Physical Layer
- Integrated Physical Coding
- Direct Memory Access (DMA) Interface to External Memory
- Support for 6 Priority Queues
- 8 Kbytes Transmit RAM and 4 Kbytes Receive RAM (refer to [Table 37-5](#) for queue-specific sizes)
- Programmable Burst Length and Endianism for DMA
- Interrupt Generation to Signal Receive and Transmit Completion, Errors or Other Events
- Automatic Pad and Cyclic Redundancy Check (CRC) Generation on Transmitted Frames
- Automatic Discard of Frames Received with Errors
- Receive and Transmit IP, TCP and UDP Checksum Offload. Both IPv4 and IPv6 Packet Types Supported
- Address Checking Logic for Four Specific 48-bit Addresses, Four Type IDs, Promiscuous Mode, Hash Matching of Unicast and Multicast Destination Addresses and Wake-on-LAN
- Management Data Input/Output (MDIO) Interface for Physical Layer Management
- Support for Jumbo Frames up to 10240 Bytes
- Full Duplex Flow Control with Recognition of Incoming Pause Frames and Hardware Generation of Transmitted Pause Frames
- Half Duplex Flow Control by Forcing Collisions on Incoming Frames
- Support for 802.1Q VLAN Tagging with Recognition of Incoming VLAN and Priority Tagged Frames
- Support for 802.1Qbb Priority-based Flow Control
- Programmable Inter Packet Gap (IPG) Stretch
- Recognition of IEEE 1588 PTP Frames
- IEEE 1588 Timestamp Unit (TSU)
- Support for 802.1AS Timing and Synchronization
- Supports 802.1Qav Traffic Shaping on Two Highest Priority Queues

### 37.3 Block Diagram

Figure 37-1. Block Diagram

### 37.4 Signal Interfaces

The GMAC includes the following signal interfaces:

- MII, RMII to an external PHY
- MDIO interface for external PHY management
- Slave APB interface for accessing GMAC registers
- Master AHB interface for memory access
- GTSUCOMP signal for TSU timer count value comparison

Table 37-1. GMAC Connections in Different Modes

| Signal Name | Function                          | MI       |
|-------------|-----------------------------------|----------|
| GTCK        | Transmit Clock or Reference Clock | TXCK     |
| GTEN        | Transmit Enable                   | TXEN     |
| GT[3..0]    | Transmit Data                     | TXD[3:0] |
| GTERR       | Transmit Coding Error             | TXER     |
| GRCK        | Receive Clock                     | RXCK     |
| GRDV        | Receive Data Valid                | RXDV     |
| GR[3..0]    | Receive Data                      | RXD[3:0] |
| GRERR       | Receive Error                     | RXER     |
| GCRS        | Carrier Sense and Data Valid      | CRS      |
| GCOL        | Collision Detect                  | COL      |
| GMDC        | Management Data Clock             | MDC      |
| GMDIO       | Management Data Input/Output      | MDIO     |

**Table 37-2.** GMAC Connections in Different Modes

| Signal Name         | Function                          | MII      | RMII     |
|---------------------|-----------------------------------|----------|----------|
| GTCK <sup>(1)</sup> | Transmit Clock or Reference Clock | TXCK     | REFCK    |
| GTEN                | Transmit Enable                   | TXEN     | TXEN     |
| GTX[3..0]           | Transmit Data                     | TXD[3:0] | TXD[1:0] |
| GTXR                | Transmit Coding Error             | TXER     | Not Used |
| GRCK                | Receive Clock                     | RXCK     | Not Used |
| GRXDV               | Receive Data Valid                | RXDV     | CRSDV    |
| GRX[3..0]           | Receive Data                      | RXD[3:0] | RXD[1:0] |
| GRXR                | Receive Error                     | RXER     | RXER     |
| GCRS                | Carrier Sense and Data Valid      | CRS      | Not Used |
| GCOL                | Collision Detect                  | COL      | Not Used |
| GMDC                | Management Data Clock             | MDC      | MDC      |
| GMDIO               | Management Data Input/Output      | MDIO     | MDIO     |

**Note:**

1. Input only. GTCK must be provided with a 25 MHz/50 MHz external crystal oscillator for MII / RMII interfaces, respectively.

## 37.5 Product Dependencies

### 37.5.1 I/O Lines

The pins used for interfacing the GMAC may be multiplexed with PIO lines. The programmer must first program the PIO Controller to assign the pins to their peripheral function. If I/O lines of the GMAC are not used by the application, they can be used for other purposes by the PIO Controller.

### 37.5.2 Power Management

The GMAC is not continuously clocked. The user must first enable the GMAC clock in the Power Management Controller before using it.

### 37.5.3 Interrupt Sources

The GMAC interrupt line is connected to one of the internal sources of the interrupt controller. Using the GMAC interrupt requires prior programming of the interrupt controller.

The GMAC features 6 interrupt sources. Refer to the table “Peripheral Identifiers” in the section “Peripherals” for the interrupt numbers for GMAC priority queues.

## 37.6 Functional Description

### 37.6.1 Media Access Controller

The Media Access Controller (MAC) transmit block takes data from FIFO, adds preamble and, if necessary, pad and frame check sequence (FCS). Both half duplex and full duplex Ethernet modes of operation are supported. When operating in half duplex mode, the MAC transmit block generates data according to the carrier sense multiple access with collision detect (CSMA/CD) protocol. The start of transmission is deferred if carrier sense (CRS) is active. If collision (COL) becomes active during transmission, a jam sequence is asserted and the transmission is retried after a random backoff. The CRS and COL signals have no effect in full duplex mode.

The MAC receive block checks for valid preamble, FCS, alignment and length, and presents received frames to the MAC address checking block and FIFO. Software can configure the GMAC to receive jumbo frames up to 10240 bytes. It can optionally strip CRC from the received frame prior to transfer to FIFO.

The address checker recognizes four specific 48-bit addresses, can recognize four different type ID values, and contains a 64-bit Hash register for matching multicast and unicast addresses as required. It can recognize the broadcast address of all ones and copy all frames. The MAC can also reject all frames that are not VLAN tagged and recognize Wake on LAN events.

The MAC receive block supports offloading of IP, TCP and UDP checksum calculations (both IPv4 and IPv6 packet types supported), and can automatically discard bad checksum frames.

### 37.6.2 1588 Timestamp Unit

The 1588 timestamp unit (TSU) is implemented as a 94-bit timer.

The 48 upper bits [93:46] of the timer count seconds and are accessible in the [GMAC 1588 Timer Seconds High Register](#) (GMAC\_TSH) and [GMAC 1588 Timer Seconds Low Register](#) (GMAC\_TSL). The 30 lower bits [45:16] of the timer count nanoseconds and are accessible in the [GMAC 1588 Timer Nanoseconds Register](#) (GMAC\_TN). The lowest 16 bits [15:0] of the timer count sub-nanoseconds.

The 46 lower bits roll over when they have counted to one second. The timer increments by a programmable period (to approximately 15.2 femtoseconds resolution) with each MCK period and can also be adjusted in 1ns resolution (incremented or decremented) through APB register accesses.

### 37.6.3 AHB Direct Memory Access Interface

The GMAC DMA controller is connected to the MAC FIFO interface and provides a scatter-gather type capability for packet data storage.

The DMA implements packet buffering where dual-port memories are used to buffer multiple frames.

#### 37.6.3.1 Packet Buffer DMA

- Easier to guarantee maximum line rate due to the ability to store multiple frames in the packet buffer, where the number of frames is limited by the amount of packet buffer memory and Ethernet frame size
- Full store and forward, or partial store and forward programmable options (partial store will cater for shorter latency requirements)
- Support for Transmit TCP/IP checksum offload
- Support for priority queueing
- When a collision on the line occurs during transmission, the packet will be automatically replayed directly from the packet buffer memory rather than having to re-fetch through the AHB (full store and forward ONLY)
- Received error packets are automatically dropped before any of the packet is presented to the AHB (full store and forward ONLY), thus reducing AHB activity
- Supports manual RX packet flush capabilities
- Optional RX packet flush when there is lack of AHB resource

#### 37.6.3.2 Partial Store and Forward Using Packet Buffer DMA

The DMA uses SRAM-based packet buffers, and can be programmed into a low latency mode, known as Partial Store and Forward. This allows for a reduced latency as the full packet is not buffered before forwarding. Note that this option is only available when the device is configured for full duplex operation.

This feature is enabled via the programmable TX and RX Partial Store and Forward registers. When the transmit Partial Store and Forward mode is activated, the transmitter will only begin to forward the packet to the MAC when there is enough packet data stored in the packet buffer. Likewise, when the receive Partial Store and Forward mode is activated, the receiver will only begin to forward the packet to the AHB when enough packet data is stored in the packet buffer. The amount of packet

data required to activate the forwarding process is programmable via watermark registers which are located at the same address as the partial store and forward enable bits.

Note that the minimum operational value for the TX partial store and forward watermark is 20. There is no operational limit for the RX partial store and forward watermark. Enabling partial store and forward is a useful means to reduce latency, but there are performance implications.

The GMAC DMA uses separate transmit and receive lists of buffer descriptors, with each descriptor describing a buffer area in memory. This allows Ethernet packets to be broken up and scattered around the AHB memory space.

### 37.6.3.3 Receive AHB Buffers

Received frames, optionally including FCS, are written to receive AHB buffers stored in memory. The receive buffer depth is programmable in the range of 64 bytes to 16 Kbytes through the DMA Configuration register, with the default being 128 bytes.

The start location for each receive AHB buffer is stored in memory in a list of receive buffer descriptors at an address location pointed to by the receive buffer queue pointer. The base address for the receive buffer queue pointer is configured in software using the Receive Buffer Queue Base Address register.

Each list entry consists of two words. The first is the address of the receive AHB buffer and the second the receive status. If the length of a receive frame exceeds the AHB buffer length, the status word for the used buffer is written with zeroes except for the “start of frame” bit, which is always set for the first buffer in a frame. Bit zero of the address field is written to 1 to show the buffer has been used. The receive buffer manager then reads the location of the next receive AHB buffer and fills that with the next part of the received frame data. AHB buffers are filled until the frame is complete and the final buffer descriptor status word contains the complete frame status. Refer to the table below for details of the receive buffer descriptor list.

Each receive AHB buffer start location is a word address. The start of the first AHB buffer in a frame can be offset by up to three bytes, depending on the value written to bits 14 and 15 of the Network Configuration register. If the start location of the AHB buffer is offset, the available length of the first AHB buffer is reduced by the corresponding number of bytes.

**Table 37-3. Receive Buffer Descriptor Entry**

| Bit    | Function                                                                                                                                                                                                                                                                                                                  |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Word 0 |                                                                                                                                                                                                                                                                                                                           |
| 31:2   | Address of beginning of buffer                                                                                                                                                                                                                                                                                            |
| 1      | Wrap—marks last descriptor in receive buffer descriptor list.                                                                                                                                                                                                                                                             |
| 0      | Ownership—needs to be zero for the GMAC to write data to the receive buffer. The GMAC sets this to one once it has successfully written a frame to memory. Software has to clear this bit before the buffer can be used again.                                                                                            |
| Word 1 |                                                                                                                                                                                                                                                                                                                           |
| 31     | Global all ones broadcast address detected                                                                                                                                                                                                                                                                                |
| 30     | Multicast hash match                                                                                                                                                                                                                                                                                                      |
| 29     | Unicast hash match                                                                                                                                                                                                                                                                                                        |
| 28     | –                                                                                                                                                                                                                                                                                                                         |
| 27     | Specific Address Register match found, bit 25 and bit 26 indicate which Specific Address Register causes the match.                                                                                                                                                                                                       |

If jumbo frames are enabled, these 12 bits are concatenated with bit[13] of the descriptor above.</p>                                                                                                                                                                                                                                                                         |

To receive frames, the AHB buffer descriptors must be initialized by writing an appropriate address to bits 31:2 in the first word of each list entry. Bit 0 must be written with zero. Bit 1 is the wrap bit and indicates the last entry in the buffer descriptor list.

The start location of the receive buffer descriptor list must be written with the receive buffer queue base address before reception is enabled (receive enable in the Network Control register). Once

reception is enabled, any writes to the Receive Buffer Queue Base Address register are ignored. When read, it will return the current pointer position in the descriptor list, though this is only valid and stable when receive is disabled.

If the filter block indicates that a frame should be copied to memory, the receive data DMA operation starts writing data into the receive buffer. If an error occurs, the buffer is recovered.

An internal counter within the GMAC represents the receive buffer queue pointer and it is not visible through the CPU interface. The receive buffer queue pointer increments by two words after each buffer has been used. It re-initializes to the receive buffer queue base address if any descriptor has its wrap bit set.

As receive AHB buffers are used, the receive AHB buffer manager sets bit zero of the first word of the descriptor to logic one indicating the AHB buffer has been used.

Software should search through the “used” bits in the AHB buffer descriptors to find out how many frames have been received, checking the start of frame and end of frame bits.

When the DMA is configured in the packet buffer Partial Store And Forward mode, received frames are written out to the AHB buffers as soon as enough frame data exists in the packet buffer. For both cases, this may mean several full AHB buffers are used before some error conditions can be detected. If a receive error is detected the receive buffer currently being written will be recovered. Previous buffers will not be recovered. As an example, when receiving frames with cyclic redundancy check (CRC) errors or excessive length, it is possible that a frame fragment might be stored in a sequence of AHB receive buffers. Software can detect this by looking for start of frame bit set in a buffer following a buffer with no end of frame bit set.

To function properly, a 10/100/1000 Ethernet system should have no excessive length frames or frames greater than 128 bytes with CRC errors. Collision fragments will be less than 128 bytes long, therefore it will be a rare occurrence to find a frame fragment in a receive AHB buffer, when using the default value of 128 bytes for the receive buffers size.

When in packet buffer full store and forward mode, only good received frames are written out of the DMA, so no fragments will exist in the AHB buffers due to MAC receiver errors. There is still the possibility of fragments due to DMA errors, for example used bit read on the second buffer of a multi-buffer frame.

If bit zero of the receive buffer descriptor is already set when the receive buffer manager reads the location of the receive AHB buffer, then the buffer has been already used and cannot be used again until software has processed the frame and cleared bit zero. In this case, the “buffer not available” bit in the Receive Status register is set and an interrupt triggered. The Receive Resource Error statistics register is also incremented.

When the DMA is configured in the packet buffer full store and forward mode, the user can optionally select whether received frames should be automatically discarded when no AHB buffer resource is available. This feature is selected via bit 24 of the DMA Configuration register (by default, the received frames are not automatically discarded). If this feature is off, then received packets will remain to be stored in the SRAM-based packet buffer until AHB buffer resource next becomes available. This may lead to an eventual packet buffer overflow if packets continue to be received when bit zero (used bit) of the receive buffer descriptor remains set. Note that after a used bit has been read, the receive buffer manager will re-read the location of the receive buffer descriptor every time a new packet is received. When the DMA is not configured in the packet buffer full store and forward mode and a used bit is read, the frame currently being received will be automatically discarded.

When the DMA is configured in the packet buffer full store and forward mode, a receive overrun condition occurs when the receive SRAM-based packet buffer is full, or because HRESP was not OK. In all other modes, a receive overrun condition occurs when either the AHB bus was not granted quickly enough, or because HRESP was not OK, or because a new frame has been detected by the receive block, but the status update or write back for the previous frame has not yet finished. For a

receive overrun condition, the receive overrun interrupt is asserted and the buffer currently being written is recovered. The next frame that is received whose address is recognized reuses the buffer.

In any packet buffer mode, a write to bit 18 of GMAC\_NCR will force a packet from the external SRAM-based receive packet buffer to be flushed. This feature is only acted upon when the RX DMA is not currently writing packet data out to AHB, i.e., it is in an IDLE state. If the RX DMA is active, a write to this bit is ignored.

### 37.6.3.4 Transmit AHB Buffers

Frames to transmit are stored in one or more transmit AHB buffers. Transmit frames can be between 1 and 16384 bytes long, so it is possible to transmit frames longer than the maximum length specified in the IEEE 802.3 standard. It should be noted that zero length AHB buffers are allowed and that the maximum number of buffers permitted for each transmit frame is 128.

The start location for each transmit AHB buffer is stored in memory in a list of transmit buffer descriptors at a location pointed to by the transmit buffer queue pointer. The base address for this queue pointer is set in software using the Transmit Buffer Queue Base Address register. Each list entry consists of two words. The first is the byte address of the transmit buffer and the second containing the transmit control and status. For the packet buffer DMA, the start location for each AHB buffer is a byte address, the bottom bits of the address being used to offset the start of the data from the data-word boundary (i.e., bits 2,1 and 0 are used to offset the address for 64-bit datapaths).

Frames can be transmitted with or without automatic CRC generation. If CRC is automatically generated, pad will also be automatically generated to take frames to a minimum length of 64 bytes. When CRC is not automatically generated (as defined in word 1 of the transmit buffer descriptor), the frame is assumed to be at least 64 bytes long and pad is not generated.

An entry in the transmit buffer descriptor list is described in the table below.

To transmit frames, the buffer descriptors must be initialized by writing an appropriate byte address to bits [31:0] in the first word of each descriptor list entry.

The second word of the transmit buffer descriptor is initialized with control information that indicates the length of the frame, whether or not the MAC is to append CRC and whether the buffer is the last buffer in the frame.

After transmission the status bits are written back to the second word of the first buffer along with the used bit. Bit 31 is the used bit which must be zero when the control word is read if transmission is to take place. It is written to one once the frame has been transmitted. Bits[29:20] indicate various transmit error conditions. Bit 30 is the wrap bit which can be set for any buffer within a frame. If no wrap bit is encountered the queue pointer continues to increment.

The Transmit Buffer Queue Base Address register can only be updated while transmission is disabled or halted; otherwise any attempted write will be ignored. When transmission is halted the transmit buffer queue pointer will maintain its value. Therefore when transmission is restarted the next descriptor read from the queue will be from immediately after the last successfully transmitted frame. While transmit is disabled (bit 3 of the Network Control register set low), the transmit buffer queue pointer resets to point to the address indicated by the Transmit Buffer Queue Base Address register. Note that disabling receive does not have the same effect on the receive buffer queue pointer.

Once the transmit queue is initialized, transmit is activated by writing to the transmit start bit (bit 9) of the Network Control register. Transmit is halted when a buffer descriptor with its used bit set is read, a transmit error occurs, or by writing to the transmit halt bit of the Network Control register. Transmission is suspended if a pause frame is received while the pause enable bit is set in the Network Configuration register. Rewriting the start bit while transmission is active is allowed. This is implemented with TXGO variable which is readable in the Transmit Status register at bit location 3. The TXGO variable is reset when:

- Transmit is disabled.
- A buffer descriptor with its ownership bit set is read.
- Bit 10, THALT, of the Network Control register is written.
- There is a transmit error such as too many retries or a transmit underrun.

To set TXGO, write TSTART to the bit 9 of the Network Control register. Transmit halt does not take effect until any ongoing transmit finishes.

If the DMA is configured for packet buffer Partial Store and Forward mode and a collision occurs during transmission of a multi-buffer frame, transmission will automatically restart from the first buffer of the frame. For packet buffer mode, the entire contents of the frame are read into the transmit packet buffer memory, so the retry attempt will be replayed directly from the packet buffer memory rather than having to re-fetch through the AHB.

If a used bit is read midway through transmission of a multi-buffer frame, this is treated as a transmit error. Transmission stops, GTXER is asserted and the FCS will be bad.

If transmission stops due to a transmit error or a used bit being read, transmission restarts from the first buffer descriptor of the frame being transmitted when the transmit start bit is rewritten.

**Table 37-4. Transmit Buffer Descriptor Entry**

| Bit    | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Word 0 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 31:0   | Byte address of buffer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Word 1 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 31     | Used—must be zero for the GMAC to read data to the transmit buffer. The GMAC sets this to one for the first buffer of a frame once it has been successfully transmitted. Software must clear this bit before the buffer can be used again.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 30     | Wrap—marks last descriptor in transmit buffer descriptor list. This can be set for any buffer within the frame.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 29     | Retry limit exceeded, transmit error detected                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 14     | Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

.....continued

| Bit  | Function         |
|------|------------------|
| 13:0 | Length of buffer |

### 37.6.3.5 DMA Bursting on the AHB

The DMA will always use SINGLE, or INCR type AHB accesses for buffer management operations. When performing data transfers, the AHB burst length used can be programmed using bits 4:0 of the DMA Configuration register so that either SINGLE, INCR or fixed length incrementing bursts (INCR4, INCR8 or INCR16) are used where possible.

When there is enough space and enough data to be transferred, the programmed fixed length bursts will be used. If there is not enough data or space available, for example when at the beginning or the end of a buffer, SINGLE type accesses are used. Also SINGLE type accesses are used at 1024 byte boundaries, so that the 1 Kbyte boundaries are not burst over as per AHB requirements.

The DMA will not terminate a fixed length burst early, unless an error condition occurs on the AHB or if receive or transmit are disabled in the Network Control register.

### 37.6.3.6 DMA Packet Buffer

The DMA uses packet buffers for both transmit and receive paths. This mode allows multiple packets to be buffered in both transmit and receive directions. This allows the DMA to withstand far greater access latencies on the AHB and make more efficient use of the AHB bandwidth. There are two modes of operation—Full Store and Forward and Partial Store and Forward.

As described in section [Partial Store and Forward Using Packet Buffer DMA](#), the DMA can be programmed into a low latency mode, known as Partial Store and Forward.

When the DMA is in full store and forward mode, full packets are buffered which provides the possibility to:

- Discard packets with error on the receive path before they are partially written out of the DMA, thus saving AHB bus bandwidth and driver processing overhead,
- Retry collided transmit frames from the buffer, thus saving AHB bus bandwidth,
- Implement transmit IP/TCP/UDP checksum generation offload.

With the packet buffers included, the structure of the GMAC data paths is shown in the figure below.

**Figure 37-2. Data Paths with Packet Buffers Included**

### 37.6.3.7 Transmit Packet Buffer

The transmitter packet buffer will continue attempting to fetch frame data from the AHB system memory until the packet buffer itself is full, at which point it will attempt to maintain its full level.

To accommodate the status and statistics associated with each frame, three words per packet are reserved at the end of the packet data. If the packet is bad and requires to be dropped, the status and statistics are the only information held on that packet. Storing the status in the DPRAM is required in order to decouple the DMA interface of the buffer from the MAC interface, to update the MAC status/statistics and to generate interrupts in the order in which the packets that they represent were fetched from the AHB memory.

If any errors occur on the AHB while reading the transmit frame, the fetching of packet data from AHB memory is halted. The MAC transmitter will continue to fetch packet data, thereby emptying the packet buffer and allowing any good non-errored frames to be transmitted successfully. Once these have been fully transmitted, the status/statistics for the errored frame will be updated and software will be informed via an interrupt that an AHB error occurred. This way, the error is reported in the correct packet order.

The transmit packet buffer will only attempt to read more frame data from the AHB when space is available in the packet buffer memory. If space is not available it must wait until the a packet fetched

by the MAC completes transmission and is subsequently removed from the packet buffer memory. Note that if full store and forward mode is active and if a single frame is fetched that is too large for the packet buffer memory, the frame is flushed and the DMA halted with an error status. This is because a complete frame must be written into the packet buffer before transmission can begin, and therefore the minimum packet buffer memory size should be chosen to satisfy the maximum frame to be transmitted in the application.

In full store and forward mode, once the complete transmit frame is written into the packet buffer memory, a trigger is sent across to the MAC transmitter, which will then begin reading the frame from the packet buffer memory. Since the whole frame is present and stable in the packet buffer memory an underflow of the transmitter is not possible. The frame is kept in the packet buffer until notification is received from the MAC that the frame data has either been successfully transmitted or can no longer be retransmitted (too many retries in half duplex mode). When this notification is received the frame is flushed from memory to make room for a new frame to be fetched from AHB system memory.

In Partial Store and Forward mode, a trigger is sent across to the MAC transmitter as soon as sufficient packet data is available, which will then begin fetching the frame from the packet buffer memory. If, after this point, the MAC transmitter is able to fetch data from the packet buffer faster than the AHB DMA can fill it, an underflow of the transmitter is possible. In this case, the transmission is terminated early, and the packet buffer is completely flushed. Transmission can only be restarted by writing to the transmit START bit.

In half duplex mode, the frame is kept in the packet buffer until notification is received from the MAC that the frame data has either been successfully transmitted or can no longer be retransmitted (too many retries in half duplex mode). When this notification is received the frame is flushed from memory to make room for a new frame to be fetched from AHB system memory.

In full duplex mode, the frame is removed from the packet buffer on the fly.

Other than underflow, the only MAC related errors that can occur are due to collisions during half duplex transmissions. When a collision occurs the frame still exists in the packet buffer memory so can be retried directly from there. Only once the MAC transmitter has failed to transmit after sixteen attempts is the frame finally flushed from the packet buffer.

### 37.6.3.8 Receive Packet Buffer

The receive packet buffer stores frames from the MAC receiver along with their status and statistics. Frames with errors are flushed from the packet buffer memory, while good frames are pushed onto the DMA AHB interface.

The receiver packet buffer monitors the FIFO write interface from the MAC receiver and translates the FIFO pushes into packet buffer writes. At the end of the received frame the status and statistics are buffered so that the information can be used when the frame is read out. When programmed in full store and forward mode, if the frame has an error the frame data is immediately flushed from the packet buffer memory allowing subsequent frames to utilise the freed up space. The status and statistics for bad frames are still used to update the GMAC registers.

To accommodate the status and statistics associated with each frame, three words per packet (or two if configured in 64-bit datapath mode) are reserved at the end of the packet data. If the packet is bad and requires to be dropped, the status and statistics are the only information held on that packet.

The receiver packet buffer will also detect a full condition so that an overflow condition can be detected. If this occurs, subsequent packets are dropped and an RX overflow interrupt is raised.

For full store and forward, the DMA only begins packet fetches once the status and statistics for a frame are available. If the frame has a bad status due to a frame error, the status and statistics are passed on to the GMAC registers. If the frame has a good status, the information is used to read the frame from the packet buffer memory and burst onto the AHB using the DMA buffer

management protocol. Once the last frame data has been transferred to the packet buffer, the status and statistics are updated to the GMAC registers.

If Partial Store and Forward mode is active, the DMA will begin fetching the packet data before the status is available. As soon as the status becomes available, the DMA will fetch this information as soon as possible before continuing to fetch the remainder of the frame. Once the last frame data has been transferred to the packet buffer, the status and statistics are updated to the GMAC registers.

### 37.6.3.9 Priority Queueing in the DMA

The DMA by default uses a single transmit and receive queue. This means the list of transmit/receive buffer descriptors point to data buffers associated with a single transmit/receive data stream. The GMAC can select up to 6 priority queues. Each queue has an independent list of buffer descriptors pointing to separate data streams.

The table below gives the DPRAM size associated with each queue:

**Table 37-5. Queue Size**

| Queue Number         | Queue Size |
|----------------------|------------|
| 5 (highest priority) | 1 KB       |
| 4                    | 2 KB       |
| 3                    | 2 KB       |
| 2                    | 512 bytes  |
| 1                    | 512 bytes  |
| 0 (lowest priority)  | 2 KB       |

In the transmit direction, higher priority queues are always serviced before lower priority queues, with Q0 as lowest priority and Q5 as highest priority. This strict priority scheme requires the user to ensure that high priority traffic is constrained so that lower priority traffic will have required bandwidth. The GMAC DMA will determine the next queue to service by initiating a sequence of buffer descriptor reads interrogating the ownership bits of each. The buffer descriptor corresponding to the highest priority queue is read first. As an example, if the ownership bit of this descriptor is set, then the DMA will progress to reading the 2nd highest priority queue's descriptor. If that ownership bit read of this lower priority queue is set, then the DMA will read the 3rd highest priority queue's descriptor. If all the descriptors return an ownership bit set, then a resource error has occurred, an interrupt is generated and transmission is automatically halted. Transmission can only be restarted by setting the START bit in the Network Control register. The GMAC DMA will need to identify the highest available queue to transmit from when the START bit in the Network Control register is written to and the TX is in a halted state, or when the last word of any packet has been fetched from external AHB memory.

The GMAC transmit DMA maximizes the effectiveness of priority queueing by ensuring that high priority traffic be transmitted as early as possible after being fetched from AHB. High priority traffic fetched from AHB will be pushed to the MAC layer, depending on traffic shaping being enabled and the associated credit value for that queue, before any lower priority traffic that may pre-exist in the transmit SRAM-based packet buffer. This is achieved by separating the transmit SRAM-based packet buffer into regions, one region per queue. The size of each region determines the amount of SRAM space allocated per queue.

For each queue, there is an associated Transmit Buffer Queue Base Address register. For the lowest priority queue (or the only queue when only one queue is selected), the Transmit Buffer Queue Base Address is located at address 0x1C. For all other queues, the Transmit Buffer Queue Base Address registers are located at sequential addresses starting at address 0x440.

In the receive direction each packet is written to AHB data buffers in the order that it is received. For each queue, there is an independent set of receive AHB buffers for each queue. There is therefore a separate Receive Buffer Queue Base Address register for each queue. For the lowest priority queue

(or the only queue when only one queue is selected), the Receive Buffer Queue Base Address is located at address 0x18. For all other queues, the Receive Buffer Queue Base Address registers are located at sequential addresses starting at address 0x480. Every received packet will pass through a programmable screening algorithm which will allocate a particular queue to that frame. The user interface to the screeners is through two types of programmable registers:

- Screening Type 1 registers—The module features 4 Screening Type 1 registers. Screening Type 1 registers hold values to match against specific IP and UDP fields of the received frames. The fields matched against are DS (Differentiated Services field of IPv4 frames), TC (Traffic class field of IPv6 frames) and/or the UDP destination port.
- Screening Type 2 registers—The module features 8 Screening Type 2 registers GMAC\_ST2RPQ. Screening Type 2 registers operate independently of Screening Type 1 registers and offer additional match capabilities. Screening Type 2 allows a screen to be configured that is the combination of all or any of the following comparisons:
  1. An enable bit VLAN priority, VLANE. A VLAN priority match will be performed if the VLAN priority enable is set. The extracted priority field in the VLAN header is compared against VLANP in the GMAC\_ST2RPQ register itself.
  2. An enable bit EtherType, ETHE. The EtherType field I2ETH inside GMAC\_ST2RPQ maps to one of 4 EtherType match registers, GMAC\_ST2ER. The extracted EtherType is compared against GMAC\_ST2ER designated by this EtherType field.
  3. An enable bit Compare A, COMPAE. This bit is associated with a Screening Type 2 Compare Word 0/1 register x, GMAC\_ST2CW0/1.
  4. An enable bit Compare B, COMPBE. This bit is associated with a Screening Type 2 Compare Word 0/1 register x, GMAC\_ST2CW0/1.
  5. An enable bit Compare C, COMPCE. This bit is associated with a Screening Type 2 Compare Word 0/1 register x, GMAC\_ST2CW0/1.

Each screener type has an enable bit, a match pattern and a queue number. If a received frame matches on an enabled Screening register, then the frame will be tagged with the queue value in the associated Screening register, and forwarded onto the DMA and subsequently into the external memory associated with that queue. If two screeners are matched, then the one which resides at the lowest register address will take priority so care must be taken on the selection of the screener location.

When the priority queuing feature is enabled, the number of interrupt outputs from the GMAC core is increased to match the number of supported queues. The number of Interrupt Status registers is increased by the same number. Only DMA related events are reported using the individual interrupt outputs, as the GMAC can relate these events to specific queues. All other events generated within the GMAC are reported in the interrupt associated with the lowest priority queue. For the lowest priority queue (or the only queue when only 1 queue is selected), the Interrupt Status register is located at address 0x24. For all other queues, the Interrupt Status register is located at sequential addresses starting at address 0x400.

**Note:** The address matching is the first level of filtering. If there is a match, the screeners are the next level of filtering for routing the data to the appropriate queue. See [MAC Filtering Block](#) for more details.

The additional screening done by the functions Compare A, B, and C each have an enable bit and compare register field. COMPA, COMPB and COMPC in GMAC\_ST2RPQ are pointers to a configured offset (OFFSVAL), value (COMPVAL), and mask (MASKVAL). If enabled, the compare is true if the data at the offset into the frame, ANDed with MASKVAL, is equal to the value of COMPVAL ANDed with MASKVAL. A 16-bit word comparison is done. The byte at the offset number of bytes from the index start is compared to bits 7:0 of the configured COMPVAL and MASKVAL. The byte at the offset number of bytes + 1 from the index start is compared to bits 15:8 of the configured COMPVAL and MASKVAL.

The offset value in bytes, OFFSVL, ranges from 0 to 127 bytes from either the start of the frame, the byte after the EtherType field, the byte after the IP header (IPv4 or IPv6) or the byte after the TCP/UDP header. Note the logic to decode the IP header or the TCP/UDP header is reused from the TCP/UDP/IP checksum offload logic and therefore has the same restrictions on use (the main limitation is that IP fragmentation is not supported). Refer to the Checksum Offload for IP, TCP and UDP section of this documentation for further details.

Compare A, B, and C use a common set of 24 GMAC\_ST2CW0/1 registers, thus all COMPA, COMPB and COMPC fields in the registers GMAC\_ST2RPQ point to a single pool of 24 GMAC\_ST2CW0/1 registers.

Note that Compare A, B and C together allow matching against an arbitrary 48 bits of data and so can be used to match against a MAC address.

All enabled comparisons are ANDed together to form the overall type 2 screening match.

### 37.6.4 MAC Transmit Block

The MAC transmitter can operate in either half duplex or full duplex mode and transmits frames in accordance with the Ethernet IEEE 802.3 standard. In half duplex mode, the CSMA/CD protocol of the IEEE 802.3 specification is followed.

A small input buffer receives data through the FIFO interface which will extract data in 32-bit form. All subsequent processing prior to the final output is performed in bytes.

Transmit data can be output using the MII interface.

Frame assembly starts by adding preamble and the start frame delimiter. Data is taken from the transmit FIFO interface a word at a time.

If necessary, padding is added to take the frame length to 60 bytes. CRC is calculated using an order 32-bit polynomial. This is inverted and appended to the end of the frame taking the frame length to a minimum of 64 bytes. If the no CRC bit is set in the second word of the last buffer descriptor of a transmit frame, neither pad nor CRC are appended. The no CRC bit can also be set through the FIFO interface.

In full duplex mode (at all data rates), frames are transmitted immediately. Back to back frames are transmitted at least 96 bit times apart to guarantee the interframe gap.

In half duplex mode, the transmitter checks carrier sense. If asserted, the transmitter waits for the signal to become inactive, and then starts transmission after the interframe gap of 96 bit times. If the collision signal is asserted during transmission, the transmitter will transmit a jam sequence of 32 bits taken from the data register and then retry transmission after the backoff time has elapsed. If the collision occurs during either the preamble or Start Frame Delimiter (SFD), then these fields will be completed prior to generation of the jam sequence.

The backoff time is based on an XOR of the 10 least significant bits of the data coming from the transmit FIFO interface and a 10-bit pseudo random number generator. The number of bits used depends on the number of collisions seen. After the first collision 1 bit is used, then the second 2 bits and so on up to the maximum of 10 bits. All 10 bits are used above ten collisions. An error will be indicated and no further attempts will be made if 16 consecutive attempts cause collision. This operation is compliant with the description in Clause 4.2.3.2.5 of the IEEE 802.3 standard which refers to the truncated binary exponential backoff algorithm.

In 10/100 mode, both collisions and late collisions are treated identically, and backoff and retry will be performed up to 16 times. This condition is reported in the transmit buffer descriptor word 1 (late collision, bit 26) and also in the Transmit Status register (late collision, bit 7). An interrupt can also be generated (if enabled) when this exception occurs, and bit 5 in the Interrupt Status register will be set.

In all modes of operation, if the transmit DMA underruns, a bad CRC is automatically appended using the same mechanism as jam insertion and the GTXER signal is asserted. For a properly

configured system this should never happen and also it is impossible if configured to use the DMA with packet buffers, as the complete frame is buffered in local packet buffer memory.

By setting when bit 28 is set in the Network Configuration register, the Inter Packet Gap (IPG) may be stretched beyond 96 bits depending on the length of the previously transmitted frame and the value written to the IPG Stretch register (GMAC\_IPGS). The least significant 8 bits of the IPG Stretch register multiply the previous frame length (including preamble). The next significant 8 bits (+1 so as not to get a divide by zero) divide the frame length to generate the IPG. IPG stretch only works in full duplex mode and when bit 28 is set in the Network Configuration register. The IPG Stretch register cannot be used to shrink the IPG below 96 bits.

### 37.6.5 MAC Receive Block

All processing within the MAC receive block is implemented using a 16-bit data path. The MAC receive block checks for valid preamble, FCS, alignment and length, presents received frames to the FIFO interface and stores the frame destination address for use by the address checking block.

If, during the frame reception, the frame is found to be too long, a bad frame indication is sent to the FIFO interface. The receiver logic ceases to send data to memory as soon as this condition occurs.

At end of frame reception the receive block indicates to the DMA block whether the frame is good or bad. The DMA block will recover the current receive buffer if the frame was bad.

Ethernet frames are normally stored in DMA memory complete with the FCS. Setting the FCS remove bit in the network configuration (bit 17) causes frames to be stored without their corresponding FCS. The reported frame length field is reduced by four bytes to reflect this operation.

The receive block signals to the register block to increment the alignment, CRC (FCS), short frame, long frame, jabber or receive symbol errors when any of these exception conditions occur.

If bit 26 is set in the network configuration, CRC errors will be ignored and CRC errored frames will not be discarded, though the Frame Check Sequence Errors statistic register will still be incremented. Additionally, if not enabled for jumbo frames mode, then bit[13] of the receiver descriptor word 1 will be updated to indicate the FCS validity for the particular frame. This is useful for applications such as EtherCAT whereby individual frames with FCS errors must be identified.

Received frames can be checked for length field error by setting the length field error frame discard bit of the Network Configuration register (bit-16). When this bit is set, the receiver compares a frame's measured length with the length field (bytes 13 and 14) extracted from the frame. The frame is discarded if the measured length is shorter. This checking procedure is for received frames between 64 bytes and 1518 bytes in length.

Each discarded frame is counted in the 10-bit Length Field Frame Error statistics register. Frames where the length field is greater than or equal to 0x0600 hex will not be checked.

### 37.6.6 Checksum Offload for IP, TCP and UDP

The GMAC can be programmed to perform IP, TCP and UDP checksum offloading in both receive and transmit directions, which is enabled by setting bit 24 in the Network Configuration register for receive and bit 11 in the DMA Configuration register for transmit.

IPv4 packets contain a 16-bit checksum field, which is the 16-bit 1's complement of the 1's complement sum of all 16-bit words in the header. TCP and UDP packets contain a 16-bit checksum field, which is the 16-bit 1's complement of the 1's complement sum of all 16-bit words in the header, the data and a conceptual IP pseudo header.

To calculate these checksums in software requires each byte of the packet to be processed. For TCP and UDP this can use a large amount of processing power. Offloading the checksum calculation to hardware can result in significant performance improvements.

For IP, TCP or UDP checksum offload to be useful, the operating system containing the protocol stack must be aware that this offload is available so that it can make use of the fact that the hardware can either generate or verify the checksum.

#### 37.6.6.1 Receiver Checksum Offload

When receive checksum offloading is enabled in the GMAC, the IPv4 header checksum is checked as per RFC 791, where the packet meets the following criteria:

- If present, the VLAN header must be four octets long and the CFI bit must not be set.
- Encapsulation must be RFC 894 Ethernet Type Encoding or RFC 1042 SNAP Encoding.
- IPv4 packet
- IP header is of a valid length

The GMAC also checks the TCP checksum as per RFC 793, or the UDP checksum as per RFC 768, if the following criteria are met:

- IPv4 or IPv6 packet
- Good IP header checksum (if IPv4)
- No IP fragmentation
- TCP or UDP packet

When an IP, TCP or UDP frame is received, the receive buffer descriptor gives an indication if the GMAC was able to verify the checksums. There is also an indication if the frame had SNAP encapsulation. These indication bits will replace the type ID match indication bits when the receive checksum offload is enabled. For details of these indication bits, refer to [Receive Buffer Descriptor Entry](#).

If any of the checksums are verified as incorrect by the GMAC, the packet is discarded and the appropriate statistics counter incremented.

#### 37.6.6.2 Transmitter Checksum Offload

The transmitter checksum offload is only available if the full store and forward mode is enabled. This is because the complete frame to be transmitted must be read into the packet buffer memory before the checksum can be calculated and written back into the headers at the beginning of the frame.

Transmitter checksum offload is enabled by setting bit [11] in the DMA Configuration register. When enabled, it will monitor the frame as it is written into the transmitter packet buffer memory to automatically detect the protocol of the frame. Protocol support is identical to the receiver checksum offload.

For transmit checksum generation and substitution to occur, the protocol of the frame must be recognized and the frame must be provided without the FCS field, by making sure that bit [16] of the transmit descriptor word 1 is clear. If the frame data already had the FCS field, this would be corrupted by the substitution of the new checksum fields.

If these conditions are met, the transmit checksum offload engine will calculate the IP, TCP and UDP checksums as appropriate. Once the full packet is completely written into packet buffer memory, the checksums will be valid and the relevant DPRAM locations will be updated for the new checksum fields as per standard IP/TCP and UDP packet structures.

If the transmitter checksum engine is prevented from generating the relevant checksums, bits [22:20] of the transmitter DMA writeback status will be updated to identify the reason for the error. Note that the frame will still be transmitted but without the checksum substitution, as typically the reason that the substitution did not occur was that the protocol was not recognized.

#### 37.6.7 MAC Filtering Block

The filter block determines which frames should be written to the FIFO interface and on to the DMA.

Whether a frame is passed depends on what is enabled in the Network Configuration register, the state of the external matching pins, the contents of the specific address, type and Hash registers and the frame's destination address and type field.

If bit 25 of the Network Configuration register is not set, a frame will not be copied to memory if the GMAC is transmitting in half duplex mode at the time a destination address is received.

Ethernet frames are transmitted a byte at a time, least significant bit first. The first six bytes (48 bits) of an Ethernet frame make up the destination address. The first bit of the destination address, which is the LSB of the first byte of the frame, is the group or individual bit. This is one for multicast addresses and zero for unicast. The all ones address is the broadcast address and a special case of multicast.

The GMAC supports recognition of four specific addresses. Each specific address requires two registers, Specific Address Bottom register and Specific Address Top register. Specific Address Bottom register stores the first four bytes of the destination address and Specific Address Top register contains the last two bytes. The addresses stored can be specific, group, local or universal.

The destination address of received frames is compared against the data stored in the Specific Address registers once they have been activated. The addresses are deactivated at reset or when their corresponding Specific Address Bottom register is written. They are activated when Specific Address Top register is written. If a receive frame address matches an active address, the frame is written to the FIFO interface and on to DMA memory.

Frames may be filtered using the type ID field for matching. Four type ID registers exist in the register address space and each can be enabled for matching by writing a one to the MSB (bit 31) of the respective register. When a frame is received, the matching is implemented as an OR function of the various types of match.

The contents of each type ID register (when enabled) are compared against the length/type ID of the frame being received (e.g., bytes 13 and 14 in non-VLAN and non-SNAP encapsulated frames) and copied to memory if a match is found. The encoded type ID match bits (Word 0, Bit 22 and Bit 23) in the receive buffer descriptor status are set indicating which type ID register generated the match, if the receive checksum offload is disabled.

The reset state of the type ID registers is zero, hence each is initially disabled.

The following example illustrates the use of the address and type ID match registers for a MAC address of 21:43:65:87:A9:CB:

|                    |                   |
|--------------------|-------------------|
| Preamble           | 55                |
| SFD                | D5                |
| DA (Octet 0 - LSB) | 21                |
| DA (Octet 1)       | 43                |
| DA (Octet 2)       | 65                |
| DA (Octet 3)       | 87                |
| DA (Octet 4)       | A9                |
| DA (Octet 5 - MSB) | CB                |
| SA (LSB)           | 00 <sup>(1)</sup> |
| SA                 | 00 <sup>(1)</sup> |
| SA                 | 00 <sup>(1)</sup> |
| SA                 | 00 <sup>(1)</sup> |
| SA                 | 00 <sup>(1)</sup> |
| SA (MSB)           | 00 <sup>(1)</sup> |
| Type ID (MSB)      | 43                |
| Type ID (LSB)      | 21                |

**Note:**

1. Contains the address of the transmitting device.

The sequence above shows the beginning of an Ethernet frame. Byte order of transmission is from top to bottom as shown. For a successful match to specific address 1, the following address matching registers must be set up:

- Specific Address 1 Bottom register (GMAC\_SAB1) (Address 0x088) 0x87654321
- Specific Address 1 Top register (GMAC\_SAT1) (Address 0x08C) 0x0000CBA9

For a successful match to the type ID, the following Type ID Match 1 register must be set up:

- Type ID Match 1 register (GMAC\_TIDM1) (Address 0x0A8) 0x80004321

### 37.6.8 Broadcast Address

Frames with the broadcast address of 0xFFFFFFFF are stored to memory only if the 'no broadcast' bit in the Network Configuration register is set to zero.

### 37.6.9 Hash Addressing

The hash address register is 64 bits long and takes up two locations in the memory map. The least significant bits are stored in Hash Register Bottom and the most significant bits in Hash Register Top.

The unicast hash enable and the multicast hash enable bits in the Network Configuration register enable the reception of hash matched frames. The destination address is reduced to a 6-bit index into the 64-bit Hash register using the following hash function: The hash function is an XOR of every sixth bit of the destination address.

```
hash_index[05] = da[05] ^ da[11] ^ da[17] ^ da[23] ^ da[29] ^ da[35] ^ da[41] ^ da[47]
hash_index[04] = da[04] ^ da[10] ^ da[16] ^ da[22] ^ da[28] ^ da[34] ^ da[40] ^ da[46]
hash_index[03] = da[03] ^ da[09] ^ da[15] ^ da[21] ^ da[27] ^ da[33] ^ da[39] ^ da[45]
hash_index[02] = da[02] ^ da[08] ^ da[14] ^ da[20] ^ da[26] ^ da[32] ^ da[38] ^ da[44]
hash_index[01] = da[01] ^ da[07] ^ da[13] ^ da[19] ^ da[25] ^ da[31] ^ da[37] ^ da[43]
hash_index[00] = da[00] ^ da[06] ^ da[12] ^ da[18] ^ da[24] ^ da[30] ^ da[36] ^ da[42]
da[0]
```

represents the least significant bit of the first byte received, that is, the multicast/unicast indicator, and da[47] represents the most significant bit of the last byte received.

If the hash index points to a bit that is set in the Hash register then the frame will be matched according to whether the frame is multicast or unicast.

A multicast match will be signalled if the multicast hash enable bit is set, da[0] is logic 1 and the hash index points to a bit set in the Hash register.

A unicast match will be signalled if the unicast hash enable bit is set, da[0] is logic 0 and the hash index points to a bit set in the Hash register.

To receive all multicast frames, the Hash register should be set with all ones and the multicast hash enable bit should be set in the Network Configuration register.

#### 37.6.10 Copy all Frames (Promiscuous Mode)

If the Copy All Frames bit is set in the Network Configuration register then all frames except those that are too long, too short, have FCS errors or have GRXER asserted during reception will be copied to memory. Frames with FCS errors will be copied if bit 26 is set in the Network Configuration register.

#### 37.6.11 Disable Copy of Pause Frames

Pause frames can be prevented from being written to memory by setting the disable copying of pause frames control bit 23 in the Network Configuration register. When set, pause frames are not

copied to memory regardless of the Copy All Frames bit, whether a hash match is found, a type ID match is identified or if a destination address match is found.

### 37.6.12 VLAN Support

The following table describes an Ethernet encoded 802.1Q VLAN tag.

**Table 37-6.** 802.1Q VLAN Tag

|                                        |                                                       |
|----------------------------------------|-------------------------------------------------------|
| TPID (Tag Protocol Identifier) 16 bits | TCI (Tag Control Information) 16 bits                 |
| 0x8100                                 | First 3 bits priority, then CFI bit, last 12 bits VID |

The VLAN tag is inserted at the 13th byte of the frame adding an extra four bytes to the frame. To support these extra four bytes, the GMAC can accept frame lengths up to 1536 bytes by setting bit 8 in the Network Configuration register.

If the VID (VLAN identifier) is null (0x000) this indicates a priority-tagged frame.

The following bits in the receive buffer descriptor status word give information about VLAN tagged frames:-

- Bit 21 set if receive frame is VLAN tagged (i.e., type ID of 0x8100).
- Bit 20 set if receive frame is priority tagged (i.e., type ID of 0x8100 and null VID). (If bit 20 is set, bit 21 will be set also.)
- Bit 19, 18 and 17 set to priority if bit 21 is set.
- Bit 16 set to CFI if bit 21 is set.

The GMAC can be configured to reject all frames except VLAN tagged frames by setting the discard non-VLAN frames bit in the Network Configuration register.

### 37.6.13 IEEE 1588 Support

IEEE 1588 is a standard for precision time synchronization in local area networks. It works with the exchange of special Precision Time Protocol (PTP) frames. The PTP messages can be transported over IEEE 802.3/Ethernet, over Internet Protocol Version 4 or over Internet Protocol Version 6 as described in the annex of IEEE P1588.D2.1.

The GMAC indicates the message timestamp point (asserted on the start packet delimiter and de-asserted at end of frame) for all frames and the passage of PTP event frames (asserted when a PTP event frame is detected and de-asserted at end of frame).

IEEE 802.1AS is a subset of IEEE 1588. One difference is that IEEE 802.1AS uses the Ethernet multicast address 0180C200000E for sync frame recognition whereas IEEE 1588 does not. GMAC is designed to recognize sync frames with both IEEE 802.1AS and IEEE 1588 addresses and so can support both 1588 and 802.1AS frame recognition simultaneously.

Synchronization between master and slave clocks is a two stage process.

First, the offset between the master and slave clocks is corrected by the master sending a sync frame to the slave with a follow up frame containing the exact time the sync frame was sent. Hardware assist modules at the master and slave side detect exactly when the sync frame was sent by the master and received by the slave. The slave then corrects its clock to match the master clock.

Second, the transmission delay between the master and slave is corrected. The slave sends a delay request frame to the master which sends a delay response frame in reply. Hardware assist modules at the master and slave side detect exactly when the delay request frame was sent by the slave and received by the master. The slave will now have enough information to adjust its clock to account for delay. For example, if the slave was assuming zero delay, the actual delay will be half the difference between the transmit and receive time of the delay request frame (assuming equal transmit and receive times) because the slave clock will be lagging the master clock by the delay time already.

The timestamp is taken when the message timestamp point passes the clock timestamp point. This can generate an interrupt if enabled (GMAC\_IER). However, MAC Filtering configuration is needed to actually 'copy' the message to memory. For Ethernet, the message timestamp point is the SFD and the clock timestamp point is the MII interface. (The IEEE 1588 specification refers to sync and delay\_req messages as event messages as these require timestamping. These events are captured in the registers GMAC\_EFTx and GMAC\_EFRx, respectively. Follow up, delay response and management messages do not require timestamping and are referred to as general messages.)

1588 version 2 defines two additional PTP event messages. These are the peer delay request (Pdelay\_Req) and peer delay response (Pdelay\_Resp) messages. These events are captured in the registers GMAC\_PEFTx and GMAC\_PEFRx, respectively. These messages are used to calculate the delay on a link. Nodes at both ends of a link send both types of frames (regardless of whether they contain a master or slave clock). The Pdelay\_Resp message contains the time at which a Pdelay\_Req was received and is itself an event message. The time at which a Pdelay\_Resp message is received is returned in a Pdelay\_Resp\_Follow\_Up message.

1588 version 2 introduces transparent clocks of which there are two kinds, peer-to-peer (P2P) and end-to-end (E2E). Transparent clocks measure the transit time of event messages through a bridge and amend a correction field within the message to allow for the transit time. P2P transparent clocks additionally correct for the delay in the receive path of the link using the information gathered from the peer delay frames. With P2P transparent clocks delay\_req messages are not used to measure link delay. This simplifies the protocol and makes larger systems more stable.

The GMAC recognizes four different encapsulations for PTP event messages:

1. 1588 version 1 (UDP/IPv4 multicast)
2. 1588 version 2 (UDP/IPv4 multicast)
3. 1588 version 2 (UDP/IPv6 multicast)
4. 1588 version 2 (Ethernet multicast)

**Table 37-7.** Example of Sync Frame in 1588 Version 1 Format

| Frame Segment                 | Value                |
|-------------------------------|----------------------|
| Preamble/SFD                  | 5555555555555D5      |
| DA (Octets 0-5)               | -                    |
| SA (Octets 6-11)              | -                    |
| Type (Octets 12-13)           | 0800                 |
| IP stuff (Octets 14-22)       | -                    |
| UDP (Octet 23)                | 11                   |
| IP stuff (Octets 24-29)       | -                    |
| IP DA (Octets 30-32)          | E00001               |
| IP DA (Octet 33)              | 81 or 82 or 83 or 84 |
| Source IP port (Octets 34-35) | -                    |
| Dest IP port (Octets 36-37)   | 013F                 |
| Other stuff (Octets 38-42)    | -                    |
| Version PTP (Octet 43)        | 01                   |
| Other stuff (Octets 44-73)    | -                    |
| Control (Octet 74)            | 00                   |
| Other stuff (Octets 75-168)   | -                    |

**Table 37-8.** Example of Delay Request Frame in 1588 Version 1 Format

| Frame Segment   | Value           |
|-----------------|-----------------|
| Preamble/SFD    | 5555555555555D5 |

For 1588 version 1 messages, sync and delay request frames are indicated by the GMAC if the frame type field indicates TCP/IP, UDP protocol is indicated, the destination IP address is 224.0.1.129/130/131 or 132, the destination UDP port is 319 and the control field is correct.

The control field is 0x00 for sync frames and 0x01 for delay request frames.

For 1588 version 2 messages, the type of frame is determined by looking at the message type field in the first byte of the PTP frame. Whether a frame is version 1 or version 2 can be determined by looking at the version PTP field in the second byte of both version 1 and version 2 PTP frames.

In version 2 messages sync frames have a message type value of 0x0, delay\_req have 0x1, Pdelay\_Req have 0x2 and Pdelay\_Resp have 0x3.

**Table 37-9.** Example of Sync Frame in 1588 Version 2 (UDP/IPv4) Format

For the multicast address 011B19000000 sync and delay request frames are recognized depending on the message type field, 00 for sync and 01 for delay request.

**Table 37-13.** Example of Sync Frame in 1588 Version 2 (Ethernet Multicast) Format

| Frame Segment           | Value            |
|-------------------------|------------------|
| Preamble/SFD            | 55555555555555D5 |
| DA (Octets 0–5)         | 011B19000000     |
| SA (Octets 6–11)        | –                |
| Type (Octets 12–13)     | 88F7             |
| Message type (Octet 14) | 00               |
| Version PTP (Octet 15)  | 02               |

Pdelay request frames need a special multicast address so they can pass through ports blocked by the spanning tree protocol. For the multicast address 0180C200000E sync, Pdelay\_Req and Pdelay\_Resp frames are recognized depending on the message type field, 00 for sync, 02 for pdelay request and 03 for pdelay response.

**Table 37-14.** Example of Pdelay\_Req Frame in 1588 Version 2 (Ethernet Multicast) Format

| Frame Segment           | Value            |

| Preamble/SFD            | 55555555555555D5 |
| DA (Octets 0–5)         | 0180C200000E     |
| SA (Octets 6–11)        | –                |
| Type (Octets 12–13)     | 88F7             |
| Message type (Octet 14) | 00               |
| Version PTP (Octet 15)  | 02               |

### 37.6.14 Timestamp Unit

The TSU consists of a timer and registers to capture the time at which PTP event frames cross the message timestamp point. An interrupt is issued when a capture register is updated.

The timer is implemented as a 94-bit register with the upper 48 bits counting seconds, the next 30 bits counting nanoseconds and the lowest 16 bits counting sub-nanoseconds. The lower 46 bits rolls over when they have counted to one second. An interrupt is generated when the seconds increment. The timer value can be read, written and adjusted through the APB interface. The timer is clocked by MCK.

The amount by which the timer increments each clock cycle is controlled by the timer increment registers (GMAC\_TI). Bits 7:0 are the default increment value in nanoseconds and an additional 16 bits of sub-nanosecond resolution are available using the Timer Increment Sub-nanoseconds register (GMAC\_TISUBN). If the rest of the register is written with zero, the timer increments by the value in [7:0], plus the value of GMAC\_TISUBN, each clock cycle.

The GMAC\_TISUBN register allows a resolution of approximately 15 femtoseconds.

Bits 15:8 of the increment register are the alternative increment value in nanoseconds and bits 23:16 are the number of increments after which the alternative increment value is used. If 23:16 are zero then the alternative increment value will never be used.

Taking the example of 10.2 MHz, there are 102 cycles every ten microseconds or 51 every five microseconds. So a timer with a 10.2 MHz clock source is constructed by incrementing by 98 ns for fifty cycles and then incrementing by 100 ns ( $98 \times 50 + 100 = 5000$ ). This is programmed by setting the 1588 Timer Increment register to 0x00326462.

For a 49.8 MHz clock source it would be 20 ns for 248 cycles followed by an increment of 40 ns ( $20 \times 248 + 40 = 5000$ ) programmed as 0x00F82814.

Having eight bits for the “number of increments” field allows frequencies up to 50 MHz to be supported with 200 kHz resolution.

Without the alternative increment field the period of the clock would be limited to an integer number of nanoseconds, resulting in supported clock frequencies of 8, 10, 20, 25, 40, 50, 100, 125, 200 and 250 MHz.

There are eight additional 80-bit registers that capture the time at which PTP event frames are transmitted and received. An interrupt is issued when these registers are updated. The TSU timer count value can be compared to a programmable comparison value. For the comparison, the 48 bits of the seconds value and the upper 22 bits of the nanoseconds value are used. A signal (GTSUCOMP) is provided to indicate when the TSU timer count value is equal to the comparison value stored in the TSU timer comparison value registers (0x0DC, 0x0E0, and 0x0E4). The GTSUCOMP signal can be routed to the Timer peripheral to automatically toggle pin TOIA11/ PD21. This can be used as the reference clock for an external PLL to regenerate the audio clock in Ethernet AVB. An interrupt can also be generated (if enabled) when the TSU timer count value and comparison value are equal, mapped to bit 29 of the Interrupt Status register.

### 37.6.15 MAC 802.3 Pause Frame Support

**Note:** See Clause 31, and Annex 31A and 31B of the IEEE standard 802.3 for a full description of MAC 802.3 pause operation.

The following table shows the start of a MAC 802.3 pause frame.

**Table 37-15.** Start of an 802.3 Pause Frame

| Address        |         | Type<br>(MAC Control Frame) | Pause  |         |
|----------------|---------|-----------------------------|--------|---------|
| Destination    | Source  |                             | Opcode | Time    |
| 0x0180C2000001 | 6 bytes | 0x8808                      | 0x0001 | 2 bytes |

The GMAC supports both hardware controlled pause of the transmitter, upon reception of a pause frame, and hardware generated pause frame transmission.

#### 37.6.15.1 802.3 Pause Frame Reception

Bit 13 of the Network Configuration register is the pause enable control for reception. If this bit is set, transmission pauses if a non zero pause quantum frame is received.

If a valid pause frame is received, then the Pause Time register is updated with the new frame's pause time, regardless of whether a previous pause frame is active or not. An interrupt (either bit 12 or bit 13 of the Interrupt Status register) is triggered when a pause frame is received, but only if the interrupt has been enabled (bit 12 and bit 13 of the Interrupt Mask register). Pause frames received with non zero quantum are indicated through the interrupt bit 12 of the Interrupt Status register. Pause frames received with zero quantum are indicated on bit 13 of the Interrupt Status register.

Once the Pause Time register is loaded and the frame currently being transmitted has been sent, no new frames are transmitted until the pause time reaches zero. The loading of a new pause time, and hence the pausing of transmission, only occurs when the GMAC is configured for full duplex operation. If the GMAC is configured for half duplex there will be no transmission pause, but the pause frame received interrupt will still be triggered. A valid pause frame is defined as having a destination address that matches either the address stored in Specific Address 1 register or if it matches the reserved address of 0x0180C2000001. It must also have the MAC control frame type ID of 0x8808 and have the pause opcode of 0x0001.

Pause frames that have frame check sequence (FCS) or other errors will be treated as invalid and will be discarded. 802.3 Pause frames that are received after Priority-based Flow Control (PFC) has been negotiated will also be discarded. Valid pause frames received will increment the Pause Frames Received statistic register.

The Pause Time register decrements every 512 bit times once transmission has stopped. For test purposes, the retry test bit can be set (bit 12 in the Network Configuration register) which causes the Pause Time register to decrement every GTXCK cycle once transmission has stopped.

The interrupt (bit 13 in the Interrupt Status register) is asserted whenever the Pause Time register decrements to zero (assuming it has been enabled by bit 13 in the Interrupt Mask register). This interrupt is also set when a zero quantum pause frame is received.

### 37.6.15.2 802.3 Pause Frame Transmission

Automatic transmission of pause frames is supported through the transmit pause frame bits of the Network Control register. If either bit 11 or bit 12 of the Network Control register is written with logic 1, an 802.3 pause frame will be transmitted, providing full duplex is selected in the Network Configuration register and the transmit block is enabled in the Network Control register.

Pause frame transmission will happen immediately if transmit is inactive or if transmit is active between the current frame and the next frame due to be transmitted.

Transmitted pause frames comprise the following:

- A destination address of 01-80-C2-00-00-01
- A source address taken from Specific Address 1 register
- A type ID of 88-08 (MAC control frame)
- A pause opcode of 00-01
- A Pause Quantum register
- Fill of 00 to take the frame to minimum frame length
- Valid FCS

The pause quantum used in the generated frame will depend on the trigger source for the frame as follows:

- If bit 11 is written with a one, the pause quantum will be taken from the Transmit Pause Quantum register. The Transmit Pause Quantum register resets to a value of 0xFFFF giving maximum pause quantum as default.
- If bit 12 is written with a one, the pause quantum will be zero.

After transmission, a pause frame transmitted interrupt will be generated (bit 14 of the Interrupt Status register) and the only the statistics register Pause Frames Transmitted is incremented.

Pause frames can also be transmitted by the MAC using normal frame transmission methods.

### 37.6.16 MAC PFC Priority-based Pause Frame Support

**Note:** Refer to the 802.1Qbb standard for a full description of priority-based pause operation.

The following table shows the start of a Priority-based Flow Control (PFC) pause frame.

**Table 37-16.** Start of a PFC Pause Frame

| Address        |         | Type<br>(Mac Control Frame) | Pause Opcode | Priority Enable Vector | Pause Time  |
|----------------|---------|-----------------------------|--------------|------------------------|-------------|
| Destination    | Source  |                             |              |                        |             |
| 0x0180C2000001 | 6 bytes | 0x8808                      | 0x1001       | 2 bytes                | 8 × 2 bytes |

The GMAC supports PFC priority-based pause transmission and reception. Before PFC pause frames can be received, bit 16 of the Network Control register must be set.

#### 37.6.16.1 PFC Pause Frame Reception

The ability to receive and decode priority-based pause frames is enabled by setting bit 16 of the Network Control register. When this bit is set, the GMAC will match either classic 802.3 pause frames or PFC priority-based pause frames. Once a priority-based pause frame has been received and

matched, then from that moment on the GMAC will only match on priority-based pause frames (this is an 802.1Qbb requirement, known as PFC negotiation). Once priority-based pause has been negotiated, any received 802.3x format pause frames will not be acted upon.

If a valid priority-based pause frame is received then the GMAC will decode the frame and determine which, if any, of the eight priorities require to be paused. Up to eight Pause Time registers are then updated with the eight pause times extracted from the frame regardless of whether a previous pause operation is active or not. An interrupt (either bit 12 or bit 13 of the Interrupt Status register) is triggered when a pause frame is received, but only if the interrupt has been enabled (bit 12 and bit 13 of the Interrupt Mask register). Pause frames received with non zero quantum are indicated through the interrupt bit 12 of the Interrupt Status register. Pause frames received with zero quantum are indicated on bit 13 of the Interrupt Status register. The loading of a new pause time only occurs when the GMAC is configured for full duplex operation. If the GMAC is configured for half duplex, the pause time counters will not be loaded, but the pause frame received interrupt will still be triggered. A valid pause frame is defined as having a destination address that matches either the address stored in Specific Address 1 register or if it matches the reserved address of 0x0180C2000001. It must also have the MAC control frame type ID of 0x8808 and have the pause opcode of 0x0101.

Pause frames that have frame check sequence (FCS) or other errors will be treated as invalid and will be discarded. Valid pause frames received will increment the Pause Frames Received Statistic register.

The Pause Time registers decrement every 512 bit times immediately following the PFC frame reception. For test purposes, the retry test bit can be set (bit 12 in the Network Configuration register) which causes the Pause Time register to decrement every GRXCK cycle once transmission has stopped.

The interrupt (bit 13 in the Interrupt Status register) is asserted whenever the Pause Time register decrements to zero (assuming it has been enabled by bit 13 in the Interrupt Mask register). This interrupt is also set when a zero quantum pause frame is received.

### 37.6.16.2 PFC Pause Frame Transmission

Automatic transmission of pause frames is supported through the transmit priority-based pause frame bit of the Network Control register. If bit 17 of the Network Control register is written with logic 1, a PFC pause frame will be transmitted providing full duplex is selected in the Network Configuration register and the transmit block is enabled in the Network Control register. When bit 17 of the Network Control register is set, the fields of the priority-based pause frame will be built using the values stored in the Transmit PFC Pause register.

Pause frame transmission will happen immediately if transmit is inactive or if transmit is active between the current frame and the next frame due to be transmitted.

Transmitted pause frames comprise the following:

- A destination address of 01-80-C2-00-00-01
- A source address taken from Specific Address 1 register
- A type ID of 88-08 (MAC control frame)
- A pause opcode of 01-01
- A priority enable vector taken from Transmit PFC Pause register
- 8 Pause Quantum registers
- Fill of 00 to take the frame to minimum frame length
- Valid FCS

The Pause Quantum registers used in the generated frame will depend on the trigger source for the frame as follows:

- If bit 17 of the Network Control register is written with a one, then the priority enable vector of the priority-based pause frame will be set equal to the value stored in the Transmit PFC Pause register [7:0]. For each entry equal to zero in the Transmit PFC Pause register [15:8], the pause quantum field of the pause frame associated with that entry will be taken from the Transmit Pause Quantum register. For each entry equal to one in the Transmit PFC Pause register [15:8], the pause quantum associated with that entry will be zero.
- The Transmit Pause Quantum register resets to a value of 0xFFFF giving maximum pause quantum as default.

After transmission, a pause frame transmitted interrupt will be generated (bit 14 of the Interrupt Status register) and the only statistics register that will be incremented will be the Pause Frames Transmitted register.

PFC Pause frames can also be transmitted by the MAC using normal frame transmission methods.

### 37.6.17 Energy-efficient Ethernet Support

IEEE 802.3az adds support for energy efficiency to Ethernet. These are the key features of 802.3az:

- Allows a system's transmit path to enter a low power mode if there is nothing to transmit.
- Allows a PHY to detect whether its link partner's transmit path is in low power mode, therefore allowing the system's receive path to enter low power mode.
- Link remains up during lower power mode and no frames are dropped.
- Asymmetric, one direction can be in low power mode while the other is transmitting normally.
- LPI (Low Power Idle) signaling is used to control entry and exit to and from low power modes.
- LPI signaling can only take place if both sides have indicated support for it through auto-negotiation.

These are the key features of 802.3az operation:

- Low power control is done at the MII (reconciliation sublayer).
- As an architectural convenience in writing the 802.3az it is assumed that transmission is deferred by asserting carrier sense, in practice it will not be done this way. This system will know when it has nothing to transmit and only enter low power mode when it is not transmitting.
- LPI should not be requested unless the link has been up for at least one second.
- LPI is signaled on the transmit path by asserting 0x01 on txd with tx\_en low and tx\_er high.
- A PHY on seeing LPI requested on the MII will send the sleep signal before going quiet. After going quiet it will periodically transmit refresh signals.
- LPI mode ends by transmitting normal idle for the wake time. There is a default time for this but it can be adjusted in software using the Link Layer Discovery Protocol (LLDP) described in Clause 79 of 802.3az.
- LPI is indicated at the receive side when sleep and refresh signaling has been detected.

### 37.6.18 802.1Qav Support - Credit-based Shaping

A credit-based shaping algorithm is available on the two highest priority queues and is defined in the standard 802.1Qav: Forwarding and Queuing Enhancements for Time-Sensitive Streams. This allows traffic on these queues to be limited and to allow other queues to transmit.

Traffic shaping is enabled via the CBS (Credit Based Shaping) Control register. This enables a counter which stores the amount of transmit 'credit', measured in bytes that a particular queue has. A queue may only transmit if it has non-negative credit. If a queue has data to send, but is held off from doing as another queue is transmitting, then credit will accumulate in the credit counter at the rate defined in the IdleSlope register (GMAC\_CBSISQx) for that queue.

**portTransmitRate** is the transmission rate, in bits per second, that the underlying MAC service that supports transmission through the Port provides. The value of this parameter is determined by the operation of the MAC.

**IdleSlope** is the rate of change of increasing credit when waiting to transmit and must be less than the value of the portTransmitRate.

The max value of IdleSlope (or sendSlope) is  $(\text{portTransmitRate} / \text{bits\_per\_MII\_Clock})$ .

In case of 100Mbps, maximum IdleSlope =  $(100\text{Mbps} / 4) = 0x17D7840$ .

When this queue is transmitting, the credit counter is decremented at the rate of sendSlope, which is defined as  $(\text{portTransmitRate} - \text{IdleSlope})$ . A queue can accumulate negative credit when transmitting which will hold off any other transfers from that queue until credit returns to a non-negative value. No transfers are halted when a queue's credit becomes negative; it will accumulate negative credit until the transfer completes.

The highest priority queue always has priority regardless of which queue has the most credit.

### 37.6.19 LPI Operation in the GMAC

It is best to use firmware to control LPI. LPI operation happens at the system level. Firmware gives maximum control and flexibility of operation. LPI operation is straightforward and firmware should be capable of responding within the required timeframes.

Autonegotiation:

1. IndicateEEE capability using next page autonegotiation.

For the transmit path:

1. If the link has been up for 1 second and there is nothing being transmitted, write to the TXLPIEN bit in the Network Control register.
2. Wake up by clearing the TXLPIEN bit in the Network Control register.

For the receive path:

1. Enable RXLPISBC bit in GMAC\_IER. The bit RXLPIS is set in Network Status Register triggering an interrupt.
2. Wait for an interrupt to indicate that LPI has been received.
3. Disable relevant parts of the receive path if desired.
4. The RXLPIS bit in Network Status Register gets cleared to indicate that regular idle has been received. This triggers an interrupt.
5. Re-enable the receive path.

### 37.6.20 PHY Interface

Different PHY interfaces are supported by the Ethernet MAC:

- MII
- RMII

The MII interface is provided for 10/100 operation and uses txd[3:0] and rxd[3:0]. The RMII interface is provided for 10/100 operation and uses txd[1:0] and rxd[1:0].

### 37.6.21 10/100 Operation

The 10/100Mbps speed bit in the Network Configuration register is used to select between 10Mbps and 100Mbps.

## 37.6.22 Jumbo Frames

The jumbo frames enable bit in the Network Configuration register allows the GMAC, in its default configuration, to receive jumbo frames up to 10240 bytes in size. This operation does not form part of the IEEE 802.3 specification and is normally disabled. When jumbo frames are enabled, frames received with a frame size greater than 10240 bytes are discarded.

## 37.7 Programming Interface

### 37.7.1 Initialization

#### 37.7.1.1 Configuration

Initialization of the GMAC configuration (e.g., loop back mode, frequency ratios) must be done while the transmit and receive circuits are disabled. See the description of the Network Control register and Network Configuration register earlier in this document.

To change loop back mode, the following sequence of operations must be followed:

1. Write to Network Control register to disable transmit and receive circuits.
2. Write to Network Control register to change loop back mode.
3. Write to Network Control register to re-enable transmit or receive circuits.

**Note:** These writes to the Network Control register cannot be combined in any way.

#### 37.7.1.2 Receive Buffer List

Receive data is written to areas of data (i.e., buffers) in system memory. These buffers are listed in another data structure that also resides in main memory. This data structure (receive buffer queue) is a sequence of descriptor entries as defined in [Receive Buffer Descriptor Entry](#).

The Receive Buffer Queue Pointer register points to this data structure.

**Figure 37-3.** Receive Buffer List

To create the list of buffers:

1. Allocate a number (N) of buffers of X bytes in system memory, where X is the DMA buffer length programmed in the DMA Configuration register.
2. Allocate an area 8N bytes for the receive buffer descriptor list in system memory and create N entries in this list. Mark all entries in this list as owned by GMAC, i.e., bit 0 of word 0 set to 0.
3. Mark the last descriptor in the queue with the wrap bit (bit 1 in word 0 set to 1).

4. Write address of receive buffer descriptor list and control information to GMAC register receive buffer queue pointer
5. The receive circuits can then be enabled by writing to the address recognition registers and the Network Control register.  
**Note:** The queue pointers must be initialized and point to USED descriptors for all queues including those not intended for use.

### 37.7.1.3 Transmit Buffer List

Transmit data is read from areas of data (the buffers) in system memory. These buffers are listed in another data structure that also resides in main memory. This data structure (Transmit Buffer Queue) is a sequence of descriptor entries as defined in [Transmit Buffer Descriptor Entry](#).

The Transmit Buffer Queue Pointer register points to this data structure.

To create this list of buffers:

1. Allocate a number (N) of buffers of between 1 and 2047 bytes of data to be transmitted in system memory. Up to 128 buffers per frame are allowed.
2. Allocate an area 8N bytes for the transmit buffer descriptor list in system memory and create N entries in this list. Mark all entries in this list as owned by GMAC, i.e., bit 31 of word 1 set to 0.
3. Mark the last descriptor in the queue with the wrap bit (bit 30 in word 1 set to 1).
4. Write address of transmit buffer descriptor list and control information to GMAC register transmit buffer queue pointer.
5. The transmit circuits can then be enabled by writing to the Network Control register.  
**Note:** The queue pointers must be initialized and point to USED descriptors for all queues including those not intended for use.

### 37.7.1.4 Address Matching

The GMAC Hash register pair and the four Specific Address register pairs must be written with the required values. Each register pair comprises of a bottom register and top register, with the bottom register being written first. The address matching is disabled for a particular register pair after the bottom register has been written and re-enabled when the top register is written. Each register pair may be written at any time, regardless of whether the receive circuits are enabled or disabled.

As an example, to set Specific Address 1 register to recognize destination address 21:43:65:87:A9:CB, the following values are written to Specific Address 1 Bottom register and Specific Address 1 Top register:

- Specific Address 1 Bottom register bits 31:0 (0x98): 0x8765\_4321.
- Specific Address 1 Top register bits 31:0 (0x9C): 0x0000\_CBA9.

**Note:** The address matching is the first level of filtering. If there is a match, the screeners are the next level of filtering for routing the data to the appropriate queue. See [Priority Queueing in the DMA](#) for more details.

### 37.7.1.5 PHY Maintenance

The PHY Maintenance register is implemented as a shift register. Writing to the register starts a shift operation which is signalled as complete when bit two is set in the Network Status register (about 2000 MCK cycles later when bits 18:16 are set to 010 in the Network Configuration register). An interrupt is generated as this bit is set.

During this time, the MSB of the register is output on the GMDIO pin and the LSB updated from the GMDIO pin with each Management Data Clock (MDC) cycle. This causes the transmission of a PHY management frame on GMDIO. See section 22.2.4.5 of the IEEE 802.3 standard.

Reading during the shift operation will return the current contents of the shift register. At the end of the management operation the bits will have shifted back to their original locations. For a read

operation the data bits are updated with data read from the PHY. It is important to write the correct values to the register to ensure a valid PHY management frame is produced.

The Management Data Clock (MDC) should not toggle faster than 2.5 MHz (minimum period of 400 ns), as defined by the IEEE 802.3 standard. MDC is generated by dividing down MCK. Three bits in the Network Configuration register determine by how much MCK should be divided to produce MDC.

### 37.7.1.6 Interrupts

There are 18 interrupt conditions that are detected within the GMAC. The conditions are ORed to make multiple interrupts. Depending on the overall system design this may be passed through a further level of interrupt collection (interrupt controller). On receipt of the interrupt signal, the CPU enters the interrupt handler. Refer to the device interrupt controller documentation to identify that it is the GMAC that is generating the interrupt. To ascertain which interrupt, read the Interrupt Status register. Note that in the default configuration this register will clear itself after being read, though this may be configured to be write-one-to-clear if desired.

At reset all interrupts are disabled. To enable an interrupt, write to Interrupt Enable register with the pertinent interrupt bit set to 1. To disable an interrupt, write to Interrupt Disable register with the pertinent interrupt bit set to 1. To check whether an interrupt is enabled or disabled, read Interrupt Mask register. If the bit is set to 1, the interrupt is disabled.

### 37.7.1.7 Transmitting Frames

The procedure to set up a frame for transmission is the following:

1. Enable transmit in the Network Control register.
2. Allocate an area of system memory for transmit data. This does not have to be contiguous, varying byte lengths can be used if they conclude on byte borders.
3. Set-up the transmit buffer list by writing buffer addresses to word zero of the transmit buffer descriptor entries and control and length to word one.
4. Write data for transmission into the buffers pointed to by the descriptors.
5. Write the address of the first buffer descriptor to transmit buffer descriptor queue pointer.
6. Enable appropriate interrupts.
7. Write to the transmit start bit (TSTART) in the Network Control register.

### 37.7.1.8 Receiving Frames

When a frame is received and the receive circuits are enabled, the GMAC checks the address and, in the following cases, the frame is written to system memory:

- If it matches one of the four Specific Address registers.
- If it matches one of the four Type ID registers.
- If it matches the hash address function.
- If it is a broadcast address (0xFFFFFFFF) and broadcasts are allowed.
- If the GMAC is configured to “copy all frames”.

The register receive buffer queue pointer points to the next entry in the receive buffer descriptor list and the GMAC uses this as the address in system memory to write the frame to.

Once the frame has been completely and successfully received and written to system memory, the GMAC then updates the receive buffer descriptor entry (see [Receive Buffer Descriptor Entry](#)) with the reason for the address match and marks the area as being owned by software. Once this is complete, a receive complete interrupt is set. Software is then responsible for copying the data to the application area and releasing the buffer (by writing the ownership bit back to 0).

If the GMAC is unable to write the data at a rate to match the incoming frame, then a receive overrun interrupt is set. If there is no receive buffer available, i.e., the next buffer is still owned by

software, a receive buffer not available interrupt is set. If the frame is not successfully received, a statistics register is incremented and the frame is discarded without informing software.

### 37.7.2 Statistics Registers

Statistics registers are described in the User Interface beginning with [GMAC Octets Transmitted Low Register](#) and ending with [GMAC UDP Checksum Errors Register](#).

The statistics register block begins at 0x100 and runs to 0x1B0, and comprises the registers listed below.

|                                                    |                                               |
|----------------------------------------------------|-----------------------------------------------|
| Octets Transmitted Low Register                    | Broadcast Frames Received Register            |
| Octets Transmitted High Register                   | Multicast Frames Received Register            |
| Frames Transmitted Register                        | Pause Frames Received Register                |
| Broadcast Frames Transmitted Register              | 64 Byte Frames Received Register              |
| Multicast Frames Transmitted Register              | 65 to 127 Byte Frames Received Register       |
| Pause Frames Transmitted Register                  | 128 to 255 Byte Frames Received Register      |
| 64 Byte Frames Transmitted Register                | 256 to 511 Byte Frames Received Register      |
| 65 to 127 Byte Frames Transmitted Register         | 512 to 1023 Byte Frames Received Register     |
| 128 to 255 Byte Frames Transmitted Register        | 1024 to 1518 Byte Frames Received Register    |
| 256 to 511 Byte Frames Transmitted Register        | 1519 to Maximum Byte Frames Received Register |
| 512 to 1023 Byte Frames Transmitted Register       | Undersize Frames Received Register            |
| 1024 to 1518 Byte Frames Transmitted Register      | Oversize Frames Received Register             |
| Greater Than 1518 Byte Frames Transmitted Register | Jabbers Received Register                     |
| Transmit Underruns Register                        | Frame Check Sequence Errors Register          |
| Single Collision Frames Register                   | Length Field Frame Errors Register            |
| Multiple Collision Frames Register                 | Receive Symbol Errors Register                |
| Excessive Collisions Register                      | Alignment Errors Register                     |
| Late Collisions Register                           | Receive Resource Errors Register              |
| Deferred Transmission Frames Register              | Receive Overrun Register                      |
| Carrier Sense Errors Register                      | IP Header Checksum Errors Register            |
| Octets Received Low Register                       | TCP Checksum Errors Register                  |
| Octets Received High Register                      | UDP Checksum Errors Register                  |
| Frames Received Register                           |                                               |

These registers reset to zero on a read and stick at all ones when they count to their maximum value. They should be read frequently enough to prevent loss of data.

The receive statistics registers are only incremented when the receive enable bit (RXEN) is set in the Network Control register.

Once a statistics register has been read, it is automatically cleared. When reading the Octets Transmitted and Octets Received registers, bits 31:0 should be read prior to bits 47:32 to ensure reliable operation.

## 37.8 Register Summary

| Offset | Name       | Bit Pos. | 7           | 6         | 5          | 4          | 3        | 2         | 1          | 0      |  |
|--------|------------|----------|-------------|-----------|------------|------------|----------|-----------|------------|--------|--|
| 0x00   | GMAC_NCR   | 7:0      | WESTAT      | INCSTAT   | CLRSTAT    | MPE        | TXEN     | RXEN      | LBL        |        |  |
|        |            | 15:8     | SRTSM       |           |            | TXZQPF     | TXPF     | THALT     | TSTART     | BP     |  |
|        |            | 23:16    |             |           |            |            | TXLPIEN  | FNP       | TXPBPF     | ENPBPR |  |
|        |            | 31:24    |             |           |            |            |          |           |            |        |  |
| 0x04   | GMAC_NCFGR | 7:0      | UNIHEN      | MTIHEN    | NBC        | CAF        | JFRAME   | DNVLAN    | FD         | SPD    |  |
|        |            | 15:8     | RXBUFO[1:0] |           | PEN        | RTY        |          |           |            | MAXFS  |  |
|        |            | 23:16    | DCPF        | DBW[1:0]  |            | CLK[2:0]   |          |           | RFCS       | LFERD  |  |
|        |            | 31:24    |             | IRXER     | RXBP       | IPGSEN     |          | IRXFCS    | EFRHD      | RXCOEN |  |
| 0x08   | GMAC_NSR   | 7:0      | RXLPIIS     |           |            |            |          |           | MDIO       |        |  |
|        |            | 15:8     |             |           |            |            |          |           |            |        |  |
|        |            | 23:16    |             |           |            |            |          |           |            |        |  |
|        |            | 31:24    |             |           |            |            |          |           |            |        |  |
| 0x0C   | GMAC_UR    | 7:0      |             |           |            |            |          |           |            | RMII   |  |
|        |            | 15:8     |             |           |            |            |          |           |            |        |  |
|        |            | 23:16    |             |           |            |            |          |           |            |        |  |
|        |            | 31:24    |             |           |            |            |          |           |            |        |  |
| 0x10   | GMAC_DCFGR | 7:0      | ESPA        | ESMA      |            | FBLDO[4:0] |          |           |            |        |  |
|        |            | 15:8     |             |           |            |            | TXCOEN   | TXPBMS    | RXBMS[1:0] |        |  |
|        |            | 23:16    | DRBS[7:0]   |           |            |            |          |           |            |        |  |
|        |            | 31:24    |             |           |            |            |          |           |            | DDRP   |  |
| 0x14   | GMAC_TSR   | 7:0      |             |           | TXCOMP     | TFC        | TXGO     | RLE       | COL        | UBR    |  |
|        |            | 15:8     |             |           |            |            |          |           |            | HRESP  |  |
|        |            | 23:16    |             |           |            |            |          |           |            |        |  |
|        |            | 31:24    |             |           |            |            |          |           |            |        |  |
| 0x18   | GMAC_RBQB  | 7:0      | ADDR[5:0]   |           |            |            |          |           |            |        |  |
|        |            | 15:8     | ADDR[13:6]  |           |            |            |          |           |            |        |  |
|        |            | 23:16    | ADDR[21:14] |           |            |            |          |           |            |        |  |
|        |            | 31:24    | ADDR[29:22] |           |            |            |          |           |            |        |  |

| Reset  | R/W<br>0 | R/W<br>0 | R/W<br>0 | R/W<br>0 | R/W<br>0 | R/W<br>0 | R/W<br>0 |          |

**Bit 19 – TXLPIEN** Enable LPI Transmission  
When set, LPI (low power idle) is immediately transmitted.

**Bit 18 – FNP** Flush Next Packet  
Flush the next packet from the external RX DPRAM. Writing one to this bit will only have an effect if the DMA is not currently writing a packet already stored in the DPRAM to memory.

**Bit 17 – TXPBPF** Transmit PFC Priority-based Pause Frame  
Takes the values stored in the Transmit PFC Pause Register.

**Bit 16 – ENPBPR** Enable PFC Priority-based Pause Reception  
Enables PFC Priority Based Pause Reception capabilities. Setting this bit enables PFC negotiation and recognition of priority-based pause frames.

**Bit 15 – SRTSM** Store Receive Timestamp to Memory

| Value | Description                                                                                                                                                                                                                                                                                 |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Normal operation.                                                                                                                                                                                                                                                                           |
| 1     | Causes the CRC of every received frame to be replaced with the value of the nanoseconds field of the 1588 timer that was captured as the receive frame passed the message timestamp point. Note that bit RFCS in register GMAC_NCFGR may not be set to 1 when the timer should be captured. |

**Bit 12 – TXZQPF** Transmit Zero Quantum Pause Frame  
Writing one to this bit causes a pause frame with zero quantum to be transmitted.

**Bit 11 – TXPF** Transmit Pause Frame  
Writing one to this bit causes a pause frame to be transmitted.

**Bit 10 – THALT** Transmit Halt

Writing one to this bit halts transmission as soon as any ongoing frame transmission ends.

**Bit 9 – TSTART** Start Transmission

Writing one to this bit starts transmission.

**Bit 8 – BP** Back pressure

If set in 10M or 100M half duplex mode, forces collisions on all received frames.

**Bit 7 – WESTAT** Write Enable for Statistics Registers

Setting this bit to one makes the statistics registers writable for functional test purposes.

**Bit 6 – INCSTAT** Increment Statistics Registers

This bit is write-only. Writing a one increments all the statistics registers by one for test purposes.

**Bit 5 – CLRSTAT** Clear Statistics Registers

This bit is write-only. Writing a one clears the statistics registers.

**Bit 4 – MPE** Management Port Enable

Set to one to enable the management port. When zero, forces GMDIO to high impedance state and MDC low.

**Bit 3 – TXEN** Transmit Enable

When set, TXEN enables the GMAC transmitter to send data. When reset transmission will stop immediately, the transmit pipeline and control registers will be cleared and the Transmit Queue Pointer Register will reset to point to the start of the transmit descriptor list.

**Bit 2 – RXEN** Receive Enable

When set, RXEN enables the GMAC to receive data. When reset frame reception stops immediately and the receive pipeline will be cleared. The Receive Queue Pointer Register is unaffected.

**Bit 1 – LBL** Loop Back Local

Connects GTX to GRX, GTXEN to GRXDV and forces full duplex mode. GRXCK and GTXCK may malfunction as the GMAC is switched into and out of internal loop back. It is important that receive and transmit circuits have already been disabled when making the switch into and out of internal loop back.

## 37.8.2 GMAC Network Configuration Register

**Name:** GMAC\_NCFGR  
**Offset:** 0x004  
**Reset:** 0x00080000  
**Property:** Read/Write

|        |             |          |      |        |          |        |       |        |
|--------|-------------|----------|------|--------|----------|--------|-------|--------|

| Access | R/W         | R/W      | R/W  | R/W    | R/W      | R/W    | R/W   | R/W    |
| Reset  | 0           | 0        | 0    | 0      | 0        | 0      | 0     | 0      |

### Bit 30 – IRXER Ignore IPG GRXER

When set, GRXER has no effect on the GMAC's operation when GRXDV is low.

### Bit 29 – RXBP Receive Bad Preamble

When set, frames with non-standard preamble are not rejected.

### Bit 28 – IPGSEN IP Stretch Enable

When set, the transmit IPG can be increased above 96 bit times depending on the previous frame length using the IPG Stretch Register.

### Bit 26 – IRXFCS Ignore RX FCS

When set, frames with FCS/CRC errors will not be rejected. FCS error statistics will still be collected for frames with bad FCS and FCS status will be recorded in frame's DMA descriptor. For normal operation this bit must be set to zero.

### Bit 25 – EFRHD Enable Frames Received in Half Duplex

Enable frames to be received in half-duplex mode while transmitting.

### Bit 24 – RXCOEN Receive Checksum Offload Enable

When set, the receive checksum engine is enabled. Frames with bad IP, TCP or UDP checksums are discarded.

### Bit 23 – DCPF Disable Copy of Pause Frames

Set to one to prevent valid pause frames being copied to memory. When set, pause frames are not copied to memory regardless of the state of the Copy All Frames bit, whether a hash match is found or whether a type ID match is identified. If a destination address match is found, the pause frame

will be copied to memory. Note that valid pause frames received will still increment pause statistics and pause the transmission of frames as required.

**Bits 22:21 – DBW[1:0]** Data Bus Width  
Should always be written to '0'.

**Bits 20:18 – CLK[2:0]** MDC CLock Division  
Set according to MCK speed. These three bits determine the number MCK will be divided by to generate Management Data Clock (MDC). For conformance with the 802.3 specification, MDC must not exceed 2.5 MHz (MDC is only active during MDIO read and write operations).

| Value | Name   | Description                           |
|-------|--------|---------------------------------------|
| 0     | MCK_8  | MCK divided by 8 (MCK up to 20 MHz)   |
| 1     | MCK_16 | MCK divided by 16 (MCK up to 40 MHz)  |
| 2     | MCK_32 | MCK divided by 32 (MCK up to 80 MHz)  |
| 3     | MCK_48 | MCK divided by 48 (MCK up to 120 MHz) |
| 4     | MCK_64 | MCK divided by 64 (MCK up to 160 MHz) |
| 5     | MCK_96 | MCK divided by 96 (MCK up to 240 MHz) |

**Bit 17 – RFCS** Remove FCS  
Setting this bit will cause received frames to be written to memory without their frame check sequence (last 4 bytes). The frame length indicated will be reduced by four bytes in this mode.

**Bit 16 – LFERD** Length Field Error Frame Discard  
Setting this bit causes frames with a measured length shorter than the extracted length field (as indicated by bytes 13 and 14 in a non-VLAN tagged frame) to be discarded. This only applies to frames with a length field less than 0x0600.

**Bits 15:14 – RXBUFO[1:0]** Receive Buffer Offset  
Indicates the number of bytes by which the received data is offset from the start of the receive buffer

**Bit 13 – PEN** Pause Enable  
When set, transmission will pause if a non-zero 802.3 classic pause frame is received and PFC has not been negotiated.

**Bit 12 – RTY** Retry Test  
Must be set to zero for normal operation. If set to one the backoff between collisions will always be one slot time. Setting this bit to one helps test the too many retries condition. Also used in the pause frame tests to reduce the pause counter's decrement time from 512 bit times, to every GRXCK cycle.

**Bit 8 – MAXFS** 1536 Maximum Frame Size  
Setting this bit means the GMAC will accept frames up to 1536 bytes in length. Normally the GMAC would reject any frame above 1518 bytes.

**Bit 7 – UNIHEN** Unicast Hash Enable  
When set, unicast frames will be accepted when the 6-bit hash function of the destination address points to a bit that is set in the Hash Register.

**Bit 6 – MTIHEN** Multicast Hash Enable  
When set, multicast frames will be accepted when the 6-bit hash function of the destination address points to a bit that is set in the Hash Register.

**Bit 5 – NBC** No Broadcast  
When set to logic one, frames addressed to the broadcast address of all ones will not be accepted.

**Bit 4 – CAF** Copy All Frames

When set to logic one, all valid frames will be accepted.

**Bit 3 – JFRAME** Jumbo Frame Size

Set to one to enable jumbo frames up to 10240 bytes to be accepted. The default length is 10240 bytes.

**Bit 2 – DNVLAN** Discard Non-VLAN FRAMES

When set only VLAN tagged frames will be passed to the address matching logic.

**Bit 1 – FD** Full Duplex

If set to logic one, the transmit block ignores the state of collision and carrier sense and allows receive while transmitting.

**Bit 0 – SPD** Speed

Set to logic one to indicate 100 Mbps operation, logic zero for 10 Mbps.

### 37.8.3 GMAC Network Status Register

**Name:** GMAC\_NSR  
**Offset:** 0x008  
**Reset:** see Note  
**Property:** Read-only

**Note:** The register reset value depends on the status of the GMDIO input pin.

|        |        |    |    |    |    |      |      |    |
|--------|--------|----|----|----|----|------|------|----|
| Bit    | 31     | 30 | 29 | 28 | 27 | 26   | 25   | 24 |
|        |        |    |    |    |    |      |      |    |
| Access |        |    |    |    |    |      |      |    |
| Reset  |        |    |    |    |    |      |      |    |
| Bit    | 23     | 22 | 21 | 20 | 19 | 18   | 17   | 16 |
|        |        |    |    |    |    |      |      |    |
| Access |        |    |    |    |    |      |      |    |
| Reset  |        |    |    |    |    |      |      |    |
| Bit    | 15     | 14 | 13 | 12 | 11 | 10   | 9    | 8  |
|        |        |    |    |    |    |      |      |    |
| Access |        |    |    |    |    |      |      |    |
| Reset  |        |    |    |    |    |      |      |    |
| Bit    | 7      | 6  | 5  | 4  | 3  | 2    | 1    | 0  |
|        | RXLPIS |    |    |    |    | IDLE | MDIO |    |
| Access | R      |    |    |    |    | R    | R    |    |
| Reset  | 0      |    |    |    |    | 1    | -    |    |

#### Bit 7 – RXLPIS LPI Indication

Low power idle has been detected on receive. This bit is set when LPI is detected and reset when normal idle is detected. An interrupt is generated when the state of this bit changes.

#### Bit 2 – IDLE PHY Management Logic Idle

The PHY management logic is idle (i.e., has completed).

#### Bit 1 – MDIO MDIO Input Status

Returns status of the GMDIO pin.

### 37.8.4 GMAC User Register

**Name:** GMAC\_UR  
**Offset:** 0x00C  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bit 0 – RMII Reduced MII Mode

| Value | Description                      |
|-------|----------------------------------|
| 0     | RMII mode is selected (default). |
| 1     | MII mode is selected.            |

#### Bit 0 – MII MII Mode

**Important:** This bit must be set to 1.

The default value of this bit is 0.

## 37.8.5 GMAC DMA Configuration Register

**Name:** GMAC\_DCFGR  
**Offset:** 0x010  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |    |    |    |    |    |    |      |

|        | ESPA | ESMA |   | FBLDO[4:0] |     |     |     |     |
| Access | R/W  | R/W  |   | R/W        | R/W | R/W | R/W | R/W |
| Reset  | 0    | 0    |   | 0          | 0   | 0   | 0   | 0   |

### Bit 24 – DDRP DMA Discard Receive Packets

When set, the GMAC DMA will automatically discard receive packets from the receiver packet buffer memory when no AHB resource is available.

When low, the received packets will remain to be stored in the SRAM based packet buffer until AHB buffer resource next becomes available.

A write to this bit is ignored if the DMA is not configured in the packet buffer full store and forward mode.

### Bits 23:16 – DRBS[7:0] DMA Receive Buffer Size

DMA receive buffer size in AHB system memory. The value defined by these bits determines the size of buffer to use in main AHB system memory when writing received data.

The value is defined in multiples of 64 bytes, thus a value of 0x01 corresponds to buffers of 64 bytes, 0x02 corresponds to 128 bytes etc.

For example:

- 0x02: 128 bytes
- 0x18: 1536 bytes (1 × max length frame/buffer)
- 0xA0: 10240 bytes (1 × 10K jumbo frame/buffer)

Note that this value should never be written as zero.

### Bit 11 – TXCOEN Transmitter Checksum Generation Offload Enable

Transmitter IP, TCP and UDP checksum generation offload enable. When set, the transmitter checksum generation engine is enabled to calculate and substitute checksums for transmit frames. When clear, frame data is unaffected.

#### Bit 10 – TXPBMS Transmitter Packet Buffer Memory Size Select

Having this bit at zero halves the amount of memory used for the transmit packet buffer. This reduces the amount of memory used by the GMAC. It is important to set this bit to one if the full configured physical memory is available. The value in brackets below represents the size that would result for the default maximum configured memory size of 4 Kbytes.

| Value | Description                                       |
|-------|---------------------------------------------------|
| 0     | Do not use top address bit (2 Kbytes).            |
| 1     | Use full configured addressable space (4 Kbytes). |

#### Bits 9:8 – RXBMS[1:0] Receiver Packet Buffer Memory Size Select

The default receive packet buffer size is 4 Kbytes. The table below shows how to configure this memory to FULL, HALF, QUARTER or EIGHTH of the default size.

| Value | Name    | Description            |
|-------|---------|------------------------|
| 0     | EIGHTH  | 4/8 Kbyte Memory Size  |
| 1     | QUARTER | 4/4 Kbytes Memory Size |
| 2     | HALF    | 4/2 Kbytes Memory Size |
| 3     | FULL    | 4 Kbytes Memory Size   |

#### Bit 7 – ESPA Endian Swap Mode Enable for Packet Data Accesses

When set, selects swapped endianness for AHB transfers. When clear, selects little endian mode.

#### Bit 6 – ESMA Endian Swap Mode Enable for Management Descriptor Accesses

When set, selects swapped endianness for AHB transfers. When clear, selects little endian mode.

#### Bits 4:0 – FBLDO[4:0] Fixed Burst Length for DMA Data Operations

Selects the burst length to attempt to use on the AHB when transferring frame data. Not used for DMA management operations and only used where space and data size allow. Otherwise SINGLE type AHB transfers are used.

One-hot priority encoding enforced automatically on register writes as follows, where 'x' represents don't care:

| Value | Name   | Description                                      |
|-------|--------|--------------------------------------------------|
| 0     | –      | Reserved                                         |
| 1     | SINGLE | 00001: Always use SINGLE AHB bursts              |
| 2     | –      | Reserved                                         |
| 4     | INCR4  | 001xx: Attempt to use INCR4 AHB bursts (Default) |
| 8     | INCR8  | 01xxx: Attempt to use INCR8 AHB bursts           |
| 16    | INCR16 | 1xxxx: Attempt to use INCR16 AHB bursts          |

## 37.8.6 GMAC Transmit Status Register

**Name:** GMAC\_TSR  
**Offset:** 0x014  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |    |          |          |          |          |          |          |
|--------|----|----|----------|----------|----------|----------|----------|----------|
| Bit    | 31 | 30 | 29       | 28       | 27       | 26       | 25       | 24       |
| Access |    |    |          |          |          |          |          |          |
| Reset  |    |    |          |          |          |          |          |          |
| Bit    | 23 | 22 | 21       | 20       | 19       | 18       | 17       | 16       |
| Access |    |    |          |          |          |          |          |          |
| Reset  |    |    |          |          |          |          |          |          |
| Bit    | 15 | 14 | 13       | 12       | 11       | 10       | 9        | 8        |
| Access |    |    |          |          |          |          |          | HRESP    |
| Reset  |    |    |          |          |          |          |          | R/W<br>0 |
| Bit    | 7  | 6  | 5        | 4        | 3        | 2        | 1        | 0        |
| Access |    |    | TXCOMP   | TFC      | TXGO     | RLE      | COL      | UBR      |
| Reset  |    |    | R/W<br>0 | R/W<br>0 | R/W<br>0 | R/W<br>0 | R/W<br>0 | R/W<br>0 |

### Bit 8 – HRESP HRESP Not OK

Set when the DMA block sees HRESP not OK. Writing a one clears this bit.

### Bit 5 – TXCOMP Transmit Complete

Set when a frame has been transmitted. Writing a one clears this bit.

### Bit 4 – TFC Transmit Frame Corruption Due to AHB Error

Transmit frame corruption due to AHB error. Set if an error occurs while midway through reading transmit frame from the AHB, including HRESP errors and buffers exhausted mid frame (if the buffers run out during transmission of a frame then transmission stops, FCS shall be bad and GTXER asserted).

Also set in DMA packet buffer mode if single frame is too large for configured packet buffer memory size.

Writing a one clears this bit.

### Bit 3 – TXGO Transmit Go

Transmit go, if high transmit is active. When using the DMA interface, this bit represents the TXGO variable as specified in the transmit buffer description.

### Bit 2 – RLE Retry Limit Exceeded

Writing a one clears this bit.

### Bit 1 – COL Collision Occurred

Set by the assertion of collision. Writing a one clears this bit. When operating in 10/100 mode, this status indicates either a collision or a late collision.

**Bit 0 – UBR** Used Bit Read

Set when a transmit buffer descriptor is read with its used bit set. Writing a one clears this bit.

### 37.8.7 GMAC Receive Buffer Queue Base Address Register

**Name:** GMAC\_RBQB  
**Offset:** 0x018  
**Reset:** 0x00000000  
**Property:** Read/Write

This register holds the start address of the receive buffer queue (receive buffers descriptor list). The receive buffer queue base address must be initialized before receive is enabled through bit 2 of the Network Control Register. Once reception is enabled, any write to the Receive Buffer Queue Base Address Register is ignored. Reading this register returns the location of the descriptor currently being accessed. This value increments as buffers are used. Software should not use this register for determining where to remove received frames from the queue as it constantly changes as new frames are received. Software should instead work its way through the buffer descriptor queue checking the “used” bits.

In terms of AMBA AHB operation, the descriptors are read from memory using a single 32-bit AHB access. The descriptors should be aligned at 32-bit boundaries and the descriptors are written to using two individual non sequential accesses.

|        |             |     |     |     |     |     |     |     |
|--------|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31          | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | ADDR[29:22] |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 23          | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | ADDR[21:14] |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15          | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | ADDR[13:6]  |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7           | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | ADDR[5:0]   |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W |     |     |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   |     |     |

**Bits 31:2 – ADDR[29:0]** Receive Buffer Queue Base Address  
Written with the address of the start of the receive queue.

### 37.8.8 GMAC Transmit Buffer Queue Base Address Register

**Name:** GMAC\_TBQB  
**Offset:** 0x01C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register holds the start address of the transmit buffer queue (transmit buffers descriptor list). The Transmit Buffer Queue Base Address Register must be initialized before transmit is started through bit 9 of the Network Control Register. Once transmission has started, any write to the Transmit Buffer Queue Base Address Register is illegal and therefore ignored.

Note that due to clock boundary synchronization, it takes a maximum of four MCK cycles from the writing of the transmit start bit before the transmitter is active. Writing to the Transmit Buffer Queue Base Address Register during this time may produce unpredictable results.

Reading this register returns the location of the descriptor currently being accessed. Since the DMA handles two frames at once, this may not necessarily be pointing to the current frame being transmitted.

In terms of AMBA AHB operation, the descriptors are written to memory using a single 32-bit AHB access. The descriptors should be aligned at 32-bit boundaries and the descriptors are read from memory using two individual non sequential accesses.

|        |             |     |     |     |     |     |     |     |
|--------|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31          | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | ADDR[29:22] |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 23          | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | ADDR[21:14] |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15          | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | ADDR[13:6]  |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7           | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | ADDR[5:0]   |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W |     |     |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   |     |     |

**Bits 31:2 – ADDR[29:0]** Transmit Buffer Queue Base Address  
Written with the address of the start of the transmit queue.

### 37.8.9 GMAC Receive Status Register

**Name:** GMAC\_RSR  
**Offset:** 0x020  
**Reset:** 0x00000000  
**Property:** Read/Write

This register, when read, provides receive status details. Once read, individual bits may be cleared by writing a one to them. It is not possible to set a bit to 1 by writing to the register.

- Bit 3 – HNO** HRESP Not OK  
 Set when the DMA block sees HRESP not OK. Writing a one clears this bit.
- Bit 2 – RXOVR** Receive Overrun  
 This bit is set if the receive status was not taken at the end of the frame. This bit is also set if the packet buffer overflows. The buffer will be recovered if an overrun occurs. Writing a one clears this bit.
- Bit 1 – REC** Frame Received  
 One or more frames have been received and placed in memory. Writing a one clears this bit.
- Bit 0 – BNA** Buffer Not Available  
 An attempt was made to get a new buffer and the pointer indicated that it was owned by the processor. The DMA will re-read the pointer each time an end of frame is received until a valid pointer is found. This bit is set following each descriptor read attempt that fails, even if consecutive pointers are unsuccessful and software has in the mean time cleared the status flag. Writing a one clears this bit.

### 37.8.10 GMAC Interrupt Status Register

**Name:** GMAC\_ISR  
**Offset:** 0x024  
**Reset:** 0x00000000  
**Property:** Read-only

This register indicates the source of the interrupt. In order that the bits of this register read 1, the corresponding interrupt source must be enabled in the mask register. If any bit is set in this register, the GMAC interrupt signal will be asserted in the system.

|        |    |    |            |     |         |     |        |        |
|--------|----|----|------------|-----|---------|-----|--------|--------|
| Bit    | 31 | 30 | 29         | 28  | 27      | 26  | 25     | 24     |
|        |    |    | TSUTIMCOMP | WOL | RXLPIBC | SRI | PDRSFT | PDRQFT |
| Access |    |    | R          | R   | R       | R   | R      | R      |
| Reset  |    |    | 0          | 0   | 0       | 0   | 0      | 0      |

|        |        |        |     |       |     |       |    |    |
|--------|--------|--------|-----|-------|-----|-------|----|----|
| Bit    | 23     | 22     | 21  | 20    | 19  | 18    | 17 | 16 |

|--------|-------|-----|------|-----|-------|-------|-------|-----|
| Bit    | 7     | 6   | 5    | 4   | 3     | 2     | 1     | 0   |
|        | TCOMP | TFC | RLEX | TUR | TXUBR | RXUBR | RCOMP | MFS |
| Access | R     | R   | R    | R   | R     | R     | R     | R   |
| Reset  | 0     | 0   | 0    | 0   | 0     | 0     | 0     | 0   |

**Bit 29 – TSUTIMCOMP** TSU Timer Comparison

Indicates when TSU timer count value is equal to programmed value. Cleared on read.

**Bit 28 – WOL** Wake On LAN

WOL interrupt. Indicates a WOL event has been received.

**Bit 27 – RXLPISBC** Receive LPI indication Status Bit Change

Receive LPI indication status bit change. Cleared on read.

**Bit 26 – SRI** TSU Seconds Register Increment

Indicates the register has incremented. Cleared on read.

**Bit 25 – PDRSFT** PDelay Response Frame Transmitted

Indicates a PTP pdelay\_resp frame has been transmitted. Cleared on read.

**Bit 24 – PDRQFT** PDelay Request Frame Transmitted

Indicates a PTP pdelay\_req frame has been transmitted. Cleared on read.

**Bit 23 – PDRSFR** PDelay Response Frame Received

Indicates a PTP pdelay\_resp frame has been received. Cleared on read.

- Bit 22 – PDRQFR** PDelay Request Frame Received  
Indicates a PTP pdelay\_req frame has been received. Cleared on read.
- Bit 21 – SFT** PTP Sync Frame Transmitted  
Indicates a PTP sync frame has been transmitted. Cleared on read.
- Bit 20 – DRQFT** PTP Delay Request Frame Transmitted  
Indicates a PTP delay\_req frame has been transmitted. Cleared on read.
- Bit 19 – SFR** PTP Sync Frame Received  
Indicates a PTP sync frame has been received. Cleared on read.
- Bit 18 – DRQFR** PTP Delay Request Frame Received  
Indicates a PTP delay\_req frame has been received. Cleared on read.
- Bit 14 – PFTR** Pause Frame Transmitted  
Indicates a pause frame has been successfully transmitted after being initiated from the Network Control register. Cleared on read.
- Bit 13 – PTZ** Pause Time Zero  
Set when either the Pause Time register at address 0x38 decrements to zero, or when a valid pause frame is received with a zero pause quantum field. Cleared on read.
- Bit 12 – PFNZ** Pause Frame with Non-zero Pause Quantum Received  
Indicates a valid pause has been received that has a non-zero pause quantum field. Cleared on read.
- Bit 11 – HRESP** HRESP Not OK  
Set when the DMA block sees HRESP not OK. Cleared on read.
- Bit 10 – ROVR** Receive Overrun  
Set when the receive overrun status bit is set. Cleared on read.
- Bit 7 – TCOMP** Transmit Complete  
Set when a frame has been transmitted. Cleared on read.
- Bit 6 – TFC** Transmit Frame Corruption Due to AHB Error  
Transmit frame corruption due to AHB error. Set if an error occurs while midway through reading transmit frame from the AHB, including HRESP errors and buffers exhausted mid frame.
- Bit 5 – RLEX** Retry Limit Exceeded  
Transmit error. Cleared on read.
- Bit 4 – TUR** Transmit Underrun  
This interrupt is set if the transmitter was forced to terminate a frame that it has already began transmitting due to further data being unavailable.  
This interrupt is set if a transmitter status write back has not completed when another status write back is attempted.  
This interrupt is also set when the transmit DMA has written the SOP data into the FIFO and either the AHB bus was not granted in time for further data, or because an AHB not OK response was returned, or because the used bit was read.
- Bit 3 – TXUBR** TX Used Bit Read  
Set when a transmit buffer descriptor is read with its used bit set. Cleared on read.

**Bit 2 – RXUBR** RX Used Bit Read

Set when a receive buffer descriptor is read with its used bit set. Cleared on read.

**Bit 1 – RCOMP** Receive Complete

A frame has been stored in memory. Cleared on read.

**Bit 0 – MFS** Management Frame Sent

The PHY Maintenance Register has completed its operation. Cleared on read.

### 37.8.11 GMAC Interrupt Enable Register

**Name:** GMAC\_IER  
**Offset:** 0x028  
**Reset:** –  
**Property:** Write-only

This register is write-only and when read will return zero.

The following values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |        |        |            |       |         |       |        |        |
|--------|--------|--------|------------|-------|---------|-------|--------|--------|
| Bit    | 31     | 30     | 29         | 28    | 27      | 26    | 25     | 24     |

### 37.8.12 GMAC Interrupt Disable Register

**Name:** GMAC\_IDR  
**Offset:** 0x02C  
**Reset:** –  
**Property:** Write-only

This register is write-only and when read will return zero.

The following values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|        |        |        |            |       |         |       |        |        |
|--------|--------|--------|------------|-------|---------|-------|--------|--------|
| Bit    | 31     | 30     | 29         | 28    | 27      | 26    | 25     | 24     |

### 37.8.13 GMAC Interrupt Mask Register

**Name:** GMAC\_IMR  
**Offset:** 0x030  
**Reset:** 0x07FFFFFFF  
**Property:** Read/Write

The Interrupt Mask Register is a read-only register indicating which interrupts are masked. All bits are set at reset and can be reset individually by writing to the Interrupt Enable Register or set individually by writing to the Interrupt Disable Register. Having separate address locations for enable and disable saves the need for performing a read modify write when updating the Interrupt Mask Register.

For test purposes there is a write-only function to this register that allows the bits in the Interrupt Status Register to be set or cleared, regardless of the state of the mask register. A write to this register directly affects the state of the corresponding bit in the Interrupt Status Register, causing an interrupt to be generated if a 1 is written.

The following values are valid for all listed bit names of this register when read:

0: The corresponding interrupt is enabled.

1: The corresponding interrupt is not enabled.

|        |    |    |            |     |         |     |        |        |
|--------|----|----|------------|-----|---------|-----|--------|--------|
| Bit    | 31 | 30 | 29         | 28  | 27      | 26  | 25     | 24     |

- Bit 0 – MFS** Management Frame Sent

### 37.8.14 GMAC PHY Maintenance Register

**Name:** GMAC\_MAN  
**Offset:** 0x034  
**Reset:** 0x00000000  
**Property:** Read/Write

The PHY Maintenance Register is implemented as a shift register. Writing to the register starts a shift operation which is signalled as complete when bit 2 is set in the Network Status Register. It takes about 2000 MCK cycles to complete, when MDC is set for MCK divide by 32 in the Network Configuration Register. An interrupt is generated upon completion.

During this time, the MSB of the register is output on the GMDIO pin and the LSB updated from the GMDIO pin with each MDC cycle. This causes transmission of a PHY management frame on the GMDIO pin. See Section 22.2.4.5 of the IEEE 802.3 standard.

Reading during the shift operation returns the current contents of the shift register. At the end of management operation, the bits will have shifted back to their original locations. For a read operation, the data bits are updated with data read from the PHY. It is important to write the correct values to the register to ensure a valid PHY management frame is produced.

The MDIO interface can read IEEE 802.3 clause 45 PHYs as well as clause 22 PHYs. To read clause 45 PHYs, bit 30 should be written with a 0 rather than a 1. To write clause 45 PHYs, bits 31:28 should be written as 0x0001. See the table below.

**Table 37-17.** Clause 22/Clause 45 PHYs Read/Write Access Configuration (GMAC\_MAN Bits 31:28)

| PHY       | Access         | Bit Value |       |       |       |
|-----------|----------------|-----------|-------|-------|-------|
|           |                | WZO       | CLTTO | OP[1] | OP[0] |
| Clause 22 | Read           | 0         | 1     | 1     | 0     |
|           | Write          | 0         | 1     | 0     | 1     |
| Clause 45 | Read           | 0         | 0     | 1     | 1     |
|           | Write          | 0         | 0     | 0     | 1     |
|           | Read + Address | 0         | 0     | 1     | 0     |

For a description of MDC generation, see [GMAC Network Configuration Register](#).

|        |            |           |         |     |           |     |          |     |

**Bit 31 – WZO** Write ZERO  
Must be written with 0.

**Bit 30 – CLTTO** Clause 22 Operation

| Value | Description         |
|-------|---------------------|
| 0     | Clause 45 operation |
| 1     | Clause 22 operation |

**Bits 29:28 – OP[1:0]** Operation

| Value | Description |
|-------|-------------|
| 01    | Write       |
| 10    | Read        |

**Bits 27:23 – PHYA[4:0]** PHY Address

**Bits 22:18 – REGA[4:0]** Register Address  
Specifies the register in the PHY to access.

**Bits 17:16 – WTN[1:0]** Write Ten  
Must be written to 10.

**Bits 15:0 – DATA[15:0]** PHY Data  
For a write operation this field is written with the data to be written to the PHY. After a read operation this field contains the data read from the PHY.

### 37.8.15 GMAC Receive Pause Quantum Register

**Name:** GMAC\_RPQ  
**Offset:** 0x038  
**Reset:** 0x00000000  
**Property:** Read-only

|        |           |    |    |    |    |    |    |    |
|--------|-----------|----|----|----|----|----|----|----|
| Bit    | 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |           |    |    |    |    |    |    |    |
| Access |           |    |    |    |    |    |    |    |
| Reset  |           |    |    |    |    |    |    |    |

|        | FL[7:0]  |     |     |     |     |     |     |     |
| Access | R/W      | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0        | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 15:0 – FL[15:0] Frame Length

Bits 7:0 are multiplied with the previously transmitted frame length (including preamble). Bits 15:8 +1 divide the frame length. If the resulting number is greater than 96 and bit 28 is set in the Network Configuration Register then the resulting number is used for the transmit inter-packet-gap. 1 is added to bits 15:8 to prevent a divide by zero. See [MAC Transmit Block](#).

### 37.8.35 GMAC Stacked VLAN Register

**Name:** GMAC\_SVLAN  
**Offset:** 0x0C0  
**Reset:** 0x00000000  
**Property:** Read/Write

| Bit    | 15              | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | VLAN_TYPE[15:8] |     |     |     |     |     |     |     |
| Access | R/W             | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0               | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7               | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | VLAN_TYPE[7:0]  |     |     |     |     |     |     |     |
| Access | R/W             | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0               | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bit 31 – ESVLAN Enable Stacked VLAN Processing Mode

| Value | Description                              |
|-------|------------------------------------------|
| 0     | Disable the stacked VLAN processing mode |
| 1     | Enable the stacked VLAN processing mode  |

#### Bits 15:0 – VLAN\_TYPE[15:0] User Defined VLAN\_TYPE Field

User defined VLAN\_TYPE field. When Stacked VLAN is enabled, the first VLAN tag in a received frame will only be accepted if the VLAN type field is equal to this user defined VLAN\_TYPE, OR equal to the standard VLAN type (0x8100). Note that the second VLAN tag of a Stacked VLAN packet will only be matched correctly if its VLAN\_TYPE field equals 0x8100.

### 37.8.36 GMAC Transmit PFC Pause Register

**Name:** GMAC\_TPFCP  
**Offset:** 0x0C4  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |          |     |     |     |     |     |     |     |
|--------|----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31       | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |          |     |     |     |     |     |     |     |
| Access |          |     |     |     |     |     |     |     |

|        |          |     |     |     |     |     |     |     |
| Access |          |     |     |     |     |     |     |     |
| Reset  |          |     |     |     |     |     |     |     |
| Bit    | 15       | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | PQ[7:0]  |     |     |     |     |     |     |     |
| Access | R/W      | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0        | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7        | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | PEV[7:0] |     |     |     |     |     |     |     |
| Access | R/W      | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0        | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 15:8 – PQ[7:0] Pause Quantum

If bit 17 of the Network Control Register is written with a one then for each entry equal to zero in the Transmit PFC Pause Register[15:8], the PFC pause frame's pause quantum field associated with that entry will be taken from the Transmit Pause Quantum Register. For each entry equal to one in the Transmit PFC Pause Register [15:8], the pause quantum associated with that entry will be zero.

#### Bits 7:0 – PEV[7:0] Priority Enable Vector

If bit 17 of the Network Control Register is written with a one then the priority enable vector of the PFC priority based pause frame will be set equal to the value stored in this register [7:0].

|        | TXO[23:16] |    |    |    |    |    |    |    |
| Access | R          | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | TXO[15:8]  |    |    |    |    |    |    |    |
| Access | R          | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7          | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | TXO[7:0]   |    |    |    |    |    |    |    |
| Access | R          | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 31:0 – TXO[31:0] Transmitted Octets

Transmitted octets in frame without errors [31:0]. The number of octets transmitted in valid frames of any type. This counter is 48-bits, and is read through two registers. This count does not include octets from automatically generated pause frames.

### 37.8.47 GMAC Octets Transmitted High Register

**Name:** GMAC\_OTH  
**Offset:** 0x104  
**Reset:** 0x00000000  
**Property:** Read-only

When reading the Octets Transmitted and Octets Received Registers, bits 31:0 should be read prior to bits 47:32 to ensure reliable operation.

#### Bits 15:0 – TXO[15:0] Transmitted Octets

Transmitted octets in frame without errors [47:32]. The number of octets transmitted in valid frames of any type. This counter is 48-bits, and is read through two registers. This count does not include octets from automatically generated pause frames.

#### Bits 15:0 – PFTX[15:0] Pause Frames Transmitted Register

This register counts the number of pause frames transmitted. Only pause frames triggered by the register interface or through the external pause pins are counted as pause frames. Pause frames received through the FIFO interface are counted in the frames transmitted counter.

## 37.8.52 GMAC 64 Byte Frames Transmitted Register

| Reset  |           |    |    |    |    |    | 0         | 0  |
| Bit    | 7         | 6  | 5  | 4  | 3  | 2  | 1         | 0  |
|        | LCOL[7:0] |    |    |    |    |    |           |    |
| Access | R         | R  | R  | R  | R  | R  | R         | R  |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0         | 0  |

#### Bits 9:0 – LCOL[9:0] Late Collisions

This register counts the number of late collisions occurring after the slot time (512 bits) has expired. In 10/100 mode, late collisions are counted twice i.e., both as a collision and a late collision.

### 37.8.64 GMAC Deferred Transmission Frames Register

**Name:** GMAC\_DTF  
**Offset:** 0x148  
**Reset:** 0x00000000  
**Property:** Read-only

|        |            |    |    |    |    |    |             |    |

#### Bits 17:0 – DEFT[17:0] Deferred Transmission

This register counts the number of frames experiencing deferral due to carrier sense being active on their first attempt at transmission. Frames involved in any collision are not counted nor are frames that experienced a transmit underrun.

### 37.8.65 GMAC Carrier Sense Errors Register

**Name:** GMAC\_CSE  
**Offset:** 0x14C  
**Reset:** 0x00000000  
**Property:** Read-only

| Access |          |    |    |    |    |    | R        | R  |
| Reset  |          |    |    |    |    |    | 0        | 0  |
| Bit    | 7        | 6  | 5  | 4  | 3  | 2  | 1        | 0  |
|        | CSR[7:0] |    |    |    |    |    |          |    |
| Access | R        | R  | R  | R  | R  | R  | R        | R  |
| Reset  | 0        | 0  | 0  | 0  | 0  | 0  | 0        | 0  |

#### Bits 9:0 – CSR[9:0] Carrier Sense Error

This register counts the number of frames transmitted where carrier sense was not seen during transmission or where carrier sense was deasserted after being asserted in a transmit frame without collision (no underrun). Only incremented in half duplex mode. The only effect of a carrier sense error is to increment this register. The behavior of the other statistics registers is unaffected by the detection of a carrier sense error.

### 37.8.66 GMAC Octets Received Low Register

**Name:** GMAC\_ORLO  
**Offset:** 0x150  
**Reset:** 0x00000000  
**Property:** Read-only

When reading the Octets Transmitted and Octets Received Registers, bits [31:0] should be read prior to bits [47:32] to ensure reliable operation.

| Access | R          | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 31:0 – RXO[31:0] Received Octets

Received octets in frame without errors [31:0]. The number of octets received in valid frames of any type. This counter is 48-bits and is read through two registers. This count does not include octets from pause frames, and is only incremented if the frame is successfully filtered and copied to memory.

### 37.8.67 GMAC Octets Received High Register

**Name:** GMAC\_ORHI  
**Offset:** 0x154  
**Reset:** 0x00000000  
**Property:** Read-only

When reading the Octets Transmitted and Octets Received Registers, bits 31:0 should be read prior to bits 47:32 to ensure reliable operation.

#### Bits 15:0 – PFRX[15:0] Pause Frames Received Register

This register counts the number of pause frames received without error.

## 37.8.72 GMAC 64 Byte Frames Received Register

**Name:** GMAC\_BFR64  
**Offset:** 0x168  
**Reset:** 0x00000000  
**Property:** Read-only

| Bit    | 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|--------|-------------|----|----|----|----|----|----|----|

### Bits 31:0 – NFRX[31:0] 64 Byte Frames Received without Error

This register counts the number of 64 byte frames successfully received without error. Excludes pause frames, and is only incremented if the frame is successfully filtered and copied to memory.

### 37.8.73 GMAC 65 to 127 Byte Frames Received Register

**Name:** GMAC\_TBFR127  
**Offset:** 0x16C  
**Reset:** 0x00000000  
**Property:** Read-only

|        |             |    |    |    |    |    |    |    |

| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 31:0 – NFRX[31:0] 65 to 127 Byte Frames Received without Error

This register counts the number of 65 to 127 byte frames successfully received without error. Excludes pause frames, and is only incremented if the frame is successfully filtered and copied to memory.

### 37.8.74 GMAC 128 to 255 Byte Frames Received Register

**Name:** GMAC\_TBFR255  
**Offset:** 0x170  
**Reset:** 0x00000000  
**Property:** Read-only

|        |             |    |    |    |    |    |    |    |

| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 31:0 – NFRX[31:0] 128 to 255 Byte Frames Received without Error

This register counts the number of 128 to 255 byte frames successfully received without error. Excludes pause frames, and is only incremented if the frame is successfully filtered and copied to memory.

### 37.8.75 GMAC 256 to 511 Byte Frames Received Register

**Name:** GMAC\_TBFR511  
**Offset:** 0x174  
**Reset:** 0x00000000  
**Property:** Read-only

| Bit    | 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Access | R           | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 31:0 – NFRX[31:0] 256 to 511 Byte Frames Received without Error

This register counts the number of 256 to 511 byte frames successfully received without error. Excludes pause frames, and is only incremented if the frame is successfully filtered and copied to memory.

### 37.8.76 GMAC 512 to 1023 Byte Frames Received Register

**Name:** GMAC\_TBFR1023  
**Offset:** 0x178  
**Reset:** 0x00000000  
**Property:** Read-only

|        |             |    |    |    |    |    |    |    |

| Access | R           | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 31:0 – NFRX[31:0] 1024 to 1518 Byte Frames Received without Error

This register counts the number of 1024 to 1518 byte frames successfully received without error, i.e., no underrun and not too many retries.

### 37.8.78 GMAC 1519 to Maximum Byte Frames Received Register

**Name:** GMAC\_TMXBFR  
**Offset:** 0x180  
**Reset:** 0x00000000  
**Property:** Read-only

|        |             |    |    |    |    |    |    |    |

|        | NFRX[7:0]   |    |    |    |    |    |    |    |
| Access | R           | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 31:0 – NFRX[31:0] 1519 to Maximum Byte Frames Received without Error

This register counts the number of 1519 byte or above frames successfully received without error. Maximum frame size is determined by the Network Configuration Register bit 8 (1536 maximum frame size) or bit 3 (jumbo frame size). Excludes pause frames, and is only incremented if the frame is successfully filtered and copied to memory. See [GMAC Network Configuration Register](#).

### 37.8.79 GMAC Undersized Frames Received Register

**Name:** GMAC\_UFR  
**Offset:** 0x184  
**Reset:** 0x00000000  
**Property:** Read-only

|        |           |    |    |    |    |    |           |    |
|--------|-----------|----|----|----|----|----|-----------|----|

| Access |           |    |    |    |    |    |           |    |
| Reset  |           |    |    |    |    |    |           |    |
| Bit    | 15        | 14 | 13 | 12 | 11 | 10 | 9         | 8  |
|        |           |    |    |    |    |    | UFRX[9:8] |    |
| Access |           |    |    |    |    |    | R         | R  |
| Reset  |           |    |    |    |    |    | 0         | 0  |
| Bit    | 7         | 6  | 5  | 4  | 3  | 2  | 1         | 0  |
|        | UFRX[7:0] |    |    |    |    |    |           |    |
| Access | R         | R  | R  | R  | R  | R  | R         | R  |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0         | 0  |

#### Bits 9:0 – UFRX[9:0] Undersize Frames Received

This register counts the number of frames received less than 64 bytes in length (10/100 mode, full duplex) that do not have either a CRC error or an alignment error.

### 37.8.80 GMAC Oversized Frames Received Register

**Name:** GMAC\_OFR  
**Offset:** 0x188  
**Reset:** 0x00000000  
**Property:** Read-only

|        |           |    |    |    |    |    |           |    |

#### Bits 9:0 – OFRX[9:0] Oversized Frames Received

This register counts the number of frames received exceeding 1518 bytes (1536 bytes if bit 8 is set in the Network Configuration Register ) in length but do not have either a CRC error, an alignment error nor a receive symbol error. See [GMAC Network Configuration Register](#).

### 37.8.81 GMAC Jabbers Received Register

#### Bits 9:0 – FCKR[9:0] Frame Check Sequence Errors

The register counts frames that are an integral number of bytes, have bad CRC and are between 64 and 1518 bytes in length (1536 if bit 8 is set in Network Configuration Register). This register is also incremented if a symbol error is detected and the frame is of valid length and has an integral number of bytes.

This register is incremented for a frame with bad FCS, regardless of whether it is copied to memory due to ignore FCS mode being enabled in bit 26 of the Network Configuration Register. See [GMAC Network Configuration Register](#).

### 37.8.83 GMAC Length Field Frame Errors Register

**Name:** GMAC\_LFFE  
**Offset:** 0x194  
**Reset:** 0x00000000  
**Property:** Read-only

| Access | R          | R  | R  | R  | R  | R  | R          | R  |
| Reset  | 0          | 0  | 0  | 0  | 0  | 0  | 0          | 0  |

#### Bits 9:0 – LFFER[9:0] Length Field Frame Errors

This register counts the number of frames received that have a measured length shorter than that extracted from the length field (bytes 13 and 14). This condition is only counted if the value of the length field is less than 0x0600, the frame is not of excessive length and checking is enabled through bit 16 of the Network Configuration Register. See [GMAC Network Configuration Register](#).

### 37.8.84 GMAC Receive Symbol Errors Register

**Name:** GMAC\_RSE  
**Offset:** 0x198  
**Reset:** 0x00000000  
**Property:** Read-only

|        |           |    |    |    |    |    |           |    |

| Access | R         | R  | R  | R  | R  | R  | R         | R  |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0         | 0  |

#### Bits 9:0 – RXSE[9:0] Receive Symbol Errors

This register counts the number of frames that had GRXER asserted during reception. For 10/100 mode symbol errors are counted regardless of frame length checks. Receive symbol errors will also be counted as an FCS or alignment error if the frame is between 64 and 1518 bytes (1536 bytes if bit 8 is set in the Network Configuration Register). If the frame is larger it will be recorded as a jabber error. See [GMAC Network Configuration Register](#).

### 37.8.85 GMAC Alignment Errors Register

**Name:** GMAC\_AE  
**Offset:** 0x19C  
**Reset:** 0x00000000  
**Property:** Read-only

| Reset  | 0        | 0  | 0  | 0  | 0  | 0  | 0        | 0  |

#### Bits 9:0 – AER[9:0] Alignment Errors

This register counts the frames that are not an integral number of bytes long and have bad CRC when their length is truncated to an integral number of bytes and are between 64 and 1518 bytes in length (1536 if bit 8 is set in Network Configuration Register). This register is also incremented if a symbol error is detected and the frame is of valid length and does not have an integral number of bytes. See [GMAC Network Configuration Register](#).

#### Bits 17:0 – RXRER[17:0] Receive Resource Errors

Counts the frames that were successfully received by the MAC but could not be copied to memory because no receive buffer was available. This occurs when the GMAC reads a buffer descriptor with its ownership (or used) bit set.

### 37.8.87 GMAC Receive Overruns Register

**Name:** GMAC\_ROE  
**Offset:** 0x1A4  
**Reset:** 0x00000000

| Reset  | 0          | 0  | 0  | 0  | 0  | 0  | 0          | 0  |

#### Bits 9:0 – RXOVR[9:0] Receive Overruns

This register counts the number of frames that are address recognized but were not copied to memory due to a receive overrun.

### 37.8.88 GMAC IP Header Checksum Errors Register

**Name:** GMAC\_IHCE  
**Offset:** 0x1A8  
**Reset:** 0x00000000  
**Property:** Read-only

| Reset  |              |     |     |     |     |     |     |     |
| Bit    | 15           | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | LSBTIR[15:8] |     |     |     |     |     |     |     |
| Access | R/W          | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0            | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7            | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | LSBTIR[7:0]  |     |     |     |     |     |     |     |
| Access | R/W          | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0            | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 15:0 – LSBTIR[15:0] Lower Significant Bits of Timer Increment Register

Lower significant bits of Timer Increment Register[15:0] giving a 24-bit timer\_increment counter. These bits are the sub-ns value which the 1588 timer will be incremented each clock cycle. Bit n =  $2^{(n-16)}$  nsec giving a resolution of approximately  $15.2E^{-15}$  sec.

### 37.8.92 GMAC 1588 Timer Seconds High Register

**Name:** GMAC\_TSH  
**Offset:** 0x1C0  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |           |     |     |     |     |     |     |     |

#### Bit 31 – ADJ Adjust 1588 Timer

Write as one to subtract from the 1588 timer. Write as zero to add to it.

#### Bits 29:0 – ITDT[29:0] Increment/Decrement

The number of nanoseconds to increment or decrement the 1588 Timer Nanoseconds Register. If necessary, the 1588 Seconds Register will be incremented or decremented.

### 37.8.96 GMAC 1588 Timer Increment Register

**Name:** GMAC\_TI  
**Offset:** 0x1DC  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 23:16 – NIT[7:0] Number of Increments

The number of increments after which the alternative increment is used.

#### Bits 15:8 – ACNS[7:0] Alternative Count Nanoseconds

Alternative count of nanoseconds by which the 1588 Timer Nanoseconds Register will be incremented each clock cycle.

#### Bits 7:0 – CNS[7:0] Count Nanoseconds

A count of nanoseconds by which the 1588 Timer Nanoseconds Register will be incremented each clock cycle.

**Bit 11 – HRESP** HRESP Not OK

**Bit 10 – ROVR** Receive Overrun

**Bit 7 – TCOMP** Transmit Complete

**Bit 6 – TFC** Transmit Frame Corruption Due to AHB Error

Transmit frame corruption due to AHB error—set if an error occurs whilst midway through reading transmit frame from the AHB, including HRESP errors and buffers exhausted mid frame.

**Bit 5 – RLEX** Retry Limit Exceeded or Late Collision

**Bit 2 – RXUBR** RX Used Bit Read

**Bit 1 – RCOMP** Receive Complete

### 37.8.110 GMAC Transmit Buffer Queue Base Address Register Priority Queue x

**Name:** GMAC\_TBQBAPQx  
**Offset:** 0x0440 + (x-1)\*0x04 [x=1..5]  
**Reset:** 0x00000000  
**Property:** Read/Write

These registers hold the start address of the transmit buffer queues (transmit buffers descriptor lists) for the additional queues and must be initialized to the address of valid descriptors, even if the priority queues are not used.

#### Bits 15:0 – RBS[15:0] Receive Buffer Size

DMA receive buffer size in AHB system memory. The value defined by these bits determines the size of buffer to use in main AHB system memory when writing received data.

The value is defined in multiples of 64 bytes such that a value of 0x01 corresponds to buffers of 64 bytes, 0x02 corresponds to 128 bytes etc.

For example:

0x02: 128bytes

0x18: 1536bytes (1 × max length frame/buffer)

0xA0: 10240bytes (1 × 10K jumbo frame/buffer)

Note that this value should never be written as zero.

### 37.8.113 GMAC Credit-Based Shaping Control Register

**Name:** GMAC\_CBSCR  
**Offset:** 0x4BC  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bit 1 – QBE Queue B CBS Enable

| Value | Description                                                               |
|-------|---------------------------------------------------------------------------|
| 0     | Credit-based shaping on the highest priority queue (queue B) is disabled. |
| 1     | Credit-based shaping on the highest priority queue (queue B) is enabled.  |

#### Bit 0 – QAE Queue A CBS Enable

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | Credit-based shaping on the second highest priority queue (queue A) is disabled. |
| 1     | Credit-based shaping on the second highest priority queue (queue A) is enabled.  |

### 37.8.114 GMAC Credit-Based Shaping IdleSlope Register for Queue A

**Name:** GMAC\_CBSISQA  
**Offset:** 0x4C0  
**Reset:** 0x00000000  
**Property:** Read/Write

Credit-based shaping must be disabled in GMAC\_CBSCR before updating this register.

#### Bits 31:0 – IS[31:0] IdleSlope

IdleSlope value for queue A in bytes/second.

The IdleSlope value is defined as the rate of change of credit when a packet is waiting to be sent.

This must not exceed the port transmit rate which is dependent on the speed of operation, e.g., 100 Mb/second = 32'h017D7840

If 50% of bandwidth was to be allocated to a particular queue in 100 Mb/second mode, then the IdleSlope value for that queue would be calculated as 32'h017D7840 / 2.

### 37.8.115 GMAC Credit-Based Shaping IdleSlope Register for Queue B

**Name:** GMAC\_CBSISQB  
**Offset:** 0x4C4  
**Reset:** 0x00000000  
**Property:** Read/Write

Credit-based shaping must be disabled in GMAC\_CBSCR before updating this register.

#### Bits 31:0 – IS[31:0] IdleSlope

IdleSlope value for queue B in bytes/second.

The IdleSlope value is defined as the rate of change of credit when a packet is waiting to be sent.

This must not exceed the port transmit rate which is dependent on the speed of operation, e.g., 100 Mb/second = 32'h017D7840.

If 50% of bandwidth was to be allocated to a particular queue in 100 Mb/second mode, then the IdleSlope value for that queue would be calculated as 32'h017D7840 / 2.

### 37.8.116 GMAC Screening Type 1 Register x Priority Queue

**Name:** GMAC\_ST1RPQx  
**Offset:** 0x0500 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

Screening type 1 registers are used to allocate up to 6 priority queues to received frames based on certain IP or UDP fields of incoming frames.

|        |            |     |      |       |             |          |     |     |

|        | UDPM[3:0]  |     |      |       | DSTCM[7:4]  |          |     |     |
| Access | R/W        | R/W | R/W  | R/W   | R/W         | R/W      | R/W | R/W |
| Reset  | 0          | 0   | 0    | 0     | 0           | 0        | 0   | 0   |
| Bit    | 7          | 6   | 5    | 4     | 3           | 2        | 1   | 0   |
|        | DSTCM[3:0] |     |      |       |             | QNB[2:0] |     |     |
| Access | R/W        | R/W | R/W  | R/W   |             | R/W      | R/W | R/W |
| Reset  | 0          | 0   | 0    | 0     |             | 0        | 0   | 0   |

#### Bit 29 – UDPE UDP Port Match Enable

When UDP port match enable is set (bit 29), the UDP Destination Port of the received UDP frame is matched against bits 27:12.

#### Bit 28 – DSTCE Differentiated Services or Traffic Class Match Enable

When DS/TC match enable is set (bit 28), the DS (differentiated services) field of the received IPv4 header or TC field (traffic class) of IPv6 headers are matched against bits 11:4.

#### Bits 27:12 – UDPM[15:0] UDP Port Match

When UDP port match enable is set (bit 29), the UDP Destination Port of the received UDP frame is matched against bits 27:12.

#### Bits 11:4 – DSTCM[7:0] Differentiated Services or Traffic Class Match

When DS/TC match enable is set (bit 28), the DS (differentiated services) field of the received IPv4 header or TC field (traffic class) of IPv6 headers are matched against bits 11:4.

#### Bits 2:0 – QNB[2:0] Queue Number (0–5)

If a match is successful, then the queue value programmed in bits 2:0 is allocated to the frame.

### 37.8.117 GMAC Screening Type 2 Register x Priority Queue

**Name:** GMAC\_ST2RPQx  
**Offset:** 0x0540 + x\*0x04 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read/Write

Screening type 2 registers are used to allocate up to 6 priority queues to received frames based on the VLAN priority field of received ethernet frames.

| Access |             | R/W        | R/W        | R/W  |            | R/W      | R/W         | R/W    |
| Reset  |             | 0          | 0          | 0    |            | 0        | 0           | 0      |

#### Bit 30 – COMPCE Compare C Enable

| Value | Description                                                        |
|-------|--------------------------------------------------------------------|
| 0     | Comparison via the register designated by index COMPC is disabled. |
| 1     | Comparison via the register designated by index COMPC is enabled.  |

#### Bits 29:25 – COMPC[4:0] Index of Screening Type 2 Compare Word 0/Word 1 register x

COMPC is a pointer to the compare registers GMAC\_ST2CW0x and GMAC\_ST2CW1x. When COMPCE is set, the compare is true if the data at the frame offset ANDed with the value MASKVAL is equal to the value of COMPVAL ANDed with the value of MASKVAL.

#### Bit 24 – COMPBE Compare B Enable

| Value | Description                                                        |
|-------|--------------------------------------------------------------------|
| 0     | Comparison via the register designated by index COMPB is disabled. |
| 1     | Comparison via the register designated by index COMPB is enabled.  |

#### Bits 23:19 – COMPB[4:0] Index of Screening Type 2 Compare Word 0/Word 1 register x

COMPB is a pointer to the compare registers GMAC\_ST2CW0x and GMAC\_ST2CW1x. When COMPBE is set, the compare is true if the data at the frame offset ANDed with the value MASKVAL is equal to the value of COMPVAL ANDed with the value of MASKVAL.

#### Bit 18 – COMPAE Compare A Enable

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | Comparison via the register designated by index COMP A is disabled. |
| 1     | Comparison via the register designated by index COMP A is enabled.  |

**Bits 17:13 – COMPA[4:0]** Index of Screening Type 2 Compare Word 0/Word 1 register x

COMPA is a pointer to the compare registers GMAC\_ST2CW0x and GMAC\_ST2CW1x. When COMPAE is set, the compare is true if the data at the frame offset ANDed with the value MASKVAL is equal to the value of COMPVAL ANDed with the value of MASKVAL.

**Bit 12 – ETHE** EtherType Enable

| Value | Description                                                                                  |
|-------|----------------------------------------------------------------------------------------------|
| 0     | EtherType match with bits 15:0 in the register designated by the value of I2ETH is disabled. |
| 1     | EtherType match with bits 15:0 in the register designated by the value of I2ETH is enabled.  |

**Bits 11:9 – I2ETH[2:0]** Index of Screening Type 2 EtherType register x

When ETHE is set (bit 12), the field EtherType (last EtherType in the header if the frame is VLAN tagged) is compared with bits 15:0 in the register designated by the value of I2ETH.

**Bit 8 – VLANE** VLAN Enable

| Value | Description             |
|-------|-------------------------|
| 0     | VLAN match is disabled. |
| 1     | VLAN match is enabled.  |

**Bits 6:4 – VLANP[2:0]** VLAN Priority

When VLAN match enable is set (bit 8), the VLAN priority field of the received frame is matched against bits 7:4 of this register.

**Bits 2:0 – QNB[2:0]** Queue Number (0–5)

If a match is successful, then the queue value programmed in QNB is allocated to the frame.

### 37.8.118 GMAC Interrupt Enable Register Priority Queue x

**Name:** GMAC\_IERPQx  
**Offset:** 0x0600 + (x-1)\*0x04 [x=1..5]  
**Reset:** –  
**Property:** Write-only

The following values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |       |     |      |    |       |       |       |    |
|--------|-------|-----|------|----|-------|-------|-------|----|
| Bit    | 31    | 30  | 29   | 28 | 27    | 26    | 25    | 24 |
|        |       |     |      |    |       |       |       |    |
| Access |       |     |      |    |       |       |       |    |
| Reset  |       |     |      |    |       |       |       |    |
| Bit    | 23    | 22  | 21   | 20 | 19    | 18    | 17    | 16 |
|        |       |     |      |    |       |       |       |    |
| Access |       |     |      |    |       |       |       |    |
| Reset  |       |     |      |    |       |       |       |    |
| Bit    | 15    | 14  | 13   | 12 | 11    | 10    | 9     | 8  |
|        |       |     |      |    | HRESP | ROVR  |       |    |
| Access |       |     |      |    | W     | W     |       |    |
| Reset  |       |     |      |    | –     | –     |       |    |
| Bit    | 7     | 6   | 5    | 4  | 3     | 2     | 1     | 0  |

| Reset  | –     | –   | –    |    |       | –     | –     |    |

**Bit 11 – HRESP** HRESP Not OK

**Bit 10 – ROVR** Receive Overrun

**Bit 7 – TCOMP** Transmit Complete

**Bit 6 – TFC** Transmit Frame Corruption Due to AHB Error

**Bit 5 – RLEX** Retry Limit Exceeded or Late Collision

**Bit 2 – RXUBR** RX Used Bit Read

**Bit 1 – RCOMP** Receive Complete

### 37.8.119 GMAC Interrupt Disable Register Priority Queue x

**Name:** GMAC\_IDRPQx  
**Offset:** 0x0620 + (x-1)\*0x04 [x=1..5]  
**Reset:** –  
**Property:** Write-only

The following values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|        |       |     |      |    |       |       |       |    |
|--------|-------|-----|------|----|-------|-------|-------|----|
| Bit    | 31    | 30  | 29   | 28 | 27    | 26    | 25    | 24 |

| Reset  | –     | –   | –    |    |       | –     | –     |    |

**Bit 11 – HRESP** HRESP Not OK

**Bit 10 – ROVR** Receive Overrun

**Bit 7 – TCOMP** Transmit Complete

**Bit 6 – TFC** Transmit Frame Corruption Due to AHB Error

**Bit 5 – RLEX** Retry Limit Exceeded or Late Collision

**Bit 2 – RXUBR** RX Used Bit Read

**Bit 1 – RCOMP** Receive Complete

### 37.8.120 GMAC Interrupt Mask Register Priority Queue x

**Name:** GMAC\_IMRPQx  
**Offset:** 0x0640 + (x-1)\*0x04 [x=1..5]  
**Reset:** 0x00000000  
**Property:** Read/Write

A read of this register returns the value of the receive complete interrupt mask.

A write to this register directly affects the state of the corresponding bit in the Interrupt Status Register, causing an interrupt to be generated if a 1 is written.

The following values are valid for all listed bit names of this register:

0: Corresponding interrupt is enabled.

1: Corresponding interrupt is disabled.

|        |       |     |      |    |       |       |       |    |
|--------|-------|-----|------|----|-------|-------|-------|----|
| Bit    | 31    | 30  | 29   | 28 | 27    | 26    | 25    | 24 |
|        |       |     |      |    |       |       |       |    |
| Access |       |     |      |    |       |       |       |    |
| Reset  |       |     |      |    |       |       |       |    |
| Bit    | 23    | 22  | 21   | 20 | 19    | 18    | 17    | 16 |
|        |       |     |      |    |       |       |       |    |
| Access |       |     |      |    |       |       |       |    |
| Reset  |       |     |      |    |       |       |       |    |
| Bit    | 15    | 14  | 13   | 12 | 11    | 10    | 9     | 8  |
|        |       |     |      |    | HRESP | ROVR  |       |    |
| Access |       |     |      |    | R/W   | R/W   |       |    |
| Reset  |       |     |      |    | 0     | 0     |       |    |
| Bit    | 7     | 6   | 5    | 4  | 3     | 2     | 1     | 0  |

| Access | R/W   | R/W | R/W  |    |       | R/W   | R/W   |    |
| Reset  | 0     | 0   | 0    |    |       | 0     | 0     |    |

**Bit 11 – HRESP** HRESP Not OK

**Bit 10 – ROVR** Receive Overrun

**Bit 7 – TCOMP** Transmit Complete

**Bit 6 – AHB** AHB Error

**Bit 5 – RLEX** Retry Limit Exceeded or Late Collision

**Bit 2 – RXUBR** RX Used Bit Read

**Bit 1 – RCOMP** Receive Complete

### 37.8.121 GMAC Screening Type 2 EtherType Register x

**Name:** GMAC\_ST2ERx  
**Offset:** 0x06E0 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |               |     |     |     |     |     |     |     |
|--------|---------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31            | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |               |     |     |     |     |     |     |     |
| Access |               |     |     |     |     |     |     |     |
| Reset  |               |     |     |     |     |     |     |     |
| Bit    | 23            | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        |               |     |     |     |     |     |     |     |
| Access |               |     |     |     |     |     |     |     |
| Reset  |               |     |     |     |     |     |     |     |
| Bit    | 15            | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | COMPVAL[15:8] |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7             | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | COMPVAL[7:0]  |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 15:0 – COMPVAL[15:0] Ethertype Compare Value

When the bit GMAC\_ST2RPQ.ETHE is enabled, the EtherType (last EtherType in the header if the frame is VLAN tagged) is compared with bits 15:0 in the register designated by GMAC\_ST2RPQ.I2ETH.

### 37.8.122 GMAC Screening Type 2 Compare Word 0 Register x

**Name:** GMAC\_ST2CW0x  
**Offset:** 0x0700 + x\*0x08 [x=0..23]  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |               |     |     |     |     |     |     |     |
|--------|---------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31            | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | COMPVAL[15:8] |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 23            | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | COMPVAL[7:0]  |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15            | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | MASKVAL[15:8] |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7             | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | MASKVAL[7:0]  |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 31:16 – COMPVAL[15:0] Compare Value

The byte stored in bits [23:16] is compared against the first byte of the 2 bytes extracted from the frame.

The byte stored in bits [31:24] is compared against the second byte of the 2 bytes extracted from the frame.

#### Bits 15:0 – MASKVAL[15:0] Mask Value

The value of MASKVAL ANDed with the 2 bytes extracted from the frame is compared to the value of MASKVAL ANDed with the value of COMPVAL.

### 37.8.123 GMAC Screening Type 2 Compare Word 1 Register x

**Name:** GMAC\_ST2CW1x  
**Offset:** 0x0704 + x\*0x08 [x=0..23]  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|

|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |             |
|--------|----|----|----|----|----|----|---|-------------|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8           |
|        |    |    |    |    |    |    |   | OFFSSTRT[1] |
| Access |    |    |    |    |    |    |   | R/W         |
| Reset  |    |    |    |    |    |    |   | 0           |

|        |             |              |     |     |     |     |     |     |
|--------|-------------|--------------|-----|-----|-----|-----|-----|-----|
| Bit    | 7           | 6            | 5   | 4   | 3   | 2   | 1   | 0   |
|        | OFFSSTRT[0] | OFFSVAL[6:0] |     |     |     |     |     |     |
| Access | R/W         | R/W          | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0            | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 8:7 – OFFSSTRT[1:0] Ethernet Frame Offset Start

| Value | Name       | Description                                         |
|-------|------------|-----------------------------------------------------|
| 0     | FRAMESTART | Offset from the start of the frame                  |
| 1     | ETHERTYPE  | Offset from the byte after the EtherType field      |
| 2     | IP         | Offset from the byte after the IP header field      |
| 3     | TCP_UDP    | Offset from the byte after the TCP/UDP header field |

#### Bits 6:0 – OFFSVAL[6:0] Offset Value in Bytes

The value of OFFSVAL ranges from 0 to 127 bytes, and is counted from either the start of the frame, the byte after the EtherType field (last EtherType in the header if the frame is VLAN tagged), the byte after the IP header (IPv4 or IPv6) or the byte after the TCP/UDP header.

## 38. Quad Serial Peripheral Interface (QSPI)

### 38.1 Description

The Quad Serial Peripheral Interface (QSPI) is a synchronous serial data link that provides communication with external devices in Master mode.

The QSPI can be used in SPI mode to interface to serial peripherals such as ADCs, DACs, LCD controllers, CAN controllers and sensors, or in Serial Memory mode to interface to serial Flash memories.

The QSPI allows the system to execute code directly from a serial Flash memory (XIP) without code shadowing to RAM. The serial Flash memory mapping is seen in the system as other memories such as ROM, SRAM, DRAM, embedded Flash memory, etc.

With the support of the Quad SPI protocol, the QSPI allows the system to use high-performance serial Flash memories which are small and inexpensive, in place of larger and more expensive parallel Flash memories.

**Note:** Stacked devices with a rollover in the memory address space at each die boundary are not supported.

### 38.2 Embedded Characteristics

- Master SPI Interface
  - Programmable clock phase and clock polarity
  - Programmable transfer delays between consecutive transfers, between clock and data, between deactivation and activation of chip select
- SPI Mode
  - Interface to serial peripherals such as ADCs, DACs, LCD controllers, CAN controllers and sensors
  - 8-bit/16-bit/32-bit programmable data length
- Serial Memory Mode
  - Interface to serial Flash memories operating in Single-bit SPI, Dual SPI and Quad SPI
  - Interface to serial Flash Memories operating in Single Data Rate Mode
  - Supports “Execute In Place” (XIP)— code execution by the system directly from a serial Flash memory
  - Flexible instruction register for compatibility with all serial Flash memories
  - 32-bit address mode (default is 24-bit address) to support serial Flash memories larger than 128 Mbits
  - Continuous read mode
  - Scrambling/unscrambling “On-The-Fly”
- Connection to DMA Channel Capabilities Optimizes Data Transfers
  - One channel for the receiver, one channel for the transmitter
- Register Write Protection

## 38.3 Block Diagram

Figure 38-1. Block Diagram

## 38.4 Signal Description

Table 38-1. Signal Description

| Pin Name                      | Pin Description                   | Type                  |
|-------------------------------|-----------------------------------|-----------------------|
| QSK                           | Serial Clock                      | Output                |
| MOSI (QIO0) <sup>(1)(2)</sup> | Data Output (Data Input Output 0) | Output (Input/Output) |
| MISO (QIO1) <sup>(1)(2)</sup> | Data Input (Data Input Output 1)  | Input (Input/Output)  |
| QIO2 <sup>(3)</sup>           | Data Input Output 2               | Input/Output          |
| QIO3 <sup>(3)</sup>           | Data Input Output 3               | Input/Output          |
| QCS                           | Peripheral Chip Select            | Output                |

### Notes:

1. MOSI and MISO are used for single-bit SPI operation.
2. QIO0–QIO1 are used for Dual SPI operation.
3. QIO0–QIO3 are used for Quad SPI operation.

## 38.5 Product Dependencies

### 38.5.1 I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the QSPI pins to their peripheral functions.

### 38.5.2 Power Management

The QSPI may be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the QSPI clock.

### 38.5.3 Interrupt Sources

The QSPI has an interrupt line connected to the Interrupt Controller. Handling the QSPI interrupt requires programming the interrupt controller before configuring the QSPI.

### 38.5.4 Direct Memory Access Controller (DMA)

The QSPI can be used in conjunction with the Direct Memory Access Controller (DMA) in order to reduce processor overhead. For a full description of the DMA, refer to the section “DMA Controller (XDMAC)”.

**Note:** DMA write accesses must be 32-bit aligned. If a single byte is to be written in a 32-bit word, the rest of the word must be filled with ones.

## 38.6 Functional Description

### 38.6.1 Serial Clock Baud Rate

The QSPI baud rate clock is generated by dividing the peripheral clock by a value between 1 and 256.

### 38.6.2 Serial Clock Phase and Polarity

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the QSPI Serial Clock register (QSPI\_SCR). The CPHA bit in the QSPI\_SCR programs the clock phase. These two parameters determine the edges of the clock signal on which data is driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Thus, the interfaced slave must use the same parameter values to communicate.

The table below shows the four modes and corresponding parameter settings.

**Table 38-2.** QSPI Bus Clock Modes

| QSPI Clock Mode | QSPI_SCR.CPOL | QSPI_SCR.CPHA | Shift QSCK Edge | Capture QSCK Edge | QSCK Inactive Level |
|-----------------|---------------|---------------|-----------------|-------------------|---------------------|
| 0               | 0             | 0             | Falling         | Falling           | Low                 |
| 1               | 0             | 1             | Rising          | Rising            | Low                 |
| 2               | 1             | 0             | Rising          | Rising            | High                |
| 3               | 1             | 1             | Falling         | Falling           | High                |

The following figures show examples of data transfers.

**Figure 38-2.** QSPI Transfer Format (QSPI\_SCR.CPHA = 0, 8 bits per transfer)

\* Not defined, but normally MSB of previous character received.

**Figure 38-3.** QSPI Transfer Format (QSPI\_SCR.CPHA = 1, 8 bits per transfer)

### 38.6.3 Transfer Delays

The figure below shows several consecutive transfers while the chip select is active. Three delays can be programmed to modify the transfer waveforms:

- The delay between the deactivation and the activation of QCS, programmed by writing QSPI\_MR.DLYCS. Allows to adjust the minimum time of QCS at high level.
- The delay before QSCK, programmed by writing QSPI\_SR.DLYBS. Allows the start of QSCK to be delayed after the chip select has been asserted.
- The delay between consecutive transfers, programmed by writing QSPI\_MR.DLYBCT. Allows insertion of a delay between two consecutive transfers. In Serial Memory mode, this delay is not programmable and DLYBCT is ignored. In this mode, DLYBCT must be written to '0'.

These delays allow the QSPI to be adapted to the interfaced peripherals and their speed and bus release time.

**Figure 38-4.** Programmable Delays

### 38.6.4 QSPI SPI Mode

In SPI mode, the QSPI acts as a standard SPI Master.

To activate this mode, QSPI\_MR.SMM must be written to '0' in QSPI\_MR.

### 38.6.4.1 SPI Mode Operations

The QSPI in standard SPI mode operates on the clock generated by the internal programmable baud rate generator. It fully controls the data transfers to and from the slave connected to the SPI bus. The QSPI drives the chip select line to the slave (QCS) and the serial clock signal (QSCK).

The QSPI features two holding registers, the Transmit Data register (QSPI\_TDR) and the Receive Data register (QSPI\_RDR), and a single internal shift register. The holding registers maintain the data flow at a constant rate.

After enabling the QSPI, a data transfer begins when the processor writes to the QSPI\_TDR. The written data is immediately transferred to the internal shift register and transfer on the SPI bus starts. While the data in the internal shift register is shifted on the MOSI line, the MISO line is sampled and shifted to the internal shift register. Receiving data cannot occur without transmitting data. If receiving mode is not needed, for example when communicating with a slave receiver only (such as an LCD), the receive status flags in the Status register (QSPI\_SR) can be discarded.

If new data is written in QSPI\_TDR during the transfer, it is retained there until the current transfer is completed. Then, the received data is transferred from the internal shift register to the QSPI\_RDR, the data in QSPI\_TDR is loaded in the internal shift register and a new transfer starts.

The transfer of a data written in QSPI\_TDR in the internal shift register is indicated by the Transmit Data Register Empty (TDRE) bit in the QSPI\_SR. When new data is written in QSPI\_TDR, this bit is cleared. QSPI\_SR.TDRE is used to trigger the Transmit DMA channel.

The end of transfer is indicated by the TXEMPTY flag in the QSPI\_SR. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, QSPI\_SR.TXEMPTY is set after the completion of this delay. The peripheral clock can be switched off at this time.

The transfer of received data from the internal shift register in QSPI\_RDR is indicated by the Receive Data Register Full (RDRF) bit in the QSPI\_SR. When the received data is read, QSPI\_SR.RDRF bit is cleared.

If the QSPI\_RDR has not been read before new data is received, the Overrun Error Status (OVRES) bit in QSPI\_SR is set. As long as this flag is set, data is loaded in QSPI\_RDR. The user must read the QSPI\_SR to clear the OVRES bit.

The following figures show, respectively, a block diagram of the SPI when operating in Master mode, and a flow chart describing how transfers are handled.

### 38.6.4.2 SPI Mode Block Diagram

Figure 38-5. SPI Mode Block Diagram

### 38.6.4.3 SPI Mode Flow Diagram

Figure 38-6. SPI Mode Flow Diagram

The figure below shows Transmit Data Register Empty (TDRE), Receive Data Register Full (RDRF) and Transmission Register Empty (TXEMPTY) status flags behavior within the QSPI\_SR during an 8-bit data transfer in Fixed mode, without DMA.

**Figure 38-7. Status Register Flags Behavior**

#### 38.6.4.4 Peripheral Deselection without DMA

During a transfer of more than one data on a Chip Select without the DMA, the QSPI\_TDR is loaded by the processor and the flag TDRE rises as soon as the content of the QSPI\_TDR is transferred into the internal shift register. When this flag is detected high, the QSPI\_TDR can be reloaded. If this reload by the processor occurs before the end of the current transfer, the Chip Select is not deasserted between the two transfers. Depending on the application software handling the QSPI\_SR flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload the QSPI\_TDR in time to keep the chip select active (low). A null Delay Between Consecutive Transfer (DLYBCT) value in the QSPI\_MR gives even less time for the processor to reload the QSPI\_TDR. With some SPI slave peripherals, requiring the chip select line to remain active (low) during a full set of transfers may lead to communication errors.

To facilitate interfacing with such devices, QSPI\_MR.CSMODE may be configured to '1'. This allows the chip select lines to remain in their current state (low = active) until the end of transfer is indicated by the Last Transfer (LASTXFER) bit in the Control register (QSPI\_CR). Even if the QSPI\_TDR is not reloaded, the chip select remains active. To have the chip select line rise at the end of the last data transfer, QSPI\_CR.LASTXFER must be written to '1' at the same time or after writing the last data to transmit into the QSPI\_TDR.

#### 38.6.4.5 Peripheral Deselection with DMA

When the DMA Controller is used, the Chip Select line remains low during the transfer since the TDRE flag is managed by the DMA itself. Reloading the QSPI\_TDR by the DMA is done as soon as the TDRE flag is set. In this case, writing QSPI\_MR.CSMODE to '1' may not be needed. However, when other DMA channels connected to other peripherals are also in use, the QSPI DMA could be delayed by another DMA with a higher priority on the bus. Having DMA buffers in slower memories like Flash memory or SDRAM compared to fast internal SRAM, may lengthen the reload time of the QSPI\_TDR by the DMA as well. This means that the QSPI\_TDR might not be reloaded in time to keep the chip select line low. In this case, the chip select line may toggle between data transfer and according to some SPI Slave devices, the communication might get lost. It may be necessary to configure QSPI\_MR.CSMODE to '1'.

When QSPI\_MR.CSMODE is configured to '0', the QCS does not rise in all cases between two transfers on the same peripheral. During a transfer on a Chip Select, the flag TDRE rises as soon as the content of the QSPI\_TDR is transferred into the internal shifter. When this flag is detected,

the QSPI\_TDR can be reloaded. If this reload occurs before the end of the current transfer, the Chip Select is not deasserted between the two transfers. This might lead to difficulties for interfacing with some serial peripherals requiring the chip select to be deasserted after each transfer. To facilitate interfacing with such devices, the QSPI\_MR may be configured with QSPI\_MR.CSMODE at '2'.

### 38.6.5 QSPI Serial Memory Mode

In Serial Memory mode, the QSPI acts as a serial Flash memory controller. The QSPI can be used to read data from the serial Flash memory allowing the CPU to execute code from it (XIP execute in place). The QSPI can also be used to control the serial Flash memory (Program, Erase, Lock, etc.) by sending specific commands. In this mode, the QSPI is compatible with single-bit SPI, Dual SPI and Quad SPI protocols.

To activate this mode, QSPI\_MR.SMM must be written to '1'.

In Serial Memory mode, data is transferred either by QSPI\_TDR and QSPI\_RDR or by writing or read in the QSPI memory space (0x1800\_0000) depending on TFRYP and SMRM configuration.

#### 38.6.5.1 Instruction Frame

In order to control serial Flash memories, the QSPI is able to send instructions via the SPI bus (ex: READ, PROGRAM, ERASE, LOCK, etc.). Because the instruction set implemented in serial Flash memories is memory vendor-dependent, the QSPI includes a complete Instruction Frame register (QSPI\_IFR), which makes it very flexible and compatible with all serial Flash memories.

An instruction frame includes:

- An instruction code (size: 8 bits). The instruction is optional in some cases (see section [Continuous Read mode](#)).
- An address (size: 24 bits or 32 bits). The address is optional but is required by instructions such as READ, PROGRAM, ERASE, LOCK. By default the address is 24 bits long, but it can be 32 bits long to support serial Flash memories larger than 128 Mbits (16 Mbytes).
- An option code (size: 1/2/4/8 bits). The option code is not required, but it is useful to activate the XIP mode or the Continuous Read mode (see section [Continuous Read mode](#)) for READ instructions, in some serial Flash memory devices. These modes improve the data read latency.
- Dummy cycles. Dummy cycles are optional but required by some READ instructions.
- Data bytes are optional. Data bytes are present for data transfer instructions such as READ or PROGRAM.

The instruction code, the address/option and the data can be sent with Single-bit SPI, Dual SPI or Quad SPI protocols.

**Figure 38-8.** Instruction Frame

#### 38.6.5.2 Instruction Frame Transmission

To send an instruction frame, the user must first configure the address to send by writing the field ADDR in the Instruction Address register (QSPI\_IAR). This step is required if the instruction frame

includes an address and no data. When data is present, the address of the instruction is defined by the address of the data accesses in the QSPI memory space, not by QSPI\_IAR.

If the instruction frame includes the instruction code and/or the option code, the user must configure the instruction code and/or the option code to send by writing the fields INST and OPT in the Instruction Code register (QSPI\_ICR).

Then, the user must write QSPI\_IFR to configure the instruction frame depending on which instruction must be sent. If the instruction frame does not include data, writing in this register triggers the send of the instruction frame in the QSPI. If the instruction frame includes data, the send of the instruction frame is triggered by the first data access in the QSPI memory space.

The instruction frame is configured by the following bits and fields of QSPI\_IFR:

- WIDTH field—used to configure which data lanes are used to send the instruction code, the address, the option code and to transfer the data. It is possible to use two unidirectional data lanes (MISO-MOSI Single-bit SPI), two bidirectional data lanes (QIO0-QIO1 Dual SPI) or four bidirectional data lanes (QIO0-QIO3 Quad SPI).
- INSTEN bit—used to enable the send of an instruction code.
- ADDREN bit—used to enable the send of an address after the instruction code.
- OPTEN bit—used to enable the send of an option code after the address.
- DATAEN bit—used to enable the transfer of data (READ or PROGRAM instruction).
- OPTL field—used to configure the option code length. The value written in OPTL must be consistent with the value written in the field WIDTH. For example: OPTL = 0 (1-bit option code) is not consistent with WIDTH = 6 (option code sent with QuadSPI protocol, thus the minimum length of the option code is 4 bits).
- ADDRRL bit—used to configure the address length.
- TFRTP field—used to define which type of data transfer must be performed.
- NBDUM field—used to configure the number of dummy cycles when reading data from the serial Flash memory. Between the address/option and the data, with some instructions, dummy cycles are inserted by the serial Flash memory.

See [38.7.12. QSPI\\_IFR](#).

If data transfer is enabled, the user can access the serial memory by reading or writing the QSPI memory space:

- To read in the serial memory, but not a memory data, for example a JEDEC-ID or the QSPI\_SR, QSPI\_IFR.TFRTP must be written to '0'.
- To read in the serial memory, and particularly a memory data, TFRTP must be written to '1'.
- To write in the serial memory, but not a memory data, for example writing the configuration or the QSPI\_SR, TFRTP must be written to '2'.
- If the user wants to write in the serial memory in particular to program a memory data, TFRTP must be written to '3'.

If QSPI\_IFR.TFRTP has a value other than '1' and QSPI\_MR.SMRM = 0, the address sent in the instruction frame is the address of the first system bus accesses. The addresses of the next accesses are not used by the QSPI. At each system bus access, an SPI transfer is performed with the same size. For example, a halfword system bus access leads to a 16-bit SPI transfer, and a byte system bus access leads to an 8-bit SPI transfer.

If SMRM = 1 and TFRTP = (0 or 2), accesses are made via the QSPI registers and the address sent in the instruction frame is the address defined in QSPI\_IAR.

Each time QSPI\_IFR is written (in case of read access), or each time QSPI\_TDR is written (in case of write transfer), an SPI transfer is performed with a byte size. Another byte is read each time

QSPI\_RDR is read (flag RDRF shows when a data can be read in QSPI\_RDR) or written each time QSPI\_TDR is written (flag TDRE shows when a new data can be written). The SPI transfer ends by writing QSPI\_CR.LASTXFER.

If TFRTP = 1, the address of the first instruction frame is the one of the first read access in the QSPI memory space. Each time the read accesses become nonsequential (addresses are not consecutive), a new instruction frame is sent with the last system bus access address. In this way, the system can read data at a random location in the serial memory. The size of the SPI transfers may differ from the size of the system bus read accesses.

When data transfer is not enabled, the end of the instruction frame is indicated when QSPI\_SR.INSTRE rises. (The QSPI\_SR.CSR flag indicates when chip select rises. A delay between these flags may exist in case of high clock division or a high DLYBCT value).

When data transfer is enabled, the user must indicate when the data transfer is completed in the QSPI memory space by setting QSPI\_CR.LASTXFER. The end of the instruction frame is indicated when QSPI\_SR.INSTRE rises.

The following figure illustrates instruction transmission management.

**Figure 38-9. Instruction Transmission Flow Diagram**

### 38.6.5.3 Read Memory Transfer

The user can access the data of the serial memory by sending an instruction with `QSPI_IFR.DATAEN = 1` and `QSPI_IFR.TFRTYP = 1`.

In this mode, the QSPI is able to read data at random address into the serial Flash memory, allowing the CPU to execute code directly from it (XIP execute-in-place).

In order to fetch data, the user must first configure the instruction frame by writing the QSPI\_IFR. Then data can be read at any address in the QSPI address space mapping. The address of the system bus read accesses match the address of the data inside the serial Flash memory.

When Fetch mode is enabled, several instruction frames can be sent before writing QSPI\_CR.LASTXFR. Each time the system bus read accesses become nonsequential (addresses are not consecutive), a new instruction frame is sent with the corresponding address.

### 38.6.5.4 Continuous Read Mode

The QSPI is compatible with the Continuous Read mode which is implemented in some serial Flash memories.

In Continuous Read mode, the instruction overhead is reduced by excluding the instruction code from the instruction frame. When the Continuous Read mode is activated in a serial Flash memory by a specific option code, the instruction code is stored in the memory. For the next instruction frames, the instruction code is not required as the memory uses the stored one.

In the QSPI, Continuous Read mode is used when reading data from the memory (QSPI\_IFR.TFRTYP = 1). The addresses of the system bus read accesses are often nonsequential and this leads to many instruction frames that have the same instruction code. By disabling the send of the instruction code, the Continuous Read mode reduces the access time of the data.

To be functional, this mode must be enabled in both the QSPI and the serial Flash memory. The Continuous Read mode is enabled in the QSPI by writing CRM to '1' in the QSPI\_IFR (TFRTYP must equal 1). The Continuous Read mode is enabled in the serial Flash memory by sending a specific option code.

**CAUTION** If the Continuous Read mode is not supported by the serial Flash memory or disabled, CRM bit must not be written to '1', otherwise data read out of the serial Flash memory is unpredictable.

**Figure 38-10.** Continuous Read Mode

### 38.6.5.5 Instruction Frame Transmission Examples

All waveforms in the following examples describe SPI transfers in SPI Clock mode 0 (QSPI\_SCR.CPOL = 0 and QSPI\_SCR.CPHA = 0; see section [Serial Clock Phase and Polarity](#)).

All system bus accesses described below refer to the system bus address phase. System bus wait cycles and system bus data phases are not shown.

Example 1:

Instruction in Single-bit SPI, without address, without option, without data.

Command: CHIP ERASE (C7h).

- Write 0x0000\_00C7 in QSPI\_ICR.
- Write 0x0000\_0010 in QSPI\_IFR.

- Wait for QSPI\_SR.INSTRE to rise.

**Figure 38-11.** Instruction Transmission Waveform 1

Example 2:

Instruction in Quad SPI, without address, without option, without data.

Command: POWER DOWN (B9h)

- Write 0x0000\_00B9 in QSPI\_ICR.
- Write 0x0000\_0016 in QSPI\_IFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 38-12.** Instruction Transmission Waveform 2

Example 3:

Instruction in Single-bit SPI, with address in Single-bit SPI, without option, without data.

Command: BLOCK ERASE (20h)

- Write the address (of the block to erase) in QSPI\_AR.
- Write 0x0000\_0020 in QSPI\_ICR.
- Write 0x0000\_0030 in QSPI\_IFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 38-13. Instruction Transmission Waveform 3****Example 4:**

Instruction in Single-bit SPI, without address, without option, with data write in Single-bit SPI.

Command: SET BURST (77h)

- Write 0x0000\_0077 in QSPI\_ICR.
- Write 0x0000\_2090 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Write data in the system bus memory space (0x1800\_0000).  
The address of system bus write accesses is not used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 38-14. Instruction Transmission Waveform 4****Example 5:**

Instruction in Single-bit SPI, with address in Dual SPI, without option, with data write in Dual SPI.

Command: BYTE/PAGE PROGRAM (02h)

- Write 0x0000\_0002 in QSPI\_ICR.
- Write 0x0000\_30B3 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Write data in the QSPI system bus memory space (0x1800\_0000).  
The address of the first system bus write access is sent in the instruction frame.  
The address of the next system bus write accesses is not used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 38-15. Instruction Transmission Waveform 5****Example 6:**

Instruction in Single-bit SPI, with address in Single-bit SPI, without option, with data read in Quad SPI, with eight dummy cycles.

Command: QUAD\_OUTPUT READ ARRAY (6Bh)

- Write 0x0000\_006B in QSPI\_ICR.
- Write 0x0008\_10B2 in QSPI\_IFR.
- Read QSPI\_IR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x1800\_0000).  
The address of the first system bus read access is sent in the instruction frame.  
The address of the next system bus read accesses is not used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 38-16. Instruction Transmission Waveform 6****Example 7:**

Instruction in Single-bit SPI, with address and option in Quad SPI, with data read in Quad SPI, with four dummy cycles, with fetch and continuous read.

Command: FAST READ QUAD I/O (EBh) - 8-BIT OPTION (0x30h)

- Write 0x0030\_00EB in QSPI\_ICR.
- Write 0x0004\_33F4 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.

- Read data in the QSPI system bus memory space (0x1800\_0000). Fetch is enabled, the address of the system bus read accesses is always used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 38-17. Instruction Transmission Waveform 7****Example 8:**

Instruction in Quad SPI, with address in Quad SPI, without option, with data read in Quad SPI, with two dummy cycles, with fetch.

Command: HIGH-SPEED READ (0Bh)

- Write 0x0000\_000B in QSPI\_ICR.
- Write 0x0002\_20B6 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x1800\_0000). Fetch is enabled, the address of the system bus read accesses is always used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 38-18. Instruction Transmission Waveform 8****Example 9:**

Instruction in Quad SPI, without address, without option, with data read in Quad SPI, without dummy cycles, without fetch.

Command: HIGH-SPEED READ (05h)

- Write 0x0000\_0005 in QSPI\_ICR.
- Write 0x0000\_0096 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.

- Read data in the QSPI system bus memory space (0x1800\_0000). Fetch is disabled.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 38-19.** Instruction Transmission Waveform 9

Example 10:

Instruction in Quad SPI, without address, without option, with data read in Quad SPI, without dummy cycles, without fetch, read launched through APB interface.

Command: HIGH-SPEED READ (05h)

- Set SMRM to '1' in QSPI\_MR
- Write 0x0000\_0005 in QSPI\_ICR.
- Write 0x0100\_0096 in QSPI\_IFR (will start the transfer).
- Wait flag RDRF and Read data in the QSPI\_RDR register  
Fetch is disabled.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 38-20.** Instruction Transmission Waveform 10

### 38.6.6 Scrambling/Unscrambling Function

The scrambling/unscrambling function cannot be performed on devices other than memories. Data is scrambled when written to memory and unscrambled when data is read.

The external data lines can be scrambled in order to prevent intellectual property data located in off-chip memories from being easily recovered by analyzing data at the package pin level of either the microcontroller or the QSPI slave device (e.g., memory).

The scrambling/unscrambling function can be enabled by writing a '1' to the SCREN bit in the QSPI Scrambling Mode Register (QSPI\_SMR).

The scrambling and unscrambling are performed on-the-fly without impacting the throughput.

The scrambling method depends on the user-configurable user scrambling key (field USRK) in the QSPI Scrambling Key Register (QSPI\_SKR). QSPI\_SKR is only accessible in Write mode.

If QSPI\_SMR.RVDIS is written to '0', the scrambling/unscrambling algorithm includes the user scrambling key plus a random value depending on device processing characteristics. Data scrambled by a given microcontroller cannot be unscrambled by another.

If QSPI\_SMR.RVDIS is written to '1', the scrambling/unscrambling algorithm includes only the user scrambling key. No random value is part of the key.

The user scrambling key or the seed for key generation must be securely stored in a reliable nonvolatile memory in order to recover data from the off-chip memory. Any data scrambled with a given key cannot be recovered if the key is lost.

### 38.6.7 Register Write Protection

To prevent any single software error from corrupting QSPI behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the QSPI Write Protection Mode Register (QSPI\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the QSPI Write Protection Status Register (QSPI\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the QSPI\_WPSR.

The following registers can be write-protected when WPEN is set in QSPI\_WPMR:

- [QSPI Mode Register](#)
- [QSPI Serial Clock Register](#)
- [QSPI Scrambling Mode Register](#)
- [QSPI Scrambling Key Register](#)

The following registers can be write-protected when WPCREN is set in QSPI\_WPMR:

- [QSPI Control Register](#)

The following registers can be write-protected when WPITEN is set in QSPI\_WPMR:

- [QSPI Interrupt Enable Register](#)
- [QSPI Interrupt Disable Register](#)

## 38.7 Register Summary

| Offset              | Name     | Bit Pos. | 7           | 6     | 5           | 4      | 3           | 2          | 1       | 0         |  |
|---------------------|----------|----------|-------------|-------|-------------|--------|-------------|------------|---------|-----------|--|
| 0x00                | QSPI_CR  | 7:0      | SWRST       |       |             |        |             |            | QSPIDIS | QSPIEN    |  |

### 38.7.1 QSPI Control Register

**Name:** QSPI\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the [QSPI Write Protection Mode Register](#).

|        |    |    |    |    |    |    |    |          |
|--------|----|----|----|----|----|----|----|----------|

|        | SWRST |   |   |   |   |   | QSPIDIS | QSPIEN |
| Access | W     |   |   |   |   |   | W       | W      |
| Reset  | –     |   |   |   |   |   | –       | –      |

#### Bit 24 – LASTXFER Last Transfer

| Value | Description                                                                                    |
|-------|------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                     |
| 1     | The chip select is deasserted after the character written in QSPI_TDR.TD has been transferred. |

#### Bit 7 – SWRST QSPI Software Reset

DMA channels are not affected by software reset.

| Value | Description                                                                             |
|-------|-----------------------------------------------------------------------------------------|
| 0     | No effect.                                                                              |
| 1     | Reset the QSPI. A software-triggered hardware reset of the QSPI interface is performed. |

#### Bit 1 – QSPIDIS QSPI Disable

As soon as QSPIDIS is set, the QSPI finishes its transfer.

All pins are set in Input mode and no data is received or transmitted.

If a transfer is in progress, the transfer is finished before the QSPI is disabled.

If both QSPIEN and QSPIDIS are equal to one when QSPI\_CR is written, the QSPI is disabled.

| Value | Description        |
|-------|--------------------|
| 0     | No effect.         |
| 1     | Disables the QSPI. |

#### Bit 0 – QSPIEN QSPI Enable

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | No effect.                                     |
| 1     | Enables the QSPI to transfer and receive data. |

## 38.7.2 QSPI Mode Register

**Name:** QSPI\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bit WPEN is cleared in the [QSPI Write Protection Mode Register](#).

|        |             |     |             |     |      |       |     |     |
|--------|-------------|-----|-------------|-----|------|-------|-----|-----|
| Bit    | 31          | 30  | 29          | 28  | 27   | 26    | 25  | 24  |
|        | DLYCS[7:0]  |     |             |     |      |       |     |     |
| Access | R/W         | R/W | R/W         | R/W | R/W  | R/W   | R/W | R/W |
| Reset  | 0           | 0   | 0           | 0   | 0    | 0     | 0   | 0   |
| Bit    | 23          | 22  | 21          | 20  | 19   | 18    | 17  | 16  |
|        | DLYBCT[7:0] |     |             |     |      |       |     |     |
| Access | R/W         | R/W | R/W         | R/W | R/W  | R/W   | R/W | R/W |
| Reset  | 0           | 0   | 0           | 0   | 0    | 0     | 0   | 0   |
| Bit    | 15          | 14  | 13          | 12  | 11   | 10    | 9   | 8   |
|        | NBBITS[3:0] |     |             |     |      |       |     |     |
| Access |             |     |             |     | R/W  | R/W   | R/W | R/W |
| Reset  |             |     |             |     | 0    | 0     | 0   | 0   |
| Bit    | 7           | 6   | 5           | 4   | 3    | 2     | 1   | 0   |
|        |             |     | CSMODE[1:0] |     | SMRM | WDRBT | LLB | SMM |
| Access |             |     | R/W         | R/W | R/W  | R/W   | R/W | R/W |
| Reset  |             |     | 0           | 0   | 0    | 0     | 0   | 0   |

### Bits 31:24 – DLYCS[7:0] Minimum Inactive QCS Delay

This field defines the minimum delay between the deactivation and the activation of QCS. The DLYCS time guarantees the slave minimum deselect time.

If DLYCS written to '0', one peripheral clock period is inserted by default.

Otherwise, the following equation determines the delay:

$$\text{DLYCS} = \text{Minimum inactive} \times f_{\text{peripheral clock}}$$

### Bits 23:16 – DLYBCT[7:0] Delay Between Consecutive Transfers

This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.

When DLYBCT is written to '0', no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers. In Serial Memory mode (SMM = 1), DLYBCT must be written to '0' and no delay is inserted.

Otherwise, the following equation determines the delay:

$$\text{DLYBCT} = (\text{Delay Between Consecutive Transfers} \times f_{\text{peripheral clock}}) / 32$$

### Bits 11:8 – NBBITS[3:0] Number Of Bits Per Transfer

NBBITS is used only when SMM is set to '0'.

| Value | Name   | Description          |
|-------|--------|----------------------|
| 0     | 8_BIT  | 8 bits for transfer  |
| 8     | 16_BIT | 16 bits for transfer |

### Bits 5:4 – CSMODE[1:0] Chip Select Mode

The CSMODE field determines how the chip select is deasserted

**Note:** This field is forced to LASTXFER when SMM is written to '1'.

| Value | Name           | Description                                                                                                                          |
|-------|----------------|--------------------------------------------------------------------------------------------------------------------------------------|
| 0     | NOT_RELOADED   | The chip select is deasserted if QSPI_TDR.TD has not been reloaded before the end of the current transfer.                           |
| 1     | LASTXFER       | The chip select is deasserted when the bit LASTXFER is written to '1' and the character written in QSPI_TDR.TD has been transferred. |
| 2     | SYSTEMATICALLY | The chip select is deasserted systematically after each transfer.                                                                    |

**Bit 3 – SMRM** Serial Memory Register Mode

| Value | Description                                                                                                                 |
|-------|-----------------------------------------------------------------------------------------------------------------------------|
| 0     | Serial Memory registers are written via AHB access. See section <a href="#">Instruction Frame Transmission</a> for details. |
| 1     | Serial Memory registers are written via APB access. See section <a href="#">Instruction Frame Transmission</a> for details. |

**Bit 2 – WDRBT** Wait Data Read Before Transfer

0 (DISABLED): No effect. In SPI mode, a transfer can be initiated whatever the state of the QSPI\_RDR is.

1 (ENABLED): In SPI mode, a transfer can start only if the QSPI\_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception.

**Bit 1 – LLB** Local Loopback Enable

0 (DISABLED): Local loopback path disabled.

1 (ENABLED): Local loopback path enabled.

LLB controls the local loopback on the data serializer for testing in SPI mode only. (MISO is internally connected on MOSI).

**Bit 0 – SMM** Serial Memory Mode

0 (SPI): The QSPI is in SPI mode.

1 (MEMORY): The QSPI is in Serial Memory mode.

38.7.3 QSPI Receive Data Register

Name: QSPI\_RDR  
Offset: 0x08  
Reset: 0x00000000  
Property: Read-only

|        |          |    |    |    |    |    |    |    |
|--------|----------|----|----|----|----|----|----|----|
| Bit    | 31       | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |          |    |    |    |    |    |    |    |
| Access |          |    |    |    |    |    |    |    |
| Reset  |          |    |    |    |    |    |    |    |
| Bit    | 23       | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |          |    |    |    |    |    |    |    |
| Access |          |    |    |    |    |    |    |    |
| Reset  |          |    |    |    |    |    |    |    |
| Bit    | 15       | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | RD[15:8] |    |    |    |    |    |    |    |
| Access | R        | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0        | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7        | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | RD[7:0]  |    |    |    |    |    |    |    |
| Access | R        | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0        | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

Bits 15:0 – RD[15:0] Receive Data  
Data received by the QSPI is stored in this register right-justified. Unused bits read zero.

38.7.4 QSPI Transmit Data Register

Name: QSPI\_TDR  
Offset: 0x0C  
Reset: -  
Property: Write-only

|        |          |    |    |    |    |    |    |    |

**Bits 15:0 – TD[15:0] Transmit Data**  
Data to be transmitted by the QSPI is stored in this register. Information to be transmitted must be written to the Transmit Data register in a right-justified format.

### 38.7.5 QSPI Status Register

**Name:** QSPI\_SR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read-only

|        |    |    |    |    |    |    |    |         |
|--------|----|----|----|----|----|----|----|---------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24      |
|        |    |    |    |    |    |    |    | QSPIENS |
| Access |    |    |    |    |    |    |    | R       |
| Reset  |    |    |    |    |    |    |    | 0       |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |        |     |     |
|--------|----|----|----|----|----|--------|-----|-----|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10     | 9   | 8   |
|        |    |    |    |    |    | INSTRE | CSS | CSR |
| Access |    |    |    |    |    | R      | R   | R   |
| Reset  |    |    |    |    |    | 0      | 0   | 0   |

|        |   |   |   |   |       |         |      |      |
|--------|---|---|---|---|-------|---------|------|------|
| Bit    | 7 | 6 | 5 | 4 | 3     | 2       | 1    | 0    |
|        |   |   |   |   | OVRES | TXEMPTY | TDRE | RDRF |
| Access |   |   |   |   | R     | R       | R    | R    |
| Reset  |   |   |   |   | 0     | 0       | 0    | 0    |

#### Bit 24 – QSPIENS QSPI Enable Status

| Value | Description       |
|-------|-------------------|
| 0     | QSPI is disabled. |
| 1     | QSPI is enabled.  |

#### Bit 10 – INSTRE Instruction End Status (cleared on read)

| Value | Description                                                                    |
|-------|--------------------------------------------------------------------------------|
| 0     | No instruction end has been detected since the last read of QSPI_SR.           |
| 1     | At least one instruction end has been detected since the last read of QSPI_SR. |

#### Bit 9 – CSS Chip Select Status

| Value | Description                      |
|-------|----------------------------------|
| 0     | The chip select is asserted.     |
| 1     | The chip select is not asserted. |

#### Bit 8 – CSR Chip Select Rise (cleared on read)

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 0     | No chip select rise has been detected since the last read of QSPI_SR.           |
| 1     | At least one chip select rise has been detected since the last read of QSPI_SR. |

#### Bit 3 – OVRES Overrun Error Status (cleared on read)

An overrun occurs when QSPI\_RDR is loaded at least twice from the serializer since the last read of the QSPI\_RDR.

| Value | Description                                                             |
|-------|-------------------------------------------------------------------------|
| 0     | No overrun has been detected since the last read of QSPI_SR.            |
| 1     | At least one overrun error has occurred since the last read of QSPI_SR. |

**Bit 2 – TXEMPTY** Transmission Registers Empty (cleared by writing QSPI\_TDR)

| Value | Description                                                                                                                           |
|-------|---------------------------------------------------------------------------------------------------------------------------------------|
| 0     | As soon as data is written in QSPI_TDR.                                                                                               |
| 1     | QSPI_TDR and the internal shifter are empty. If a transfer delay has been defined, TXEMPTY is set after the completion of such delay. |

**Bit 1 – TDRE** Transmit Data Register Empty (cleared by writing QSPI\_TDR)

TDRE equals zero when the QSPI is disabled or at reset. The QSPI enable command sets this bit to one.

| Value | Description                                                                   |
|-------|-------------------------------------------------------------------------------|
| 0     | Data has been written to QSPI_TDR and not yet transferred to the serializer.  |
| 1     | The last data written in the QSPI_TDR has been transferred to the serializer. |

**Bit 0 – RDRF** Receive Data Register Full (cleared by reading QSPI\_RDR)

| Value | Description                                                                                                                        |
|-------|------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No data has been received since the last read of QSPI_RDR.                                                                         |
| 1     | Data has been received and the received data has been transferred from the serializer to QSPI_RDR since the last read of QSPI_RDR. |

### 38.7.6 QSPI Interrupt Enable Register

**Name:** QSPI\_IER  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [QSPI Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |    |    |    |    |       |         |      |      |
|--------|----|----|----|----|-------|---------|------|------|
| Bit    | 31 | 30 | 29 | 28 | 27    | 26      | 25   | 24   |
|        |    |    |    |    |       |         |      |      |
| Access |    |    |    |    |       |         |      |      |
| Reset  |    |    |    |    |       |         |      |      |
| Bit    | 23 | 22 | 21 | 20 | 19    | 18      | 17   | 16   |
|        |    |    |    |    |       |         |      |      |
| Access |    |    |    |    |       |         |      |      |
| Reset  |    |    |    |    |       |         |      |      |
| Bit    | 15 | 14 | 13 | 12 | 11    | 10      | 9    | 8    |
|        |    |    |    |    |       | INSTRE  | CSS  | CSR  |
| Access |    |    |    |    |       | W       | W    | W    |
| Reset  |    |    |    |    |       | –       | –    | –    |
| Bit    | 7  | 6  | 5  | 4  | 3     | 2       | 1    | 0    |
|        |    |    |    |    | OVRES | TXEMPTY | TDRE | RDRF |
| Access |    |    |    |    | W     | W       | W    | W    |
| Reset  |    |    |    |    | –     | –       | –    | –    |

**Bit 10 – INSTRE** Instruction End Interrupt Enable

**Bit 9 – CSS** Chip Select Status Interrupt Enable

**Bit 8 – CSR** Chip Select Rise Interrupt Enable

**Bit 3 – OVRES** Overrun Error Interrupt Enable

**Bit 2 – TXEMPTY** Transmission Registers Empty Enable

**Bit 1 – TDRE** Transmit Data Register Empty Interrupt Enable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Enable

### 38.7.7 QSPI Interrupt Disable Register

**Name:** QSPI\_IDR  
**Offset:** 0x18  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [QSPI Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|        |    |    |    |    |       |         |      |      |
|--------|----|----|----|----|-------|---------|------|------|
| Bit    | 31 | 30 | 29 | 28 | 27    | 26      | 25   | 24   |
|        |    |    |    |    |       |         |      |      |
| Access |    |    |    |    |       |         |      |      |
| Reset  |    |    |    |    |       |         |      |      |
| Bit    | 23 | 22 | 21 | 20 | 19    | 18      | 17   | 16   |
|        |    |    |    |    |       |         |      |      |
| Access |    |    |    |    |       |         |      |      |
| Reset  |    |    |    |    |       |         |      |      |
| Bit    | 15 | 14 | 13 | 12 | 11    | 10      | 9    | 8    |
|        |    |    |    |    |       | INSTRE  | CSS  | CSR  |
| Access |    |    |    |    |       | W       | W    | W    |
| Reset  |    |    |    |    |       | –       | –    | –    |
| Bit    | 7  | 6  | 5  | 4  | 3     | 2       | 1    | 0    |
|        |    |    |    |    | OVRES | TXEMPTY | TDRE | RDRF |
| Access |    |    |    |    | W     | W       | W    | W    |
| Reset  |    |    |    |    | –     | –       | –    | –    |

**Bit 10 – INSTRE** Instruction End Interrupt Disable

**Bit 9 – CSS** Chip Select Status Interrupt Disable

**Bit 8 – CSR** Chip Select Rise Interrupt Disable

**Bit 3 – OVRES** Overrun Error Interrupt Disable

**Bit 2 – TXEMPTY** Transmission Registers Empty Disable

**Bit 1 – TDRE** Transmit Data Register Empty Interrupt Disable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Disable

### 38.7.8 QSPI Interrupt Mask Register

**Name:** QSPI\_IMR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

|        |    |    |    |    |       |         |      |      |
|--------|----|----|----|----|-------|---------|------|------|
| Bit    | 31 | 30 | 29 | 28 | 27    | 26      | 25   | 24   |
|        |    |    |    |    |       |         |      |      |
| Access |    |    |    |    |       |         |      |      |
| Reset  |    |    |    |    |       |         |      |      |
| Bit    | 23 | 22 | 21 | 20 | 19    | 18      | 17   | 16   |
|        |    |    |    |    |       |         |      |      |
| Access |    |    |    |    |       |         |      |      |
| Reset  |    |    |    |    |       |         |      |      |
| Bit    | 15 | 14 | 13 | 12 | 11    | 10      | 9    | 8    |
|        |    |    |    |    |       | INSTRE  | CSS  | CSR  |
| Access |    |    |    |    |       | R       | R    | R    |
| Reset  |    |    |    |    |       | 0       | 0    | 0    |
| Bit    | 7  | 6  | 5  | 4  | 3     | 2       | 1    | 0    |
|        |    |    |    |    | OVRES | TXEMPTY | TDRE | RDRF |
| Access |    |    |    |    | R     | R       | R    | R    |
| Reset  |    |    |    |    | 0     | 0       | 0    | 0    |

**Bit 10 – INSTRE** Instruction End Interrupt Mask

**Bit 9 – CSS** Chip Select Status Interrupt Mask

**Bit 8 – CSR** Chip Select Rise Interrupt Mask

**Bit 3 – OVRES** Overrun Error Interrupt Mask

**Bit 2 – TXEMPTY** Transmission Registers Empty Mask

**Bit 1 – TDRE** Transmit Data Register Empty Interrupt Mask

**Bit 0 – RDRF** Receive Data Register Full Interrupt Mask

### 38.7.9 QSPI Serial Clock Register

**Name:** QSPI\_SCR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bit WPEN is cleared in the [QSPI Write Protection Mode Register](#).

|        |            |     |     |     |     |     |      |      |
|--------|------------|-----|-----|-----|-----|-----|------|------|
| Bit    | 31         | 30  | 29  | 28  | 27  | 26  | 25   | 24   |
| Access |            |     |     |     |     |     |      |      |
| Reset  |            |     |     |     |     |     |      |      |
| Bit    | 23         | 22  | 21  | 20  | 19  | 18  | 17   | 16   |
| Access | DLYBS[7:0] |     |     |     |     |     |      |      |
| Reset  | R/W        | R/W | R/W | R/W | R/W | R/W | R/W  | R/W  |
| Reset  | 0          | 0   | 0   | 0   | 0   | 0   | 0    | 0    |
| Bit    | 15         | 14  | 13  | 12  | 11  | 10  | 9    | 8    |
| Access | SCBR[7:0]  |     |     |     |     |     |      |      |
| Reset  | R/W        | R/W | R/W | R/W | R/W | R/W | R/W  | R/W  |
| Reset  | 0          | 0   | 0   | 0   | 0   | 0   | 0    | 0    |
| Bit    | 7          | 6   | 5   | 4   | 3   | 2   | 1    | 0    |
| Access |            |     |     |     |     |     | CPHA | CPOL |
| Reset  |            |     |     |     |     |     | R/W  | R/W  |
| Reset  |            |     |     |     |     |     | 0    | 0    |

#### Bits 23:16 – DLYBS[7:0] Delay Before QSCK

This field defines the delay from QCS valid to the first valid QSCK transition.  
 When DLYBS equals zero, the QCS valid to QSCK transition is 1/2 the QSCK clock period.  
 Otherwise, the following equation determines the delay:  

$$\text{DLYBS} = \text{Delay Before QSCK} \times f_{\text{peripheral clock}}$$

#### Bits 15:8 – SCBR[7:0] Serial Clock Baud Rate

The QSPI uses a modulus counter to derive the QSCK baud rate from the peripheral clock. The baud rate is selected by writing a value from 0 to 255 in the SCBR field. The following equation determines the QSCK baud rate:

$$\text{SCBR} = (f_{\text{peripheral clock}} / \text{QSCK Baudrate}) - 1$$

#### Bit 1 – CPHA Clock Phase

CPHA determines which edge of QSCK causes data to change and which edge causes data to be captured. CPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

| Value | Description                                                                             |
|-------|-----------------------------------------------------------------------------------------|
| 0     | Data is captured on the leading edge of QSCK and changed on the following edge of QSCK. |
| 1     | Data is changed on the leading edge of QSCK and captured on the following edge of QSCK. |

#### Bit 0 – CPOL Clock Polarity

CPOL is used to determine the inactive state value of the serial clock (QSCK). It is used with CPHA to produce the required clock/data relationship between master and slave devices.

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | The inactive state value of QSCK is logic level zero. |
| 1     | The inactive state value of QSCK is logic level one.  |

38.7.10 QSPI Instruction Address Register

Name: QSPI\_IAR  
Offset: 0x30  
Reset: 0x00000000  
Property: Read/Write

|        |             |     |     |     |     |     |     |     |

**Bits 20:16 – NBDUM[4:0]** Number Of Dummy Cycles

The NBDUM field defines the number of dummy cycles required by the serial Flash memory before data transfer.

**Bit 14 – CRM** Continuous Read Mode

0 (DISABLED): Continuous Read mode is disabled.

1 (ENABLED): Continuous Read mode is enabled.

**Bits 13:12 – TFRTYP[1:0]** Data Transfer Type

| Value | Name                | Description                                                                                                                                                   |
|-------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | TRSFER_READ         | Read transfer from the serial memory.<br>Scrambling is not performed.<br>Read at random location (fetch) in the serial Flash memory is not possible.          |
| 1     | TRSFER_READ_MEMORY  | Read data transfer from the serial memory.<br>If enabled, scrambling is performed.<br>Read at random location (fetch) in the serial Flash memory is possible. |
| 2     | TRSFER_WRITE        | Write transfer into the serial memory.<br>Scrambling is not performed.                                                                                        |
| 3     | TRSFER_WRITE_MEMORY | Write data transfer into the serial memory.<br>If enabled, scrambling is performed.                                                                           |

**Bit 10 – ADDRL** Address Length

The ADDRL bit determines the length of the address.

0 (24\_BIT): The address is 24 bits long.

1 (32\_BIT): The address is 32 bits long.

**Bits 9:8 – OPTL[1:0] Option Code Length**

The OPTL field determines the length of the option code. The value written in OPTL must be consistent with the value written in the field WIDTH. For example, OPTL = 0 (1-bit option code) is not consistent with WIDTH = 6 (option code sent with QuadSPI protocol, thus the minimum length of the option code is 4 bits).

| Value | Name        | Description                     |
|-------|-------------|---------------------------------|
| 0     | OPTION_1BIT | The option code is 1 bit long.  |
| 1     | OPTION_2BIT | The option code is 2 bits long. |
| 2     | OPTION_4BIT | The option code is 4 bits long. |
| 3     | OPTION_8BIT | The option code is 8 bits long. |

**Bit 7 – DATAEN Data Enable**

| Value | Description                                               |
|-------|-----------------------------------------------------------|
| 0     | No data is sent/received to/from the serial Flash memory. |
| 1     | Data is sent/received to/from the serial Flash memory.    |

**Bit 6 – OPTEN Option Enable**

| Value | Description                                        |
|-------|----------------------------------------------------|
| 0     | The option is not sent to the serial Flash memory. |
| 1     | The option is sent to the serial Flash memory.     |

**Bit 5 – ADDREN Address Enable**

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | The transfer address is not sent to the serial Flash memory. |
| 1     | The transfer address is sent to the serial Flash memory.     |

**Bit 4 – INSTEN Instruction Enable**

| Value | Description                                             |
|-------|---------------------------------------------------------|
| 0     | The instruction is not sent to the serial Flash memory. |
| 1     | The instruction is sent to the serial Flash memory.     |

**Bits 2:0 – WIDTH[2:0] Width of Instruction Code, Address, Option Code and Data**

| Value | Name           | Description                                                                         |
|-------|----------------|-------------------------------------------------------------------------------------|
| 0     | SINGLE_BIT_SPI | Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Single-bit SPI |
| 1     | DUAL_OUTPUT    | Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Dual SPI       |
| 2     | QUAD_OUTPUT    | Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Quad SPI       |
| 3     | DUAL_IO        | Instruction: Single-bit SPI / Address-Option: Dual SPI / Data: Dual SPI             |
| 4     | QUAD_IO        | Instruction: Single-bit SPI / Address-Option: Quad SPI / Data: Quad SPI             |
| 5     | DUAL_CMD       | Instruction: Dual SPI / Address-Option: Dual SPI / Data: Dual SPI                   |
| 6     | QUAD_CMD       | Instruction: Quad SPI / Address-Option: Quad SPI / Data: Quad SPI                   |

38.7.13 QSPI Scrambling Mode Register

Name: QSPI\_SMR  
Offset: 0x40  
Reset: 0x00000000  
Property: Read/Write

This register can only be written if bit WPEN is cleared in the [QSPI Write Protection Mode Register](#).

Bit 1 – RVDIS Scrambling/Unscrambling Random Value Disable

| Value | Description                                                                                                                 |
|-------|-----------------------------------------------------------------------------------------------------------------------------|
| 0     | The scrambling/unscrambling algorithm includes the user scrambling key plus a random value that may differ between devices. |
| 1     | The scrambling/unscrambling algorithm includes only the user scrambling key.                                                |

Bit 0 – SCREN Scrambling/Unscrambling Enable

0 (DISABLED): The scrambling/unscrambling is disabled.  
1 (ENABLED): The scrambling/unscrambling is enabled.

### 38.7.14 QSPI Scrambling Key Register

**Name:** QSPI\_SKR  
**Offset:** 0x44  
**Reset:** –  
**Property:** Write-only

This register can only be written if bit WPEN is cleared in the [QSPI Write Protection Mode Register](#).

|        | WPKEY[7:0]   |    |    |    |    |        |        |      |
| Access | W            | W  | W  | W  | W  | W      | W      | W    |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0      | 0      | 0    |
| Bit    | 7            | 6  | 5  | 4  | 3  | 2      | 1      | 0    |
|        |              |    |    |    |    | WPCREN | WPITEN | WPEN |
| Access |              |    |    |    |    | R/W    | R/W    | R/W  |
| Reset  |              |    |    |    |    | 0      | 0      | 0    |

## Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                                          |
|----------|--------|------------------------------------------------------------------------------------------------------|
| 0x515350 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0. |

## Bit 2 – WPCREN Write Protection Control Register Enable

| Value | Description                                                                             |
|-------|-----------------------------------------------------------------------------------------|
| 0     | Disables the write protection on the Control register if WPKEY corresponds to 0x515350. |
| 1     | Enables the write protection on the Control register if WPKEY corresponds to 0x515350.  |

## Bit 1 – WPITEN Write Protection Interrupt Enable

| Value | Description                                                                            |
|-------|----------------------------------------------------------------------------------------|
| 0     | Disables the write protection on Interrupt registers if WPKEY corresponds to 0x515350. |
| 1     | Enables the write protection on Interrupt registers if WPKEY corresponds to 0x515350.  |

## Bit 0 – WPEN Write Protection Enable

See section [Register Write Protection](#) for the list of registers that can be protected.

| Value | Description                                                                   |
|-------|-------------------------------------------------------------------------------|
| 0     | Disables the write protection if WPKEY corresponds to 0x515350 (QSP in ASCII) |
| 1     | Enables the write protection if WPKEY corresponds to 0x515350 (QSP in ASCII)  |

38.7.16 QSPI Write Protection Status Register

Name: QSPI\_WPSR  
Offset: 0xE8  
Reset: 0x00000000  
Property: Read-only

|        |            |    |    |    |    |    |    |      |
|--------|------------|----|----|----|----|----|----|------|
| Bit    | 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        |            |    |    |    |    |    |    |      |
| Access |            |    |    |    |    |    |    |      |
| Reset  |            |    |    |    |    |    |    |      |
| Bit    | 23         | 22 | 21 | 20 | 19 | 18 | 17 | 16   |
|        |            |    |    |    |    |    |    |      |
| Access |            |    |    |    |    |    |    |      |
| Reset  |            |    |    |    |    |    |    |      |
| Bit    | 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8    |
|        | WPVSR[7:0] |    |    |    |    |    |    |      |
| Access | R          | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7          | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        |            |    |    |    |    |    |    | WPVS |
| Access |            |    |    |    |    |    |    | R    |
| Reset  |            |    |    |    |    |    |    | 0    |

**Bits 15:8 – WPVSR[7:0]** Write Protection Violation Source  
When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description                                                                                                                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protection violation has occurred since the last read of the QSPI_WPSR.                                                                                                                                   |
| 1     | A write protection violation has occurred since the last read of the QSPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

## 39. Flexible Serial Communication Controller (FLEXCOM)

### 39.1 Description

The Flexible Serial Communication Controller (FLEXCOM) offers several serial communication protocols that are managed by the three submodules USART, SPI, and TWI.

The Universal Synchronous Asynchronous Receiver Transceiver (USART) provides one full-duplex universal synchronous asynchronous serial link. Data frame format is widely programmable (data length, parity, number of stop bits) to support a maximum of standards. The receiver implements parity error, framing error and overrun error detection. The receiver timeout enables handling variable-length frames and the transmitter timeguard facilitates communications with slow remote devices. Multidrop communications are also supported through address bit handling in reception and transmission.

The USART features three test modes: Remote Loopback, Local Loopback and Automatic Echo.

The USART supports specific operating modes providing interfaces on RS485, LIN, LON, , with ISO7816 T = 0 or T = 1 smart card slots, and infrared transceivers. The hardware handshaking feature enables an out-of-band flow control by automatic management of the pins RTS and CTS.

The USART supports the connection to the DMA Controller, which enables data transfers to the transmitter and from the receiver. The DMAC provides chained buffer management without any intervention of the processor.

The Serial Peripheral Interface (SPI) circuit is a synchronous serial data link that provides communication with external devices in Master or Slave mode. It also enables communication between processors if an external processor is connected to the system.

The Serial Peripheral Interface is essentially a shift register that serially transmits data bits to other SPIs. During a data transfer, one SPI system acts as the “master” which controls the data flow, while the other devices act as “slaves” which have data shifted into and out by the master. Different CPUs can take turn being masters (multiple master protocol, contrary to single master protocol where one CPU is always the master while all of the others are always slaves). One master can simultaneously shift data into multiple slaves. However, only one slave can drive its output to write data back to the master at any given time.

A slave device is selected when the master asserts its NSS signal. If multiple slave devices exist, the master generates a separate slave select signal for each slave (NPCS).

The SPI system consists of two data lines and two control lines:

- Master Out Slave In (MOSI)—This data line supplies the output data from the master shifted into the input(s) of the slave(s).
- Master In Slave Out (MISO)—This data line supplies the output data from a slave to the input of the master. There may be no more than one slave transmitting data during any particular transfer.
- Serial Clock (SPCK)—This control line is driven by the master and regulates the flow of the data bits. The master can transmit data at a variety of baud rates; there is one SPCK pulse for each bit that is transmitted.
- Slave Select (NSS)—This control line allows slaves to be turned on and off by hardware.

The Two-wire Interface (TWI) interconnects components on a unique two-wire bus, made up of one clock line and one data line with speeds of up to 400 kbits per second in Fast mode and up to 3.4 Mbits per second in High-speed Slave mode only, based on a byte-oriented transfer format. It can be used with any Atmel Two-wire Interface bus Serial EEPROM and I<sup>2</sup>C-compatible devices, such as a Real-Time Clock (RTC), Dot Matrix/Graphic LCD Controller and temperature sensor. The

TWI is programmable as a master or a slave with sequential or single-byte access. Multiple master capability is supported.

Arbitration of the bus is performed internally and puts the TWI in Slave mode automatically if the bus arbitration is lost.

A configurable baud rate generator permits the output data rate to be adapted to a wide range of core clock frequencies.

The following table lists the compatibility level of the Atmel Two-wire Interface in Master mode and a full I<sup>2</sup>C compatible device.

**Table 39-1.** Atmel TWI Compatibility with I<sup>2</sup>C Standard

| I <sup>2</sup> C Standard                    | Atmel TWI     |
|----------------------------------------------|---------------|
| Standard Mode Speed (100 kHz)                | Supported     |
| Fast Mode Speed (400 kHz)                    | Supported     |
| High-speed Mode (Slave only, 3.4 MHz)        | Supported     |
| 7- or 10-bit <sup>(1)</sup> Slave Addressing | Supported     |
| Repeated Start (Sr) Condition                | Supported     |
| ACK and NACK Management                      | Supported     |
| Input Filtering                              | Supported     |
| Slope Control                                | Not Supported |
| Clock Stretching                             | Supported     |
| Multi Master Capability                      | Supported     |

Notes: 1. 10-bit support in Master mode only

## 39.2 Embedded Characteristics

### 39.2.1 USART/UART Characteristics

- 16-byte Transmit and Receive FIFOs
- Programmable Baud Rate Generator
- Baud Rate can be Independent of the Processor/Peripheral Clock
- Comparison Function on Received Character
- 5-bit to 9-bit Full-duplex Synchronous or Asynchronous Serial Communications
  - 1, 1.5 or 2 Stop Bits in Asynchronous Mode or 1 or 2 Stop Bits in Synchronous Mode
  - Parity Generation and Error Detection
  - Framing Error Detection, Overrun Error Detection
  - Digital Filter on Receive Line
  - MSB- or LSB-first
  - Optional Break Generation and Detection
  - By 8 or by 16 Oversampling Receiver Frequency
  - Optional Hardware Handshaking RTS-CTS
  - Receiver Timeout and Transmitter Timeguard
  - Optional Multidrop Mode with Address Generation and Detection
- RS485 with Driver Control Signal
- ISO7816, T = 0 or T = 1 Protocols for Interfacing with Smart Cards
  - NACK Handling, Error Counter with Repetition and Iteration Limit
- IrDA Modulation and Demodulation

- Communication at up to 115.2 kbit/s
- LIN Mode
  - Compliant with LIN 1.3 and LIN 2.0 specifications
  - Master or Slave
  - Processing of Frames with Up to 256 Data Bytes
  - Response Data Length can be Configurable or Defined Automatically by the Identifier
  - Self-synchronization in Slave Node Configuration
  - Automatic Processing and Verification of the “Synch Break” and the “Synch Field”
  - “Synch Break” Detection Even When Partially Superimposed with a Data Byte
  - Automatic Identifier Parity Calculation/Sending and Verification
  - Parity Sending and Verification Can be Disabled
  - Automatic Checksum Calculation/sending and Verification
  - Checksum Sending and Verification Can be Disabled
  - Support Both “Classic” and “Enhanced” Checksum Types
  - Full LIN Error Checking and Reporting
  - Frame Slot Mode: Master Allocates Slots to the Scheduled Frames Automatically
  - Generation of the Wakeup Signal
- LON Mode
  - Compliant with CEA-709 Specification
  - Full-layer 2 Implementation
  - Differential Manchester Encoding/Decoding (CDP)
  - Preamble Generation Including Bit- and Byte-sync Fields
  - LON Timings Handling (beta1, beta2, IDT, etc.)
  - CRC Generation and Checking
  - Automated Random Number Generation
  - Backlog Calculation and Update
  - Collision Detection Support
  - Supports Both comm\_type = 1 and comm\_type = 2 Modes
  - Clock Drift Tolerance Up to 16%
  - Optimal for Node-to-Node Communication (no embedded digital line filter)
- Test Modes
  - Remote Loopback, Local Loopback, Automatic Echo
- Supports Connection of:
  - Two DMA Controller (DMAC) Channels
  - Offers Buffer Transfer without Processor Intervention
- Register Write Protection

### 39.2.2 SPI Characteristics

- 8-byte Transmit and Receive FIFOs
- Master or Slave Serial Peripheral Bus Interface
  - 8-bit to 16-bit programmable data length per chip select
  - Programmable phase and polarity per chip select

- Programmable transfer delay between consecutive transfers and delay before SPI clock per chip select
  - Programmable delay between chip selects
- Selectable Mode Fault Detection
- Master Mode Can Drive SPCK up to Peripheral Clock
- Master Mode Bit Rate Can Be Independent of the Processor/Peripheral Clock
- Slave Mode Operates on SPCK, Asynchronously with Core and Bus Clock
- Four Chip Selects with External Decoder Support Allow Communication with up to 15Peripherals
- Communication with Serial External Devices Supported
  - Serial memories, such as DataFlash and 3-wire EEPROMs
  - Serial peripherals, such as ADCs, DACs, LCD controllers, CAN controllers and sensors
  - External coprocessors
- Connection to DMA Channel Capabilities, Optimizing Data Transfers
  - One channel for the receiver
  - One channel for the transmitter
- Register Write Protection

### 39.2.3 TWI/SMBus Characteristics

- 8-byte Transmit and Receive FIFOs
- Bit Rate: Up to 400 kbit/s in Fast Mode and 3.4 Mbit/s in High-Speed Mode (Slave Only)
- Bit Rate can be Independent of the Processor/Peripheral Clock
- SMBus Support
- Compatible with Atmel Two-wire Interface Serial Memory and I<sup>2</sup>C Compatible Devices<sup>(1)</sup>
- Master and Multi-Master Operation (Standard and Fast Mode Only)
- Slave Mode Operation (Standard, Fast and High-Speed Mode)
- One, Two or Three Bytes for Slave Address
- Sequential Read/Write Operations
- General Call Supported in Slave Mode
- Connection to DMA Controller Channels Optimizes Data Transfers
  - One Channel for the Receiver
  - One Channel for the Transmitter
- Register Write Protection

Note: 1. See table [Atmel TWI Compatibility with I<sup>2</sup>C Standard](#) for further details.

## 39.3 Block Diagram

Figure 39-1. FLEXCOM Block Diagram

## 39.4 I/O Lines Description

Table 39-2. I/O Lines Description

| Name        | Description |           |      | Type |
|-------------|-------------|-----------|------|------|
|             | USART/UART  | SPI       | TWI  |      |
| FLEXCOM_IO0 | TXD         | MOSI      | TWD  | I/O  |
| FLEXCOM_IO1 | RXD         | MISO      | TWCK | I/O  |
| FLEXCOM_IO2 | SCK         | SPCK      | -    | I/O  |
| FLEXCOM_IO3 | CTS         | NPCS0/NSS | -    | I/O  |
| FLEXCOM_IO4 | RTS         | NPCS1     | -    | O    |
| FLEXCOM_IO5 | -           | NPCS2     | -    | O    |
| FLEXCOM_IO6 | -           | NPCS3     | -    | O    |
| FLEXCOM_IO7 | LONCOL      | -         | -    | I    |

## 39.5 Product Dependencies

### 39.5.1 I/O Lines

The pins used for interfacing the FLEXCOM are multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the desired FLEXCOM pins to their peripheral function. If I/O lines of the FLEXCOM are not used by the application, they can be used for other purposes by the PIO Controller.

### 39.5.2 Power Management

The peripheral clock is not continuously provided to the FLEXCOM. The programmer must first enable the FLEXCOM Clock in the Power Management Controller (PMC) before using the USART or SPI or TWI.

### 39.5.3 Interrupt Sources

The FLEXCOM interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the FLEXCOM interrupt requires the Interrupt Controller to be programmed first.

## 39.6 Register Accesses

Register accesses support 8-bit, 16-bit and 32-bit accesses, which means that only an 8-bit part of a 32-bit register can be written in one access, for instance. For this the access must be done with the right size at the right address.

8-bit, 16-bit and 32-bit accesses are supported for register accesses. However, a field in a register cannot be partially written (e.g., if a field is bigger than 8 bits, the whole field must be written).

This feature helps avoiding a read-modify-write process if only a small part of the register is to be modified.

## 39.7 USART Functional Description

### 39.7.1 Baud Rate Generator

The baud rate generator provides the bit period clock named “baud rate clock” to both the receiver and the transmitter.

Configuring the USCLKS field in FLEX\_US\_MR selects the baud rate generator clock from one of the following sources:

- the peripheral clock
- a division of the peripheral clock, the divider being product dependent, but generally set to 8
- a fully programmable generic clock (GCLK) provided by PMC and independent of processor/peripheral clock
- the external clock, available on the SCK pin

The baud rate generator is based upon a 16-bit divider, which is programmed with the CD field of the Baud Rate Generator Register (FLEX\_US\_BRGR). If a zero is written to CD, the baud rate generator does not generate any clock. If a one is written to CD, the divider is bypassed and becomes inactive.

If the external SCK clock is selected, the duration of the low and high levels of the signal provided on the SCK pin must be longer than a peripheral clock period. The frequency of the signal provided on SCK must be at least three times lower than peripheral clock.

If GCLK is selected, the baud rate is independent of the processor/peripheral clock and thus processor/peripheral clock frequency can be changed without affecting the USART transfer. The GCLK frequency must be at least three times lower than peripheral clock frequency.

If GCLK is selected (USCLKS = 2) and the SCK pin is driven (CLKO = 1), the CD field must be greater than 1.

**Figure 39-2. Baud Rate Generator**

### 39.7.1.1 Baud Rate in Asynchronous Mode

If the USART is programmed to operate in Asynchronous mode, the selected clock is first divided by CD, which is field-programmed in FLEX\_US\_BRGR. The resulting clock is provided to the receiver as a sampling clock and then divided by 16 or 8, depending on the programming of FLEX\_US\_MR.OVER.

If OVER is set, the receiver sampling is eight times higher than the baud rate clock. If OVER is cleared, the sampling is performed at 16 times the baud rate clock.

The baud rate is calculated as per the following formula:

$$\text{Baud rate} = \frac{\text{Selected Clock}}{(8(2 - \text{OVER})\text{CD})}$$

This gives a maximum baud rate of peripheral clock divided by 8, assuming that peripheral clock is the highest possible clock and that the OVER bit is set.

#### 39.7.1.1.1 Baud Rate Calculation Example

The following table shows calculations of CD to obtain a baud rate at 38,400 bit/s for different source clock frequencies. It also shows the actual resulting baud rate and the error.

**Table 39-3. Baud Rate Example (OVER = 0)**

| Source Clock (MHz) | Expected Baud Rate (bit/s) | Calculation Result | CD | Actual Baud Rate (bit/s) | Error |
|--------------------|----------------------------|--------------------|----|--------------------------|-------|
| 3,686,400          | 38,400                     | 6.00               | 6  | 38,400.00                | 0.00% |
| 4,915,200          | 38,400                     | 8.00               | 8  | 38,400.00                | 0.00% |
| 5,000,000          | 38,400                     | 8.14               | 8  | 39,062.50                | 1.70% |
| 7,372,800          | 38,400                     | 12.00              | 12 | 38,400.00                | 0.00% |
| 8,000,000          | 38,400                     | 13.02              | 13 | 38,461.54                | 0.16% |
| 12,000,000         | 38,400                     | 19.53              | 20 | 37,500.00                | 2.40% |
| 12,288,000         | 38,400                     | 20.00              | 20 | 38,400.00                | 0.00% |
| 14,318,180         | 38,400                     | 23.30              | 23 | 38,908.10                | 1.31% |
| 14,745,600         | 38,400                     | 24.00              | 24 | 38,400.00                | 0.00% |
| 18,432,000         | 38,400                     | 30.00              | 30 | 38,400.00                | 0.00% |
| 24,000,000         | 38,400                     | 39.06              | 39 | 38,461.54                | 0.16% |
| 24,576,000         | 38,400                     | 40.00              | 40 | 38,400.00                | 0.00% |
| 25,000,000         | 38,400                     | 40.69              | 40 | 38,109.76                | 0.76% |
| 32,000,000         | 38,400                     | 52.08              | 52 | 38,461.54                | 0.16% |
| 32,768,000         | 38,400                     | 53.33              | 53 | 38,641.51                | 0.63% |

.....continued

| Source Clock (MHz) | Expected Baud Rate (bit/s) | Calculation Result | CD | Actual Baud Rate (bit/s) | Error |
|--------------------|----------------------------|--------------------|----|--------------------------|-------|
| 33,000,000         | 38,400                     | 53.71              | 54 | 38,194.44                | 0.54% |
| 40,000,000         | 38,400                     | 65.10              | 65 | 38,461.54                | 0.16% |
| 50,000,000         | 38,400                     | 81.38              | 81 | 38,580.25                | 0.47% |

The baud rate is calculated with the following formula:

$$\text{Baud rate} = \text{MCK} / \text{CD} \times 16$$

The baud rate error is calculated with the following formula. It is not recommended to work with an error higher than 5%.

$$\text{Error} = 1 - \left( \frac{\text{Expected Baud Rate}}{\text{Actual Baud Rate}} \right)$$

### 39.7.1.2 Fractional Baud Rate in Asynchronous Mode

The baud rate generator previously defined is subject to the following limitation: the output frequency changes by only integer multiples of the reference frequency. An approach to this problem is to integrate a fractional N clock generator that has a high resolution. The generator architecture is modified to obtain baud rate changes by a fraction of the reference source clock. This fractional part is programmed with the FP field in FLEX\_US\_BRGR. If FP is not 0, the fractional part is activated. The resolution is one eighth of the clock divider. The fractional baud rate is calculated using the following formula:

$$\text{Baud rate} = \frac{\text{Selected Clock}}{\left( 8(2 - \text{OVER}) \left( \text{CD} + \frac{\text{FP}}{8} \right) \right)}$$

The modified architecture is presented in the following figure.

**Figure 39-3.** Fractional Baud Rate Generator

**WARNING** When the value of field FP is greater than 0, the SCK (oversampling clock) generates nonconstant duty cycles. The SCK high duration is increased by “selected clock” period from time to time. The duty cycle depends on the value of the CD field.

### 39.7.1.3 Baud Rate in Synchronous Mode

If the USART is programmed to operate in Synchronous mode, the selected clock is simply divided by the CD field in FLEX\_US\_BRGR:

$$\text{Baud rate} = \frac{\text{Selected Clock}}{\text{CD}}$$

In Synchronous mode, if the external clock is selected (USCLKS = 3) and CLKO = 0 (Slave mode), the clock is provided directly by the signal on the USART SCK pin. No division is active. The value written in FLEX\_US\_BRGR has no effect. The external clock frequency must be at least three times lower than the system clock. In Synchronous mode master (USCLKS = 0 or 1, CLKO = 1), the receive part limits the SCK maximum frequency to  $f_{\text{peripheral clock}}/3$ .

When either the external clock SCK or the internal clock divided (peripheral clock/DIV or GCLK) is selected, the value programmed in CD must be even if the user has to ensure a 50:50 mark/space ratio on the SCK pin. If the peripheral clock is selected, the baud rate generator ensures a 50:50 duty cycle on the SCK pin, even if the value programmed in CD is odd.

### 39.7.1.4 Baud Rate in ISO 7816 Mode

The ISO7816 specification defines the bit rate with the following formula:

$$B = \frac{D_i}{F_i} \times f$$

where:

- B is the bit rate
- Di is the bit rate adjustment factor
- Fi is the clock frequency division factor
- f is the ISO7816 clock frequency (Hz)

Di is a binary value encoded on a 4-bit field, named DI, as represented in the following table.

**Table 39-4.** Binary and Decimal Values for Di

| DI field     | 0001 | 0010 | 0011 | 0100 | 0101 | 0110 | 1000 | 1001 |
|--------------|------|------|------|------|------|------|------|------|
| Di (decimal) | 1    | 2    | 4    | 8    | 16   | 32   | 12   | 20   |

Fi is a binary value encoded on a 4-bit field, named FI, as represented in the following table.

**Table 39-5.** Binary and Decimal Values for Fi

| FI field     | 0000 | 0001 | 0010 | 0011 | 0100 | 0101 | 0110 | 1001 | 1010 | 1011 | 1100 | 1101 |
|--------------|------|------|------|------|------|------|------|------|------|------|------|------|
| Fi (decimal) | 372  | 372  | 558  | 744  | 1116 | 1488 | 1860 | 512  | 768  | 1024 | 1536 | 2048 |

The following table shows the resulting Fi/Di Ratio, which is the ratio between the ISO7816 clock and the baud rate clock.

**Table 39-6.** Possible Values for the Fi/Di Ratio

| Fi/Di | 372   | 558   | 744   | 1116  | 1488 | 1806  | 512   | 768  | 1024  | 1536 | 2048  |
|-------|-------|-------|-------|-------|------|-------|-------|------|-------|------|-------|
| 1     | 372   | 558   | 744   | 1116  | 1488 | 1860  | 512   | 768  | 1024  | 1536 | 2048  |
| 2     | 186   | 279   | 372   | 558   | 744  | 930   | 256   | 384  | 512   | 768  | 1024  |
| 4     | 93    | 139.5 | 186   | 279   | 372  | 465   | 128   | 192  | 256   | 384  | 512   |
| 8     | 46.5  | 69.75 | 93    | 139.5 | 186  | 232.5 | 64    | 96   | 128   | 192  | 256   |
| 16    | 23.25 | 34.87 | 46.5  | 69.75 | 93   | 116.2 | 32    | 48   | 64    | 96   | 128   |
| 32    | 11.62 | 17.43 | 23.25 | 34.87 | 46.5 | 58.13 | 16    | 24   | 32    | 48   | 64    |
| 12    | 31    | 46.5  | 62    | 93    | 124  | 155   | 42.66 | 64   | 85.33 | 128  | 170.6 |
| 20    | 18.6  | 27.9  | 37.2  | 55.8  | 74.4 | 93    | 25.6  | 38.4 | 51.2  | 76.8 | 102.4 |

If the USART is configured in ISO7816 mode, the clock selected by the USCLKS field in FLEX\_US\_MR is first divided by the value programmed in field CD field in FLEX\_US\_BRGR. The resulting clock can be provided to the SCK pin to feed the smart card clock inputs. This means that FLEX\_US\_MR.CLKO can be set.

This clock is then divided by the value programmed in the FI\_DI\_RATIO field in the FI DI Ratio Register (FLEX\_US\_FIDI). This is performed by the Sampling Divider, which performs a division by up to 2047 in ISO7816 mode. The noninteger values of the Fi/Di Ratio are not supported and the user must program the FI\_DI\_RATIO field to a value as close as possible to the expected value.

The FI\_DI\_RATIO field resets to the value 0x174 (372 in decimal) and is the most common divider between the ISO7816 clock and the bit rate ( $F_i = 372$ ,  $D_i = 1$ ).

The following figure shows the relation between the Elementary Time Unit, corresponding to a bit time, and the ISO 7816 clock.

**Figure 39-4.** Elementary Time Unit (ETU)

## 39.7.2 Receiver and Transmitter Control

After reset, the receiver is disabled. The user must enable the receiver by setting the RXEN bit in the USART Control Register (FLEX\_US\_CR). However, the receiver registers can be programmed before the receiver clock is enabled.

After reset, the transmitter is disabled. The user must enable it by setting the TXEN bit in FLEX\_US\_CR. However, the transmitter registers can be programmed before being enabled.

The receiver and the transmitter can be enabled together or independently.

At any time, the software can perform a reset on the receiver or the transmitter of the USART by setting the corresponding bit, RSTRX and RSTTX respectively, in FLEX\_US\_CR. The software resets clear the status flag and reset internal state machines but the user interface configuration registers hold the value configured prior to software reset. Regardless of what the receiver or the transmitter is performing, the communication is immediately stopped.

The user can also independently disable the receiver or the transmitter by setting RXDIS and TXDIS respectively in FLEX\_US\_CR. If the receiver is disabled during a character reception, the USART waits until the end of reception of the current character, then the reception is stopped. If the transmitter is disabled while it is operating, the USART waits the end of transmission of both the current character and character being stored in the USART Transmit Holding Register (FLEX\_US\_THR). If a timeguard is programmed, it is handled normally.

## 39.7.3 Synchronous and Asynchronous Modes

### 39.7.3.1 Transmitter Operations

The transmitter performs the same in both Synchronous and Asynchronous operating modes (SYNC = 0 or SYNC = 1). One start bit, up to 9 data bits, 1 optional parity bit and up to 2 stop bits are successively shifted out on the TXD pin at each falling edge of the programmed serial clock.

The number of data bits is selected by the CHRL field and the MODE9 bit in FLEX\_US\_MR. Nine bits are selected by setting the MODE9 bit regardless of the CHRL field. The parity bit is set according to the PAR field in FLEX\_US\_MR. The even, odd, space, marked or none parity bit can be configured. The MSBF bit in FLEX\_US\_MR configures which data bit is sent first. If written to 1, the most significant bit is sent first. If written to 0, the less significant bit is sent first. The number of stop bits is selected by the NBSTOP field in FLEX\_US\_MR. The 1.5 stop bit is supported in Asynchronous mode only.

**Figure 39-5. Character Transmit**

Example: 8-bit, Parity Enabled One Stop

The characters are sent by writing in FLEX\_US\_THR. The transmitter reports two status bits in the USART Channel Status Register (FLEX\_US\_CSR): TXRDY (Transmitter Ready), which indicates that FLEX\_US\_THR is empty and TXEMPTY, which indicates that all the characters written in FLEX\_US\_THR have been processed. When the current character processing is completed, the last character written in FLEX\_US\_THR is transferred into the shift register of the transmitter and FLEX\_US\_THR is emptied, thus TXRDY rises.

Both TXRDY and TXEMPTY bits are low when the transmitter is disabled. Writing a character in FLEX\_US\_THR while TXRDY is low has no effect and the written character is lost.

**Figure 39-6. Transmitter Status**

### 39.7.3.2 Manchester Encoder

When the Manchester encoder is in use, characters transmitted through the USART are encoded based on biphase Manchester II format. To enable this mode, set the FLEX\_US\_MR.MAN bit to 1. Depending on polarity configuration, a logic level (zero or one), is transmitted as a coded signal one-to-zero or zero-to-one. Thus, a transition always occurs at the midpoint of each bit time. It consumes more bandwidth than the original NRZ signal (2x) but the receiver has more error control since the expected input must show a change at the center of a bit cell. An example of Manchester encoded sequence is: the byte 0xB1 or 10110001 encodes to 10 01 10 10 01 01 01 10, assuming the default polarity of the encoder. The following figure illustrates this coding scheme.

**Figure 39-7. NRZ to Manchester Encoding**

The Manchester encoded character can also be encapsulated by adding both a configurable preamble and a start frame delimiter pattern. Depending on the configuration, the preamble is a training sequence, composed of a predefined pattern with a programmable length from 1 to 15 bit times. If the preamble length is set to 0, the preamble waveform is not generated prior to any character. The preamble pattern is chosen among the following sequences: ALL\_ONE, ALL\_ZERO, ONE\_ZERO or ZERO\_ONE, writing the FLEX\_US\_MAN.TX\_PP field. The TX\_PL field is used to configure the preamble length. The following figure illustrates and defines the valid patterns. To improve flexibility, the encoding scheme can be configured using the FLEX\_US\_MAN.TX\_MPOL bit. If the TX\_MPOL bit is set to zero (default), a logic zero is encoded with a zero-to-one transition and a logic one is encoded with a one-to-zero transition. If the TX\_MPOL bit is set to one, a logic one is encoded with a one-to-zero transition and a logic zero is encoded with a zero-to-one transition.

**Figure 39-8. Preamble Patterns, Default Polarity Assumed**

A start frame delimiter is to be configured using the FLEX\_US\_MR.ONEBIT bit. It consists of a user-defined pattern that indicates the beginning of a valid data. The following figure illustrates these patterns. If the start frame delimiter, also known as the start bit, is one bit, (ONEBIT = 1), a logic zero is Manchester encoded and indicates that a new character is being sent serially on the line. If the start frame delimiter is a synchronization pattern also referred to as sync (ONEBIT = 0), a sequence of three bit times is sent serially on the line to indicate the start of a new character. The sync waveform is in itself an invalid Manchester waveform as the transition occurs at the middle of the second bit time. Two distinct sync patterns are used: the command sync and the data sync. The command sync has a logic one level for one and a half bit times, then a transition to logic zero for the second one and a half bit times. If the FLEX\_US\_MR.MODSYNC bit is set to 1, the next character is a command. If it is set to 0, the next character is a data. When direct memory access is used, the MODSYNC bit can be immediately updated with a modified character located in memory. To enable

this mode, the FLEX\_US\_MR.VAR\_SYNC bit must be set. In this case, the FLEX\_US\_MR.MODSYNC bit is bypassed and the sync configuration is held in the FLEX\_US\_THR.TXSYNH bit. The USART character format is modified and includes sync information.

**Figure 39-9. Start Frame Delimiter**

### 39.7.3.2.1 Drift Compensation

Drift compensation is available only in 16X Oversampling mode. An hardware recovery system allows a larger clock drift. To enable the hardware system, the bit in the FLEX\_US\_MAN register must be set. If the RXD edge is one 16X clock cycle from the expected edge, this is considered as normal jitter and no corrective actions is taken. If the RXD event is between 4 and 2 clock cycles before the expected edge, then the current period is shortened by one clock cycle. If the RXD event is between 2 and 3 clock cycles after the expected edge, then the current period is lengthened by one clock cycle. These intervals are considered to be drift and so corrective actions are automatically taken.

**Figure 39-10. Bit Resynchronization**

### 39.7.3.3 Asynchronous Receiver

If the USART is programmed in Asynchronous operating mode (SYNC = 0), the receiver oversamples the RXD input line. The oversampling is either 16 or 8 times the baud rate clock, depending on the FLEX\_US\_MR.OVER bit.

The receiver samples the RXD line. If the line is sampled during one half of a bit time to 0, a start bit is detected and data, parity and stop bits are successively sampled on the bit rate clock.

If the oversampling is 16 (OVER = 0), a start is detected at the eighth sample to 0. Data bits, parity bit and stop bit are assumed to have a duration corresponding to 16 oversampling clock cycles. If the oversampling is 8 (OVER = 1), a start bit is detected at the fourth sample to 0. Data bits, parity bit and stop bit are assumed to have a duration corresponding to 8 oversampling clock cycles.

The number of data bits, first bit sent and Parity mode are selected by the same fields and bits as the transmitter, i.e., respectively CHRL, MODE9, MSBF and PAR. For the synchronization mechanism only, the number of stop bits has no effect on the receiver as it considers only one stop bit, regardless of the NBSTOP field, so that resynchronization between the receiver and the transmitter can occur. Moreover, as soon as the stop bit is sampled, the receiver starts looking for a new start bit so that resynchronization can also be accomplished when the transmitter is operating with one stop bit.

The following figures illustrate start detection and character reception when USART operates in Asynchronous mode.

**Figure 39-11. Asynchronous Start Detection**

**Figure 39-12. Asynchronous Character Reception**

Example: 8-bit, Parity Enabled

### 39.7.3.4 Manchester Decoder

When the FLEX\_US\_MR.MAN bit is set, the Manchester decoder is enabled. The decoder performs both preamble and start frame delimiter detection. One input line is dedicated to Manchester encoded input data.

An optional preamble sequence can be defined. Its length is user-defined and totally independent of the transmitter side. Use the FLEX\_US\_MAN.RX\_PL field to configure the length of the preamble sequence. If the length is set to 0, no preamble is detected and the function is disabled. In addition, the polarity of the input stream is programmable with the FLEX\_US\_MAN.RX\_MPOL bit. Depending on the desired application, the preamble pattern matching is to be defined via the

FLEX\_US\_MAN.RX\_PP field. See figure [Preamble Patterns, Default Polarity Assumed](#) for available preamble patterns.

Unlike preamble, the start frame delimiter is shared between Manchester Encoder and Decoder. So, if ONEBIT bit = 1, only a zero encoded Manchester can be detected as a valid start frame delimiter. If ONEBIT = 0, only a sync pattern is detected as a valid start frame delimiter. Decoder operates by detecting transition on incoming stream. If RXD is sampled during one quarter of a bit time to zero, a start bit is detected. See the following figure. The sample pulse rejection mechanism applies.

The FLEX\_US\_MAN.RXIDLEV bit informs the USART of the receiver line idle state value (receiver line inactive). The user must define RXIDLEV to ensure reliable synchronization. By default, RXIDLEV is set to one (receiver line is at level 1 when there is no activity).

**Figure 39-13.** Asynchronous Start Bit Detection

The receiver is activated and starts preamble and frame delimiter detection, sampling the data at one quarter and then three quarters. If a valid preamble pattern or start frame delimiter is detected, the receiver continues decoding with the same synchronization. If the stream does not match a valid pattern or a valid start frame delimiter, the receiver resynchronizes on the next valid edge. The minimum time threshold to estimate the bit value is three quarters of a bit time.

If a valid preamble (if used) followed with a valid start frame delimiter is detected, the incoming stream is decoded into NRZ data and passed to USART for processing. The following figure illustrates Manchester pattern mismatch. When incoming data stream is passed to the USART, the receiver is also able to detect Manchester code violation. A code violation is a lack of transition in the middle of a bit cell. In this case, the MANE flag in FLEX\_US\_CSR is raised. It is cleared by writing a one to FLEX\_US\_CR.RSTSTA. See figure "Manchester Error Flag" below for an example of Manchester error detection during the data phase.

**Figure 39-14.** Preamble Pattern Mismatch

**Figure 39-15. Manchester Error Flag**

When the start frame delimiter is a sync pattern (ONEBIT = 0), both command and data delimiter are supported. If a valid sync is detected, the received character is written as RXCHR field in the Receive Holding Register (FLEX\_US\_RHR) and the RXSYNH is updated. RXCHR is set to 1 when the received character is a command, and it is set to 0 if the received character is a data. This mechanism alleviates and simplifies the direct memory access as the character contains its own sync field in the same register.

As the decoder is setup to be used in Unipolar mode, the first bit of the frame has to be a zero-to-one transition.

### 39.7.3.5 Radio Interface: Manchester Encoded USART Application

This section describes low data rate RF transmission systems and their integration with a Manchester encoded USART. These systems are based on transmitter and receiver ICs that support ASK and FSK modulation schemes.

The goal is to perform full-duplex radio transmission of characters using two different frequency carriers. See configuration in the following figure.

**Figure 39-16. Manchester Encoded Characters RF Transmission**

The USART peripheral is configured as a Manchester encoder/decoder. Looking at the downstream communication channel, Manchester encoded characters are serially sent to the RF transmitter. This may also include a user defined preamble and a start frame delimiter. Mostly, preamble is used in

the RF receiver to distinguish between a valid data from a transmitter and signals due to noise. The Manchester stream is then modulated. See the following figure for an example of ASK modulation scheme. When a logic one is sent to the ASK modulator, the power amplifier, referred to as PA, is enabled and transmits an RF signal at downstream frequency. When a logic zero is transmitted, the RF signal is turned off. If the FSK modulator is activated, two different frequencies are used to transmit data. When a logic 1 is sent, the modulator outputs an RF signal at frequency  $F_0$  and switches to  $F_1$  if the data sent is a 0. See figure "FSK Modulator Output" below.

From the receiver side, another carrier frequency is used. The RF receiver performs a bit check operation examining demodulated data stream. If a valid pattern is detected, the receiver switches to Receiving mode. The demodulated stream is sent to the Manchester decoder. Because of bit checking inside RF IC, the data transferred to the microcontroller is reduced by a user-defined number of bits. The Manchester preamble length is to be defined in accordance with the RF IC configuration.

**Figure 39-17. ASK Modulator Output**

**Figure 39-18. FSK Modulator Output**

### 39.7.3.6 Synchronous Receiver

In Synchronous mode ( $\text{SYNC} = 1$ ), the receiver samples the RXD signal on each rising edge of the baud rate clock. If a low level is detected, it is considered as a start. All data bits, the parity bit and the stop bits are sampled and the receiver waits for the next start bit. Synchronous mode operations provide a high-speed transfer capability.

Configuration fields and bits are the same as in Asynchronous mode.

The following figure illustrates a character reception in Synchronous mode.

**Figure 39-19. Synchronous Mode Character Reception**

Example: 8-bit, Parity Enabled 1 Stop

### 39.7.3.7 Receiver Operations

When a character reception is completed, it is transferred to the Receive Holding Register (FLEX\_US\_RHR) and the FLEX\_US\_CSR.RXRDY bit is raised. If a character is completed while the RXRDY is set, the Overrun Error (OVRE) bit is set. The last character is transferred into FLEX\_US\_RHR and overwrites the previous one. The OVRE bit is cleared by writing a one to Reset Status bit FLEX\_US\_CR.RSTSTA.

**Figure 39-20. Receiver Status**

### 39.7.3.8 Parity

The USART supports five parity modes that are selected by writing to the FLEX\_US\_MR.PAR field. The PAR field also enables the Multidrop mode (see section [Multidrop Mode](#)). Even and odd parity bit generation and error detection are supported.

If even parity is selected, the parity generator of the transmitter drives the parity bit to 0 if a number of 1s in the character data bit is even, and to 1 if the number of 1s is odd. Accordingly, the receiver parity checker counts the number of received 1s and reports a parity error if the sampled parity bit does not correspond. If odd parity is selected, the parity generator of the transmitter drives the parity bit to 1 if a number of 1s in the character data bit is even, and to 0 if the number of 1s is odd. Accordingly, the receiver parity checker counts the number of received 1s and reports a parity error if the sampled parity bit does not correspond. If the mark parity is used, the parity generator of the transmitter drives the parity bit to 1 for all characters. The receiver parity checker reports an error if the parity bit is sampled to 0. If the space parity is used, the parity generator of the transmitter drives the parity bit to 0 for all characters. The receiver parity checker reports an error if the parity bit is sampled to 1. If parity is disabled, the transmitter does not generate any parity bit and the receiver does not report any parity error.

The following table shows an example of the parity bit for the character 0x41 (character ASCII "A") depending on the configuration of the USART. Because there are two bits set to 1 in the character value, the parity bit is set to 1 when the parity is odd, or configured to 0 when the parity is even.

**Table 39-7. Parity Bit Examples**

| Character | Hexadecimal | Binary    | Parity Bit | Parity Mode |
|-----------|-------------|-----------|------------|-------------|
| A         | 0x41        | 0100 0001 | 1          | Odd         |
| A         | 0x41        | 0100 0001 | 0          | Even        |
| A         | 0x41        | 0100 0001 | 1          | Mark        |
| A         | 0x41        | 0100 0001 | 0          | Space       |
| A         | 0x41        | 0100 0001 | None       | None        |

When the receiver detects a parity error, it sets the Parity Error bit FLEX\_US\_CSR.PARE. The PARE bit can be cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit. The following figure illustrates the parity bit status setting and clearing.

**Figure 39-21. Parity Error**

### 39.7.3.9 Multidrop Mode

If the value 0x6 or 0x07 is written to the FLEX\_US\_MR.PAR field, the USART runs in Multidrop mode. This mode differentiates the data characters and the address characters. Data are transmitted with the parity bit to 0 and addresses are transmitted with the parity bit to 1.

If the USART is configured in Multidrop mode, the receiver sets the PARE parity error bit when the parity bit is high and the transmitter is able to send a character with the parity bit high when a one is written to the FLEX\_US\_CR.SENDA bit.

To handle parity error, the PARE bit is cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit.

The transmitter sends an address byte (parity bit set) when the FLEX\_US\_CR.SENDA bit is written to 1. In this case, the next byte written to FLEX\_US\_THR is transmitted as an address. Any character written in FLEX\_US\_THR when the SENDA command is not written is transmitted normally with parity to 0.

### 39.7.3.10 Transmitter Timeguard

The timeguard feature enables the USART interface with slow remote devices.

The timeguard function enables the transmitter to insert an idle state on the TXD line between two characters. This idle state actually acts as a long stop bit.

The duration of the idle state is programmed in the TG field of the Transmitter Timeguard Register (FLEX\_US\_TTGR). When this field is written to zero, no timeguard is generated. Otherwise, the

transmitter holds a high level on TXD after each transmitted byte during the number of bit periods programmed in TG in addition to the number of stop bits.

As illustrated in the following figure, the behavior of the TXRDY and TXEMPTY status bits is modified by the programming of a timeguard. TXRDY rises only when the start bit of the next character is sent, and thus remains to 0 during the timeguard transmission if a character has been written in FLEX\_US\_THR. TXEMPTY remains low until the timeguard transmission is completed as the timeguard is part of the current character being transmitted.

**Figure 39-22.** Timeguard Operations

The following table indicates the maximum length of a timeguard period that the transmitter can handle in relation to the function of the baud rate.

**Table 39-8.** Maximum Timeguard Length Depending on Baud Rate

| Baud Rate (bit/s) | Bit Time (μs) | Timeguard (ms) |
|-------------------|---------------|----------------|
| 1,200             | 833           | 212.50         |
| 9,600             | 104           | 26.56          |
| 14,400            | 69.4          | 17.71          |
| 19,200            | 52.1          | 13.28          |
| 28,800            | 34.7          | 8.85           |
| 38,400            | 26            | 6.63           |
| 56,000            | 17.9          | 4.55           |
| 57,600            | 17.4          | 4.43           |
| 115,200           | 8.7           | 2.21           |

### 39.7.3.11 Receiver Timeout

The Receiver Timeout provides support in handling variable-length frames. This feature detects an idle condition on the RXD line. When a timeout is detected, the FLEX\_US\_CSR.TIMEOUT bit rises and can generate an interrupt, thus indicating to the driver an end of frame.

The timeout delay period (during which the receiver waits for a new character) is programmed in the TO field of the Receiver Timeout Register (FLEX\_US\_RTOR). If the TO field is written to 0, the Receiver Timeout is disabled and no timeout is detected. The FLEX\_US\_CSR.TIMEOUT bit remains at 0. Otherwise, the receiver loads a 16-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the FLEX\_US\_CSR.TIMEOUT bit rises. Then, the user can either:

- Stop the counter clock until a new character is received. This is performed by writing a '1' to FLEX\_US\_CR.STTTO. In this case, the idle state on RXD before a new character is received does not provide a timeout. This prevents having to handle an interrupt before a character is received and enables waiting for the next idle state on RXD after a frame is received.

- Obtain an interrupt while no character is received. This is performed by writing a '1' to FLEX\_US\_CR.RETTO. In this case, the counter starts counting down immediately from the value TO. This generates a periodic interrupt so that a user timeout can be handled, for example when no key is pressed on a keyboard.

The following figure shows the block diagram of the Receiver Timeout feature.

**Figure 39-23.** Receiver Timeout Block Diagram

The following table gives the maximum timeout period for some standard baud rates.

**Table 39-9.** Maximum Timeout Period

| Baud Rate (bit/s) | Bit Time ( $\mu$ s) | Timeout (ms) |
|-------------------|---------------------|--------------|
| 600               | 1,667               | 109,225      |
| 1,200             | 833                 | 54,613       |
| 2,400             | 417                 | 27,306       |
| 4,800             | 208                 | 13,653       |
| 9,600             | 104                 | 6,827        |
| 14,400            | 69                  | 4,551        |
| 19,200            | 52                  | 3,413        |
| 28,800            | 35                  | 2,276        |
| 38,400            | 26                  | 1,704        |
| 56,000            | 18                  | 1,170        |
| 57,600            | 17                  | 1,138        |
| 200,000           | 5                   | 328          |

### 39.7.3.12 Framing Error

The receiver is capable of detecting framing errors. A framing error happens when the stop bit of a received character is detected at level 0. This can occur if the receiver and the transmitter are fully desynchronized.

A framing error is reported on the FLEX\_US\_CSR.FRAME bit. The FRAME bit is asserted in the middle of the stop bit as soon as the framing error is detected. It is cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit.

**Figure 39-24. Framing Error Status**

### 39.7.3.13 Transmit Break

The user can request the transmitter to generate a break condition on the TXD line. A break condition drives the TXD line low during at least one complete character. It appears the same as a 0x00 character sent with the parity and the stop bits to 0. However, the transmitter holds the TXD line at least during one character until the user requests the break condition to be removed.

A break is transmitted by setting the FLEX\_US\_CR.STTBK bit. This can be done at any time, either while the transmitter is empty (no character in either the shift register or in FLEX\_US\_THR) or when a character is being transmitted. If a break is requested while a character is being shifted out, the character is first completed before the TXD line is held low.

Once the Start Break command is requested, further Start Break commands are ignored until the end of the break is completed.

The break condition is removed by setting the FLEX\_US\_CR.STPBK bit. If the Stop Break command is requested before the end of the minimum break duration (one character, including start, data, parity and stop bits), the transmitter ensures that the break condition completes.

The transmitter considers the break as though it is a character, i.e., the Start Break and Stop Break commands are processed only if the FLEX\_US\_CSR.TXRDY bit = 1 and the start of the break condition clears the TXRDY and TXEMPTY bits as if a character was processed.

Setting both the FLEX\_US\_CR.STTBK and FLEX\_US\_CR.STPBK bits can lead to an unpredictable result. All Stop Break commands requested without a previous Start Break command are ignored. A byte written into the Transmit Holding register while a break is pending, but not started, is ignored.

After the break condition, the transmitter returns the TXD line to 1 for a minimum of 12 bit times. Thus, the transmitter ensures that the remote receiver detects correctly the end of break and the start of the next character. If the timeguard is programmed with a value higher than 12, the TXD line is held high for the timeguard period.

After holding the TXD line for this period, the transmitter resumes normal operations.

The following figure illustrates the effect of both the Start Break (STTBK) and Stop Break (STPBK) commands on the TXD line.

**Figure 39-25. Break Transmission**

### 39.7.3.14 Receive Break

The receiver detects a break condition when all data, parity and stop bits are low. This corresponds to detecting a framing error with data to 0x00, but FRAME remains low.

When the low stop bit is detected, the receiver asserts the FLEX\_US\_CSR.RXBRK bit. FLEX\_US\_CSR.RXBRK may be cleared by setting the FLEX\_US\_CR.RSTSTA bit.

An end of receive break is detected by a high level for at least 2/16ths of a bit period in Asynchronous operating mode or one sample at high level in Synchronous operating mode. The end of break detection also asserts the RXBRK bit.

### 39.7.3.15 Hardware Handshaking

The USART features a hardware handshaking out-of-band flow control. The RTS and CTS pins are used to connect with the remote device, as shown in the following figure.

**Figure 39-26. Connection with a Remote Device for Hardware Handshaking**

Setting the USART to operate with hardware handshaking is performed by writing the FLEX\_US\_MR.USART\_MODE field to the value 0x2.

The USART behavior when hardware handshaking is enabled is the same as the behavior in standard Synchronous or Asynchronous mode, except that the receiver drives the RTS pin as described below and the level on the CTS pin modifies the behavior of the transmitter as described below. Using this mode requires using the DMAC channel for reception. The transmitter can handle hardware handshaking in any case.

**Figure 39-27. RTS Line Software Control when FLEX\_US\_MR.USART\_MODE = 2**

The following figure shows how the transmitter operates if hardware handshaking is enabled. The CTS pin disables the transmitter. If a character is being processed, the transmitter is disabled only after the completion of the current character and transmission of the next character happens as soon as the pin CTS falls.

**Figure 39-28.** Transmitter Behavior when Operating with Hardware Handshaking

If USART FIFOs are enabled (bit FLEX\_US\_CR.FIFOEN), the RTS pin can be controlled by the USART Receive FIFO thresholds. The RTS pin control through Receive FIFO thresholds can be activated with the FLEX\_US\_FMR.FRTSC bit. Once activated, the RTS pin will be controlled by Receive FIFO thresholds, set to level 1 each time RXFTHRES is reached and set to level '0' each time RXFTHRES2 is reached (and RXFTHRES is not reached).

**Figure 39-29.** Receiver Behavior When FIFO Enabled and FRTSC Set to '1'

**Note:** In this mode, RXFTHRES must be > RXFTHRES2.

### 39.7.4 ISO7816 Mode

The USART features an ISO7816-compatible operating mode. This mode permits interfacing with smart cards and Security Access Modules (SAM) communicating through an ISO7816 link. Both T = 0 and T = 1 protocols defined by the ISO7816 specification are supported.

Setting the USART in ISO7816 mode is performed by writing the FLEX\_US\_MR.USART\_MODE field to the value 0x4 for protocol T = 0 and to the value 0x6 for protocol T = 1.

#### 39.7.4.1 ISO7816 Mode Overview

The ISO7816 is a half-duplex communication on only one bidirectional line. The baud rate is determined by a division of the clock provided to the remote device (see figure in section [Baud Rate Generator](#)).

The USART connects to a smart card as shown in the following figure. The TXD line becomes bidirectional and the baud rate generator feeds the ISO7816 clock on the SCK pin. As the TXD pin becomes bidirectional, its output remains driven by the output of the transmitter but only when the transmitter is active while its input is directed to the input of the receiver. The USART is considered as the master of the communication as it generates the clock.

**Figure 39-30.** Connection of a Smart Card to the USART

When operating in ISO7816, either in T = 0 or T = 1 modes, the character format is fixed. The configuration is 8 data bits, even parity and 1 or 2 stop bits, regardless of the values programmed in the CHRL, MODE9, PAR and CHMODE fields. MSBF can be used to transmit LSB or MSB first. Parity Bit (PAR) can be used to transmit in Normal or Inverse mode. See section 39.10.5. [FLEX\\_US\\_MR](#) and description of field PAR (Parity Type).

The USART cannot operate concurrently in both Receiver and Transmitter modes as the communication is unidirectional at a time. It has to be configured according to the required mode by enabling or disabling either the receiver or the transmitter as desired. Enabling both the receiver and the transmitter at the same time in ISO7816 mode may lead to unpredictable results.

The ISO7816 specification defines an inverse transmission format. Data bits of the character must be transmitted on the I/O line at their negative value.

#### 39.7.4.2 Protocol T = 0

In T = 0 protocol, a character is made up of 1 start bit, 8 data bits, 1 parity bit and 1 guard time, which lasts two bit times. The transmitter shifts out the bits and does not drive the I/O line during the guard time.

If no parity error is detected, the I/O line remains at 1 during the guard time and the transmitter can continue with the transmission of the next character, as shown in the following figure.

If a parity error is detected by the receiver, it drives the I/O line to 0 during the guard time, as shown in figure "T = 0 Protocol with Parity Error" below. This error bit is also named NACK, for Non Acknowledge. In this case, the character lasts 1 bit time more, as the guard time length is the same and is added to the error bit time which lasts 1 bit time.

When the USART is the receiver and it detects an error, it does not load the erroneous character in the Receive Holding Register (FLEX\_US\_RHR). It appropriately sets the PARE bit in the Status Register (FLEX\_US\_CSR) so that the software can handle the error.

**Figure 39-31.** T = 0 Protocol without Parity Error**Figure 39-32.** T = 0 Protocol with Parity Error

#### 39.7.4.2.1 Receive Error Counter

The USART receiver also records the total number of errors. This can be read in the Number of Error (FLEX\_US\_NER) register. The NB\_ERRORS field can record up to 255 errors. Reading FLEX\_US\_NER automatically clears the NB\_ERRORS field.

#### 39.7.4.2.2 Receive NACK Inhibit

The USART can be configured to inhibit an error. This is done by writing a '1' to FLEX\_US\_MR.INACK. In this case, no error signal is driven on the I/O line even if a parity bit is detected.

Moreover, if INACK = 1, the erroneous received character is stored in the Receive Holding register as if no error occurred, and the RXRDY bit rises.

#### 39.7.4.2.3 Transmit Character Repetition

When the USART is transmitting a character and gets a NACK, it can automatically repeat the character before moving on to the next one. Repetition is enabled by writing the FLEX\_US\_MR.MAX\_ITERATION field at a value higher than 0. Each character can be transmitted up to eight times: the first transmission plus seven repetitions.

If MAX\_ITERATION does not equal zero, the USART repeats the character as many times as the value loaded in MAX\_ITERATION.

When the USART repetition number reaches MAX\_ITERATION, and the last repeated character is not acknowledged, the FLEX\_US\_CSR.ITER bit is set. If the repetition of the character is acknowledged by the receiver, the repetitions are stopped and the iteration counter is cleared.

The FLEX\_US\_CSR.ITER bit can be cleared by writing the FLEX\_US\_CR.RSTIT bit to 1.

#### 39.7.4.2.4 Disable Successive Receive NACK

The receiver can limit the number of successive NACKs sent back to the remote transmitter. This is programmed by setting the FLEX\_US\_MR.DSNACK bit. The maximum number of NACKs transmitted is programmed in the MAX\_ITERATION field. As soon as MAX\_ITERATION is reached, no error signal is driven on the I/O line and the FLEX\_US\_CSR.ITER bit is set.

#### 39.7.4.3 Protocol T = 1

When operating in ISO7816 protocol T = 1, the transmission is similar to an asynchronous format with only one stop bit. The parity is generated when transmitting and checked when receiving. Parity error detection sets the FLEX\_US\_CSR.PARE bit.

#### 39.7.5 IrDA Mode

The USART features an IrDA mode supplying half-duplex point-to-point wireless communication. It embeds the modulator and demodulator which allows a glueless connection to the infrared transceivers, as shown in the following figure. The modulator and demodulator are compliant with the IrDA specification version 1.1 and support data transfer speeds ranging from 2.4 kbit/s to 115.2 kbit/s.

The USART IrDA mode is enabled by setting the FLEX\_US\_MR.USART\_MODE field to the value 0x8. The IrDA Filter Register (FLEX\_US\_IF) allows configuring the demodulator filter. The USART transmitter and receiver operate in a normal Asynchronous mode and all parameters are accessible. Note that the modulator and the demodulator are activated.

**Figure 39-33.** Connection to IrDA Transceivers

The receiver and the transmitter must be enabled or disabled according to the direction of the transmission to be managed.

To receive IrDA signals, the following needs to be done:

- Disable TX and Enable RX
- Configure the TXD pin as PIO and set it as an output to 0 (to avoid LED transmission). Disable the internal pullup (better for power consumption).
- Receive data

**39.7.5.1 IrDA Modulation**

For baud rates up to and including 115.2 kbit/s, the RZI modulation scheme is used. "0" is represented by a light pulse of 3/16th of a bit time. Some examples of signal pulse duration are shown in the following table.

**Table 39-10.** IrDA Pulse Duration

| Baud Rate    | Pulse Duration (3/16) |
|--------------|-----------------------|
| 2.4 kbit/s   | 78.13 $\mu$ s         |
| 9.6 kbit/s   | 19.53 $\mu$ s         |
| 19.2 kbit/s  | 9.77 $\mu$ s          |
| 38.4 kbit/s  | 4.88 $\mu$ s          |
| 57.6 kbit/s  | 3.26 $\mu$ s          |
| 115.2 kbit/s | 1.63 $\mu$ s          |

The following figure shows an example of character transmission.

**Figure 39-34.** IrDA Modulation

**39.7.5.2 IrDA Baud Rate**

The following table gives some examples of CD values, baud rate error and pulse duration. Note that the requirement on the maximum acceptable error of  $\pm 1.87\%$  must be met.

**Table 39-11.** IrDA Baud Rate Error

| Peripheral Clock | Baud Rate (bit/s) | CD  | Baud Rate Error | Pulse Time (μs) |
|------------------|-------------------|-----|-----------------|-----------------|
| 3,686,400        | 115,200           | 2   | 0.00%           | 1.63            |
| 20,000,000       | 115,200           | 11  | 1.38%           | 1.63            |
| 32,768,000       | 115,200           | 18  | 1.25%           | 1.63            |
| 40,000,000       | 115,200           | 22  | 1.38%           | 1.63            |
| 3,686,400        | 57,600            | 4   | 0.00%           | 3.26            |
| 20,000,000       | 57,600            | 22  | 1.38%           | 3.26            |
| 32,768,000       | 57,600            | 36  | 1.25%           | 3.26            |
| 40,000,000       | 57,600            | 43  | 0.93%           | 3.26            |
| 3,686,400        | 38,400            | 6   | 0.00%           | 4.88            |
| 20,000,000       | 38,400            | 33  | 1.38%           | 4.88            |
| 32,768,000       | 38,400            | 53  | 0.63%           | 4.88            |
| 40,000,000       | 38,400            | 65  | 0.16%           | 4.88            |
| 3,686,400        | 19,200            | 12  | 0.00%           | 9.77            |
| 20,000,000       | 19,200            | 65  | 0.16%           | 9.77            |
| 32,768,000       | 19,200            | 107 | 0.31%           | 9.77            |
| 40,000,000       | 19,200            | 130 | 0.16%           | 9.77            |
| 3,686,400        | 9,600             | 24  | 0.00%           | 19.53           |
| 20,000,000       | 9,600             | 130 | 0.16%           | 19.53           |
| 32,768,000       | 9,600             | 213 | 0.16%           | 19.53           |
| 40,000,000       | 9,600             | 260 | 0.16%           | 19.53           |
| 3,686,400        | 2,400             | 96  | 0.00%           | 78.13           |
| 20,000,000       | 2,400             | 521 | 0.03%           | 78.13           |
| 32,768,000       | 2,400             | 853 | 0.04%           | 78.13           |

### 39.7.5.3 IrDA Demodulator

The demodulator is based on the IrDA Receive filter comprised of an 8-bit down counter which is loaded with the value programmed in FLEX\_US\_IF. When a falling edge is detected on the RXD pin, the Filter Counter starts counting down at the peripheral clock speed. If a rising edge is detected on the RXD pin, the counter stops and is reloaded with FLEX\_US\_IF. If no rising edge is detected when the counter reaches 0, the input of the receiver is driven low during one bit time.

The following figure illustrates the operations of the IrDA demodulator.

**Figure 39-35.** IrDA Demodulator Operations

The programmed value in the FLEX\_US\_IF register must always meet the following criteria:

$$t_{\text{peripheral clock}} \times (\text{IRDA\_FILTER} + 3) < 1.41 \mu\text{s}$$

As the IrDA mode uses the same logic as the ISO7816, note that the FLEX\_US\_FIDI.FI\_DI\_RATIO field must be set to a value higher than 0 to make sure IrDA communications operate correctly.

### 39.7.6 RS485 Mode

The USART features the RS485 mode to enable line driver control. While operating in RS485 mode, the USART behaves as though in Asynchronous or Synchronous mode and configuration of all the parameters is possible. The difference is that the RTS pin is driven high when the transmitter is operating. The behavior of the RTS pin is controlled by the TXEMPTY bit. A typical connection of the USART to an RS485 bus is shown in the following figure.

**Figure 39-36.** Typical Connection to an RS485 Bus

The USART is set in RS485 mode by writing the value 0x1 to the FLEX\_US\_MR.USART\_MODE field.

The RTS pin is at a level inverse to the TXEMPTY bit. Significantly, the RTS pin remains high when a timeguard is programmed, so that the line can remain driven after the last character completion. The following figure gives an example of the RTS waveform during a character transmission when the timeguard is enabled.

**Figure 39-37.** Example of RTS Drive with Timeguard

### 39.7.7 USART Comparison Function on Received Character

The CMP flag in FLEX\_US\_CSR is set when the received character matches the conditions programmed in FLEX\_US\_CMPR. The CMP flag is set as soon as FLEX\_US\_RHR is loaded with the new received character. The CMP flag is cleared by writing a one to FLEX\_US\_CR.RSTSTA.

FLEX\_US\_CMPR can be programmed to provide different comparison methods:

- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if any received character equals VAL1 or VAL2.

When the FLEX\_US\_CMPR.CMPMODE bit is set to FLAG\_ONLY (value 0), all received data are loaded in FLEX\_US\_RHR and the CMP flag provides the status of the comparison result.

By programming the START\_CONDITION.CMPMODE bit (value 1), the comparison function result triggers the start of the loading of FLEX\_US\_RHR (see the following figure). The trigger condition exists as soon as the received character value matches the condition defined by the programming of VAL1, VAL2 and CMPPAR in FLEX\_US\_CMPR. The comparison trigger event is restarted by writing a 1 to the FLEX\_US\_CR.REQCLR bit.

The value programmed in the VAL1 and VAL2 fields must not exceed the maximum value of the received character (see CHRL field in register [39.10.5. FLEX\\_US\\_MR](#)).

**Figure 39-38.** Receive Holding Register Management

CMPMODE = 1, VAL1 = VAL2 = 0x06

### 39.7.8 LIN Mode

The LIN mode provides master node and slave node connectivity on a LIN bus.

The LIN (Local Interconnect Network) is a serial communication protocol which efficiently supports the control of mechatronic nodes in distributed automotive applications.

The main properties of the LIN bus are:

- Single master/multiple slaves concept
- Low-cost silicon implementation based on common UART/SCI interface hardware, an equivalent in software, or as a pure state machine.
- Self synchronization without quartz or ceramic resonator in the slave nodes
- Deterministic signal transmission
- Low cost single-wire implementation
- Speed up to 20 kbit/s

LIN provides cost efficient bus communication where the bandwidth and versatility of CAN are not required.

The LIN mode enables processing LIN frames with a minimum of action from the microprocessor.

#### 39.7.8.1 Modes of Operation

The USART can act either as a LIN master node or as a LIN slave node.

The node configuration is chosen by setting the USART\_MODE field in the USART Mode Register (FLEX\_US\_MR):

- LIN master node (USART\_MODE = 0xA)
- LIN slave node (USART\_MODE = 0xB)

In order to avoid unpredictable behavior, any change of the LIN node configuration must be followed by a software reset of the transmitter and of the receiver (except the initial node configuration after a hardware reset). (See section [39.7.2. Receiver and Transmitter Control](#).)

### 39.7.8.2 Baud Rate Configuration

See section [Baud Rate in Asynchronous Mode](#).

- LIN master node: The baud rate is configured in FLEX\_US\_BRGR.
- LIN slave node: The initial baud rate is configured in FLEX\_US\_BRGR. This configuration is automatically copied in the LIN Baud Rate Register (FLEX\_US\_LINBRR) when writing FLEX\_US\_BRGR. After the synchronization procedure, the baud rate is updated in FLEX\_US\_LINBRR.

### 39.7.8.3 Receiver and Transmitter Control

See section [39.7.2. Receiver and Transmitter Control](#).

### 39.7.8.4 Character Transmission

See section [Transmitter Operations](#).

### 39.7.8.5 Character Reception

See section [Receiver Operations](#).

### 39.7.8.6 Header Transmission (Master Node Configuration)

All the LIN Frames start with a header which is sent by the master node and consists of a Synch Break Field, Synch Field and Identifier Field.

So in master node configuration, the frame handling starts with the sending of the header.

The header is transmitted as soon as the identifier is written in the LIN Identifier Register (FLEX\_US\_LINIR). At this moment the flag TXRDY falls.

The Break Field, the Synch Field and the Identifier Field are sent automatically one after the other.

The Break Field consists of 13 dominant bits and 1 recessive bit, the Synch Field is the character 0x55 and the Identifier corresponds to the character written in the LIN Identifier Register (FLEX\_US\_LINIR). The Identifier parity bits can be automatically computed and sent (see section [Identifier Parity](#)).

The flag TXRDY rises when the identifier character is transferred into the shift register of the transmitter.

As soon as the Synch Break Field is transmitted, the FLEX\_US\_CSR.LINBK flag bit is set. Likewise, as soon as the Identifier Field is sent, the FLEX\_US\_CSR.LINID flag bit is set. These flags are reset by writing a one to the FLEX\_US\_CR.RSTSTA bit.

**Figure 39-39. Header Transmission**

### 39.7.8.7 Header Reception (Slave Node Configuration)

All the LIN frames start with a header which is sent by the master node and consists of a Synch Break Field, Synch Field and Identifier Field.

In slave node configuration, the frame handling starts with the reception of the header.

The USART uses a break detection threshold of 11 nominal bit times at the actual baud rate. At any time, if 11 consecutive recessive bits are detected on the bus, the USART detects a Break Field. As long as a Break Field has not been detected, the USART stays idle and the received data are not taken in account.

When a Break Field has been detected, the FLEX\_US\_CSR.LINBK flag is set and the USART expects the Synch Field character to be 0x55. This field is used to update the actual baud rate in order to remain synchronized (see section [Slave Node Synchronization](#)). If the received Synch character is not 0x55, an Inconsistent Synch Field error is generated (see section [LIN Errors](#)).

After receiving the Synch Field, the USART expects to receive the Identifier Field.

When the Identifier Field has been received, the FLEX\_US\_CSR.LINID flag bit is set. At this moment, the IDCHR field in the LIN Identifier Register (FLEX\_US\_LINIR) is updated with the received character. The Identifier parity bits can be automatically computed and checked (see section [Identifier Parity](#)).

If the header is not entirely received within the time given by the maximum length of the header  $t_{Header\_Maximum}$ , the FLEX\_US\_CSR.LINHTE error flag bit is set.

The flag bits LINID, LINBK and LINHTE are reset by writing a one to the FLEX\_US\_CR.RSTSTA bit.

**Figure 39-40. Header Reception**

### 39.7.8.8 Slave Node Synchronization

The synchronization is done only in slave node configuration. The procedure is based on time measurement between the falling edges of the Synch Field. The falling edges are available in distances of 2, 4, 6 and 8 bit times.

**Figure 39-41. Synch Field**

The time measurement is made by a 19-bit counter driven by the sampling clock (see section [Baud Rate Generator](#)).

When the start bit of the Synch Field is detected, the counter is reset. Then during the next eight  $t_{bit}$  of the Synch Field, the counter is incremented. At the end of these eight  $t_{bit}$ , the counter is stopped. At this moment, the 16 most significant bits of the counter (value divided by 8) give the new clock divider (LINCD) and the 3 least significant bits of this value (the remainder) give the new fractional part (LINFP).

Once the Synch Field has been entirely received, the clock divider (LINCD) and the fractional part (LINFP) are updated in the LIN Baud Rate Register (FLEX\_US\_LINBRR) with the computed values, if the Synchronization is not disabled by the SYNCDIS bit in the LIN Mode Register (FLEX\_US\_LINMR).

After reception of the Synch Field:

- If it appears that the computed baud rate deviation compared to the initial baud rate is superior to the maximum tolerance  $FTol\_Unsynch$  ( $\pm 15\%$ ), then the clock divider (LINCD) and the fractional part (LINFP) are not updated, and the FLEX\_US\_CSR.LINSTE error flag bit is set.
- If it appears that the sampled Synch character is not equal to 0x55, then the clock divider (LINCD) and the fractional part (LINFP) are not updated, and the FLEX\_US\_CSR.LINISFE error flag bit is set.

Flags LINSTE and LINISFE are reset by writing a one to the FLEX\_US\_CR.RSTSTA bit.

**Figure 39-42. Slave Node Synchronization**

The synchronization accuracy depends on several parameters:

- The nominal clock frequency ( $f_{Nom}$ ) (the theoretical slave node clock frequency)
- The baud rate
- The oversampling ( $OVER = 0 \Rightarrow 16X$  or  $OVER = 1 \Rightarrow 8X$ )

The following formula is used to compute the deviation of the slave bit rate relative to the master bit rate after synchronization ( $f_{SLAVE}$  is the real slave node clock frequency).

$$\text{Baud rate deviation} = \left( 100 \times \frac{[\alpha \times 8 \times (2 - \text{Over}) + \beta] \times \text{Baud rate}}{8 \times f_{SLAVE}} \right) \%$$

$$\text{Baud rate deviation} = \left( 100 \times \frac{[\alpha \times 8 \times (2 - \text{Over}) + \beta] \times \text{Baud rate}}{8 \times \left( \frac{f_{TOL\_UNSYNCH}}{100} \right) \times f_{Nom}} \right) \%$$

$$-0.5 \leq \alpha \leq +0.5 \quad -1 < \beta < +1$$

$f_{TOL\_UNSYNCH}$  is the deviation of the real slave node clock from the nominal clock frequency. The LIN Standard imposes that it must not exceed  $\pm 15\%$ . The LIN Standard imposes also that for communication between two nodes, their bit rate must not differ by more than  $\pm 2\%$ . This means that the baud rate deviation must not exceed  $\pm 1\%$ .

Therefore, a minimum value for the nominal clock frequency can be computed as follows:

$$f_{Nom}(\min) = \left( 100 \times \frac{[0.5 \times 8 \times (2 - \text{Over}) + 1] \times \text{Baud rate}}{8 \times \left( \frac{-15}{100} + 1 \right) \times 1\%} \right) \text{Hz}$$

Examples:

- Baud rate = 20 kbit/s,  $OVER = 0$  (Oversampling 16X)  $\Rightarrow f_{Nom}(\min) = 2.64 \text{ MHz}$
- Baud rate = 20 kbit/s,  $OVER = 1$  (Oversampling 8X)  $\Rightarrow f_{Nom}(\min) = 1.47 \text{ MHz}$
- Baud rate = 1 kbit/s,  $OVER = 0$  (Oversampling 16X)  $\Rightarrow f_{Nom}(\min) = 132 \text{ kHz}$
- Baud rate = 1 kbit/s,  $OVER = 1$  (Oversampling 8X)  $\Rightarrow f_{Nom}(\min) = 74 \text{ kHz}$

### 39.7.8.9 Identifier Parity

A protected identifier consists of two subfields: the identifier and the identifier parity. Bits 0 to 5 are assigned to the identifier, and bits 6 and 7 are assigned to the parity.

The USART interface can generate/check these parity bits, but this feature can also be disabled. The user can choose between two modes via the FLEX\_US\_LINMR.PARDIS bit:

- PARDIS = 0:
  - During header transmission, the parity bits are computed and sent with the six least significant bits of the IDCHR field of the LIN Identifier Register (FLEX\_US\_LINIR). Bits 6 and 7 of this register are discarded.
  - During header reception, the parity bits of the identifier are checked. If the parity bits are wrong, an Identifier Parity error occurs (see section [Parity](#)). Only the six least significant bits of the IDCHR field are updated with the received Identifier. Bits 6 and 7 are stuck to 0.
- PARDIS = 1:
  - During header transmission, all the bits of the IDCHR field of the LIN Identifier Register (FLEX\_US\_LINIR) are sent on the bus.
  - During header reception, all the bits of the IDCHR field are updated with the received Identifier.

### 39.7.8.10 Node Action

Depending on the identifier, the node is affected—or not—by the LIN response. Consequently, after sending or receiving the identifier, the USART must be configured. There are three possible configurations:

- PUBLISH: the node sends the response.
- SUBSCRIBE: the node receives the response.
- IGNORE: the node is not concerned by the response, it does not send and does not receive the response.

This configuration is made by the LIN Node Action (NACT) field in USART LIN Mode Register (FLEX\_US\_LINMR).

Example: a LIN cluster that contains a master and two slaves:

- Data transfer from the master to slave 1 and to slave 2:

NACT(master) = PUBLISH

NACT(slave 1) = SUBSCRIBE

NACT(slave 2) = SUBSCRIBE

- Data transfer from the master to slave 1 only:

NACT(master) = PUBLISH

NACT(slave 1) = SUBSCRIBE

NACT(slave 2) = IGNORE

- Data transfer from slave 1 to the master:

NACT(master) = SUBSCRIBE

NACT(slave 1) = PUBLISH

NACT(slave 2) = IGNORE

- Data transfer from slave 1 to slave 2:

NACT(master) = IGNORE

NACT(slave 1) = PUBLISH

NACT(slave 2) = SUBSCRIBE

- Data transfer from slave 2 to the master and to slave 1:

NACT(master) = SUBSCRIBE

NACT(slave 1) = SUBSCRIBE

NACT(slave 2) = PUBLISH

### 39.7.8.11 Response Data Length

The LIN response data length is the number of data fields (bytes) of the response excluding the checksum.

The response data length can either be configured by the user or be defined automatically by bits 4 and 5 of the Identifier (compatibility to LIN Specification 1.1). The user can choose between these two modes by the FLEX\_US\_LINMR.DLM bit:

- DLM = 0: The response data length is configured by the user via the FLEX\_US\_LINMR.DLC field. The response data length is equal to (DLC + 1) bytes. DLC can be programmed from 0 to 255, so the response can contain from 1 data byte up to 256 data bytes.
- DLM = 1: The response data length is defined by the Identifier (IDCHR in FLEX\_US\_LINIR) according to the table below. The FLEX\_US\_LINMR.DLC field is discarded. The response can contain 2 or 4 or 8 data bytes.

**Table 39-12.** Response Data Length if DLM = 1

| IDCHR[5] | IDCHR[4] | Response Data Length (bytes) |
|----------|----------|------------------------------|
| 0        | 0        | 2                            |
| 0        | 1        | 2                            |
| 1        | 0        | 4                            |
| 1        | 1        | 8                            |

**Figure 39-43.** Response Data Length

### 39.7.8.12 Checksum

The last field of a frame is the checksum. The checksum contains the inverted 8-bit sum with carry, over all data bytes or all data bytes and the protected identifier. Checksum calculation over the data bytes only is called classic checksum and it is used for communication with LIN 1.3 slaves. Checksum calculation over the data bytes and the protected identifier byte is called enhanced checksum and it is used for communication with LIN 2.0 slaves.

The USART can be configured to:

- Send/Check an Enhanced checksum automatically (CHKDIS = 0 & CHKTYP = 0)
- Send/Check a Classic checksum automatically (CHKDIS = 0 & CHKTYP = 1)
- Not send/check a checksum (CHKDIS = 1)

This configuration is made by the Checksum Type (CHKTYP) and Checksum Disable (CHKDIS) bits of FLEX\_US\_LINMR.

If the checksum feature is disabled, the user can send it manually all the same, by considering the checksum as a normal data byte and by adding 1 to the response data length (see section [Response Data Length](#)).

### 39.7.8.13 Frame Slot Mode

This mode is useful only for master nodes. It respects the following rule: each frame slot shall be longer than or equal to  $t_{\text{Frame\_Maximum}}$ .

If the Frame Slot mode is enabled (FSDIS = 0) and a frame transfer has been completed, the TXRDY flag is set again only after  $t_{\text{Frame\_Maximum}}$  delay, from the start of frame. So the master node cannot send a new header if the frame slot duration of the previous frame is inferior to  $t_{\text{Frame\_Maximum}}$ .

If the Frame Slot mode is disabled (FSDIS = 1) and a frame transfer has been completed, the TXRDY flag is set again immediately.

The  $t_{\text{Frame\_Maximum}}$  is calculated as follows:

If the Checksum is sent (CHKDIS = 0):

- $t_{\text{Header\_Nominal}} = 34 \times t_{\text{bit}}$
- $t_{\text{Response\_Nominal}} = 10 \times (\text{NData} + 1) \times t_{\text{bit}}$
- $t_{\text{Frame\_Maximum}} = 1.4 \times (t_{\text{Header\_Nominal}} + t_{\text{Response\_Nominal}} + 1)^{(1)}$
- $t_{\text{Frame\_Maximum}} = 1.4 \times (34 + 10 \times (\text{DLC} + 1 + 1) + 1) \times t_{\text{bit}}$
- $t_{\text{Frame\_Maximum}} = (77 + 14 \times \text{DLC}) \times t_{\text{bit}}$

If the Checksum is not sent (CHKDIS = 1):

- $t_{\text{Header\_Nominal}} = 34 \times t_{\text{bit}}$
- $t_{\text{Response\_Nominal}} = 10 \times \text{NData} \times t_{\text{bit}}$
- $t_{\text{Frame\_Maximum}} = 1.4 \times (t_{\text{Header\_Nominal}} + t_{\text{Response\_Nominal}} + 1)^{(1)}$
- $t_{\text{Frame\_Maximum}} = 1.4 \times (34 + 10 \times (\text{DLC} + 1) + 1) \times t_{\text{bit}}$
- $t_{\text{Frame\_Maximum}} = (63 + 14 \times \text{DLC}) \times t_{\text{bit}}$

Note: 1. The term “+1” leads to an integer result for  $t_{\text{Frame\_Maximum}}$  (LIN Specification 1.3).

**Figure 39-44. Frame Slot Mode**

### 39.7.8.14 LIN Errors

#### 39.7.8.14.1 Bit Error

This error is generated in master or slave node configuration, when the USART is transmitting and if the transmitted value on the Tx line is different from the value sampled on the Rx line. If a bit error is detected, the transmission is aborted at the next byte border.

This error is reported by the FLEX\_US\_CSR.LINBE flag.

**39.7.8.14.2 Inconsistent Synch Field Error**

This error is generated in slave node configuration, if the Synch Field character received is other than 0x55.

This error is reported by the FLEX\_US\_CSR.LINISFE flag.

**39.7.8.14.3 Identifier Parity Error**

This error is generated in slave node configuration, if the parity of the identifier is wrong. This error can be generated only if the parity feature is enabled (PARDIS = 0).

This error is reported by the FLEX\_US\_CSR.LINIPE flag.

**39.7.8.14.4 Checksum Error**

This error is generated in master of slave node configuration, if the received checksum is wrong. This flag can be set to 1 only if the checksum feature is enabled (CHKDIS = 0).

This error is reported by the FLEX\_US\_CSR.LINCE flag.

**39.7.8.14.5 Slave Not Responding Error**

This error is generated in master of slave node configuration, when the USART expects a response from another node (NACT = SUBSCRIBE) but no valid message appears on the bus within the time given by the maximum length of the message frame,  $t_{\text{Frame\_Maximum}}$  (see section [Frame Slot Mode](#)). This error is disabled if the USART does not expect any message (NACT = PUBLISH or NACT = IGNORE).

This error is reported by the FLEX\_US\_CSR.LINSNRE.

**39.7.8.14.6 Synch Tolerance Error**

This error is generated in slave node configuration if, after the clock synchronization procedure, it appears that the computed baud rate deviation compared to the initial baud rate is superior to the maximum tolerance FTol\_Unsynch ( $\pm 15\%$ ).

This error is reported by the FLEX\_US\_CSR.LINSTE flag.

**39.7.8.14.7 Header Timeout Error**

This error is generated in slave node configuration, if the Header is not entirely received within the time given by the maximum length of the Header,  $t_{\text{Header\_Maximum}}$ .

This error is reported by the FLEX\_US\_CSR.LINHTE flag.

**39.7.8.15 LIN Frame Handling****39.7.8.15.1 Master Node Configuration**

- Write FLEX\_US\_CR.TXEN and FLEX\_US\_CR.RXEN to enable both the transmitter and the receiver.
- Write FLEX\_US\_MR.USART\_MODE to select the LIN mode and the master node configuration.
- Write FLEX\_US\_BRGR.CD and FLEX\_US\_BRGR.FP to configure the baud rate.
- Write NACT, PARDIS, CHKDIS, CHKTYPE, DLCM, FSDIS and DLC in FLEX\_US\_LINMR to configure the frame transfer.
- Check that FLEX\_US\_CSR.TXRDY is set to 1.
- Write FLEX\_US\_LINIR.IDCHR to send the header.

What comes next depends on the NACT configuration:

- Case 1: NACT = PUBLISH, the USART sends the response.
  - Wait until FLEX\_US\_CSR.TXRDY rises.
  - Write FLEX\_US\_THR.TCHR to send a byte.
  - If all the data have not been written, repeat the two previous steps.
  - Wait until FLEX\_US\_CSR.LINTC rises.

- Check the LIN errors.
- Case 2: NACT = SUBSCRIBE, the USART receives the response.
  - Wait until FLEX\_US\_CSR.RXRDY rises.
  - Read FLEX\_US\_RHR.RCHR.
  - If all the data have not been read, repeat the two previous steps.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.
- Case 3: NACT = IGNORE, the USART is not concerned by the response.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.

**Figure 39-45. Master Node Configuration, NACT = PUBLISH**

**Figure 39-46. Master Node Configuration, NACT = SUBSCRIBE**

**Figure 39-47. Master Node Configuration, NACT = IGNORE**

### 39.7.8.15.2 Slave Node Configuration

- Write FLEX\_US\_CR.TXEN and FLEX\_US\_CR.RXEN to enable both the transmitter and the receiver.
- Write FLEX\_US\_MR.USART\_MODE to select the LIN mode and the slave node configuration.
- Write FLEX\_US\_BRGR.CD and FLEX\_US\_BRGR.FP to configure the baud rate.
- Wait until FLEX\_US\_CSR.LINID rises.
- Check LINISFE and LINPE errors.
- Read FLEX\_US\_RHR.IDCHR.
- Write NACT, PARDIS, CHKDIS, CHKTYPE, DLCM and DLC in FLEX\_US\_LINMR to configure the frame transfer.

**IMPORTANT:** If the NACT configuration for this frame is PUBLISH, FLEX\_US\_LINMR must be written with NACT = PUBLISH even if this field is already correctly configured, in order to set the TXREADY flag and the corresponding write transfer request.

What comes next depends on the NACT configuration:

- Case 1: NACT = PUBLISH, the LIN controller sends the response.
  - Wait until FLEX\_US\_CSR.TXRDY rises.
  - Write FLEX\_US\_THR.TCHR to send a byte.
  - If all the data have not been written, repeat the two previous steps.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.
- Case 2: NACT = SUBSCRIBE, the USART receives the response.
  - Wait until FLEX\_US\_CSR.RXRDY rises.
  - Read FLEX\_US\_RHR.RCHR.
  - If all the data have not been read, repeat the two previous steps.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.
- Case 3: NACT = IGNORE, the USART is not concerned by the response.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.

**Figure 39-48. Slave Node Configuration, NACT = PUBLISH****Figure 39-49. Slave Node Configuration, NACT = SUBSCRIBE****Figure 39-50. Slave Node Configuration, NACT = IGNORE**

### 39.7.8.16 LIN Frame Handling with the DMAC

The USART can be used in association with the DMAC in order to transfer data directly into/from the on- and off-chip memories without any processor intervention.

The DMAC uses the trigger flags, TXRDY and RXRDY, to write or read into the USART. The DMAC always writes in the Transmit Holding Register (FLEX\_US\_THR) and it always reads in the Receive Holding Register (FLEX\_US\_RHR). The size of the data written or read by the DMAC in the USART is always a byte.

#### 39.7.8.16.1 Master Node Configuration

The user can choose between two DMAC modes by configuring the FLEX\_US\_LINMR.PDCM bit:

- **PDCM = 1:** The LIN configuration is stored in the WRITE buffer and it is written by the DMAC in the Transmit Holding register FLEX\_US\_THR (instead of the LIN Mode register FLEX\_US\_LINMR). Because the DMAC transfer size is limited to a byte, the transfer is split into two accesses. During the first access, the NACT, PARDIS, CHKDIS, CHKTYP, DLM and FSDIS bits are written. During the second access, the 8-bit DLC field is written.

- PDCM = 0: The LIN configuration is not stored in the WRITE buffer and it must be written by the user in FLEX\_US\_LINMR.

The WRITE buffer also contains the Identifier and the data, if the USART sends the response (NACT = PUBLISH).

The READ buffer contains the data if the USART receives the response (NACT = SUBSCRIBE).

**Figure 39-51. Master Node with DMAC (PDCM = 1)**

**Figure 39-52. Master Node with DMAC (PDCM = 0)**

### 39.7.8.16.2 Slave Node Configuration

In this configuration, the DMAC transfers only the data. The identifier must be read by the user in the LIN Identifier Register (FLEX\_US\_LINIR). The LIN mode must be written by the user in FLEX\_US\_LINMR.

The WRITE buffer contains the data if the USART sends the response (NACT = PUBLISH).

The READ buffer contains the data if the USART receives the response (NACT = SUBSCRIBE).

**Figure 39-53. Slave Node with DMAC**

### 39.7.8.17 Wakeup Request

Any node in a sleeping LIN cluster may request a wakeup.

In the LIN 2.0 specification, the wakeup request is issued by forcing the bus to the dominant state from 250  $\mu$ s to 5 ms. For this, it is necessary to send the character 0xF0 in order to impose five successive dominant bits. Whatever the baud rate is, this character respects the specified timings.

- Baud rate min = 1 kbit/s  $\rightarrow t_{bit} = 1 \text{ ms} \rightarrow 5 t_{bit} = 5 \text{ ms}$
- Baud rate max = 20 kbit/s  $\rightarrow t_{bit} = 50 \mu\text{s} \rightarrow 5 t_{bit} = 250 \mu\text{s}$

In the LIN 1.3 specification, the wakeup request should be generated with the character 0x80 in order to impose eight successive dominant bits.

Using the FLEX\_US\_LINMR.WKUPTYP bit, the user can choose to send either a LIN 2.0 wakeup request (WKUPTYP = 0) or a LIN 1.3 wakeup request (WKUPTYP = 1).

A wakeup request is transmitted by writing the FLEX\_US\_CR.LINWKUP bit to 1. Once the transfer is completed, the LINTC flag is asserted in the Status Register (FLEX\_US\_CSR). It is cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit.

### 39.7.8.18 Bus Idle Timeout

If the LIN bus is inactive for a certain duration, the slave nodes shall automatically enter in Sleep mode. In the LIN 2.0 specification, this timeout is defined as 4 seconds. In the LIN 1.3 specification, it is defined as 25,000  $t_{bit}$ .

In slave Node configuration, the receiver timeout detects an idle condition on the RXD line. When a timeout is detected, the FLEX\_US\_CSR.TIMEOUT bit rises and can generate an interrupt, thus indicating to the driver to go into Sleep mode.

The timeout delay period (during which the receiver waits for a new character) is programmed in the FLEX\_US\_RTOR.TO field. If a zero is written to the TO field, the Receiver Timeout is disabled and no timeout is detected. The FLEX\_US\_CSR.TIMEOUT bit remains at 0. Otherwise, the receiver loads a 17-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the FLEX\_US\_CSR.TIMEOUT bit rises.

If STTTO is performed, the counter clock is stopped until a first character is received.

If RETTO is performed, the counter starts counting down immediately from the value TO.

**Table 39-13. Receiver Timeout Programming**

| LIN Specification | Baud Rate    | Timeout period | TO     |
|-------------------|--------------|----------------|--------|
| 2.0               | 1,000 bit/s  | 4s             | 4,000  |
|                   | 2,400 bit/s  |                | 9,600  |
|                   | 9,600 bit/s  |                | 38,400 |
|                   | 19,200 bit/s |                | 76,800 |
|                   | 20,000 bit/s |                | 80,000 |

.....continued

| LIN Specification | Baud Rate | Timeout period   | TO     |
|-------------------|-----------|------------------|--------|
| 1.3               | –         | 25,000 $t_{bit}$ | 25,000 |

### 39.7.9 LON Mode

The LON mode provides connectivity to the local operating network (LON).

The LON standard covers all seven layers of the OSI (Open Systems Interconnect) reference model from the physical interfaces such as wired, power line, RF, and IP to the application layer and all layers in between.

The LON mode enables the transmission and reception of Physical Protocol Data Unit (PPDU) frames with minimum intervention from the microprocessor.

**Figure 39-54.** LON Protocol Layering

The USART configured in LON mode is a full-layer 2 implementation including standard timings handling, framing (transmit and receive PPDU frames), backlog estimation and other features. At the frame encoding/decoding level, differential Manchester encoding is used (also known as CDP). When configured in LON mode, there is no embedded digital line filter, thus the optimal usage is node-to-node communication.

#### 39.7.9.1 Mode of Operation

To configure the USART to act as a LON node, the USART\_MODE field of the USART Mode Register (FLEX\_US\_MR) must be set to 0x9.

To avoid unpredictable behavior, any change of the LON node configuration must be preceded by a software reset of the transmitter and the receiver (except the initial node configuration after a hardware reset) and followed by a transmitter/receiver enable. See section [Receiver and Transmitter Control](#).

#### 39.7.9.2 Receiver and Transmitter Control

See section [Receiver and Transmitter Control](#).

### 39.7.9.3 Character Transmission

A LON frame is made up of a preamble, a data field (up to 256 bytes) and a 16-bit CRC field. The preamble and CRC fields are automatically generated and the LON node starts the transmission algorithm on a write to LON\_L2HDR. See section [Sending a Frame](#).

### 39.7.9.4 Character Reception

When receiving a LON frame, the Receive Holding Register (FLEX\_US\_RHR) is updated upon completed character reception and the RXRDY bit in the Status register rises. If a character is completed while the RXRDY bit is set, the OVRE (Overrun Error) bit is set. The LON preamble field is only used for synchronization, therefore only the Data and CRC fields are transmitted to the Receive Holding Register (FLEX\_US\_RHR). See section [Sending a Frame](#).

### 39.7.9.5 LON Frame

Figure 39-55. LON Framing

#### 39.7.9.5.1 Encoding / Decoding

The USART configured in LON mode encodes transmitted data and decodes received data using differential Manchester encoding. In differential Manchester encoding, a '1' bit is indicated by making the first half of the signal equal to the last half of the previous bit's signal (no transition at the start of the bit-time). A '0' bit is indicated by making the first half of the signal opposite to the last half of the previous bit's signal (a zero bit is indicated by a transition at the beginning of the bit-time). As is the case with normal Manchester encoding, missing transition at the middle of bit-time represents a Manchester code violation.

The FLEX\_US\_MAN.RXIDLEV bit informs the USART of the receiver line idle state value (receiver line inactive) thus ensuring higher reliability of preamble synchronization. By default, RXIDLEV is set (receiver line is at level 1 when there is no activity).

Differential Manchester encoding is polarity-insensitive.

Figure 39-56. LON PPDU

#### 39.7.9.5.2 Preamble Transmission

Each LON frame begins with a preamble of variable length which consists of a bit-sync field and a byte-sync field. The LONPL field of the USART LON Preamble Register (FLEX\_US\_LONPR) defines the preamble length. Note that a preamble length of '0' is not allowed.

The LON implementation allows two different preamble patterns ALL\_ONE and ALL\_ZERO which can be configured through the TX\_PL field of the USART Manchester Configuration Register (FLEX\_US\_MAN). The following figure illustrates and defines the valid patterns.

Other preamble patterns are not supported.

**Figure 39-57. Preamble Patterns**

### 39.7.9.5.3 Preamble Reception

LON received frames begin with a preamble of variable length. The receiving algorithm does not check the preamble length, although a minimum of length of 4 bits is required for the receiving algorithm to consider the received preamble as valid.

As is the case with LON preamble transmission, two preamble patterns (ALL\_ONE and ALL\_ZERO) are allowed and can be configured through the RX\_PL field of the USART Manchester Configuration Register (FLEX\_US\_MAN). The above figure illustrates and defines the valid patterns.

Other preamble patterns are not supported.

### 39.7.9.5.4 Header Transmission

Each LON frame, after sending the preamble, starts with the frame header also called L2HDR according to CEA-709 specification. This header consists of the priority bit, the alternative path bit and the backlog increment. It is the first data to be sent.

In LON mode, the transmitting algorithm starts when FLEX\_US\_LONL2HDR is written (it is the first data to send).

### 39.7.9.5.5 Header Reception

Each LON frame, after receiving the preamble, receives the frame header also called L2HDR according to CEA-709 specification. This header consists of the priority bit, the alternative path bit, and the backlog increment.

The frame header is the first received data and the RXRDY bit rises as soon as the frame header has been received and stored in the Receive Holding Register (FLEX\_US\_RHR).

### 39.7.9.5.6 Data

Data are sent/received serially after the preamble transmission/reception. Data can be either sent/received MSB first or LSB first depending on the MSBF bit value in the USART Mode Register (FLEX\_US\_MR).

### 39.7.9.5.7 CRC

The two last bytes of LON frames are dedicated to CRC.

When transmitting, the CRC of the frame is automatically generated and sent when expected.

When receiving frames, the CRC is automatically checked and the FLEX\_US\_CSR.LCRCE flag is set if the calculated CRC does not match the received one. Note that the two received CRC bytes are seen as two additional data from the user point of view.

### 39.7.9.5.8 End Of Frame

The USART configured in LON mode terminates the frame with a three  $t_{bit}$  long Manchester code violation. After sending the last CRC bit, it maintains the data transitionless during three bit periods.

### 39.7.9.6 LON Operating Modes

#### 39.7.9.6.1 Transmitting/Receiving Modules

According to the LON node configuration and LON network state, the transmitting module is activated if a transmission request has been made and access to the LON bus granted. It returns to idle state once the transmission ends.

According to the LON node configuration and LON network state, the receiving module is activated if a valid preamble is detected and the transmitting module is not activated.

#### 39.7.9.6.2 comm\_type

In CEA-709 standard 2, communication configurations are defined and configurable through the `comm_type` variable. The `comm_type` variable value can be set in the USART LON Mode Register (FLEX\_US\_LONMR) through the COMMT bit. The selection of the `comm_type` determines the MAC behavior in the following ways:

- `comm_type = 1`:
  - An indeterminate time is defined during the Beta 1 period in which all transitions on the channel are ignored (see figure below).
  - The MAC sublayer ignores collisions occurring during the first 25% of the transmitted preamble. Optionally (according to the FLEX\_US\_LONMR.CDTAIL bit), it ignores collisions reported following the transmission of the CRC but prior to the end of transmission.
  - If a collision is detected during preamble transmission, the MAC sublayer can terminate the packet if so configured according to the FLEX\_US\_LONMR.TCOL bit. Collisions detected after the preamble have been sent do not terminate transmission.
- `comm_type = 2`:
  - No indeterminate time is defined at the MAC sublayer.
  - The MAC sublayer always terminates the packet upon notification of a collision.

**Figure 39-58.** LON Indeterminate Time

#### 39.7.9.6.3 Collision Detection

As an option of the CEA-709 standard collision detection is supported through an active low Collision Detect (CD) input from the transceiver.

The Collision Detection source can be either external (see section [I/O Lines Description](#)) or internal. The collision detection source selection is defined through the LCDS bit in the USART LON Mode Register (FLEX\_US\_LONMR).

The Collision Detection feature can be activated through the COLDET bit of the USART LON Mode Register. If the collision detection feature is enabled and CD signal goes low for at least half  $t_{bit}$  period then a collision is detected and reported as defined in section [comm\\_type](#).

#### 39.7.9.6.4 Collision Detection Mode

As defined in section [comm\\_type](#), if `comm_type = 1` the LON node can be configured to either not terminate transmission upon collision notification during preamble transmission or terminate transmission.

The FLEX\_US\_LONMR.TCOL bit allows to decide whether to terminate transmission or not upon collision notification during preamble transmission.

### 39.7.9.6.5 Collision Detection after CRC

As defined in section [comm\\_type](#), if `comm_type = 1` the LON node can be configured to ignore collisions reported after the CRC has been sent but prior to the end of the frame.

The `FLEX_US_LONMR.CDTAIL` bit can be used to decide whether such collision notifications must be considered or not.

### 39.7.9.6.6 Random Number Generation

The Predictive p-persistent CSMA algorithm defined in the CEA-709.1 Standard is based on a random number generation.

This random number is automatically generated by an internal algorithm.

In addition, a USART IC DIFF Register (`FLEX_US_ICDIFF`) is available to avoid that two same chips with the same software generate the same random number after reset. The value of this register is used by the internal algorithm to generate the random number. Therefore, putting a different value here for each chip ensures that the random number generated after a reset at the same time will not be the same. It is recommended to put the chip ID code here.

### 39.7.9.7 LON Node Backlog Estimation

As defined in CEA-709, the LON node maintains its own backlog estimation. The node backlog estimation is initially set to one, will always be greater than 1 and will never exceed 63. If the node backlog estimation exceeds the maximum backlog value, the backlog value is set to 63 and a backlog overflow error flag is set (LBLOVFE flag).

The node backlog estimation is incremented each time a frame is sent or received successfully. The increment to the backlog is encoded into the link layer header, and represents the number of messages that the packet shall cause to be generated upon reception.

The backlog decrements under one of the following conditions:

- On waiting to transmit: If Wbase randomizing slots go by without channel activity.
- On receive: If a packet is received with a backlog increment of '0'.
- On transmit: If a packet is transmitted with a backlog increment of '0'.
- On idle: If a packet cycle time expires without channel activity.

#### 39.7.9.7.1 Optional Collision Detection Feature And Backlog Estimation

Each time a frame is transmitted and a collision occurred, the backlog is incremented by 1. In this case, the backlog increment encoded in the link layer is ignored.

### 39.7.9.8 LON Timings

Figure 39-59. LON Timings

#### 39.7.9.8.1 Beta2

A node wishing to transmit generates a random delay  $T$ . This delay is an integer number of randomizing slots of duration  $\text{Beta2}$ .

The  $\text{beta2}$  length (in  $t_{\text{bit}}$ ) is configurable through `FLEX_US_FIDI`. Note that a length of '0' is not allowed.

**39.7.9.8.2 Beta1 Tx/Rx**

Beta1 is the period immediately following the end of a packet cycle (see the above figure). A node attempting to transmit monitors the state of the channel, and if it detects no transmission during the Beta1 period, it determines the channel to be idle.

The Beta1 value is different depending on the previous packet type (received packet or transmitted packet).

Beta1Rx and Beta1Tx length can be configured respectively through the USART LON Beta1 Rx Register (FLEX\_US\_LONB1RX) and the USART LON Beta1 Tx Register (FLEX\_US\_LONB1TX). Note that a length of '0' is not allowed.

**39.7.9.8.3 Pcycle Timer**

The packet cycle timer is reset to its initial value whenever the backlog is changed. It is started (begins counting down at its current value) whenever the MAC layer becomes idle. An idle MAC layer is defined as:

- Not receiving
- Not transmitting,
- Not waiting to transmit,
- Not timing Beta1,
- Not waiting for priority slots, and not waiting for the first Wbase randomizing window to complete.

On transition from idle to either transmit or receive, the packet cycle timer is halted.

The pcycle timer value can be configured in FLEX\_US\_TTGR. Note that '0' value is not allowed.

**39.7.9.8.4 Wbase**

The wbase timer represents the base windows size. Its duration, derived from Beta2, equals 16 Beta2 slots.

**39.7.9.8.5 Priority Slots**

On a channel by channel basis, the protocol supports optional priority. Priority slots, if any, follow immediately after the Beta1 period that follows the transmission of a packet (see the above figure). The number of priority slots per channel ranges from 0 to 127.

The number of priority slots in the LON network configuration is defined through the PSNB field of the USART LON Priority Register (FLEX\_US\_LONPRIO). And the priority slot affected to the LON node, if any, is defined through the FLEX\_US\_LONPRIO.NPS field.

**39.7.9.8.6 Indeterminate Time**

See section [comm\\_type](#).

Like Beta1, the IDT value is different depending on whether the previous frame was transmitted or received.

IDTRx and IDTTx can be configured respectively through the USART LON IDT Rx Register (FLEX\_US\_LONIDTRX) and the USART LON IDT Tx Register (FLEX\_US\_LONIDTTX).

**39.7.9.8.7 End of Frame Condition**

The USART configured in LON mode terminates the frame with a three  $t_{bit}$  long Manchester code violation. After sending the last CRC bit, it maintains the data transitionless during three bit periods.

While receiving data, the USART configured in LON mode detects an end of frame condition after a  $t_{eof}$  transitionless Manchester code violation. The EOFS field in the USART LON Mode Register can configure  $t_{eof}$ .

### 39.7.9.9 LON Errors

All these flags can be read in the LON Channel Status Register (FLEX\_US\_CSR) and generate interrupts if configured in the LON Interrupt Enable Register (FLEX\_US\_IER).

These flags can be reset by writing a one to the FLEX\_US\_CR.RSTSTA bit.

#### 39.7.9.9.1 Underrun Error

If the USART is in LON mode and if a character is sent while the Transmit Holding Register (FLEX\_US\_THR) is empty, the UNRE bit flag is set.

#### 39.7.9.9.2 Collision Detection

The LCOL flag is set whenever a valid collision has been detected and the LON node is configured to report it (see section [Collision Detection](#)).

#### 39.7.9.9.3 LON Frame Early Termination

The LFET flag is set whenever a LON frame has been terminated early due to collision detection.

#### 39.7.9.9.4 Reception Error

The LCRCE flag is set if the received frame has an erroneous CRC and the flag LSFE is set if the received frame is too short (LON frames must be at least 8 bytes long).

These flags can be read in FLEX\_US\_CSR.

#### 39.7.9.9.5 Backlog Overflow

The LBLOVFE flag is set if the LON node backlog estimation goes over 63, which is the maximum backlog value.

### 39.7.9.10 Drift Compensation

It may happen that while receiving a frame, the baud rate used by the sender is not exactly the one expected, due to sender clock drifting for instance. In such case, the hardware drift compensation algorithm is used to recover up to 16% clock drift (expected baud rate  $\pm 16\%$  is supported).

Drift compensation is available only in 16X Oversampling mode. To enable the hardware system, the DRIFT bit of the FLEX\_US\_MAN register must be set. If the RXD edge is between one and three 16X clock cycles away from the expected edge, then the period is shortened or lengthened accordingly to center the RXD edge.

Drift compensation hardware feature allows up to 16% clock drift to be handled, provided system clock is fast enough compared to the selected baud rate.

**Figure 39-60. Bit Resynchronization**

### 39.7.9.11 LON Frame Handling

#### 39.7.9.11.1 Sending a Frame

1. Write FLEX\_US\_CR.TXEN and FLEX\_US\_CR.RXEN to enable both the transmitter and the receiver.

2. Write FLEX\_US\_MR.USART\_MODE to select the LON mode configuration.
3. Write FLEX\_US\_BRGR.CD and FLEX\_US\_BRGR.FP to configure the baud rate.
4. Write COMMT, COLDET, TCOL, CDTAIL, RDMNBM and DMAM in FLEX\_US\_LONMR to configure the LON operating mode.
5. Write BETA2, BETA1TX, BETA1RX, PCYCLE, PSNB, NPS, IDTTX and ITDRX respectively in FLEX\_US\_FIDI, FLEX\_US\_LONB1TX, FLEX\_US\_LONB1RX, FLEX\_US\_TTGR, FLEX\_US\_LONPRIO, FLEX\_US\_LONIDTTX and FLEX\_US\_LONIDTRX to set the LON network configuration.
6. Write FLEX\_US\_MAN.TX\_PL to select the preamble pattern to use.
7. Write LONPL and LONDL in FLEX\_US\_LONPR and FLEX\_US\_LONDL to set the frame transfer.
8. Check that FLEX\_US\_CSR.TXRDY is set to 1.
9. Write FLEX\_US\_LONL2HDR to send the header.
10. Wait until FLEX\_US\_CSR.TXRDY rises.
11. Write FLEX\_US\_THR.TCHR to send a byte.
12. If all the data have not been written, repeat the two previous steps.
13. Wait until FLEX\_US\_CSR.LTXD rises.
14. Check the LON errors.

**Figure 39-61. Tx Frame**

### 39.7.9.11.2 Receiving a Frame

1. Write FLEX\_US\_CR.TXEN and FLEX\_US\_CR.RXEN to enable both the transmitter and the receiver.
2. Write FLEX\_US\_MR.USART\_MODE to select the LON mode configuration.
3. Write FLEX\_US\_BRGR.CD and FLEX\_US\_BRGR.FP to configure the baud rate.
4. Write COMMT, COLDET, TCOL, CDTAIL, RDMNBM and DMAM in FLEX\_US\_LONMR to configure the LON operating mode.
5. Write BETA2, BETA1TX, BETA1RX, PCYCLE, PSNB, NPS, IDTTX and ITDRX respectively in FLEX\_US\_FIDI, FLEX\_US\_LONB1TX, FLEX\_US\_LONB1RX, FLEX\_US\_TTGR, FLEX\_US\_LONPRIO, FLEX\_US\_LONIDTTX and FLEX\_US\_LONIDTRX to set the LON network configuration.
6. Write FLEX\_US\_MAN.RXIDLEV and FLEX\_US\_MAN.RX\_PL to indicate the receiver line value and select the preamble pattern to use.
7. Wait until FLEX\_US\_CSR.RXRDY rises.
8. Read FLEX\_US\_RHR.RCHR.
9. If all the data and the two CRC bytes have not been read, repeat the two previous steps.
10. Wait until FLEX\_US\_CSR.LRXD rises.
11. Check the LON errors.

**Figure 39-62. Rx Frame**

### 39.7.9.12 LON Frame Handling with the Peripheral DMA Controller

The USART can be used in association with the DMA Controller in order to transfer data directly into/from the on- and off-chip memories without any processor intervention.

The DMA uses the trigger flags, TXRDY and RXRDY, to write or read into the USART. The DMA always writes in the Transmit Holding Register (FLEX\_US\_THR) and it always reads in the Receive Holding Register (FLEX\_US\_RHR). The size of the data written or read by the DMA in the USART is always a byte.

#### 39.7.9.12.1 Configuration

The user can choose between two DMA modes by the DMAM bit in the LON Mode register

(FLEX\_US\_LONMR):

- DMAM = 1: The LON frame data length (DATAL) is stored in the WRITE buffer and it is written by the DMA in the Transmit Holding register FLEX\_US\_THR (instead of the LON Data Length register FLEX\_US\_LONDL).
- DMAM = 0: The LON frame data length (DATAL) is not stored in the WRITE buffer and it must be written by the user in the LON Data Length Register (FLEX\_US\_LONDL).

In both DMA modes, L2HDR is considered as a data and its value must be stored in the WRITE buffer as the first data to write.

**Figure 39-63. DMAM = 1**

**Figure 39-64. DMAM = 0**

### 39.7.9.12.2 DMA and Collision Detection

As explained in section [comm\\_type](#), depending on LON configuration the transmission may be terminated early upon collision notification which means that the DMA transfer may be stopped before its end.

In case of early end of transmission due to collision detection, the USART in LON mode acts as follows:

- Send the end of frame trigger.
- Hold down TXRDY, thus avoiding any additional DMA transfer.
- Set the LTXD, LCOL and LFET flags in FLEX\_US\_CSR.
- Wait for the application to reconfigure the DMA.
- Wait until the LCOL and LFET flags are cleared through the FLEX\_US\_CR.RSTSTA bit (it will release the TXRDY signal).

**Figure 39-65. DMA, Collision and Early Frame Termination**

## 39.7.10 Test Modes

The USART can be programmed to operate in three different test modes. The internal loopback capability allows on-board diagnostics. In Loopback mode, the USART interface pins are disconnected or not and reconfigured for loopback internally or externally.

### 39.7.10.1 Normal Mode

Normal mode connects the RXD pin on the receiver input and the transmitter output on the TXD pin.

**Figure 39-66.** Normal Mode Configuration

### 39.7.10.2 Automatic Echo Mode

Automatic Echo mode allows bit-by-bit retransmission. When a bit is received on the RXD pin, it is sent to the TXD pin, as shown in the following figure. Programming the transmitter has no effect on the TXD pin. The RXD pin is still connected to the receiver input, thus the receiver remains active.

**Figure 39-67.** Automatic Echo Mode Configuration

### 39.7.10.3 Local Loopback Mode

Local Loopback mode connects the output of the transmitter directly to the input of the receiver, as shown in the following figure. The TXD and RXD pins are not used. The RXD pin has no effect on the receiver and the TXD pin is continuously driven high, as in idle state.

**Figure 39-68.** Local Loopback Mode Configuration

### 39.7.10.4 Remote Loopback Mode

Remote Loopback mode directly connects the RXD pin to the TXD pin, as shown in the following figure. The transmitter and the receiver are disabled and have no effect. This mode allows bit-by-bit retransmission.

**Figure 39-69.** Remote Loopback Mode Configuration

## 39.7.11 USART FIFOs

### 39.7.11.1 Overview

The USART includes two FIFOs which can be enabled/disabled using FLEX\_US\_CR.FIFOEN/FIFODIS. Both the transmitter and the receiver must be disabled before enabling or disabling the FIFOs, using the FLEX\_US\_CR.TXDIS/RXDIS bits.

Writing FLEX\_US\_CR.FIFOEN to '1' enables a 16-data Transmit FIFO and a 16-data Receive FIFO.

It is possible to write or to read single or multiple data in the same access to FLEX\_US\_THR/RHR. See sections [USART Single Data Mode](#) and [USART Multiple Data Mode](#).

**Figure 39-70.** FIFOs Block Diagram

### 39.7.11.2 Sending Data with FIFO Enabled

When the Transmit FIFO is enabled, write access to FLEX\_US\_THR loads the Transmit FIFO.

The FIFO level is provided in FLEX\_US\_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor FLEX\_US\_CSR.TXRDY and the data can be successively written in FLEX\_US\_THR.

If the FIFO cannot accept the data due to insufficient space, wait for the TXRDY flag to be set before writing the data in FLEX\_US\_THR.

When the space in the FIFO allows only a portion of the data to be written, the TXRDY flag must be monitored before writing the remaining data.

**Figure 39-71. Sending Data with FIFO Enabled****39.7.11.3 Receiving Data with FIFO Enabled**

When the Receive FIFO is enabled, FLEX\_US\_RHR access reads the FIFO.

When data are present in the Receive FIFO (RXRDY flag set to '1'), the exact number of data can be checked with FLEX\_US\_FLR.RXFL. All the data can be read successively in FLEX\_US\_RHR without checking the RXRDY flag between each access.

**Figure 39-72.** Receiving Data with FIFO Enabled

#### 39.7.11.4 Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using FLEX\_US\_CR.TXFCLR/RXFCLR.

#### 39.7.11.5 TXEMPTY, TXRDY and RXRDY Behavior

FLEX\_US\_CSR.TXEMPTY, FLEX\_US\_CSR.TXRDY and FLEX\_US\_CSR.RXRDY flags display a specific behavior when FIFOs are enabled.

The TXEMPTY flag is cleared as long as there are characters in the Transmit FIFO or in the internal shift register. TXEMPTY is set when there are no characters in the Transmit FIFO and in the internal shift register.

TXRDY indicates if a data can be written in the Transmit FIFO. Thus the TXRDY flag is set as long as the Transmit FIFO can accept new data. See figure [TXRDY in Single Data Mode and TXRDYM = 0](#).

RXRDY indicates if an unread data is present in the Receive FIFO. Thus the RXRDY flag is set as soon as one unread data is in the Receive FIFO. See figure [RXRDY in Single Data Mode and RXRDYM = 0](#) below.

TXRDY and RXRDY behavior can be modified using the TXRDYM and RXRDYM fields in the USART FIFO Mode Register (FLEX\_US\_FMR) to reduce the number of accesses to FLEX\_US\_RHR/THR. However, for some configurations, the following constraints apply:

- If FLEX\_US\_MR.MODE9 is set, FLEX\_US\_FMR.TXRDYM/RXRDYM must be cleared.
- If FLEX\_US\_MR.USART\_MODE is set to either LON\_MODE, LIN\_MASTER or LIN\_SLAVE, FLEX\_US\_FMR.TXRDYM/RXRDYM must be cleared.

See USART FIFO Mode Register for the FIFO configuration.

**Figure 39-73.** TXRDY in Single Data Mode and TXRDYM = 0**Figure 39-74.** RXRDY in Single Data Mode and RXRDYM = 0

### 39.7.11.6 USART Single Data Mode

In Single Data mode, only one data is written every time FLEX\_US\_THR is accessed, and only one data is read every time FLEX\_US\_RHR is accessed.

When FLEX\_US\_FMR.TXRDYM = 0, the Transmit FIFO operates in Single Data mode.

When FLEX\_US\_FMR.RXRDYM = 0, the Receive FIFO operates in Single Data mode.

If FLEX\_US\_MR.MODE9 is set, or if FLEX\_US\_MR.USART\_MODE is set to either LON\_MODE, LIN\_MASTER or LIN\_SLAVE, the FIFOs must operate in Single Data mode.

See [USART Receive Holding Register \(FLEX\\_US\\_RHR\)](#) and [USART Transmit Holding Register \(FLEX\\_US\\_THR\)](#).

#### 39.7.11.6.1 DMAC

The DMAC transfer type must be configured in bytes or halfwords when FIFOs operate in Single Data mode (the same applies when FIFOs are disabled).

### 39.7.11.7 USART Multiple Data Mode

Multiple Data mode minimizes the number of accesses by concatenating the data to send/read in one access.

When FLEX\_US\_FMR.TXRDYM > 0, the Transmit FIFO operates in Multiple Data mode.

When FLEX\_US\_FMR.RXRDYM > 0, the Receive FIFO operates in Multiple Data mode.

However, Multiple Data mode cannot be used for the following configurations:

- If FLEX\_US\_MR.MODE9 is set
- If FLEX\_US\_MR.USART\_MODE is set to either LON\_MODE, LIN\_MASTER or LIN\_SLAVE

In Multiple Data mode, it is possible to write/read up to four data in one FLEX\_US\_THR/FLEX\_US\_RHR access.

The number of data to write/read is defined by the size of the register access. If the access is a byte-size register access, only one data is written/read, if the access is a halfword size register access, then two data are written/read and, finally, if the access is a word-size register access, four data are written/read.

Written/read data are always right-aligned, as described in sections [USART Receive Holding Register \(FIFO Multi Data\)](#) and [USART Transmit Holding Register \(FIFO Multi Data\)](#).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six FLEX\_US\_THR-byte write accesses
- three FLEX\_US\_THR-halfword write accesses
- one FLEX\_US\_THR word write access and one FLEX\_US\_THR halfword write access

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six FLEX\_US\_RHR-byte read accesses
- three FLEX\_US\_RHR-halfword read accesses
- one FLEX\_US\_RHR-word read access and one FLEX\_US\_RHR-halfword read access

#### 39.7.11.7.1 TXRDY and RXRDY Configuration

In Multiple Data mode, it is possible to write one or more data in the same FLEX\_US\_THR/FLEX\_US\_RHR access. The TXRDY flag indicates if one or more data can be written in the FIFO depending on the configuration of FLEX\_US\_FMR.TXRDYM/RXRDYM.

As an example, if four data are written each time in FLEX\_US\_THR, it is useful to configure the TXRDYM field to the value '2' so that the TXRDY flag is at '1' only when at least four data can be written in the Transmit FIFO.

In the same way, if four data are read each time in FLEX\_US\_RHR, it is useful to configure the RXRDYM field to the value '2' so that the RXRDY flag is at '1' only when at least four unread data are in the Receive FIFO.

#### 39.7.11.7.2 DMAC

When FIFOs operate in Multiple Data mode, the DMAC transfer type must be configured in byte, halfword or word depending on the FLEX\_US\_FMR.TXRDYM/RXRDYM settings.

### 39.7.11.8 Transmit FIFO Lock

- LIN Mode:

If a frame is aborted using the Abort LIN Transmission bit (FLEX\_US\_CR.LINABT), a lock is set on the Transmit FIFO, preventing any new frame from being sent until it is cleared. This allows clearing the FIFO if needed, resetting DMAC channels, etc., without any risk.

- LON Mode:

If a frame is terminated early due to collision, a lock is set on the Transmit FIFO preventing any new frame from being sent until it is cleared. This allows clearing the FIFO if needed, resetting DMAC channels, etc., without any risk.

The TXFLOCK bit in the USART FIFO Event Status Register (FLEX\_US\_FESR) is used to check the state of the Transmit FIFO lock.

The Transmit FIFO lock can be cleared by setting FLEX\_US\_CR.TXFLCLR to '1'.

### 39.7.11.9 FIFO Pointer Error

A FIFO overflow is reported in FLEX\_US\_FESR.

If the Transmit FIFO is full and a write access is performed on FLEX\_US\_THR, it generates a Transmit FIFO pointer error and sets FLEX\_US\_FESR.TXFPTEF.

In Multiple Data mode, if the number of data written in FLEX\_US\_THR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO pointer error is generated and FLEX\_US\_FESR.TXFPTEF is set.

A FIFO underflow is reported in FLEX\_US\_FESR.

In Multiple Data mode, if the number of data read in FLEX\_US\_RHR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO pointer error is generated and FLEX\_US\_FESR.RXFPTEF is set.

No pointer error occurs if the FIFO state/level is checked before writing/reading in FLEX\_US\_THR/ FLEX\_US\_RHR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When a pointer error occurs, other FIFO flags may not behave as expected; their states should be ignored.

If a Transmit pointer error occurs, a transmitter reset must be performed using FLEX\_US\_CR.RSTTX. If a Receive pointer error occurs, a receiver reset must be performed using FLEX\_US\_CR.RSTRX.

### 39.7.11.10 FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using the field FLEX\_US\_FMR.TXFTHRES. Each time the Transmit FIFO level goes from 'above threshold' to 'equal to or below threshold', the flag FLEX\_US\_FESR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field FLEX\_US\_FMR.RXFTHRES. Each time the Receive FIFO level goes from 'below threshold' to 'equal to or above threshold', the flag FLEX\_US\_FESR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The Receive FIFO threshold 2 can be set using the field FLEX\_US\_FMR.RXFTHRES2. Each time the Receive FIFO level goes from 'above threshold 2' to 'equal to or below threshold 2', the flag FLEX\_US\_FESR.RXFTHF2 is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF, RXFTHF and RXTHF2 flags can be configured to generate an interrupt using FLEX\_US\_FIER and FLEX\_US\_FIDR.

### 39.7.11.11 FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through FLEX\_US\_FIER and FLEX\_US\_FIDR.

FIFO flags state can be read in FLEX\_US\_FESR. They are cleared by writing FLEX\_US\_CR.RSTSTA to '1'.

### 39.7.12 USART Register Write Protection

The FLEXCOM operating mode (FLEX\_MR.OPMODE) must be set to FLEX\_MR\_OPMODE\_USART to enable access to the write protection registers.

To prevent any single software error from corrupting USART behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable) bit in the [USART Write Protection Mode Register \(FLEX\\_US\\_WPMR\)](#).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the [USART Write Protection Status Register \(FLEX\\_US\\_WPSR\)](#) is set and the Write Protection Violation Source (WPVSR) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading FLEX\_US\_WPSR.

The following registers can be write-protected when WPEN is set:

- USART Mode Register
- USART Baud Rate Generator Register
- USART Receiver Timeout Register
- USART Transmitter Timeguard Register
- USART FI DI RATIO Register
- USART IrDA FILTER Register
- USART Manchester Configuration Register
- USART LON Mode Register
- USART LON Beta1 Tx Register
- USART LON Beta1 Rx Register
- USART LON Priority Register
- USART LON IDT Tx Register
- USART LON IDT Rx Register
- USART IC DIFF Register
- USART Comparison Register

## 39.8 SPI Functional Description

### 39.8.1 Modes of Operation

The SPI operates in Master mode or in Slave mode.

- The SPI operates in Master mode by writing a 1 to the MSTR bit in the SPI Mode Register (FLEX\_SPI\_MR):
  - The pins NPCS0 to NPCS3 are all configured as outputs.
  - The SPCK pin is driven.
  - The MISO line is wired on the receiver input.
  - The MOSI line is driven as an output by the transmitter.
- The SPI operates in Slave mode if the MSTR bit in FLEX\_SPI\_MR is written to 0:
  - The MISO line is driven by the transmitter output.
  - The MOSI line is wired on the receiver input.
  - The SPCK pin is driven by the transmitter to synchronize the receiver.
  - The NPCS0 pin becomes an input, and is used as a slave select signal (NSS).

- Pins NPCS1 to NPCS3 are not driven and can be used for other purposes.

The data transfers are identically programmable for both modes of operation. The bit rate generator is activated only in Master mode.

### 39.8.2 Data Transfer

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the SPI Chip Select Register (FLEX\_SPI\_CSR). The clock phase is programmed with the NCPHA bit. These two parameters determine the edges of the clock signal on which data are driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Consequently, a master/slave pair must use the same parameter pair values to communicate. If multiple slaves are connected and require different configurations, the master must reconfigure itself each time it needs to communicate with a different slave.

The following table shows the four modes and corresponding parameter settings.

**Table 39-14.** SPI Bus Protocol Mode

| SPI Mode | CPOL | NCPHA | Shift SPCK Edge | Capture SPCK Edge | SPCK Inactive Level |
|----------|------|-------|-----------------|-------------------|---------------------|
| 0        | 0    | 1     | Falling         | Rising            | Low                 |
| 1        | 0    | 0     | Rising          | Falling           | Low                 |
| 2        | 1    | 1     | Rising          | Falling           | High                |
| 3        | 1    | 0     | Falling         | Rising            | High                |

The following figures show examples of data transfers.

**Figure 39-75.** SPI Transfer Format (NCPHA = 1, 8 bits per transfer example)

**Figure 39-76. SPI Transfer Format (NCPHA = 0, 8 bits per transfer example)**

### 39.8.3 Master Mode Operations

When configured in Master mode, the SPI operates on the clock generated by the internal programmable bit rate generator. It fully controls the data transfers to and from the slave(s) connected to the SPI bus. The SPI drives the chip select line to the slave and the serial clock signal (SPCK).

The SPI features two holding registers, the Transmit Data Register (FLEX\_SPI\_TDR) and the Receive Data Register (FLEX\_SPI\_RDR), and a single shift register. The holding registers maintain the data flow at a constant rate.

After enabling the SPI, a data transfer starts when the processor writes to FLEX\_SPI\_TDR. The written data are immediately transferred in the shift register and the transfer on the SPI bus starts. While the data in the shift register is shifted on the MOSI line, the MISO line is sampled and shifted in the shift register. Data cannot be loaded in FLEX\_SPI\_RDR without transmitting data. If there is no data to transmit, a dummy data can be used (FLEX\_SPI\_TDR filled with ones). When the WDRBT bit is set, a new data cannot be transmitted if FLEX\_SPI\_RDR has not been read. If Receiving mode is not required, for example when communicating with a slave receiver only (such as an LCD), the receive status flags in the SPI Status Register (FLEX\_SPI\_SR) can be discarded.

Before writing the TDR, the FLEX\_SPI\_MR.PCS field must be set in order to select a slave.

If new data are written in FLEX\_SPI\_TDR during the transfer, it is kept in FLEX\_SPI\_TDR until the current transfer is completed. Then, the received data are transferred from the shift register to FLEX\_SPI\_RDR, the data in FLEX\_SPI\_TDR is loaded in the shift register and a new transfer starts.

As soon as the FLEX\_SPI\_TDR is written, the Transmit Data Register Empty (TDRE) flag in FLEX\_SPI\_SR is cleared. When the data written in FLEX\_SPI\_TDR is loaded into the shift register, the FLEX\_SPI\_SR.TDRE flag is set. The TDRE bit is used to trigger the Transmit DMA channel (see figure below).

The end of transfer is indicated by FLEX\_SPI\_SR.TXEMPTY. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, TXEMPTY is set after the completion of this delay. The peripheral clock can be switched off at this time.

**Notes:**

1. When the SPI is enabled, the TDRE and TXEMPTY flags are set.
2. The TXEMPTY flag alone cannot be used to detect the end of the buffer DMA transfer.

**Figure 39-77. TDRE and TXEMPTY Flag Behavior**

The transfer of received data from the shift register to FLEX\_SPI\_RDR is indicated by the Receive Data Register Full (RDRF) bit in FLEX\_SPI\_SR. When the received data are read, the RDRF bit is cleared.

If FLEX\_SPI\_RDR has not been read before new data are received, the Overrun Error bit (OVRES) in FLEX\_SPI\_SR is set. As long as this flag is set, data are loaded in FLEX\_SPI\_RDR. The user has to read the status register to clear the OVRES bit.

The following figures show, respectively, a block diagram of the SPI when operating in Master mode and a flow chart describing how transfers are handled.

### 39.8.3.1 Master Mode Block Diagram

Figure 39-78. Master Mode Block Diagram

**Figure 39-80. Status Register Flags Behavior**

### 39.8.3.3 Clock Generation

The SPI bit rate clock is generated by dividing a source clock which can be the peripheral clock or a programmable clock from the GCLK. The divider can be a value between 1 and 255.

If the SCBR field is programmed to 1 and the clock source is GCLK, the operating bit rate is peripheral clock (refer to the section “Electrical Characteristics” for the SPCK maximum frequency). Triggering a transfer while SCBR is at 0 can lead to unpredictable results.

At reset, SCBR is 0 and the user has to program it to a valid value before performing the first transfer.

The divisor can be defined independently for each chip select, as it has to be programmed in the FLEX\_SPI\_CSR.SCBR field. This allows the SPI to automatically adapt the bit rate for each interfaced peripheral without reprogramming.

If GCLK is selected as source clock (FLEX\_SPI\_MR.BRSRCCLK = 1), the bit rate is independent of the processor/bus clock. Thus, the processor clock can be changed while SPI is enabled. The processor clock frequency changes must be performed only by programming the PMC\_MCKR.PRES field (refer to the section “Power Management Controller” (PMC)). Any other method to modify the processor/bus clock frequency (PLL multiplier, etc.) is forbidden when SPI is enabled.

The peripheral clock frequency must be at least three times higher than GCLK.

### 39.8.3.4 Transfer Delays

The figure below shows a chip select transfer change and consecutive transfers on the same chip select. Three delays can be programmed to modify the transfer waveforms:

- The delay between the chip selects. It is programmable only once for all chip selects by writing the FLEX\_SPI\_MR.DLYBCS field. The SPI slave device deactivation delay is managed through DLYBCS. If there is only one SPI slave device connected to the master, the DLYBCS field does not need to be configured. If several slave devices are connected to a master, DLYBCS must be configured depending on the highest deactivation delay. Refer to the SPI slave device electrical characteristics.

- The delay before SPCK, independently programmable for each chip select by writing the DLYBS field. The SPI slave device activation delay is managed through DLYBS. Refer to the SPI slave device electrical characteristics to define DLYBS.
- The delay between consecutive transfers, independently programmable for each chip select by writing the DLYBCT field. The time required by the SPI slave device to process received data is managed through DLYBCT. This time depends on the SPI slave system activity.

These delays allow the SPI to be adapted to the interfaced peripherals and their speed and bus release time.

**Figure 39-81.** Programmable Delays

### 39.8.3.5 Peripheral Selection

The serial peripherals are selected through the assertion of the NPCS0 to NPCS3 signals. By default, all NPCS signals are high before and after each transfer.

- Fixed Peripheral Select Mode: SPI exchanges data with only one peripheral. Fixed Peripheral Select mode is enabled by writing the FLEX\_SPI\_MR.PS bit to zero. In this case, the current peripheral is defined by the FLEX\_SPI\_MR.PCS field, and the FLEX\_SPI\_TDR.PCS field has no effect.
- Variable Peripheral Select Mode: Data can be exchanged with more than one peripheral without having to reprogram FLEX\_SPI\_MR.PCS. Variable Peripheral Select Mode is enabled by setting the FLEX\_SPI\_MR.PS bit to one. The FLEX\_SPI\_TDR.PCS field is used to select the current peripheral. This means that the peripheral selection can be defined for each new data. The value must be written in a single access to FLEX\_SPI\_TDR in the following format:

[xxxxxxx(7-bit) + LASTXFER(1-bit)<sup>(1)</sup> + xxxx(4-bit) + PCS (4-bit) + TD (8 to 16-bit data)]

with LASTXFER at 0 or 1 depending on the CSAAT bit, and PCS equal to the chip select to assert, as defined in section [SPI Transmit Data Register \(FLEX\\_SPI\\_TDR\)](#).

Note: 1. Optional

The CSAAT, LASTXFER and CSNAAT bits are discussed in section [Peripheral Deselection with DMA](#).

If LASTXFER is used, the command must be issued after writing the last character. Instead of LASTXFER, the user can use the SPIDIS command. After the end of the DMA transfer, it is necessary to wait for the TXEMPTY flag and then write SPIDIS into the SPI Control Register (FLEX\_SPI\_CR). This does not change the configuration register values. The NPCS is disabled after the last character transfer. Then, another DMA transfer can be started if the FLEX\_SPI\_CR.SPIEN bit has previously been written.

### 39.8.3.6 SPI Direct Access Memory Controller (DMAC)

In both Fixed and Variable modes, the Direct Memory Access Controller (DMAC) can be used to reduce processor overhead.

The fixed peripheral selection allows buffer transfers with a single peripheral. Using the DMAC is an optimal means, as the size of the data transfer between the memory and the SPI is either 8 bits or 16 bits. However, if the peripheral selection is modified, FLEX\_SPI\_MR must be reprogrammed.

The variable peripheral selection allows buffer transfers with multiple peripherals without reprogramming FLEX\_SPI\_MR. Data written in FLEX\_SPI\_TDR is 32 bits wide and defines the real data to be transmitted and the destination peripheral. Using the DMAC in this mode requires 32-bit wide buffers, with the data in the LSBs and the PCS and LASTXFER fields in the MSBs. However, the SPI still controls the number of bits (8 to 16) to be transferred through MISO and MOSI lines with the chip select configuration registers. This is not the optimal means in terms of memory size for the buffers, but it provides a very effective means to exchange data with several peripherals without any intervention of the processor.

### 39.8.3.7 Peripheral Chip Select Decoding

The user can program the SPI to operate with up to 15 slave peripherals by decoding the four chip select lines, NPCS0 to NPCS3 with an external decoder/demultiplexer (see the following figure). This can be enabled by setting the FLEX\_SPI\_MR.PCSDEC bit.

When operating without decoding, the SPI makes sure that in any case only one chip select line is activated, i.e., one NPCS line driven low at a time. If two bits are defined low in a PCS field, only the lowest numbered chip select is driven low.

When operating with decoding, the SPI directly outputs the value defined by the PCS field on the NPCS lines of either FLEX\_SPI\_MR or FLEX\_SPI\_TDR (depending on PS).

As the SPI sets a default value of 0xF on the chip select lines (i.e., all chip select lines at 1) when not processing any transfer, only 15 peripherals can be decoded.

The SPI has only four Chip Select registers. As a result, when external decoding is activated, each NPCS chip select defines the characteristics of up to four peripherals. As an example, FLEX\_SPI\_CRSD0 defines the characteristics of the externally decoded peripherals 0 to 3, corresponding to the PCS values 0x0 to 0x3. Consequently, the user has to make sure to connect compatible peripherals on the decoded chip select lines 0 to 3, 4 to 7, 8 to 11 and 12 to 14. The following figure shows this type of implementation.

If the CSAAT bit is used, with or without the DMAC, the mode fault detection for NPCS0 line must be disabled. This is not needed for all other chip select lines since mode fault detection is only on NPCS0.

**Figure 39-82.** Chip Select Decoding Application Block Diagram: Single Master/Multiple Slave Implementation

### 39.8.3.8 Peripheral Deselection without DMA

During a transfer of more than one data on a Chip Select without the DMA, FLEX\_SPI\_TDR is loaded by the processor, the TDRE flag rises as soon as the content of FLEX\_SPI\_TDR is transferred into the internal shift register. When this flag is detected high, FLEX\_SPI\_TDR can be reloaded. If this reload by the processor occurs before the end of the current transfer, and if the next transfer is performed on the same chip select as the current transfer, the Chip Select is not deasserted between the two transfers. But depending on the application software handling the SPI status register flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload FLEX\_SPI\_TDR in time to keep the chip select active (low). A null DLYBCT value (delay between consecutive transfers) in FLEX\_SPI\_CSR, gives even less time for the processor to reload FLEX\_SPI\_TDR. With some SPI slave peripherals, if the chip select line must remain active (low) during a full set of transfers, communication errors can occur.

To facilitate interfacing with such devices, the Chip Select registers [CSR0...CSR3] can be programmed with the Chip Select Active After Transfer (CSAAT) bit to 1. This allows the chip select lines to remain in their current state (low = active) until a transfer to another chip select is required. Even if FLEX\_SPI\_TDR is not reloaded, the chip select remains active. To de-assert the chip select line at the end of the transfer, the Last Transfer (LASTXFER) bit in FLEX\_SPI\_CR must be set after writing the last data to transmit into FLEX\_SPI\_TDR.

### 39.8.3.9 Peripheral Deselection with DMA

DMA provides faster reloads of FLEX\_SPI\_TDR compared to software. However, depending on the system activity, it is not guaranteed that FLEX\_SPI\_TDR is written with the next data before the end of the current transfer. Consequently, a data can be lost by the deassertion of the NPCS line for SPI slave peripherals requiring the chip select line to remain active between two transfers. The only way to guarantee a safe transfer in this case is the use of the CSAAT and LASTXFER bits.

When the CSAAT bit is cleared, the NPCS does not rise in all cases between two transfers on the same peripheral. During a transfer on a Chip Select, the TDRE flag rises as soon as the content of FLEX\_SPI\_TDR is transferred into the internal shift register. When this flag is detected, FLEX\_SPI\_TDR can be reloaded. If this reload occurs before the end of the current transfer and if the next transfer is performed on the same chip select as the current transfer, the Chip Select is not deasserted between the two transfers. This can lead to difficulties to interface with some serial peripherals requiring the chip select to be deasserted after each transfer. To facilitate interfacing with such devices, FLEX\_SPI\_CSR can be programmed with the Chip Select Not Active After Transfer (CSNAAT)

bit to 1. This allows the chip select lines to be deasserted systematically during a time “DLYBCS” (the value of the CSNAAT bit is processed only if the CSAAT bit is cleared for the same chip select).

The following figure shows different peripheral deselection cases and the effect of the CSAAT and CSNAAT bits.

**Figure 39-83.** Peripheral Deselection

### 39.8.3.10 Mode Fault Detection

The SPI has the capability to operate in multi-master environment. Consequently, the NPCS0/NSS line must be monitored. If one of the masters on the SPI bus is currently transmitting, the NPCS0/NSS line is low and the SPI must not transmit a data. A mode fault is detected when the SPI is programmed in Master mode and a low level is driven by an external master on the NPCS0/NSS signal. In multi-master environment, NPCS0, MOSI, MISO and SPCK pins must be configured in open drain (through the PIO controller). When a mode fault is detected, the FLEX\_SPI\_SR.MODF bit is set until FLEX\_SPI\_SR is read and the SPI is automatically disabled until it is re-enabled by writing the FLEX\_SPI\_CR.SPIEN bit to 1.

By default, the mode fault detection is enabled. The user can disable it by setting the FLEX\_SPI\_MR.MODFDIS bit.

#### 39.8.4 SPI Slave Mode

When operating in Slave mode, the SPI processes data bits on the clock provided on the SPI clock pin (SPCK).

The SPI waits until NSS goes active before receiving the serial clock from an external master. When NSS falls, the clock is validated and the data are loaded in FLEX\_SPI\_RDR according to the configuration value of the FLEX\_SPI\_CSR0.BITS field. These bits are processed following a phase and a polarity defined respectively by the FLEX\_SPI\_CSR0.NCPHA and FLEX\_SPI\_CSR0.CPOL bits. Note that the BITS field, CPOL bit and NCPHA bit of the other Chip Select registers have no effect when the SPI is programmed in Slave mode.

The bits are shifted out on the MISO line and sampled on the MOSI line.

**Note:** For more information on the BITS field, see also the note below the FLEX\_SPI\_CSRx register bitmap in section [SPI Chip Select Register](#)

When all bits are processed, the received data are transferred in FLEX\_SPI\_RDR and the RDRF bit rises. If FLEX\_SPI\_RDR has not been read before new data are received, the Overrun Error bit (OVRES) in FLEX\_SPI\_SR is set. As long as this flag is set, data are loaded in FLEX\_SPI\_RDR. The user must read FLEX\_SPI\_SR to clear the OVRES bit.

When a transfer starts, the data shifted out is the data present in the shift register. If no data has been written in FLEX\_SPI\_TDR, the last data received is transferred. If no data has been received since the last reset, all bits are transmitted low, as the shift register resets to 0.

When a first data is written in FLEX\_SPI\_TDR, it is transferred immediately in the shift register and the TDRE flag rises. If new data is written, it remains in FLEX\_SPI\_TDR until a transfer occurs, i.e., NSS falls and there is a valid clock on the SPCK pin. When the transfer occurs, the last data written in FLEX\_SPI\_TDR is transferred in the shift register and the TDRE flag rises. This enables frequent updates of critical variables with single transfers.

Then, a new data is loaded in the shift register from FLEX\_SPI\_TDR. If no character is ready to be transmitted, i.e., no character has been written in FLEX\_SPI\_TDR since the last load from FLEX\_SPI\_TDR to the shift register, FLEX\_SPI\_TDR is retransmitted. In this case the Underrun Error Status Flag (UNDES) is set in FLEX\_SPI\_SR.

If NSS rises between two characters, it must be kept high for two MCK clock periods or more and the next SPCK capture edge must not occur less than four MCK periods after NSS rise.

In slave mode, if the NSS line rises and the received character length does not match the configuration defined in FLEX\_SPI\_CSR0.BITS, the flag SFERR is set in FLEX\_SPI\_SR.

The following figure shows a block diagram of the SPI when operating in Slave mode.

**Figure 39-84.** Slave Mode Functional Block Diagram

### 39.8.5 SPI Comparison Function on Received Character

The comparison is only relevant for SPI Slave mode (MSTR = 0 in FLEX\_US\_MR).

In Active mode, the CMP flag in FLEX\_SPI\_SR is raised. It is set when the received character matches the conditions programmed in the SPI Comparison Register (FLEX\_SPI\_CMPR). The CMP flag is set as soon as FLEX\_SPI\_RDR is loaded with the new received character. The CMP flag is cleared by reading FLEX\_SPI\_SR.

The SPI Comparison Register (FLEX\_SPI\_CMPR) can be programmed to provide different comparison methods. These are listed below:

- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if any received character equals VAL1 or VAL2.

When FLEX\_SPI\_MR.CMPMODE is cleared, all received data is loaded in FLEX\_SPI\_RDR and the CMP flag provides the status of the comparison result.

By setting the CMPMODE bit, the comparison result triggers the start of FLEX\_SPI\_RDR loading (see figure below). The trigger condition exists as soon as the received character value matches the conditions defined by VAL1 and VAL2 in FLEX\_SPI\_CMPR. The comparison trigger event is restarted by writing a 1 to the FLEX\_SPI\_CR.REQCLR bit.

The value programmed in VAL1 and VAL2 fields must not exceed the maximum value of the received character (see BITS field in SPI Chip Select Register (FLEX\_SPI\_CSR)).

**Figure 39-85.** Receive Data Register Management

CMPMODE = 1, VAL1 = VAL2 = 0x06

## 39.8.6 SPI FIFOs

### 39.8.6.1 Overview

The SPI includes two FIFOs which can be enabled/disabled using the FLEX\_SPI\_CR.FIFOEN/FIFODIS. The SPI module must be disabled before enabling or disabling the SPI FIFOs (FLEX\_SPI\_CR.SPIDIS).

Writing FLEX\_SPI\_CR.FIFOEN to '1' enables a FIFO\_DEPTH-data Transmit FIFO and a FIFO\_DEPTH-data Receive FIFO.

It is possible to write or to read single or multiple data in the same access to FLEX\_SPI\_TDR/RDR. See sections [SPI Single Data Mode](#) and [SPI Multiple Data Mode](#).

**Figure 39-86.** FIFOs Block Diagram

### 39.8.6.2 Sending Data with FIFO Enabled

When the Transmit FIFO is enabled, write access to FLEX\_SPI\_TDR loads the Transmit FIFO.

The FIFO level is provided in FLEX\_SPI\_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor FLEX\_SPI\_SR.TDRE and the data can be successively written in FLEX\_SPI\_TDR.

If the FIFO cannot accept the data due to insufficient space, wait for the TDRE flag to be set before writing the data in FLEX\_SPI\_TDR.

When the space in the FIFO allows only a portion of the data to be written, the TDRE flag must be monitored before writing the remaining data.

**Figure 39-87.** Sending Data with FIFO Enabled

### 39.8.6.3 Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, FLEX\_SPI\_RDR access reads the FIFO.

When data are present in the Receive FIFO (RDRF flag set to '1'), the exact number of data can be checked with FLEX\_SPI\_FLR.RXFL. All the data can be read successively in FLEX\_SPI\_RDR without checking the RDRF flag between each access.

**Figure 39-88.** Receiving Data with FIFO Enabled

### 39.8.6.4 Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using FLEX\_SPI\_CR.TXFCLR/RXFCLR.

### 39.8.6.5 TXEMPTY, TDRE and RDRF Behavior

FLEX\_SPI\_SR.TXEMPTY, FLEX\_SPI\_SR.TDRE and FLEX\_SPI\_SR.RDRF flags display a specific behavior when FIFOs are enabled.

The TXEMPTY flag is cleared as long as there are characters in the Transmit FIFO or in the internal shift register. TXEMPTY is set when there are no characters in the Transmit FIFO and in the internal shift register.

TDRE indicates if a data can be written in the Transmit FIFO. Thus the TDRE flag is set as long as the Transmit FIFO can accept new data. See figure [TDRE in Single Data Mode and TXRDYM = 0](#).

RDRF indicates if an unread data is present in the Receive FIFO. Thus the RDRF flag is set as soon as one unread data is in the Receive FIFO. See figure [RDRF in Single Data Mode and RXRDYM = 0](#).

TDRE and RDRF behavior can be modified using the TXRDYM and RXRDYM fields in the SPI FIFO Mode Register (FLEX\_SPI\_FMR) to reduce the number of accesses to FLEX\_SPI\_TDR/RDR. However, for some configurations, the following constraints apply:

- When the Variable Peripheral Select mode is used (FLEX\_SPI\_MR.PS=1), TXRDYM/RXRDYM must be cleared.
- In Master mode (FLEX\_SPI\_MR.MSTR=1), RXRDYM must be cleared.

As an example, in Master mode, the Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0.

See SPI FIFO Mode Register ([FLEX\\_SPI\\_FMR](#)) for the FIFO configuration.

**Figure 39-89.** TDRE in Single Data Mode and TXRDYM = 0**Figure 39-90.** RDRF in Single Data Mode and RXRDYM = 0

### 39.8.6.6 SPI Single Data Mode

In Single Data mode, only one data is written every time FLEX\_SPI\_TDR is accessed, and only one data is read every time FLEX\_SPI\_RDR is accessed.

When FLEX\_SPI\_FMR.TXRDYM = 0, the Transmit FIFO operates in Single Data mode.

When FLEX\_SPI\_FMR.RXRDYM = 0, the Receive FIFO operates in Single Data mode.

If Master mode is used (FLEX\_SPI\_MR.MSTR=1), the Receive FIFO must operate in Single Data mode.

If Variable Peripheral Select mode is used (FLEX\_SPI\_MR.PS=1), the Transmit FIFO must operate in Single Data mode.

See sections [SPI Transmit Data Register](#) and [SPI Receive Data Register](#).

### 39.8.6.6.1 DMAC

When FIFOs operate in Single Data mode, the DMAC transfer type must be configured either in bytes, halfwords or words depending on FLEX\_SPI\_MR.PS bit value and FLEX\_SPI\_CSRx.BITS field value.

The same applies when FIFOs are disabled.

### 39.8.6.7 SPI Multiple Data Mode

Multiple Data mode minimizes the number of accesses by concatenating the data to send/read in one access.

When FLEX\_SPI\_FMR.TXRDYM > 0, the Transmit FIFO operates in Multiple Data mode.

When FLEX\_SPI\_FMR.RXRDYM > 0, the Receive FIFO operates in Multiple Data mode.

Multiple data can be read from the Receive FIFO only in Slave mode (FLEX\_SPI\_MR.MSTR=0).

The Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0 and when FLEX\_SPI\_MR.PS=0.

In Multiple Data mode, up to two data can be written in one FLEX\_SPI\_TDR write access. It is also possible to read up to four data in one FLEX\_SPI\_RDR access if FLEX\_SPI\_CSRx.BITS is configured to '0' (8-bit data size) and up to two data if FLEX\_SPI\_CSRx.BITS is configured to a value other than '0' (more than 8-bit data size).

The number of data to write/read is defined by the size of the register access. If the access is a byte-size register access, only one data is written/read. If the access is a halfword size register access, then up to two data are read and only one data is written. Lastly, if the access is a word-size register access, then up to four data are read and up to two data are written.

Written/read data are always right-aligned, as described in sections [SPI Receive Data Register \(FIFO Multiple Data, 8-bit\)](#), [SPI Receive Data Register \(FIFO Multiple Data, 16-bit\)](#) and [SPI Transmit Data Register \(FIFO Multiple Data, 8- to 16-bit\)](#).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six FLEX\_SPI\_TDR-byte write accesses
- three FLEX\_SPI\_TDR-halfword write accesses

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six FLEX\_SPI\_RDR-byte read accesses
- three FLEX\_SPI\_RDR-halfword read accesses
- one FLEX\_SPI\_RDR-word read access and one FLEX\_SPI\_RDR-halfword read access

#### 39.8.6.7.1 TDRE and RDRF Configuration

In Multiple Data mode, it is possible to write one or more data in the same FLEX\_SPI\_TDR/RDR access. The TDRE flag indicates if one or more data can be written in the FIFO depending on the configuration of FLEX\_SPI\_FMR.TXRDYM/RXRDYM.

As an example, if two data are written each time in FLEX\_SPI\_TDR, it is useful to configure the TXRDYM field to the value '1' so that the TDRE flag is at '1' only when at least two data can be written in the Transmit FIFO.

Similarly, if four data are read each time in FLEX\_SPI\_RDR, it is useful to configure the RXRDYM field to the value '2' so that the RDRF flag is at '1' only when at least four unread data are in the Receive FIFO.

### 39.8.6.7.2 DMAC

It is mandatory to configure DMAC channel size (byte, halfword or word) according to FLEX\_SPI\_FMR.TXRDYM/RXRDYM configuration. See section [SPI Multiple Data Mode](#) for constraints.

### 39.8.6.8 FIFO Pointer Error

A FIFO overflow is reported in FLEX\_SPI\_SR.

If the Transmit FIFO is full and a write access is performed on FLEX\_SPI\_TDR, it generates a Transmit FIFO pointer error and sets FLEX\_SPI\_SR.TXFPTEF.

In Multiple Data mode, if the number of data written in FLEX\_SPI\_TDR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO pointer error is generated and FLEX\_SPI\_SR.TXFPTEF is set.

A FIFO underflow is reported in FLEX\_SPI\_SR.

In Multiple Data mode, if the number of data read in FLEX\_SPI\_RDR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO pointer error is generated and FLEX\_SPI\_SR.RXFPTEF is set.

No pointer error occurs if the FIFO state/level is checked before writing/reading in FLEX\_SPI\_TDR/ SPI\_RDR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When a pointer error occurs, other FIFO flags may not behave as expected; their states should be ignored.

If a pointer error occurs, a software reset must be performed using FLEX\_SPI\_CR.SWRST (configuration will be lost).

### 39.8.6.9 FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using the field FLEX\_SPI\_FMR.TXFTHRES. Each time the Transmit FIFO level goes from 'above threshold' to 'equal to or below threshold', the flag FLEX\_SPI\_SR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field FLEX\_SPI\_FMR.RXFTHRES. Each time the Receive FIFO level goes from 'below threshold' to 'equal to or above threshold', the flag FLEX\_SPI\_SR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF and RXFTHF flags can be configured to generate an interrupt using FLEX\_SPI\_IER and FLEX\_SPI\_IDR.

### 39.8.6.10 FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through FLEX\_SPI\_IER and FLEX\_SPI\_IDR.

FIFO flags state can be read in FLEX\_SPI\_SR. They are cleared when FLEX\_SPI\_SR is read.

## 39.8.7 SPI Register Write Protection

The FLEXCOM operating mode (FLEX\_MR.OPMODE) must be set to FLEX\_MR.OPMODE\_SPI to enable access to the write protection registers.

To prevent any single software error from corrupting SPI behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write

Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the SPI Write Protection Mode Register (FLEX\_SPI\_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the SPI Write Protection Status Register (FLEX\_SPI\_WPSR) is set and the Write Protection Violation Source (WPVSR) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading FLEX\_SPI\_WPSR.

The following registers can be write-protected when WPEN is set:

- SPI Mode Register
- SPI Chip Select Register
- SPI Comparison Register

The following registers can be write-protected when WPITEN is set:

- SPI Interrupt Enable Register
- SPI Interrupt Disable Register

The following register can be write-protected when WPCREN is set:

- SPI Control Register

## 39.9 TWI Functional Description

### 39.9.1 Transfer Format

The data put on the TWD line must be 8 bits long. Data are transferred MSB first; each byte must be followed by an acknowledgement. The number of bytes per transfer is unlimited (see figure below).

Figure 39-91. Transfer Format

Each transfer begins with a START condition and terminates with a STOP condition (see figure below).

- A high-to-low transition on the TWD line while TWCK is high defines the START condition.
- A low-to-high transition on the TWD line while TWCK is high defines a STOP condition.

Figure 39-92. START and STOP Conditions

### 39.9.2 Modes of Operation

The TWI has different modes of operation:

- Master Transmitter mode (Standard and Fast modes only)
- Master Receiver mode (Standard and Fast modes only)
- Multi-master Transmitter mode (Standard and Fast modes only)
- Multi-master Receiver mode (Standard and Fast modes only)
- Slave Transmitter mode (Standard, Fast and High-speed modes)
- Slave Receiver mode (Standard, Fast and High-speed modes)

These modes are described in the following sections.

### 39.9.3 Master Mode

#### 39.9.3.1 Definition

The master is the device that starts a transfer, generates a clock and stops it.

#### 39.9.3.2 Programming Master Mode

The following fields must be programmed before entering Master mode:

1. DADR (+ IADRSZ + IADR if a 10-bit device is addressed): The device address is used to access slave devices in Read or Write mode.
2. CWGR + CKDIV + CHDIV + CLDIV: Clock waveform.
3. SVDIS: Disables Slave mode.
4. MSEN: Enables Master mode.

**Note:** If the TWI is already in Master mode, the device address (DADR) can be configured without disabling the Master mode.

#### 39.9.3.3 Transfer Speed/Bit Rate

The TWI speed is defined in FLEX\_TWI\_CWGR. The TWI bit rate can be based either on the peripheral clock if the BRSRCCLK bit value is 0 or on a programmable clock source provided by the GCLK if the BRSRCCLK bit value is 1.

If BRSRCCLK = 1, the bit rate is independent of the processor/peripheral clock and thus processor/peripheral clock frequency can be changed without affecting the TWI transfer rate.

The GCLK frequency must be at least three times lower than the peripheral clock frequency.

#### 39.9.3.4 Master Transmitter Mode

After the master initiates a START condition when writing into the Transmit Holding register FLEX\_TWI\_THR, it sends a 7-bit slave address, configured in the Master Mode Register (DADR in FLEX\_TWI\_MMR), to notify the slave device. The bit following the slave address indicates the transfer direction, 0 in this case (FLEX\_TWI\_MMR.MREAD = 0).

The TWI transfers require the slave to acknowledge each received byte. During the acknowledge clock pulse (ninth pulse), the master releases the data line (HIGH), enabling the slave to pull it down in order to generate the acknowledge. If the slave does not acknowledge the byte, then the Not Acknowledge flag (NACK) is set in the TWI Status Register (FLEX\_TWI\_SR) of the master and a STOP condition is sent. Alternatively, if the FLEX\_TWI\_MMR.NOAP bit is set, no stop condition will be sent and a START or STOP condition must be triggered manually through the FLEX\_TWI\_CR.START or FLEX\_TWI\_CR.STOP bit once the software is ready for the transmission of the condition. The NACK flag must be cleared by reading the TWI Status Register (FLEX\_TWI\_SR) before the next write into the TWI Transmit Holding Register (FLEX\_TWI\_THR). As with the other status bits, an interrupt can be generated if enabled in the interrupt enable Register (FLEX\_TWI\_IER). If the slave acknowledges the byte, the data written in FLEX\_TWI\_THR is then shifted in the internal shifter and transferred. When an acknowledge is detected, the TXRDY bit is set until a new write in FLEX\_TWI\_THR.

TXRDY is used as transmit ready for the DMA transmit channel.

**Note:** To clear the TXRDY flag in Master mode, write the FLEX\_TWI\_CR.MSDIS bit to 1, then write the FLEX\_TWI\_CR.MSEN bit to 1.

While no new data is written in FLEX\_TWI\_THR, the serial clock line is tied low. When new data is written in FLEX\_TWI\_THR, the SCL is released and the data is sent. To generate a STOP event, the STOP command must be performed by writing in the STOP field of the TWI Control Register (FLEX\_TWI\_CR).

After a master write transfer, the Serial Clock line is stretched (tied low) while no new data is written in FLEX\_TWI\_THR or until a STOP command is performed.

See the following figures.

**Figure 39-93. Master Write with One Data Byte**

**Figure 39-94. Master Write with Multiple Data Bytes**

**Figure 39-95. Master Write with One Byte Internal Address and Multiple Data Bytes**

### 39.9.3.5 Master Receiver Mode

Master Receiver mode is not available if High-speed mode is selected.

The read sequence begins by setting the START bit. After the start condition has been sent, the master sends a 7-bit slave address to notify the slave device. The bit following the slave address indicates the transfer direction, 1 in this case (`FLEX_TWI_MMR.MREAD = 1`). During the acknowledge clock pulse (9th pulse), the master releases the data line (HIGH), enabling the slave to pull it down in order to generate the acknowledge. The master polls the data line during this clock pulse and sets the `FLEX_TWI_SR.NACK` bit if the slave does not acknowledge the byte.

If an acknowledge is received, the master is then ready to receive data from the slave. After data has been received, the master sends an acknowledge condition to notify the slave that the data has been received except for the last data (see figure "Master Read with One Data Byte" below). When the `FLEX_TWI_SR.RXRDY` bit is set, a character has been received in the Receive Holding Register (`FLEX_TWI_RHR`). The `RXRDY` bit is reset when reading `FLEX_TWI_RHR`.

When a single data byte read is performed, with or without internal address (IADR), the START and STOP bits must be set at the same time. See figure "Master Read with One Data Byte" below. When a multiple data byte read is performed, with or without internal address (IADR), the STOP bit must be set after the next-to-last data received (same condition applies for START bit to generate a repeated start). See figure "Master Read with Multiple Data Bytes" below. For internal address usage, see section [Internal Address](#).

If `FLEX_TWI_RHR` is full (`RXRDY` high) and the master is receiving data, the serial clock line will be tied low before receiving the last bit of the data and until `FLEX_TWI_RHR` is read. Once `FLEX_TWI_RHR` is read, the master will stop stretching the serial clock line and end the data reception. See figure "Master Read Clock Stretching with Multiple Data Bytes" below.

**WARNING** When receiving multiple bytes in Master Read mode, if the next-to-last access is not read (the `RXRDY` flag remains high), the last access will not be completed until `FLEX_TWI_RHR` is read. The last access stops on the next-to-last bit (clock stretching). When `FLEX_TWI_RHR` is read there is only half a bit period to send the STOP bit (or START bit) command, else another read access might occur (spurious access).

A possible workaround is to set the STOP bit (or START bit) before reading `FLEX_TWI_RHR` on the next-to-last access (within IT handler).

**Figure 39-96. Master Read with One Data Byte****Figure 39-97. Master Read with Multiple Data Bytes****Figure 39-98. Master Read Clock Stretching with Multiple Data Bytes**

RXRDY is used as receive ready trigger event for the DMA receive channel.

### 39.9.3.6 Internal Address

The TWI interface can perform transfers with 7-bit slave address devices and with 10-bit slave address devices.

#### 39.9.3.6.1 7-bit Slave Addressing

When addressing 7-bit slave devices, the internal address bytes are used to perform random address (read or write) accesses to reach one or more data bytes, e.g., within a memory page location in a serial memory. When performing read operations with an internal address, the TWI performs a write operation to set the internal address into the slave device, and then switch to Master Receiver mode. Note that the second start condition (after sending the IADR) is sometimes called "repeated start" (Sr) in I<sup>2</sup>C fully-compatible devices. See figure [Master Read with One, Two or Three Bytes Internal Address and One Data Byte](#).

See figures [Master Write with One, Two or Three Bytes Internal Address and One Data Byte](#) and [Internal Address Usage](#) for the master write operation with internal address.

The three internal address bytes are configurable through the Master Mode Register (FLEX\_TWI\_MMR).

If the slave device supports only a 7-bit address, i.e., no internal address, IADRSZ must be configured to 0.

The abbreviations listed below are used in the following figures:

|      |                  |
|------|------------------|
| S    | Start            |
| Sr   | Repeated Start   |
| P    | Stop             |
| W    | Write            |
| R    | Read             |
| A    | Acknowledge      |
| N    | Not Acknowledge  |
| DADR | Device Address   |
| IADR | Internal Address |

**Figure 39-99. Master Write with One, Two or Three Bytes Internal Address and One Data Byte**

**Figure 39-100. Master Read with One, Two or Three Bytes Internal Address and One Data Byte**

### 39.9.3.6.2 10-bit Slave Addressing

For a slave address higher than seven bits, the user must configure the address size (IADRSZ) and set the other slave address bits in the Internal Address Register (FLEX\_TWI\_IADR). The two remaining internal address bytes, IADR[15:8] and IADR[23:16], can be used the same way as in 7-bit slave addressing.

Example: Address a 10-bit device (10-bit device address is b1 b2 b3 b4 b5 b6 b7 b8 b9 b10)

1. Program IADRSZ = 1
2. Program DADR with 1 1 1 1 0 b1 b2 (b1 is the MSB of the 10-bit address, b2, etc.)
3. Program FLEX\_TWI\_IADR with b3 b4 b5 b6 b7 b8 b9 b10 (b10 is the LSB of the 10-bit address)

The following figure shows a byte write to an Atmel AT24LC512 EEPROM. This demonstrates the use of internal addresses to access the device.

**Figure 39-101.** Internal Address Usage

### 39.9.3.7 Repeated Start

In addition to Internal Address mode, repeated start (Sr) can be generated manually by writing the START bit at the end of a transfer instead of the STOP bit. In such case the parameters of the next transfer (direction, SADR, etc.) will need to be set before writing the START bit at the end of the previous transfer.

See section [Read/Write Flowcharts](#).

### 39.9.3.8 Bus Clear Command

The TWI interface can perform a Bus Clear Command:

1. Configure the Master mode (DADR, CKDIV, etc).
2. Start the transfer by setting the FLEX\_TWI\_CR.CLEAR bit.

**Note:** If an alternative command is used (ACMEN bit = 1), the DATAL field must be cleared.

### 39.9.3.9 SMBus Mode

SMBus mode is enabled when the FLEX\_TWI\_CR.SMBEN bit is written to one. SMBus mode operation is similar to I<sup>2</sup>C operation with the following exceptions:

1. Only 7-bit addressing can be used.
2. The SMBus standard describes a set of timeout values to ensure progress and throughput on the bus. These timeout values must be programmed into FLEX\_TWI\_SMBTR.
3. Transmissions can optionally include a CRC byte, called Packet Error Check (PEC).
4. A set of addresses has been reserved for protocol handling, such as alert response address (ARA) and host header (HH) address. Address matching on these addresses can be enabled by configuring FLEX\_TWI\_CR appropriately.

#### 39.9.3.9.1 Packet Error Checking

Each SMBus transfer can optionally end with a CRC byte, called the PEC byte. Writing the FLEX\_TWI\_CR.PECEN bit to one enables automatic PEC handling in the current transfer. Transfers with and without PEC can freely be intermixed in the same system, since some slaves may not support PEC. The PEC LFSR is always updated on every bit transmitted or received, so that PEC handling on combined transfers will be correct.

In Master Transmitter mode, the master calculates a PEC value and transmits it to the slave after all data bytes have been transmitted. Upon reception of this PEC byte, the slave will compare it to the PEC value it has computed itself. If the values match, the data was received correctly, and the slave will return an ACK to the master. If the PEC values differ, data was corrupted, and the slave will return a NACK value. Some slaves may not be able to check the received PEC in time to return a NACK if an error occurred. In this case, the slave should always return an ACK after the PEC byte, and some other mechanism must be implemented to verify that the transmission was received correctly.

In Master Receiver mode, the slave calculates a PEC value and transmits it to the master after all data bytes have been transmitted. Upon reception of this PEC byte, the master will compare it to the PEC value it has computed itself. If the values match, the data was received correctly. If the PEC values differ, data was corrupted, and the FLEX\_TWI\_SR.PECERR bit is set. In Master Receiver mode,

the PEC byte is always followed by a NACK transmitted by the master, since it is the last byte in the transfer.

In combined transfers, the PECRQ bit should only be set in the last of the combined transfers. If Alternative Command mode is enabled, only the NPEC bit should be set.

Consider the following transfer:

S, ADR+W, COMMAND\_BYTE, ACK, SR, ADR+R, DATA\_BYTE, ACK, PEC\_BYTE, NACK, P

See section [Read/Write Flowcharts](#) for detailed flowcharts.

### 39.9.3.9.2 Timeouts

The FLEX\_TWI\_SMBTR.TLOWS/TLOWM fields configure the SMBus timeout values. If a timeout occurs, the master transmits a STOP condition and leaves the bus. Furthermore, the FLEX\_TWI\_SR.TOUT bit is set.

### 39.9.3.10 SMBus Quick Command (Master Mode Only)

The TWI interface can perform a quick command:

1. Configure the Master mode (DADR, CKDIV, etc).
2. Write the FLEX\_TWI\_MMR.MREAD bit at the value of the one-bit command to be sent.
3. Start the transfer by setting the FLEX\_TWI\_CR.QUICK bit.

**Note:** If an alternative command is used (ACMEN bit = 1), the DATAL field must be cleared.

**Figure 39-102.** SMBus Quick Command

### 39.9.3.11 Alternative Command

Another way to configure the transfer is to enable the Alternative Command mode with the ACMEN bit of the TWI Control Register.

In this mode, the transfer is configured through the TWI Alternative Command Register. It is possible to define a simple read or write transfer or a combined transfer with a repeated start.

In order to set a simple transfer, the DATAL field and the DIR field of the TWI Alternative Command Register must be filled accordingly and the NDATAL field must be cleared. To begin the transfer, either set the START bit in the TWI Control Register in case of a read transfer, or write the TWI Transmit Holding Register in case of a write transfer.

For a combined transfer linked by a repeated start, the NDATAL field must be filled with the length of the second transfer and NDIR with the corresponding direction.

The PEC and NPEC bits are used to set a PEC field. In the case of a single transfer with PEC, the PEC bit must be set. In the case of a combined transfer, the NPEC bit must be set.

**Note:** If the Alternative Command mode is used, the TWIHS\_MMR.IADRSZ field must be set to 0.

See [Read/Write Flowcharts](#) for detailed flowcharts.

### 39.9.3.12 Handling Errors in Alternative Command

In case of NACK generated by a slave device or SMBus timeout error, the TWI stops immediately the frame, but the DMA transfer may still be active. To prevent a new frame to be restarted with the remaining DMA data (transmit), the TWI prevents any start of frame until the FLEX\_TWI\_SR.LOCK flag is cleared.

The FLEX\_TWI\_SR.LOCK bit indicates the state of the TWI (locked or not locked).

When the TWI is locked, no transfer can begin until the LOCK is cleared using the FLEX\_TWI\_CR.LOCKCLR bit and until the error flags are cleared reading FLEX\_TWI\_SR.

In case of error, FLEX\_TWI\_THR may have been loaded with a new data. The FLEX\_TWI\_CR.THRCLR bit can be used to flush FLEX\_TWI\_THR. If the THRCLR bit is set, the TXRDY and TXCOMP flags are set.

### 39.9.3.13 Read/Write Flowcharts

The flowcharts shown in this section provide examples for read and write operations. A polling or interrupt method can be used to check the status bits. The interrupt method requires that the Interrupt Enable Register (FLEX\_TWI\_IER) be configured first.

**Figure 39-103.** TWI Write Operation with Single Data Byte without Internal Address

## 39.9.4 Multi-Master Mode

### 39.9.4.1 Definition

In Multi-Master mode, more than one master may handle the bus at the same time without data corruption by using arbitration.

Arbitration starts as soon as two or more masters place information on the bus at the same time, and stops (arbitration is lost) for the master that intends to send a logical one while the other master sends a logical zero.

As soon as arbitration is lost by a master, it stops sending data and listens to the bus in order to detect a STOP. When the STOP is detected, the master that has lost arbitration may put its data on the bus by respecting arbitration.

Arbitration is illustrated in figure "Arbitration Cases" below.

### 39.9.4.2 Different Multi-Master Modes

Two Multi-Master modes may be distinguished:

- TWI as Master Only—TWI is considered as a master only and will never be addressed.
- TWI as Master or Slave—TWI may be either a master or a slave and may be addressed.

**Note:** Arbitration is supported in both Multi-Master modes.

#### 39.9.4.2.1 TWI as Master Only

In this mode, the TWI is considered as a master only (MSEN is always at one) and must be driven like a master with the ARBLST (ARBitration Lost) flag in addition.

If arbitration is lost (ARBLST = 1), the user must reinitiate the data transfer.

If the user starts a transfer (ex.: DADR + START + W + Write in THR) and if the bus is busy, the TWI automatically waits for a STOP condition on the bus to initiate the transfer (see figure "User Sends Data While the Bus is Busy" below).

**Note:** The state of the bus (busy or free) is not indicated in the user interface.

#### 39.9.4.2.2 TWI as Master or Slave

The automatic reversal from master to slave is not supported in case of a lost arbitration.

Then, in the case where TWI may be either a master or a slave, the user must manage the pseudo Multi-Master mode described in the steps below:

1. Program the TWI in Slave mode (SADR + MSDIS + SVEN) and perform a slave access (if TWI is addressed).
2. If the TWI has to be set in Master mode, wait until TXCOMP flag is at 1.
3. Program the Master mode (DADR + SVDIS + MSEN) and start the transfer (ex: START + Write in THR).
4. As soon as the Master mode is enabled, the TWI scans the bus in order to detect if it is busy or free. When the bus is considered as free, the TWI initiates the transfer.
5. As soon as the transfer is initiated and until a STOP condition is sent, the arbitration becomes relevant and the user must monitor the ARBLST flag.
6. If the arbitration is lost (ARBLST is = 1), the user must program the TWI in Slave mode in case the master that won the arbitration needs to access the TWI.
7. If the TWI has to be set in Slave mode, wait until TXCOMP flag is at 1 and then program the Slave mode.

**Note:** In case the arbitration is lost and the TWI is addressed, the TWI will not acknowledge even if it is programmed in Slave mode as soon as ARBLST = 1. Then the master must repeat SADR.

**Figure 39-117.** User Sends Data While the Bus is Busy

Figure 39-118. Arbitration Cases

The flowchart shown in the following figure gives an example of read and write operations in Multi-Master mode.

**Figure 39-119. Multi-Master Mode**

### 39.9.5 Slave Mode

### 39.9.5.1 Definition

Slave mode is defined as a mode where the device receives the clock and the address from another device called the master.

In this mode, the device never initiates and never completes the transmission (START, REPEATED START and STOP conditions are always provided by the master).

### 39.9.5.2 Programming Slave Mode

The following fields must be programmed before entering Slave mode:

1. FLEX\_TWI\_SMR.SADR: The slave device address is used in order to be accessed by master devices in Read or Write mode.
2. (Optional) FLEX\_TWI\_SMR.MASK can be set to mask some SADR address bits and thus allow multiple address matching.
3. FLEX\_TWI\_CR.MSDIS: Disables the Master mode.
4. FLEX\_TWI\_CR.SVEN: Enables the Slave mode.

As the device receives the clock, values written in FLEX\_TWI\_CWGR are not processed.

### 39.9.5.3 Receiving Data

After a START or repeated START condition is detected, and if the address sent by the master matches the slave address programmed in the SADR (Slave Address) field, the SVACC (Slave Access) flag is set and SVREAD (Slave Read) indicates the direction of the transfer.

SVACC remains high until a STOP condition or a repeated START is detected. When such a condition is detected, EOSACC (End Of Slave Access) flag is set.

#### 39.9.5.3.1 Read Sequence

In the case of a read sequence (SVREAD is high), the TWI transfers data written in FLEX\_TWI\_THR (TWI Transmit Holding Register) until a STOP condition or a REPEATED\_START + an address different from SADR is detected. Note that at the end of the read sequence TXCOMP (Transmission Complete) flag is set and SVACC is reset.

As soon as data is written in FLEX\_TWI\_THR, the TXRDY (Transmit Holding Register Ready) flag is reset, and it is set when the internal shifter is empty and the sent data acknowledged or not. If the data is not acknowledged, the NACK flag is set.

Note that a STOP or a repeated START always follows a NACK.

See figure "Read Access Ordered by a Master" below.

**Note:** To clear the TXRDY flag in Slave mode, write the FLEX\_TWI\_CR.SVDIS bit to 1, then write the FLEX\_TWI\_CR.SVEN bit to 1.

#### 39.9.5.3.2 Write Sequence

In the case of a write sequence (SVREAD is low), the RXRDY (Receive Holding Register Ready) flag is set as soon as a character has been received in FLEX\_TWI\_RHR (TWI Receive Holding Register). RXRDY is reset when reading FLEX\_TWI\_RHR.

TWI continues receiving data until a STOP condition or a REPEATED\_START + an address different from SADR is detected. Note that at the end of the write sequence TXCOMP flag is set and SVACC reset.

See figure "Write Access Ordered by a Master" below.

#### 39.9.5.3.3 Clock Stretching Sequence

If FLEX\_TWI\_THR or FLEX\_TWI\_RHR is not written/read in time, the TWI performs a clock stretching.

Clock stretching information is given by the SCLWS (Clock Wait State) bit.

See figures "Clock Stretching in Read Mode" and "Clock Stretching in Write Mode" below.

**Note:** Clock stretching can be disabled by configuring the FLEX\_TWI\_SMR.SCLWSDIS bit. In that case, UNRE and OVRE flags will indicate underrun (when FLEX\_TWI\_THR is not filled on time) or overrun (when FLEX\_TWI\_RHR is not read on time).

#### 39.9.5.3.4 General Call

In the case where a GENERAL CALL is performed, the GACC (General Call Access) flag is set.

After GACC is set, it is up to the user to interpret the meaning of the GENERAL CALL and to decode the new address programming sequence.

See figure "Master Performs a General Call" below.

### 39.9.5.4 Data Transfer

#### 39.9.5.4.1 Read Operation

The Read mode is defined as a data requirement from the master.

After a START or a REPEATED START condition is detected, the decoding of the address starts. If the slave address (SADR) is decoded, SVACC is set and SVREAD indicates the direction of the transfer.

Until a STOP or REPEATED START condition is detected, TWI continues sending data loaded in FLEX\_TWI\_THR.

If a STOP condition or a REPEATED START + an address different from SADR is detected, SVACC is reset.

The following figure describes the read operation.

**Figure 39-120. Read Access Ordered by a Master**

#### Notes:

1. When SVACC is low, the state of SVREAD becomes irrelevant.
2. TXRDY is reset when data has been transmitted from FLEX\_TWI\_THR to the internal shifter and set when this data has been acknowledged or non acknowledged.

#### 39.9.5.4.2 Write Operation

The Write mode is defined as a data transmission from the master.

After a START or a REPEATED START, the decoding of the address starts. If the slave address is decoded, SVACC is set and SVREAD indicates the direction of the transfer (SVREAD is low in this case).

Until a STOP or REPEATED START condition is detected, TWI stores the received data in FLEX\_TWI\_RHR.

If a STOP condition or a REPEATED START + an address different from SADR is detected, SVACC is reset.

The following figure describes the write operation.

**Figure 39-121. Write Access Ordered by a Master****Notes:**

1. When SVACC is low, the state of SVREAD becomes irrelevant.
2. RXRDY is set when data has been transmitted from the internal shifter to FLEX\_TWI\_RHR, and reset when this data is read.

**39.9.5.4.3 General Call**

The general call is performed in order to change the address of the slave.

If a GENERAL CALL is detected, GACC is set.

After the detection of general call, it is up to the user to decode the commands which follow.

In case of a WRITE command, the user has to decode the programming sequence and program a new SADR if the programming sequence matches.

The following figure describes the general call access.

**Figure 39-122. Master Performs a General Call**

**Note:** This method enables to create a user-specific programming sequence by choosing the number of programming bytes. The programming sequence has to be provided to the master.

**39.9.5.4.4 Clock Stretching**

In both Read and Write modes, it may happen that the FLEX\_TWI\_THR/FLEX\_TWI\_RHR buffer is not filled/emptied before the transmission/reception of a new character. In this case, to avoid sending/receiving undesired data, a clock stretching mechanism is implemented.

**Note:** Clock stretching can be disabled by setting the FLEX\_TWI\_SMR.SCLWSDIS bit. In that case, the UNRE and OVRE flags indicate an underrun (when FLEX\_TWI\_THR is not filled on time) or an overrun (when FLEX\_TWI\_RHR is not read on time).

**— Clock Stretching in Read Mode**

The clock is tied low if the internal shifter is empty and if a STOP or REPEATED START condition was not detected. It is tied low until the internal shifter is loaded.

The following figure describes clock stretching in Read mode.

**Figure 39-123. Clock Stretching in Read Mode****Notes:**

1. TXRDY is reset when data has been written in FLEX\_TWI\_THR to the internal shifter, and set when this data has been acknowledged or non acknowledged.
2. At the end of the read sequence, TXCOMP is set after a STOP or after a REPEATED\_START + an address different from SADR.
3. SCLWS is automatically set when the clock stretching mechanism is started.

**— Clock Stretching in Write Mode**

The clock is tied low if the internal shifter and FLEX\_TWI\_RHR are full. If a STOP or REPEATED\_START condition was not detected, it is tied low until FLEX\_TWI\_RHR is read.

The following figure describes the clock stretching in Write mode.

**Figure 39-124. Clock Stretching in Write Mode****Notes:**

1. At the end of the read sequence, TXCOMP is set after a STOP or after a REPEATED\_START + an address different from SADR.
2. SCLWS is automatically set when the clock stretching mechanism is started and automatically reset when the mechanism is finished.

### 39.9.5.4.5 Reversal after a Repeated Start

#### — Reversal of Read to Write

The master initiates the communication by a read command and finishes it by a write command.

The following figure describes the repeated start and the reversal from Read mode to Write mode.

**Figure 39-125.** Repeated Start and Reversal from Read Mode to Write Mode

#### — Reversal of Write to Read

The master initiates the communication by a write command and finishes it by a read command.

The following figure describes the repeated start and the reversal from Write mode to Read mode.

**Figure 39-126.** Repeated Start and Reversal from Write Mode to Read Mode

### 39.9.5.4.6 SMBus Mode

SMBus mode is enabled when the FLEX\_TWI\_CR.SMEN bit is written to one. SMBus mode operation is similar to I<sup>2</sup>C operation with the following exceptions:

1. Only 7-bit addressing can be used.
2. The SMBus standard describes a set of timeout values to ensure progress and throughput on the bus. These timeout values must be programmed into FLEX\_TWI\_SMBTR.
3. Transmissions can optionally include a CRC byte, called Packet Error Check (PEC).

4. A set of addresses have been reserved for protocol handling, such as alert response address (ARA) and host header (HH) address. Address matching on these addresses can be enabled by configuring FLEX\_TWI\_CR appropriately.

#### — Packet Error Checking

Each SMBus transfer can optionally end with a CRC byte, called the PEC byte. Writing the FLEX\_TWI\_CR.PECEN bit to one will send/check the FLEX\_TWI\_ACR.PEC field in the current transfer. The PEC generator is always updated on every bit transmitted or received, so that PEC handling on following linked transfers will be correct.

In Slave Receiver mode, the master calculates a PEC value and transmits it to the slave after all data bytes have been transmitted. Upon reception of this PEC byte, the slave will compare it to the PEC value it has computed itself. If the values match, the data was received correctly, and the slave will return an ACK to the master. If the PEC values differ, data was corrupted, and the slave will return a NACK value. The FLEX\_TWI\_SR.PECERR bit is set automatically if a PEC error occurred.

In Slave Transmitter mode, the slave calculates a PEC value and transmits it to the master after all data bytes have been transmitted. Upon reception of this PEC byte, the master will compare it to the PEC value it has computed itself. If the values match, the data was received correctly. If the PEC values differ, data was corrupted, and the master must take appropriate action.

See section [Slave Read/Write Flowcharts](#) for detailed flowcharts.

#### — Timeouts

The TWI SMBus Timing Register (FLEX\_TWI\_SMBTR) configures the SMBus timeout values. If a timeout occurs, the slave will leave the bus. Furthermore, the FLEX\_TWI\_SR.TOUT bit is set.

### 39.9.5.5 High-Speed Slave Mode

High-speed mode is enabled when the FLEX\_TWI\_CR.HSEN bit is written to one. Furthermore, the analog pad filter must be enabled, the FLEX\_TWI\_FILTR.PADFEN bit must be written to one and the FLEX\_TWI\_FILTR.FILT bit must be cleared. TWI High-speed mode operation is similar to TWI operation with the following exceptions:

1. A master code is received first at normal speed before entering High-speed mode period.
2. When TWI High-speed mode is active, clock stretching is only allowed after acknowledge (ACK), not-acknowledge (NACK), START (S) or repeated START (Sr) (as a consequence, OVF may happen).

TWI High-speed mode allows transfers of up to 3.4 Mbit/s.

The TWI slave in High-speed mode requires that the peripheral clock runs at a minimum of 14 MHz if slave clock stretching is enabled (SCLWSDIS bit at '0'). If slave clock stretching is disabled (SCLWSDIS bit at '1'), the peripheral clock must run at a minimum of 11 MHz (assuming the system has no latency).

#### Notes:

1. When slave clock stretching is disabled, FLEX\_TWI\_RHR must always be read before receiving the next data (MASTER write frame). It is strongly recommended to use either the polling method on the FLEX\_TWI\_SR.RXRDY flag, or the DMA. If the receive is managed by an interrupt, the TWI interrupt priority must be set to the right level and its latency minimized to avoid receive overrun.
2. When slave clock stretching is disabled, FLEX\_TWI\_THR must be filled with the first data to send before the beginning of the frame (MASTER read frame). It is strongly recommended to use either the polling method on the FLEX\_TWI\_SR.TXRDY flag, or the DMA. If the transmit is managed by an interrupt, the TWI interrupt priority must be set to the right level and its latency minimized to avoid transmit underrun.

#### 39.9.5.5.1 Read/Write Operation

A TWI high-speed frame always begins with the following sequence:

1. START condition (S)
2. Master Code (0000 1XXX)
3. Not-acknowledge (NACK)

When the TWI is programmed in Slave mode and TWI High-speed mode is activated, master code matching is activated and internal timings are set to match the TWI High-speed mode requirements.

**Figure 39-127. High-Speed Mode Read/Write**

### 39.9.5.5.2 Usage

TWI High-speed mode usage is the same as the standard TWI (see section [Read/Write Flowcharts](#)).

### 39.9.5.6 Alternative Command

In Slave mode, the Alternative Command mode is used when the SMBus mode is enabled to send or check the PEC byte.

The Alternative Command mode is enabled by setting the ACMEN bit of the TWIHS Control Register, and the transfer is configured in TWIHS\_ACR.

For a combined transfer with PEC, only the NPEC bit in TWIHS\_ACR must be set as the PEC byte is sent once at the end of the frame.

See section [Slave Read/Write Flowcharts](#) for detailed flowcharts.

### 39.9.5.7 Slave Read/Write Flowcharts

The flowchart shown in the following figure gives an example of read and write operations in Slave mode. A polling or interrupt method can be used to check the status bits. The interrupt method requires that the Interrupt Enable Register (FLEX\_TWI\_IER) be configured first.

Figure 39-128. Read/Write in Slave Mode

Figure 39-129. Read/Write in Slave Mode with SMBus PEC

**Figure 39-130.** Read/Write in Slave Mode with SMBus PEC and Alternative Command Mode

## 39.9.6 TWI FIFOs

### 39.9.6.1 Overview

The TWI includes two FIFOs which can be enabled/disabled using FLEX\_TWI\_CR.FIFOEN/FIFODIS. Both Master and Slave modes must be disabled before enabling or disabling the FIFOs (FLEX\_TWI\_CR.MSDIS/SVDIS).

Writing FLEX\_TWI\_CR.FIFOEN to '1' enables a 8-data Transmit FIFO and a 8-data Receive FIFO.

It is possible to write or to read single or multiple data in the same access to FLEX\_TWI\_THR/RHR, depending on FLEX\_TWI\_FMR.TXRDYM/RXRDYM settings.

**Figure 39-131. FIFOs Block Diagram**

### 39.9.6.2 Sending Data with FIFO Enabled

When the Transmit FIFO is enabled, write access to FLEX\_TWI\_THR loads the Transmit FIFO.

The Transmit FIFO level is provided in FLEX\_TWI\_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor FLEX\_TWI\_SR.TXRDY and the data can be successively written in FLEX\_TWI\_THR.

If the FIFO cannot accept the data due to insufficient space, wait for the TXRDY flag to be set before writing the data in FLEX\_TWI\_THR.

When the space in the FIFO allows only a portion of the data to be written, the TXRDY flag must be monitored before writing the remaining data.

See figures [Sending Data with FIFO Enabled in Master Mode](#) and [Sending/Receiving Data with FIFO Enabled in Slave Mode](#).

**Figure 39-132.** Sending Data with FIFO Enabled in Master Mode

### 39.9.6.3 Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, FLEX TWI RHR access reads the FIFO.

When data are present in the Receive FIFO (RXRDY flag set to '1'), the exact number of data can be checked with FLEX\_TWI\_FLR.RXFL. All the data can be read successively in FLEX\_TWI\_RHR without checking the FLEX\_TWI\_SR.RXRDY flag between each access.

See figures [Receiving Data with FIFO Enabled in Master Mode](#) and [Sending/Receiving Data with FIFO Enabled in Slave Mode](#).

**Figure 39-133. Receiving Data with FIFO Enabled in Master Mode****39.9.6.4 Sending/Receiving with FIFO Enabled in Slave Mode**

See sections [Sending Data with FIFO Enabled](#) and [Receiving Data with FIFO Enabled](#) for details.

**Figure 39-134.** Sending/Receiving Data with FIFO Enabled in Slave Mode

### 39.9.6.5 Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using FLEX\_TWI\_CR.TXFCLR/RXFCLR.

### 39.9.6.6 TXRDY and RXRDY Behavior

FLEX\_TWI\_SR.TXRDY/RXRDY flags display a specific behavior when FIFOs are enabled.

TXRDY indicates if a data can be written in the Transmit FIFO. Thus the TXRDY flag is set as long as the Transmit FIFO can accept new data. See figure [TXRDY Behavior when TXRDYM = 0 in Master mode](#).

RXRDY indicates if an unread data is present in the Receive FIFO. Thus the RXRDY flag is set as soon as one unread data is in the Receive FIFO. Refer to figure [RXRDY Behavior when RXRDYM = 0 in Master and Slave modes](#).

TXRDY and RXRDY behavior can be modified using the TXRDYM and RXRDYM fields in the TWI FIFO Mode Register (FLEX\_TWI\_FMR) to reduce the number of accesses to FLEX\_TWI\_THR/RHR.

As an example, in Master mode, the Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0.

See TWI FIFO Mode Register for the FIFO configuration.

**Figure 39-135.** TXRDY Behavior when TXRDYM = 0 in Master Mode

**Figure 39-136.** RXRDY Behavior when RXRDYM = 0 in Master and Slave Modes

**Figure 39-137. TXRDY Behavior when TXRDYM = 0 in Slave Mode**

### 39.9.6.7 TWI Single Data Mode

In Single Data mode, only one data is written every time FLEX\_TWI\_THR is accessed, and only one data is read every time FLEX\_TWI\_RHR is accessed.

When FLEX\_TWI\_FMR.TXRDYM = 0, the Transmit FIFO operates in Single Data mode.

When FLEX\_TWI\_FMR.RXRDYM = 0, the Receive FIFO operates in Single Data mode.

See sections [TWI Transmit Holding Register](#) and [TWI Receive Holding Register](#).

### 39.9.6.8 TWI Multiple Data Mode

Multiple Data mode minimizes the number of accesses by concatenating the data to send/read in one access.

When FLEX\_TWI\_FMR.TXRDYM > 0, the Transmit FIFO operates in Multiple Data mode.

When FLEX\_TWI\_FMR.RXRDYM > 0, the Receive FIFO operates in Multiple Data mode.

In Multiple Data mode, it is possible to write/read up to four data in one FLEX\_TWI\_THR/FLEX\_TWI\_RHR register access.

The number of data to write/read is defined by the size of the register access. If the access is a byte-size register access, only one data is written/read. If the access is a halfword size register access, then up to two data are read and only one data is written. Lastly, if the access is a wordsize register access, then up to four data are read and up to two data are written.

Written/Read data are always right-aligned, as described in sections [TWI Receive Holding Register \(FIFO Enabled\)](#) and [TWI Transmit Holding Register \(FIFO Enabled\)](#).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six FLEX\_TWI\_THR-byte write accesses
- three FLEX\_TWI\_THR-halfword write accesses
- one FLEX\_TWI\_THR-word write access and one FLEX\_TWI\_THR halfword write access

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six FLEX\_TWI\_RHR-byte read accesses
- three FLEX\_TWI\_RHR-halfword read accesses
- one FLEX\_TWI\_RHR-word read access and one FLEX\_TWI\_RHR-halfword read access

### 39.9.6.8.1 TXRDY and RXRDY Configuration

In Multiple Data mode, it is possible to write one or more data in the same FLEX\_TWI\_THR/FLEX\_TWI\_RHR access. The TXRDY flag indicates if one or more data can be written in the FIFO depending on the configuration of FLEX\_TWI\_FMR.TXRDYM/RXRDYM.

As an example, if two data are written each time in FLEX\_TWI\_THR, it is useful to configure the TXRDYM field to the value '1' so that the TXRDY flag is at '1' only when at least two data can be written in the Transmit FIFO.

In the same way, if four data are read each time in FLEX\_TWI\_RHR, it is useful to configure the RXRDYM field to the value '2' so that the RXRDY flag is at '1' only when at least four unread data are in the Receive FIFO.

### 39.9.6.8.2 DMAC

When FIFOs operate in Multiple Data mode, the DMAC transfer type must be configured in byte, halfword or word depending on the FLEX\_TWI\_FMR.TXRDYM/RXRDYM settings.

### 39.9.6.9 Transmit FIFO Lock

If a frame is terminated early due to a not-acknowledge error (NACK flag), SMBus timeout error (TOUT flag) or master code acknowledge error (MACK flag), a lock is set on the Transmit FIFO preventing any new frame from being sent until it is cleared. This allows clearing the FIFO if needed, resetting DMAC channels, etc., without any risk.

FLEX\_TWI\_SR.LOCK is used to check the state of the Transmit FIFO lock.

The Transmit FIFO lock can be cleared by setting FLEX\_TWI\_CR.TXFLCLR to '1'.

### 39.9.6.10 FIFO Pointer Error

A FIFO overflow is reported in FLEX\_TWI\_FSR.

If the Transmit FIFO is full and a write access is performed on FLEX\_TWI\_THR, it generates a Transmit FIFO pointer error and sets FLEX\_TWI\_FSR.TXFPTEF.

In Multiple Data mode, if the number of data written in FLEX\_TWI\_THR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO pointer error is generated and FLEX\_TWI\_FSR.TXFPTEF is set.

A FIFO underflow is reported in FLEX\_TWI\_FSR.

In Multiple Data mode, if the number of data read in FLEX\_TWI\_RHR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO pointer error is generated and FLEX\_TWI\_FSR.RXFPTEF is set.

No pointer error occurs if the FIFO state/level is checked before writing/reading in FLEX\_TWI\_THR/FLEX\_TWI\_RHR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When a pointer error occurs, other FIFO flags may not behave as expected; their states should be ignored.

If a Transmit or Receive pointer error occurs, a software reset must be performed using FLEX\_TWI\_CR.SWRST. Note that issuing a software while transmitting might leave a slave in an unknown state holding the TWD line. In such case, a Bus Clear Command will allow to make the slave release the TWD line (the first frame sent afterwards might not be received properly by the slave).

### 39.9.6.11 FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using the field FLEX\_TWI\_FMR.TXFTHRES. Each time the Transmit FIFO level goes from 'above threshold' to 'equal to or below threshold', the flag FLEX\_TWI\_FSR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field FLEX\_TWI\_FMR.RXFTHRES. Each time the Receive FIFO level goes from 'below threshold' to 'equal to or above threshold', the flag FLEX\_TWI\_FESR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF and RXFTHF flags can be configured to generate an interrupt using FLEX\_TWI\_FIER and FLEX\_TWI\_FIDR.

### 39.9.6.12 FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through FLEX\_TWI\_FIER and FLEX\_TWI\_FIDR.

FIFO flags state can be read in FLEX\_TWI\_FSR. They are cleared when FLEX\_TWI\_FSR is read.

### 39.9.7 Sniffer Mode

The Slave Sniffer mode of a TWI can be enabled to ease the analysis/debug of a TWI bus activity. The TWI bus to be analyzed can be mastered by one TWI master embedded in the product or mastered by an I2C master outside the product.

In this mode, the TWI reports all (or part of) the TWI bus activity without impacting the TWI bus (no bus drive is performed). Depending on the MASK field value, only some specific transfers can be logged instead of the whole activity.

The peripheral TWIn+1 can be configured to analyze the peripheral TWIn (n being the instance index of the TWI) in a full transparent mode via predefined internal connections between TWI instances.

The predefined internal connections provides the capability to use the TWD and TWCK pins for alternate functions while the TWI peripheral is configured in Sniffer Slave mode and the selected TWI bus to analyze is carried on these internal links.

The following fields must be programmed before entering Slave mode:

1. FLEX\_TWI\_SMR.SADR: Use the slave device address to indicate which frame(s) to log.
2. FLEX\_TWI\_SMR.MASK: Indicate which SADR bits should be masked and thus which transfers should be logged (set to 0x7F to log the whole TWI bus activity; all SADR bits are masked in this case). General Call accesses will always match.
3. FLEX\_TWI\_SMR.BSEL: Select the TWI bus to analyze (see [Figure 39-138](#)).
4. FLEX\_TWI\_SMR.SNIFF: Set to '1' to enable Slave Sniffer mode.
5. FLEX\_TWI\_CR.MSDIS: Disable Master mode.
6. FLEX\_TWI\_CR.SVEN: Enable Slave mode.

As the device receives the clock, values written in FLEX\_TWI\_CWGR are not relevant.

Once configured in Slave Sniffer mode, the FLEX\_TWI\_SR.RXRDY bit indicates when a transfer has been logged in FLEX\_TWI\_RHR. An interrupt can be generated if configured. The FLEX\_TWI\_SR.OVRE flag indicates if an overrun error occurred if the application is not fast enough to read FLEX\_TWI\_RHR.

In Slave Sniffer mode, FLEX\_TWI\_RHR logs data as follows:

- The RXDATA field reports the sniffed 8-bit data field.
- The SSTATE field indicates if a START condition has been detected before the 8-bit data field.
- The PSTATE field indicates if a STOP condition has been detected after the previously sniffed 8-bit data field.
- The ASTATE field indicates which acknowledge condition has been detected after the previously sniffed 8-bit data field.

**Figure 39-138. Sniffer Mode Application Overview****Figure 39-139. Slave Sniffer Mode Log**

### 39.9.8 TWI Register Write Protection

The FLEXCOM operating mode (FLEX\_MR.OPMODE) must be set to FLEX\_MR\_OPMODE\_TWI to enable access to the write protection registers.

To prevent any single software error from corrupting TWI behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the TWI Write Protection Mode Register (FLEX\_TWI\_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the TWI Write Protection Status Register (FLEX\_TWI\_WPSR) is set and the Write Protection Violation Source (WPVSR) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading FLEX\_TWI\_WPSR.

The following register(s) can be write-protected when WPEN is set:

- TWI Slave Mode Register
- TWI Clock Waveform Generator Register
- TWI SMBus Timing Register
- TWI FIFO Mode Register

The following register(s) can be write-protected when WPITEN is set:

- TWI Interrupt Enable Register
- TWI Interrupt Disable Register

The following register(s) can be write-protected when WPCREN is set:

- TWI Control Register

## 39.10 Register Summary

| Offset                | Name                      | Bit Pos. | 7            | 6        | 5           | 4       | 3               | 2                  | 1           | 0       |
|-----------------------|---------------------------|----------|--------------|----------|-------------|---------|-----------------|--------------------|-------------|---------|
| 0x00                  | FLEX_MR                   | 7:0      |              |          |             |         |                 |                    | OPMODE[1:0] |         |

39.10.1 FLEXCOM Mode Register

Name: FLEX\_MR  
Offset: 0x000  
Reset: 0x00000001  
Property: Read/Write

Bits 1:0 – OPMODE[1:0] FLEXCOM Operating Mode

| Value | Name   | Description                                                                                                                                                |
|-------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | NO_COM | No communication                                                                                                                                           |
| 1     | USART  | All UART-related protocols are selected (RS232, RS485, IrDA, ISO7816, LIN, LON)<br>SPI/TWI-related registers are not accessible and have no impact on IOs. |
| 2     | SPI    | SPI operating mode is selected.<br>USART/TWI related registers are not accessible and have no impact on IOs.                                               |
| 3     | TWI    | All TWI-related protocols are selected (TWI, SMBus).<br>USART/SPI-related registers are not accessible and have no impact on IOs.                          |

### 39.10.2 FLEXCOM Receive Holding Register

**Name:** FLEX\_RHR  
**Offset:** 0x010  
**Reset:** 0x00000000  
**Property:** Read-only

If enabled in the SFR module (default is disabled), a debugger read access does not clear the clear-on-read flags in FLEX\_US\_CSR, FLEX\_SPI\_SR, FLEX\_TWI\_SR.

|        |              |    |    |    |    |    |    |    |

| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 15:0 – RXDATA[15:0] Receive Data

This register is a mirror of:

- USART Receive Holding Register (FLEX\_US\_RHR) if FLEX\_MR.OPMODE field equals 1
- SPI Receive Data Register (FLEX\_SPI\_RDR) if FLEX\_MR.OPMODE field equals 2
- TWI Transmit Holding Register (FLEX\_TWI\_RHR) if FLEX\_MR.OPMODE field equals 3

### 39.10.3 FLEXCOM Transmit Holding Register

**Name:** FLEX\_THR  
**Offset:** 0x020  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |              |     |     |     |     |     |     |     |
|--------|--------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31           | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |              |     |     |     |     |     |     |     |
| Access |              |     |     |     |     |     |     |     |
| Reset  |              |     |     |     |     |     |     |     |
| Bit    | 23           | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        |              |     |     |     |     |     |     |     |
| Access |              |     |     |     |     |     |     |     |
| Reset  |              |     |     |     |     |     |     |     |
| Bit    | 15           | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | TXDATA[15:8] |     |     |     |     |     |     |     |
| Access | R/W          | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0            | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7            | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | TXDATA[7:0]  |     |     |     |     |     |     |     |
| Access | R/W          | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0            | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 15:0 – TXDATA[15:0] Transmit Data

This register is a mirror of:

- USART Transmit Holding Register (FLEX\_US\_THR) if FLEX\_MR.OPMODE field equals 1
- SPI Transmit Data Register (FLEX\_SPI\_TDR) if FLEX\_MR.OPMODE field equals 2
- TWI Transmit Holding Register (FLEX\_TWI\_THR) if FLEX\_MR.OPMODE field equals 3

### 39.10.4 USART Control Register

**Name:** FLEX\_US\_CR  
**Offset:** 0x200  
**Reset:** –  
**Property:** Write-only

|        |         |        |    |        |    |         |        |        |
|--------|---------|--------|----|--------|----|---------|--------|--------|
| Bit    | 31      | 30     | 29 | 28     | 27 | 26      | 25     | 24     |
|        | FIFODIS | FIFOEN |    | REQCLR |    | TXFLCLR | RXFCLR | TXFCLR |
| Access | W       | W      |    | W      |    | W       | W      | W      |
| Reset  | –       | –      |    | –      |    | –       | –      | –      |

|        |    |    |         |        |        |       |    |    |

| Reset  | –     | –       | –     | –     | –     | –      | –      | –      |

|        |       |      |       |      |       |       |   |   |
|--------|-------|------|-------|------|-------|-------|---|---|
| Bit    | 7     | 6    | 5     | 4    | 3     | 2     | 1 | 0 |
|        | TXDIS | TXEN | RXDIS | RXEN | RSTTX | RSTRX |   |   |
| Access | W     | W    | W     | W    | W     | W     |   |   |
| Reset  | –     | –    | –     | –    | –     | –     |   |   |

#### Bit 31 – FIFODIS FIFO Disable

| Value | Description                              |
|-------|------------------------------------------|
| 0     | No effect.                               |
| 1     | Disables the Transmit and Receive FIFOs. |

#### Bit 30 – FIFOEN FIFO Enable

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | No effect.                              |
| 1     | Enables the Transmit and Receive FIFOs. |

#### Bit 28 – REQCLR Request to Clear the Comparison Trigger

| Value | Description                                                    |
|-------|----------------------------------------------------------------|
| 0     | No effect.                                                     |
| 1     | Restarts the comparison trigger to enable FLEX_US_RHR loading. |

#### Bit 26 – TXFLCLR Transmit FIFO Lock CLEAR

| Value | Description                    |
|-------|--------------------------------|
| 0     | No effect.                     |
| 1     | Clears the Transmit FIFO Lock. |

#### Bit 25 – RXFCLR Receive FIFO Clear

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | Empties the Receive FIFO. |

#### Bit 24 – TXFCLR Transmit FIFO Clear

| Value | Description                |
|-------|----------------------------|
| 0     | No effect.                 |
| 1     | Empties the Transmit FIFO. |

**Bit 21 – LINWKUP** Send LIN Wakeup Signal

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Sends a wakeup signal on the LIN bus. |

**Bit 20 – LINABT** Abort LIN Transmission

| Value | Description                          |
|-------|--------------------------------------|
| 0     | No effect.                           |
| 1     | Aborts the current LIN transmission. |

**Bit 19 – RTSDIS** Request to Send Disable

| Value | Description                                                                                                                  |
|-------|------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                   |
| 1     | Drives the RTS pin to 0 if FLEX_US_MR.USART_MODE field = 2, else drives the RTS pin to 1 if FLEX_US_MR.USART_MODE field = 0. |

**Bit 18 – RTSEN** Request to Send Enable

| Value | Description                                                                                                                  |
|-------|------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                   |
| 1     | Drives the RTS pin to 1 if FLEX_US_MR.USART_MODE field = 2, else drives the RTS pin to 0 if FLEX_US_MR.USART_MODE field = 0. |

**Bit 15 – RETTO** Start Timeout Immediately

| Value | Description                          |
|-------|--------------------------------------|
| 0     | No effect                            |
| 1     | Immediately restarts timeout period. |

**Bit 14 – RSTNACK** Reset Non Acknowledge

| Value | Description              |
|-------|--------------------------|
| 0     | No effect                |
| 1     | Resets FLEX_US_CSR.NACK. |

**Bit 13 – RSTIT** Reset Iterations

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | No effect.                                                        |
| 1     | Resets FLEX_US_CSR.ITER. No effect if the ISO7816 is not enabled. |

**Bit 12 – SENDA** Send Address

| Value | Description                                                                                         |
|-------|-----------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                          |
| 1     | In Multidrop mode only, the next character written to FLEX_US_THR is sent with the address bit set. |

**Bit 11 – STTTO** Clear TIMEOUT Flag and Start Timeout After Next Character Received

| Value | Description                                                                                                                                                       |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                        |
| 1     | Starts waiting for a character before clocking the timeout counter. Immediately disables a timeout period in progress. Resets the FLEX_US_CSR.TIMEOUT status bit. |

**Bit 10 – STPBRK** Stop Break

| Value | Description                                                                                                                                                           |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                            |
| 1     | Stops transmission of the break after a minimum of one character length and transmits a high level during 12-bit periods. No effect if no break is being transmitted. |

**Bit 9 – STTBRK Start Break**

| Value | Description                                                                                                                                                                          |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                           |
| 1     | Starts transmission of a break after the characters present in FLEX_US_THR and the Transmit Shift Register have been transmitted. No effect if a break is already being transmitted. |

**Bit 8 – RSTSTA Reset Status Bits**

| Value | Description                                                                                                                                                                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                                                         |
| 1     | Resets the PARE, FRAME, OVRE, MANE, LINBE, LINISFE, LINIPE, LINC, LINSNRE, LINSTE, LINHTE, LINID, LINTC, LINBK, CMP and RXBRK in FLEX_US_CSR status bits, as well as the TXFEF, TXFFF, TXFTHF, RXFEF, RXFFF, RXFTHF, TXFPTEF, RXFPTEF in FLEX_US_FESR status bits. |

**Bit 7 – TXDIS Transmitter Disable**

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | Disables the transmitter. |

**Bit 6 – TXEN Transmitter Enable**

| Value | Description                            |
|-------|----------------------------------------|
| 0     | No effect.                             |
| 1     | Enables the transmitter if TXDIS is 0. |

**Bit 5 – RXDIS Receiver Disable**

| Value | Description            |
|-------|------------------------|
| 0     | No effect.             |
| 1     | Disables the receiver. |

**Bit 4 – RXEN Receiver Enable**

| Value | Description                          |
|-------|--------------------------------------|
| 0     | No effect.                           |
| 1     | Enables the receiver, if RXDIS is 0. |

**Bit 3 – RSTTX Reset Transmitter**

| Value | Description             |
|-------|-------------------------|
| 0     | No effect.              |
| 1     | Resets the transmitter. |

**Bit 2 – RSTRX Reset Receiver**

| Value | Description          |
|-------|----------------------|
| 0     | No effect.           |
| 1     | Resets the receiver. |

### 39.10.5 USART Mode Register

**Name:** FLEX\_US\_MR  
**Offset:** 0x204  
**Reset:** 0xC0000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

|        |        |         |     |        |    |                    |     |     |
|--------|--------|---------|-----|--------|----|--------------------|-----|-----|
| Bit    | 31     | 30      | 29  | 28     | 27 | 26                 | 25  | 24  |

|        | CHRL[1:0] |     | USCLKS[1:0] |     | USART_MODE[3:0] |     |     |     |
| Access | R/W       | R/W | R/W         | R/W | R/W             | R/W | R/W | R/W |
| Reset  | -         | -   | -           | -   | -               | -   | -   | -   |

#### Bit 31 – ONEBIT Start Frame Delimiter Selector

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | Start frame delimiter is COMMAND or DATA SYNC. |
| 1     | Start frame delimiter is one bit.              |

#### Bit 30 – MODSYNC Manchester Synchronization Mode

| Value | Description                                      |
|-------|--------------------------------------------------|
| 0     | The Manchester start bit is a 0 to 1 transition  |
| 1     | The Manchester start bit is a 1 to 0 transition. |

#### Bit 29 – MAN Manchester Encoder/Decoder Enable

| Value | Description                              |
|-------|------------------------------------------|
| 0     | Manchester encoder/decoder are disabled. |
| 1     | Manchester encoder/decoder are enabled.  |

#### Bit 28 – FILTER Receive Line Filter

| Value | Description                                                                                          |
|-------|------------------------------------------------------------------------------------------------------|
| 0     | The USART does not filter the receive line.                                                          |
| 1     | The USART filters the receive line using a three-sample filter (1/16-bit clock) (2 over 3 majority). |

#### Bits 26:24 – MAX\_ITERATION[2:0] Maximum Number of Automatic Iterations

| Value | Description                                                               |
|-------|---------------------------------------------------------------------------|
| 0–7   | Defines the maximum number of iterations in mode ISO7816, protocol T = 0. |

#### Bit 23 – INVDATA Inverted Data

| Value | Description                                                                                                                                                                                                                                                                                                                                        |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The data field transmitted on TXD line is the same as the one written in FLEX_US_THR or the content read in FLEX_US_RHR is the same as RXD line. Normal mode of operation.                                                                                                                                                                         |
| 1     | The data field transmitted on TXD line is inverted (voltage polarity only) compared to the value written in FLEX_US_THR or the content read in FLEX_US_RHR is inverted compared to what is received on RXD line (or ISO7816 IO line). Inverted mode of operation, useful for contactless card application. To be used with configuration bit MSBF. |

**Bit 22 – VAR\_SYNC** Variable Synchronization of Command/Data Sync Start Frame Delimiter

| Value | Description                                                                          |
|-------|--------------------------------------------------------------------------------------|
| 0     | User defined configuration of command or data sync field depending on MODSYNC value. |
| 1     | The sync field is updated when a character is written into FLEX_US_THR.              |

**Bit 21 – DSNACK** Disable Successive NACK

The MAX\_ITERATION field must be cleared if DSNACK is cleared.

| Value | Description                                                                                                                                                                                                                                              |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | NACK is sent on the ISO line as soon as a parity error occurs in the received character (unless INACK is set).                                                                                                                                           |
| 1     | Successive parity errors are counted up to the value specified in the MAX_ITERATION field. These parity errors generate a NACK on the ISO line. As soon as this value is reached, no additional NACK is sent on the ISO line. The flag ITER is asserted. |

**Bit 20 – INACK** Inhibit Non Acknowledge

| Value | Description                |
|-------|----------------------------|
| 0     | The NACK is generated.     |
| 1     | The NACK is not generated. |

**Bit 19 – OVER** Oversampling Mode

| Value | Description       |
|-------|-------------------|
| 0     | 16x Oversampling. |
| 1     | 8x Oversampling.  |

**Bit 18 – CLKO** Clock Output Select

| Value | Description                                                                                                              |
|-------|--------------------------------------------------------------------------------------------------------------------------|
| 0     | The USART does not drive the SCK pin (Synchronous Slave mode or Asynchronous mode with external baud rate clock source). |
| 1     | The USART drives the SCK pin if USCLKS does not select the external clock SCK (USART Synchronous Master mode).           |

**Bit 17 – MODE9** 9-bit Character Length

| Value | Description                    |
|-------|--------------------------------|
| 0     | CHRL defines character length. |
| 1     | 9-bit character length.        |

**Bit 16 – MSBF** Bit Order

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | Least significant bit is sent/received first. |
| 1     | Most significant bit is sent/received first.  |

**Bits 15:14 – CHMODE[1:0]** Channel Mode

| Value | Name            | Description                                                            |
|-------|-----------------|------------------------------------------------------------------------|
| 0     | NORMAL          | Normal mode                                                            |
| 1     | AUTOMATIC       | Automatic Echo. Receiver input is connected to the TXD pin.            |
| 2     | LOCAL_LOOPBACK  | Local Loopback. Transmitter output is connected to the Receiver Input. |
| 3     | REMOTE_LOOPBACK | Remote Loopback. RXD pin is internally connected to the TXD pin.       |

**Bits 13:12 – NBSTOP[1:0]** Number of Stop Bits

| Value | Name  | Description |
|-------|-------|-------------|
| 0     | 1_BIT | 1 stop bit  |

| Value | Name    | Description                                    |
|-------|---------|------------------------------------------------|
| 1     | 1_5_BIT | 1.5 stop bit (SYNC = 0) or reserved (SYNC = 1) |
| 2     | 2_BIT   | 2 stop bits                                    |

**Bits 11:9 – PAR[2:0] Parity Type**

| Value | Name      | Description                |
|-------|-----------|----------------------------|
| 0     | EVEN      | Even parity                |
| 1     | ODD       | Odd parity                 |
| 2     | SPACE     | Parity forced to 0 (Space) |
| 3     | MARK      | Parity forced to 1 (Mark)  |
| 4     | NO        | No parity                  |
| 6     | MULTIDROP | Multidrop mode             |

**Bit 8 – SYNC Synchronous Mode Select**

| Value | Description                                 |
|-------|---------------------------------------------|
| 0     | USART operates in Asynchronous mode (UART). |
| 1     | USART operates in Synchronous mode.         |

**Bits 7:6 – CHRL[1:0] Character Length**

| Value | Name  | Description                |
|-------|-------|----------------------------|
| 0     | 5_BIT | Character length is 5 bits |
| 1     | 6_BIT | Character length is 6 bits |
| 2     | 7_BIT | Character length is 7 bits |
| 3     | 8_BIT | Character length is 8 bits |

**Bits 5:4 – USCLKS[1:0] Clock Selection**

| Value | Name | Description                                                                                              |
|-------|------|----------------------------------------------------------------------------------------------------------|
| 0     | MCK  | Peripheral clock is selected                                                                             |
| 1     | DIV  | Peripheral clock divided (DIV = 8) is selected                                                           |
| 2     | GCLK | PMC generic clock is selected. If the SCK pin is driven (CLKO = 1), the CD field must be greater than 1. |
| 3     | SCK  | External pin SCK is selected                                                                             |

**Bits 3:0 – USART\_MODE[3:0] USART Mode of Operation**

Values not listed in the table below should be considered 'reserved'.

| Value | Name           | Description             |
|-------|----------------|-------------------------|
| 0x0   | NORMAL         | Normal mode             |
| 0x1   | RS485          | RS485                   |
| 0x2   | HW_HANDSHAKING | Hardware handshaking    |
| 0x4   | IS07816_T_0    | IS07816 Protocol: T = 0 |
| 0x6   | IS07816_T_1    | IS07816 Protocol: T = 1 |

### 39.10.6 USART Interrupt Enable Register

**Name:** FLEX\_US\_IER  
**Offset:** 0x208  
**Reset:** –  
**Property:** Write-only

For LIN-specific configurations, see [USART Interrupt Enable Register \(LIN\\_MODE\)](#).

For LON-specific configurations, see [USART Interrupt Enable Register \(LON\\_MODE\)](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt.

|        |    |    |    |    |    |    |    |      |
|--------|----|----|----|----|----|----|----|------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        |    |    |    |    |    |    |    | MANE |

**Bit 28 – LBLOVFE** LON Backlog Overflow Error Interrupt Disable

**Bit 27 – LRXD** LON Reception Done Interrupt Disable

**Bit 26 – LFET** LON Frame Early Termination Interrupt Disable

**Bit 25 – LCOL** LON Collision Interrupt Disable

**Bit 24 – LTXD** LON Transmission Done Interrupt Disable

**Bit 10 – UNRE** Underrun Error Interrupt Disable

**Bit 9 – TXEMPTY** TXEMPTY Interrupt Disable

**Bit 7 – LCRCE** LON CRC Error Interrupt Disable

**Bit 6 – LSFE** LON Short Frame Error Interrupt Disable

**Bit 5 – OVRE** Overrun Error Interrupt Disable

**Bit 1 – TXRDY** TXRDY Interrupt Disable

**Bit 0 – RXRDY** RXRDY Interrupt Disable

### 39.10.12 USART Interrupt Mask Register

**Name:** FLEX\_US\_IMR  
**Offset:** 0x210  
**Reset:** 0x00000000  
**Property:** Read-only

For LIN-specific configurations, see [USART Interrupt Mask Register \(LIN\\_MODE\)](#).

For LON-specific configurations, see [USART Interrupt Mask Register \(LON\\_MODE\)](#).

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

|        |    |    |    |    |    |    |    |      |
|--------|----|----|----|----|----|----|----|------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        |    |    |    |    |    |    |    | MANE |
| Access |    |    |    |    |    |    |    | R    |
| Reset  |    |    |    |    |    |    |    | 0    |

|        |    |     |    |    |       |    |    |    |
|--------|----|-----|----|----|-------|----|----|----|

### 39.10.15 USART Channel Status Register

**Name:** FLEX\_US\_CSR  
**Offset:** 0x214  
**Reset:** 0x00000000  
**Property:** Read-only

If enabled in the SFR module (default is disabled), a debugger read access does not clear the flag CTSIC.

For LIN-specific configurations, see [USART Channel Status Register \(LIN\\_MODE\)](#).

For LON-specific configurations, see [USART Channel Status Register \(LON\\_MODE\)](#).

| Reset  | -    | -     | -    |   |   | -     | -     | -     |

#### Bit 24 – MANE Manchester Error

| Value | Description                                                                               |
|-------|-------------------------------------------------------------------------------------------|
| 0     | No Manchester error has been detected since the last RSTSTA command was issued.           |
| 1     | At least one Manchester error has been detected since the last RSTSTA command was issued. |

#### Bit 23 – CTS Image of CTS Input

| Value | Description               |
|-------|---------------------------|
| 0     | CTS input is driven low.  |
| 1     | CTS input is driven high. |

#### Bit 22 – CMP Comparison Status

| Value | Description                                                                                                                                       |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No received character matched the comparison criteria programmed in VAL1, VAL2 fields and CMPPAR bit in since the last RSTSTA command was issued. |
| 1     | A received character matched the comparison criteria since the last RSTSTA command was issued.                                                    |

#### Bit 19 – CTSIC Clear to Send Input Change Flag

| Value | Description                                                                                    |
|-------|------------------------------------------------------------------------------------------------|
| 0     | No input change has been detected on the CTS pin since the last read of FLEX_US_CSR.           |
| 1     | At least one input change has been detected on the CTS pin since the last read of FLEX_US_CSR. |

#### Bit 13 – NACK Non Acknowledge Interrupt

| Value | Description                                                            |
|-------|------------------------------------------------------------------------|
| 0     | Non acknowledge has not been detected since the last RSTNACK.          |
| 1     | At least one non acknowledge has been detected since the last RSTNACK. |

**Bit 10 – ITER** Max Number of Repetitions Reached

| Value | Description                                                                                 |
|-------|---------------------------------------------------------------------------------------------|
| 0     | Maximum number of repetitions has not been reached since the last RSTIT command was issued. |
| 1     | Maximum number of repetitions has been reached since the last RSTIT command was issued.     |

**Bit 9 – TXEMPTY** Transmitter Empty (cleared by writing FLEX\_US\_THR)

| Value | Description                                                                                                |
|-------|------------------------------------------------------------------------------------------------------------|
| 0     | There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled. |
| 1     | There are no characters in FLEX_US_THR, nor in the Transmit Shift Register.                                |

**Bit 8 – TIMEOUT** Receiver Timeout

| Value | Description                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------|
| 0     | There has not been a timeout since the last Start Timeout command (FLEX_US_CR.STTTO) or the Timeout Register is 0. |
| 1     | There has been a timeout since the last Start Timeout command (FLEX_US_CR.STTTO).                                  |

**Bit 7 – PARE** Parity Error

| Value | Description                                                                           |
|-------|---------------------------------------------------------------------------------------|
| 0     | No parity error has been detected since the last RSTSTA command was issued.           |
| 1     | At least one parity error has been detected since the last RSTSTA command was issued. |

**Bit 6 – FRAME** Framing Error

| Value | Description                                                                           |
|-------|---------------------------------------------------------------------------------------|
| 0     | No stop bit has been detected low since the last RSTSTA command was issued.           |
| 1     | At least one stop bit has been detected low since the last RSTSTA command was issued. |

**Bit 5 – OVRE** Overrun Error

| Value | Description                                                                       |
|-------|-----------------------------------------------------------------------------------|
| 0     | No overrun error has occurred since the last RSTSTA command was issued.           |
| 1     | At least one overrun error has occurred since the last RSTSTA command was issued. |

**Bit 2 – RXBRK** Break Received/End of Break

| Value | Description                                                                          |
|-------|--------------------------------------------------------------------------------------|
| 0     | No break received or end of break detected since the last RSTSTA command was issued. |
| 1     | Break received or end of break detected since the last RSTSTA command was issued.    |

**Bit 1 – TXRDY** Transmitter Ready (cleared by writing FLEX\_US\_THR)

When FIFOs are disabled:

0: A character in FLEX\_US\_THR is waiting to be transferred to the Transmit Shift Register, or an STTBRK command has been requested, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1.

1: There is no character in FLEX\_US\_THR.

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

TXRDY behavior with FIFO enabled is illustrated in [39.7.11.5. TXEMPTY, TXRDY and RXRDY Behavior](#).

**Bit 0 – RXRDY** Receiver Ready (cleared by reading FLEX\_US\_RHR)

When FIFOs are disabled:

0: No complete character has been received since the last read of FLEX\_US\_RHR or the receiver is disabled. If characters were received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled.

1: At least one complete character has been received and FLEX\_US\_RHR has not yet been read.

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read

1: At least one unread data is in the Receive FIFO

RXRDY behavior with FIFO enabled is illustrated in [39.7.11.5. TXEMPTY, TXRDY and RXRDY Behavior](#).

**39.10.16 USART Channel Status Register (LIN\_MODE)****Name:** FLEX\_US\_CSR (LIN\_MODE)**Offset:** 0x214**Reset:** –**Property:** Read-only

This configuration is relevant only if USART\_MODE = 0xA or 0xB in the [USART Mode Register](#).

**Bit 31 – LINHTE LIN Header Timeout Error**

| Value | Description                                                                             |
|-------|-----------------------------------------------------------------------------------------|
| 0     | No LIN header timeout error has been detected since the last RSTSTA command was issued. |
| 1     | A LIN header timeout error has been detected since the last RSTSTA command was issued.  |

**Bit 30 – LINSTE LIN Synch Tolerance Error**

| Value | Description                                                                              |
|-------|------------------------------------------------------------------------------------------|
| 0     | No LIN synch tolerance error has been detected since the last RSTSTA command was issued. |
| 1     | A LIN synch tolerance error has been detected since the last RSTSTA command was issued.  |

**Bit 29 – LINSNRE LIN Slave Not Responding Error**

| Value | Description                                                                                   |
|-------|-----------------------------------------------------------------------------------------------|
| 0     | No LIN slave not responding error has been detected since the last RSTSTA command was issued. |
| 1     | A LIN slave not responding error has been detected since the last RSTSTA command was issued.  |

**Bit 28 – LINCE LIN Checksum Error**

| Value | Description                                                                       |
|-------|-----------------------------------------------------------------------------------|
| 0     | No LIN checksum error has been detected since the last RSTSTA command was issued. |
| 1     | A LIN checksum error has been detected since the last RSTSTA command was issued.  |

**Bit 27 – LINIPE LIN Identifier Parity Error**

| Value | Description                                                                                |
|-------|--------------------------------------------------------------------------------------------|
| 0     | No LIN identifier parity error has been detected since the last RSTSTA command was issued. |
| 1     | A LIN identifier parity error has been detected since the last RSTSTA command was issued.  |

**Bit 26 – LINISFE LIN Inconsistent Synch Field Error**

| Value | Description                                                                                                                                  |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No LIN inconsistent synch field error has been detected since the last RSTSTA                                                                |
| 1     | The USART is configured as a slave node and a LIN Inconsistent synch field error has been detected since the last RSTSTA command was issued. |

**Bit 25 – LINBE LIN Bit Error**

| Value | Description                                                              |
|-------|--------------------------------------------------------------------------|
| 0     | No bit error has been detected since the last RSTSTA command was issued. |
| 1     | A bit error has been detected since the last RSTSTA command was issued.  |

**Bit 23 – LINBLS LIN Bus Line Status**

| Value | Description               |
|-------|---------------------------|
| 0     | LIN bus line is set to 0. |
| 1     | LIN bus line is set to 1. |

**Bit 15 – LINTC LIN Transfer Completed**

| Value | Description                                                                 |
|-------|-----------------------------------------------------------------------------|
| 0     | The USART is idle or a LIN transfer is ongoing.                             |
| 1     | A LIN transfer has been completed since the last RSTSTA command was issued. |

**Bit 14 – LINID LIN Identifier Sent or LIN Identifier Received**

If USART operates in LIN Master mode (USART\_MODE = 0xA):

0: No LIN identifier has been sent since the last RSTSTA command was issued.

1: At least one LIN identifier has been sent since the last RSTSTA command was issued.

If USART operates in LIN Slave mode (USART\_MODE = 0xB):

0: No LIN identifier has been received since the last RSTSTA command was issued.

1: At least one LIN identifier has been received since the last RSTSTA.

**Bit 13 – LINBK LIN Break Sent or LIN Break Received**

Applicable if USART operates in LIN Master mode (USART\_MODE = 0xA):

0: No LIN break has been sent since the last RSTSTA command was issued.

1: At least one LIN break has been sent since the last RSTSTA.

If USART operates in LIN Slave mode (USART\_MODE = 0xB):

0: No LIN break has received sent since the last RSTSTA command was issued.

1: At least one LIN break has been received since the last RSTSTA command was issued.

**Bit 9 – TXEMPTY Transmitter Empty (cleared by writing FLEX\_US\_THR)**

| Value | Description                                                                                                |
|-------|------------------------------------------------------------------------------------------------------------|
| 0     | There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled. |
| 1     | There are no characters in FLEX_US_THR, nor in the Transmit Shift Register.                                |

**Bit 8 – TIMEOUT Receiver Timeout**

| Value | Description                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------|
| 0     | There has not been a timeout since the last start timeout command (FLEX_US_CR.STTTO) or the Timeout Register is 0. |
| 1     | There has been a timeout since the last start timeout command (FLEX_US_CR.STTTO).                                  |

**Bit 7 – PARE Parity Error**

| Value | Description                                                                           |
|-------|---------------------------------------------------------------------------------------|
| 0     | No parity error has been detected since the last RSTSTA command was issued.           |
| 1     | At least one parity error has been detected since the last RSTSTA command was issued. |

**Bit 6 – FRAME Framing Error**

| Value | Description                                                                           |
|-------|---------------------------------------------------------------------------------------|
| 0     | No stop bit has been detected low since the last RSTSTA command was issued.           |
| 1     | At least one stop bit has been detected low since the last RSTSTA command was issued. |

**Bit 5 – OVRE** Overrun Error

| Value | Description                                                                       |
|-------|-----------------------------------------------------------------------------------|
| 0     | No overrun error has occurred since the last RSTSTA command was issued.           |
| 1     | At least one overrun error has occurred since the last RSTSTA command was issued. |

**Bit 1 – TXRDY** Transmitter Ready (cleared by writing FLEX\_US\_THR)

| Value | Description                                                                                                                                                                     |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | A character in FLEX_US_THR is waiting to be transferred to the Transmit Shift Register, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1. |
| 1     | There is no character in FLEX_US_THR.                                                                                                                                           |

**Bit 0 – RXRDY** Receiver Ready (cleared by reading FLEX\_US\_RHR)

| Value | Description                                                                                                                                                                                                                |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No complete character has been received since the last read of FLEX_US_RHR or the receiver is disabled. If characters were being received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled. |
| 1     | At least one complete character has been received and FLEX_US_RHR has not yet been read.                                                                                                                                   |

**39.10.17 USART Channel Status Register (LON\_MODE)****Name:** FLEX\_US\_CSR (LON\_MODE)**Offset:** 0x214**Reset:** –**Property:** Read-only

This configuration is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

**Bit 28 – LBLOVFE LON Backlog Overflow Error**

| Value | Description                                                                            |
|-------|----------------------------------------------------------------------------------------|
| 0     | No backlog overflow error occurred since the last RSTSTA command was issued.           |
| 1     | At least one backlog error overflow occurred since the last RSTSTA command was issued. |

**Bit 27 – LRXD LON Reception End Flag**

| Value | Description                                                                           |
|-------|---------------------------------------------------------------------------------------|
| 0     | Reception on going or no reception occurred since the last RSTSTA command was issued. |
| 1     | At least one reception has been performed since the last RSTSTA command was issued.   |

**Bit 26 – LFET LON Frame Early Termination**

| Value | Description                                                                                                                                                          |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No frame has been terminated early due to collision detection since the last RSTSTA command was issued.                                                              |
| 1     | At least one transmission has been terminated due to collision detection since the last RSTSTA command was issued. (This stops the DMA until reset with RSTSTA bit). |

**Bit 25 – LCOL LON Collision Detected Flag**

| Value | Description                                                                                  |
|-------|----------------------------------------------------------------------------------------------|
| 0     | No collision occurred while transmitting since the last RSTSTA command was issued.           |
| 1     | At least one collision occurred while transmitting since the last RSTSTA command was issued. |

**Bit 24 – LTXD LON Transmission End Flag**

| Value | Description                                                                                 |
|-------|---------------------------------------------------------------------------------------------|
| 0     | Transmission on going or no transmission occurred since the last RSTSTA command was issued. |
| 1     | At least one transmission has been performed since the last RSTSTA command was issued.      |

**Bit 10 – UNRE Underrun Error**

| Value | Description                                                                            |
|-------|----------------------------------------------------------------------------------------|
| 0     | No LON underrun error has occurred since the last RSTSTA command was issued.           |
| 1     | At least one LON underrun error has occurred since the last RSTSTA command was issued. |

**Bit 9 – TXEMPTY Transmitter Empty (cleared by writing FLEX\_US\_THR)**

| Value | Description                                                                                                |
|-------|------------------------------------------------------------------------------------------------------------|
| 0     | There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled. |
| 1     | There are no characters in FLEX_US_THR, nor in the Transmit Shift Register.                                |

**Bit 7 – LCRCE LON CRC Error**

| Value | Description                                                                        |
|-------|------------------------------------------------------------------------------------|
| 0     | No CRC error has been detected since the last RSTSTA command was issued.           |
| 1     | At least one CRC error has been detected since the last RSTSTA command was issued. |

**Bit 6 – LSFE LON Short Frame Error**

| Value | Description                                                                 |
|-------|-----------------------------------------------------------------------------|
| 0     | No short frame received since the last RSTSTA command was issued.           |
| 1     | At least one short frame received since the last RSTSTA command was issued. |

**Bit 5 – OVRE Overrun Error**

| Value | Description                                                                       |
|-------|-----------------------------------------------------------------------------------|
| 0     | No overrun error has occurred since the last RSTSTA command was issued.           |
| 1     | At least one overrun error has occurred since the last RSTSTA command was issued. |

**Bit 1 – TXRDY Transmitter Ready (cleared by writing FLEX\_US\_THR)**

| Value | Description                                                                                                                                                                     |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | A character in FLEX_US_THR is waiting to be transferred to the Transmit Shift Register, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1. |
| 1     | There is no character in FLEX_US_THR.                                                                                                                                           |

**Bit 0 – RXRDY Receiver Ready (cleared by reading FLEX\_US\_RHR)**

| Value | Description                                                                                                                                                                                                                |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No complete character has been received since the last read of FLEX_US_RHR or the receiver is disabled. If characters were being received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled. |
| 1     | At least one complete character has been received and FLEX_US_RHR has not yet been read.                                                                                                                                   |

### 39.10.18 USART Receive Holding Register

**Name:** FLEX\_US\_RHR  
**Offset:** 0x218  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit) and FLEX\_US\_FMR.RXRDYM = 0, see [39.7.11.6. USART Single Data Mode](#) for details.

If enabled in the SFR module (default is disabled), a debugger read access on FLEX\_US\_RHR does not clear the FLEX\_US\_CSR.RXRDY flag.

|        |        |    |    |    |    |    |    |          |
|--------|--------|----|----|----|----|----|----|----------|
| Bit    | 31     | 30 | 29 | 28 | 27 | 26 | 25 | 24       |
|        |        |    |    |    |    |    |    |          |

| Reset  |        |    |    |    |    |    |    |          |
| Bit    | 23     | 22 | 21 | 20 | 19 | 18 | 17 | 16       |
|        |        |    |    |    |    |    |    |          |
| Access |        |    |    |    |    |    |    |          |
| Reset  |        |    |    |    |    |    |    |          |
| Bit    | 15     | 14 | 13 | 12 | 11 | 10 | 9  | 8        |
|        | RXSYNH |    |    |    |    |    |    | RXCHR[8] |
| Access | R      |    |    |    |    |    |    | R        |
| Reset  | 0      |    |    |    |    |    |    | 0        |
| Bit    | 7      | 6  | 5  | 4  | 3  | 2  | 1  | 0        |
|        |        |    |    |    |    |    |    |          |
|        |        |    |    |    |    |    |    |          |
| Access | R      | R  | R  | R  | R  | R  | R  | R        |
| Reset  | 0      | 0  | 0  | 0  | 0  | 0  | 0  | 0        |

#### Bit 15 – RXSYNH Received Sync

| Value | Description                           |
|-------|---------------------------------------|
| 0     | Last character received is a data.    |
| 1     | Last character received is a command. |

#### Bits 8:0 – RXCHR[8:0] Received Character

Last character received if RXRDY is set.

39.10.19 USART Receive Holding Register (FIFO Multi Data)

**Name:** FLEX\_US\_RHR (FIFO\_MULTI\_DATA)  
**Offset:** 0x218  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit) and FLEX\_US\_FMR.RXRDYM > 0, see [39.7.11.7. USART Multiple Data Mode](#) for details.

If enabled in the SFR module (default is disabled), a debugger read access on FLEX\_US\_RHR does not modify the Receive FIFO status.

|        |             |    |    |    |    |    |    |    |

|        | RXCHR1[7:0] |    |    |    |    |    |    |    |
| Access | R           | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7           | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | RXCHR0[7:0] |    |    |    |    |    |    |    |
| Access | R           | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 0:7, 8:15, 16:23, 24:31 – RXCHR<sub>x</sub> Received Character**  
 First unread character in the Receive FIFO if RXRDY is set.

### 39.10.20 USART Transmit Holding Register

**Name:** FLEX\_US\_THR  
**Offset:** 0x21C  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit) and FLEX\_US\_FMR.TXRDY = 0, see [39.7.11.6. USART Single Data Mode](#) for details.

|        |            |    |    |    |    |    |    |          |
|--------|------------|----|----|----|----|----|----|----------|

|        |            |    |    |    |    |    |    |          |
| Access |            |    |    |    |    |    |    |          |
| Reset  |            |    |    |    |    |    |    |          |
| Bit    | 23         | 22 | 21 | 20 | 19 | 18 | 17 | 16       |
|        |            |    |    |    |    |    |    |          |
| Access |            |    |    |    |    |    |    |          |
| Reset  |            |    |    |    |    |    |    |          |
| Bit    | 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8        |
|        | TXSYNH     |    |    |    |    |    |    | TXCHR[8] |
| Access | W          |    |    |    |    |    |    | W        |
| Reset  | –          |    |    |    |    |    |    | –        |
| Bit    | 7          | 6  | 5  | 4  | 3  | 2  | 1  | 0        |
|        | TXCHR[7:0] |    |    |    |    |    |    |          |
| Access | W          | W  | W  | W  | W  | W  | W  | W        |
| Reset  | –          | –  | –  | –  | –  | –  | –  | –        |

#### Bit 15 – TXSYNH Sync Field to be Transmitted

| Value | Description                                                                             |
|-------|-----------------------------------------------------------------------------------------|
| 0     | The next character sent is encoded as a data. Start frame delimiter is DATA SYNC.       |
| 1     | The next character sent is encoded as a command. Start frame delimiter is COMMAND SYNC. |

#### Bits 8:0 – TXCHR[8:0] Character to be Transmitted

The next character to be transmitted after the current character if TXRDY is not set.

**39.10.21 USART Transmit Holding Register (FIFO Multi Data)**

**Name:** FLEX\_US\_THR (FIFO\_MULTI\_DATA)  
**Offset:** 0x21C  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit) and FLEX\_US\_FMR.TXRDY > 0, see [39.7.11.7. USART Multiple Data Mode](#) for details.

|        | CD[15:8] |     |     |     |     |     |         |     |
| Access | R/W      | R/W | R/W | R/W | R/W | R/W | R/W     | R/W |
| Reset  | 0        | 0   | 0   | 0   | 0   | 0   | 0       | 0   |
| Bit    | 7        | 6   | 5   | 4   | 3   | 2   | 1       | 0   |
|        | CD[7:0]  |     |     |     |     |     |         |     |
| Access | R/W      | R/W | R/W | R/W | R/W | R/W | R/W     | R/W |
| Reset  | 0        | 0   | 0   | 0   | 0   | 0   | 0       | 0   |

Bits 18:16 – FP[2:0] Fractional Part

When the value of field FP is greater than 0, the SCK (oversampling clock) generates nonconstant duty cycles. The SCK high duration is increased by “selected clock” period from time to time. The duty cycle depends on the value of the CD field.

| Value | Description                                        |
|-------|----------------------------------------------------|
| 0     | Fractional divider is disabled.                    |
| 1–7   | Baud rate resolution, defined by $FP \times 1/8$ . |

Bits 15:0 – CD[15:0] Clock Divider

| CD         | USART_MODE ≠ ISO7816                   |                                       |                                 | USART_MODE = ISO7816                            |
|------------|----------------------------------------|---------------------------------------|---------------------------------|-------------------------------------------------|
|            | SYNC = 0                               |                                       | SYNC = 1                        |                                                 |
|            | OVER = 0                               | OVER = 1                              |                                 |                                                 |
| 0          | Baud Rate Clock Disabled               |                                       |                                 |                                                 |
| 1 to 65535 | CD = Selected Clock / (16 × Baud Rate) | CD = Selected Clock / (8 × Baud Rate) | CD = Selected Clock / Baud Rate | CD = Selected Clock / (FI_DI_RATIO × Baud Rate) |

### 39.10.23 USART Receiver Timeout Register

**Name:** FLEX\_US\_RTOR  
**Offset:** 0x224  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

|        |          |     |     |     |     |     |     |        |

#### Bits 16:0 – TO[16:0] Timeout Value

The TO field size is limited to 8 bits if the ISO7816 logic is not implemented on some instances of FLEXCOM. The ISO7816 logic is implemented if it is possible to write FLEX\_US\_MR.MAX\_ITERATIONS=1 (a read operation must be performed after the write operation to check that MAX\_ITERATIONS equals 1).

| Value    | Description                                                               |
|----------|---------------------------------------------------------------------------|
| 0        | The receiver timeout is disabled.                                         |
| 1–131071 | The receiver timeout is enabled and the timeout delay is TO × bit period. |

39.10.24 USART Transmitter Timeguard Register

**Name:** FLEX\_US\_TTGR  
**Offset:** 0x228  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

For LON-specific configurations, see [USART Transmitter Timeguard Register \(LON\\_MODE\)](#).

|        |         |     |     |     |     |     |     |     |
|--------|---------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31      | 30  | 29  | 28  | 27  | 26  | 25  | 24  |

| Reset  | –              | –  | –  | –  | –  | –  | –  | –  |

#### Bits 7:0 – NB\_ERRORS[7:0] Number of Errors

Total number of errors that occurred during an ISO7816 transfer. This register automatically clears when read.

39.10.29 USART IrDA FILTER Register

**Name:** FLEX\_US\_IF  
**Offset:** 0x24C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x8 in the [USART Mode Register](#).  
This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

|        |                  |     |     |     |     |     |     |     |
|--------|------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31               | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |                  |     |     |     |     |     |     |     |
| Access |                  |     |     |     |     |     |     |     |
| Reset  |                  |     |     |     |     |     |     |     |

| Access |                  |     |     |     |     |     |     |     |
| Reset  |                  |     |     |     |     |     |     |     |
| Bit    | 15               | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        |                  |     |     |     |     |     |     |     |
| Access |                  |     |     |     |     |     |     |     |
| Reset  |                  |     |     |     |     |     |     |     |
| Bit    | 7                | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | IRDA_FILTER[7:0] |     |     |     |     |     |     |     |
| Access | R/W              | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0                | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 7:0 – IRDA\_FILTER[7:0]** IrDA Filter  
The IRDA\_FILTER value must be defined to meet the following criteria:  
 $t_{\text{peripheral clock}} \times (\text{IRDA\_FILTER} + 3) < 1.41 \mu\text{s}$

### 39.10.30 USART Manchester Configuration Register

**Name:** FLEX\_US\_MAN  
**Offset:** 0x250  
**Reset:** 0xB0011004  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

|        |         |       |     |         |    |    |            |     |

|--------|----|----|----|---------|----|----|------------|-----|
| Bit    | 15 | 14 | 13 | 12      | 11 | 10 | 9          | 8   |
|        |    |    |    | TX_MPOL |    |    | TX_PP[1:0] |     |
| Access |    |    |    | R/W     |    |    | R/W        | R/W |
| Reset  |    |    |    | 1       |    |    | 0          | 0   |

|        |   |   |   |   |            |     |     |     |
|--------|---|---|---|---|------------|-----|-----|-----|
| Bit    | 7 | 6 | 5 | 4 | 3          | 2   | 1   | 0   |
|        |   |   |   |   | TX_PL[3:0] |     |     |     |
| Access |   |   |   |   | R/W        | R/W | R/W | R/W |
| Reset  |   |   |   |   | 0          | 1   | 0   | 0   |

#### Bit 31 – RXIDLEV Receiver Idle Value

| Value | Description                    |
|-------|--------------------------------|
| 0     | Receiver line idle value is 0. |
| 1     | Receiver line idle value is 1. |

#### Bit 30 – DRIFT Drift Compensation

| Value | Description                                                                 |
|-------|-----------------------------------------------------------------------------|
| 0     | The USART cannot recover from an important clock drift.                     |
| 1     | The USART can recover from clock drift. The 16X Clock mode must be enabled. |

#### Bit 29 – ONE Must Be Set to 1

Bit 29 must always be set to 1 when programming the FLEX\_US\_MAN register.

#### Bit 28 – RX\_MPOL Receiver Manchester Polarity

| Value | Description                                                                                      |
|-------|--------------------------------------------------------------------------------------------------|
| 0     | Logic zero is coded as a zero-to-one transition, Logic one is coded as a one-to-zero transition. |
| 1     | Logic zero is coded as a one-to-zero transition, Logic one is coded as a zero-to-one transition. |

#### Bits 25:24 – RX\_PP[1:0] Receiver Preamble Pattern detected

The following values assume that RX\_MPOL field is not set:

| Value | Name     | Description                        |
|-------|----------|------------------------------------|
| 0     | ALL_ONE  | The preamble is composed of '1's.  |
| 1     | ALL_ZERO | The preamble is composed of '0's.  |
| 2     | ZERO_ONE | The preamble is composed of '01's. |
| 3     | ONE_ZERO | The preamble is composed of '10's. |

**Bits 19:16 – RX\_PL[3:0] Receiver Preamble Length**

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | The receiver preamble pattern detection is disabled.                |
| 1–15  | The detected preamble length is $RX\_PL \times \text{Bit Period}$ . |

**Bit 12 – TX\_MPOL Transmitter Manchester Polarity**

| Value | Description                                                                                      |
|-------|--------------------------------------------------------------------------------------------------|
| 0     | Logic zero is coded as a zero-to-one transition, Logic one is coded as a one-to-zero transition. |
| 1     | Logic zero is coded as a one-to-zero transition, Logic one is coded as a zero-to-one transition. |

**Bits 9:8 – TX\_PP[1:0] Transmitter Preamble Pattern**

The following values assume that TX\_MPOL field is not set:

| Value | Name     | Description                        |
|-------|----------|------------------------------------|
| 0     | ALL_ONE  | The preamble is composed of '1's.  |
| 1     | ALL_ZERO | The preamble is composed of '0's.  |
| 2     | ZERO_ONE | The preamble is composed of '01's. |
| 3     | ONE_ZERO | The preamble is composed of '10's. |

**Bits 3:0 – TX\_PL[3:0] Transmitter Preamble Length**

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 0     | The transmitter preamble pattern generation is disabled.   |
| 1–15  | The preamble length is $TX\_PL \times \text{Bit Period}$ . |

## 39.10.31 USART LIN Mode Register

**Name:** FLEX\_US\_LINMR  
**Offset:** 0x254  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0xA or 0xB in the [USART Mode Register](#).

|        |          |          |          |          |          |          |           |          |
|--------|----------|----------|----------|----------|----------|----------|-----------|----------|
| Bit    | 31       | 30       | 29       | 28       | 27       | 26       | 25        | 24       |
| Access |          |          |          |          |          |          |           |          |
| Reset  |          |          |          |          |          |          |           |          |
| Bit    | 23       | 22       | 21       | 20       | 19       | 18       | 17        | 16       |
| Access |          |          |          |          |          |          | SYNCDIS   | PDCM     |
| Reset  |          |          |          |          |          |          | R/W<br>0  | R/W<br>0 |
| Bit    | 15       | 14       | 13       | 12       | 11       | 10       | 9         | 8        |
| Access | DLC[7:0] |          |          |          |          |          |           |          |
| Reset  | R/W<br>0 | R/W<br>0 | R/W<br>0 | R/W<br>0 | R/W<br>0 | R/W<br>0 | R/W<br>0  | R/W<br>0 |
| Bit    | 7        | 6        | 5        | 4        | 3        | 2        | 1         | 0        |
| Access | WKUPTYP  | FSDIS    | DLM      | CHKTYP   | CHKDIS   | PARDIS   | NACT[1:0] |          |
| Reset  | R/W<br>0 | R/W<br>0 | R/W<br>0 | R/W<br>0 | R/W<br>0 | R/W<br>0 | R/W<br>0  | R/W<br>0 |

## Bit 17 – SYNCDIS Synchronization Disable

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 0     | The synchronization procedure is performed in LIN slave node configuration.     |
| 1     | The synchronization procedure is not performed in LIN slave node configuration. |

## Bit 16 – PDCM DMAC Mode

| Value | Description                                                                       |
|-------|-----------------------------------------------------------------------------------|
| 0     | The LIN mode register FLEX_US_LINMR is not written by the DMAC.                   |
| 1     | The LIN mode register FLEX_US_LINMR (excepting that flag) is written by the DMAC. |

## Bits 15:8 – DLC[7:0] Data Length Control

| Value | Description                                                                                                 |
|-------|-------------------------------------------------------------------------------------------------------------|
| 0–255 | Defines the response data length if DLM = 0, in that case the response data length is equal to DLC+1 bytes. |

## Bit 7 – WKUPTYP Wake-up Signal Type

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 0     | Setting the LINWKUP bit in the control register sends a LIN 2.0 wake-up signal. |
| 1     | Setting the LINWKUP bit in the control register sends a LIN 1.3 wake-up signal. |

## Bit 6 – FSDIS Frame Slot Mode Disable

| Value | Description                      |
|-------|----------------------------------|
| 0     | The Frame Slot mode is enabled.  |
| 1     | The Frame Slot mode is disabled. |

## Bit 5 – DLM Data Length Mode

| Value | Description                                                                                      |
|-------|--------------------------------------------------------------------------------------------------|
| 0     | The response data length is defined by the DLC field of this register.                           |
| 1     | The response data length is defined by the bits 5 and 6 of the identifier (FLEX_US_LINIR.IDCHR). |

**Bit 4 – CHKTYP** Checksum Type

| Value | Description                 |
|-------|-----------------------------|
| 0     | LIN 2.0 “enhanced” checksum |
| 1     | LIN 1.3 “classic” checksum  |

**Bit 3 – CHKDIS** Checksum Disable

| Value | Description                                                                                                                                        |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | In master node configuration, the checksum is computed and sent automatically. In slave node configuration, the checksum is checked automatically. |
| 1     | Whatever the node configuration is, the checksum is not computed/sent and it is not checked.                                                       |

**Bit 2 – PARDIS** Parity Disable

| Value | Description                                                                                                                                                               |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | In master node configuration, the identifier parity is computed and sent automatically. In master node and slave node configuration, the parity is checked automatically. |
| 1     | Whatever the node configuration is, the Identifier parity is not computed/sent and it is not checked.                                                                     |

**Bits 1:0 – NACT[1:0]** LIN Node Action

Values which are not listed in the table must be considered as “reserved”.

| Value | Name      | Description                                                    |
|-------|-----------|----------------------------------------------------------------|
| 0     | PUBLISH   | The USART transmits the response.                              |
| 1     | SUBSCRIBE | The USART receives the response.                               |
| 2     | IGNORE    | The USART does not transmit and does not receive the response. |

39.10.32 USART LIN Identifier Register

**Name:** FLEX\_US\_LINIR  
**Offset:** 0x258  
**Reset:** 0x00000000  
**Property:** Read/Write

Write is possible only in LIN master node configuration.

This register is relevant only if USART\_MODE = 0xA or 0xB in [USART Mode Register](#).

Bits 7:0 – IDCHR[7:0] Identifier Character

If USART\_MODE = 0xA (master node configuration):

- IDCHR is Read/Write and its value is the identifier character to be transmitted.

If USART\_MODE = 0xB (slave node configuration):

- IDCHR is Read-only and its value is the last identifier character that has been received.

### 39.10.33 USART LIN Baud Rate Register

**Name:** FLEX\_US\_LINBRR  
**Offset:** 0x25C  
**Reset:** 0x00000000  
**Property:** Read-only

This register is relevant only if USART\_MODE = 0xA or 0xB in [USART Mode Register](#).  
 Returns the baud rate value after the synchronization process completion.

|        |             |    |    |    |    |            |    |    |
|--------|-------------|----|----|----|----|------------|----|----|
| Bit    | 31          | 30 | 29 | 28 | 27 | 26         | 25 | 24 |
|        |             |    |    |    |    |            |    |    |
| Access |             |    |    |    |    |            |    |    |
| Reset  |             |    |    |    |    |            |    |    |
| Bit    | 23          | 22 | 21 | 20 | 19 | 18         | 17 | 16 |
|        |             |    |    |    |    | LINFP[2:0] |    |    |
| Access |             |    |    |    |    | R          | R  | R  |
| Reset  |             |    |    |    |    | 0          | 0  | 0  |
| Bit    | 15          | 14 | 13 | 12 | 11 | 10         | 9  | 8  |
|        | LINCD[15:8] |    |    |    |    |            |    |    |
| Access | R           | R  | R  | R  | R  | R          | R  | R  |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0          | 0  | 0  |
| Bit    | 7           | 6  | 5  | 4  | 3  | 2          | 1  | 0  |
|        | LINCD[7:0]  |    |    |    |    |            |    |    |
| Access | R           | R  | R  | R  | R  | R          | R  | R  |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0          | 0  | 0  |

**Bits 18:16 – LINFP[2:0]** Fractional Part after Synchronization

**Bits 15:0 – LINCD[15:0]** Clock Divider after Synchronization

## 39.10.34 USART LON Mode Register

**Name:** FLEX\_US\_LONMR  
**Offset:** 0x260  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

|        |           |     |      |      |        |      |        |       |
|--------|-----------|-----|------|------|--------|------|--------|-------|
| Bit    | 31        | 30  | 29   | 28   | 27     | 26   | 25     | 24    |
| Access |           |     |      |      |        |      |        |       |
| Reset  |           |     |      |      |        |      |        |       |
| Bit    | 23        | 22  | 21   | 20   | 19     | 18   | 17     | 16    |
| Access | EOFS[7:0] |     |      |      |        |      |        |       |
| Reset  | R/W       | R/W | R/W  | R/W  | R/W    | R/W  | R/W    | R/W   |
| Reset  | 0         | 0   | 0    | 0    | 0      | 0    | 0      | 0     |
| Bit    | 15        | 14  | 13   | 12   | 11     | 10   | 9      | 8     |
| Access |           |     |      |      |        |      |        |       |
| Reset  |           |     |      |      |        |      |        |       |
| Bit    | 7         | 6   | 5    | 4    | 3      | 2    | 1      | 0     |
| Access |           |     | LCDS | DMAM | CDTAIL | TCOL | COLDET | COMMT |
| Reset  |           |     | R/W  | R/W  | R/W    | R/W  | R/W    | R/W   |
| Reset  |           |     | 0    | 0    | 0      | 0    | 0      | 0     |

## Bits 23:16 – EOFS[7:0] End of Frame Condition Size

| Value | Description                                                                                                                                                    |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–255 | Defines the minimum transitionless time for the IP to detect a LON end of frame condition.<br>$t_{eof} = (EOFS+1) \times t_{clock} \times 8 \times (2 - OVER)$ |

## Bit 5 – LCDS LON Collision Detection Source

| Value | Description                                 |
|-------|---------------------------------------------|
| 0     | LON collision detection source is external. |
| 1     | LON collision detection source is internal. |

## Bit 4 – DMAM LON DMA Mode

| Value | Description                                                           |
|-------|-----------------------------------------------------------------------|
| 0     | The LON data length register FLEX_US_LONDL is not written by the DMA. |
| 1     | The LON data length register FLEX_US_LONDL is written by the DMA.     |

## Bit 3 – CDTAIL LON Collision Detection on Frame Tail

| Value | Description                                                                                        |
|-------|----------------------------------------------------------------------------------------------------|
| 0     | Detect collisions after CRC has been sent but prior end of transmission in LON comm_type = 1 mode. |
| 1     | Ignore collisions after CRC has been sent but prior end of transmission in LON comm_type = 1 mode. |

## Bit 2 – TCOL Terminate Frame upon Collision Notification

| Value | Description                                                                         |
|-------|-------------------------------------------------------------------------------------|
| 0     | Do not terminate the frame in LON comm_type = 1 mode upon collision detection.      |
| 1     | Terminate the frame in LON comm_type = 1 mode upon collision detection if possible. |

**Bit 1 – COLDET** LON Collision Detection Feature

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | LON collision detection feature disabled. |
| 1     | LON collision detection feature enabled.  |

**Bit 0 – COMMT** LON comm\_type Parameter Value

| Value | Description             |
|-------|-------------------------|
| 0     | LON comm_type = 1 mode. |
| 1     | LON comm_type = 2 mode. |

### 39.10.35 USART LON Preamble Register

**Name:** FLEX\_US\_LONPR  
**Offset:** 0x264  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

|        |            |     |             |     |     |     |     |     |
|--------|------------|-----|-------------|-----|-----|-----|-----|-----|
| Bit    | 31         | 30  | 29          | 28  | 27  | 26  | 25  | 24  |
|        |            |     |             |     |     |     |     |     |
| Access |            |     |             |     |     |     |     |     |
| Reset  |            |     |             |     |     |     |     |     |
| Bit    | 23         | 22  | 21          | 20  | 19  | 18  | 17  | 16  |
|        |            |     |             |     |     |     |     |     |
| Access |            |     |             |     |     |     |     |     |
| Reset  |            |     |             |     |     |     |     |     |
| Bit    | 15         | 14  | 13          | 12  | 11  | 10  | 9   | 8   |
|        |            |     | LONPL[13:8] |     |     |     |     |     |
| Access |            |     | R/W         | R/W | R/W | R/W | R/W | R/W |
| Reset  |            |     | 0           | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7          | 6   | 5           | 4   | 3   | 2   | 1   | 0   |
|        | LONPL[7:0] |     |             |     |     |     |     |     |
| Access | R/W        | R/W | R/W         | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0          | 0   | 0           | 0   | 0   | 0   | 0   | 0   |

#### Bits 13:0 – LONPL[13:0] LON Preamble Length

| Value   | Description                                           |
|---------|-------------------------------------------------------|
| 1–16383 | LON preamble length in $t_{bit}$ (without byte-sync). |

39.10.36 USART LON Data Length Register

Name: FLEX\_US\_LONDL  
Offset: 0x268  
Reset: 0x00000000  
Property: Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

Bits 7:0 – LONDL[7:0] LON Data Length

| Value | Description                        |
|-------|------------------------------------|
| 0–255 | LON data length is LONDL + 1 byte. |

### 39.10.37 USART LON L2HDR Register

**Name:** FLEX\_US\_LONL2HDR  
**Offset:** 0x26C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

|        |     |      |          |     |     |     |     |     |
|--------|-----|------|----------|-----|-----|-----|-----|-----|
| Bit    | 31  | 30   | 29       | 28  | 27  | 26  | 25  | 24  |
|        |     |      |          |     |     |     |     |     |
| Access |     |      |          |     |     |     |     |     |
| Reset  |     |      |          |     |     |     |     |     |
| Bit    | 23  | 22   | 21       | 20  | 19  | 18  | 17  | 16  |
|        |     |      |          |     |     |     |     |     |
| Access |     |      |          |     |     |     |     |     |
| Reset  |     |      |          |     |     |     |     |     |
| Bit    | 15  | 14   | 13       | 12  | 11  | 10  | 9   | 8   |
|        |     |      |          |     |     |     |     |     |
| Access |     |      |          |     |     |     |     |     |
| Reset  |     |      |          |     |     |     |     |     |
| Bit    | 7   | 6    | 5        | 4   | 3   | 2   | 1   | 0   |
|        | PB  | ALTP | BLI[5:0] |     |     |     |     |     |
| Access | R/W | R/W  | R/W      | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0   | 0    | 0        | 0   | 0   | 0   | 0   | 0   |

#### Bit 7 – PB LON Priority Bit

| Value | Description             |
|-------|-------------------------|
| 0     | LON priority bit reset. |
| 1     | LON priority bit set.   |

#### Bit 6 – ALTP LON Alternate Path Bit

| Value | Description                   |
|-------|-------------------------------|
| 0     | LON alternate path bit reset. |
| 1     | LON alternate path bit set.   |

#### Bits 5:0 – BLI[5:0] LON Backlog Increment

| Value | Description                                                                    |
|-------|--------------------------------------------------------------------------------|
| 0–63  | LON backlog increment to be generated as a result of delivering the LON frame. |

39.10.38 USART LON Backlog Register

Name: FLEX\_US\_LONBL  
Offset: 0x270  
Reset: 0x00000000  
Property: Read-only

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

Bits 5:0 – LONBL[5:0] LON Node Backlog Value

| Value | Description             |
|-------|-------------------------|
| 1–63  | LON node backlog value. |

**39.10.39 USART LON Beta1 Tx Register**

**Name:** FLEX\_US\_LONB1TX  
**Offset:** 0x274  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

|        |                |     |     |     |     |     |     |     |
|--------|----------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31             | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |                |     |     |     |     |     |     |     |
| Access |                |     |     |     |     |     |     |     |
| Reset  |                |     |     |     |     |     |     |     |
| Bit    | 23             | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | BETA1TX[23:16] |     |     |     |     |     |     |     |
| Access | R/W            | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0              | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15             | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | BETA1TX[15:8]  |     |     |     |     |     |     |     |
| Access | R/W            | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0              | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7              | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | BETA1TX[7:0]   |     |     |     |     |     |     |     |
| Access | R/W            | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0              | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 23:0 – BETA1TX[23:0] LON Beta1 Length after Transmission**

| Value          | Description                                        |
|----------------|----------------------------------------------------|
| 1–<br>16777215 | LON beta1 length after transmission in $t_{bit}$ . |

### 39.10.40 USART LON Beta1 Rx Register

**Name:** FLEX\_US\_LONB1RX  
**Offset:** 0x278  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

#### Bits 23:0 – BETA1RX[23:0] LON Beta1 Length after Reception

| Value      | Description                                     |
|------------|-------------------------------------------------|
| 1–16777215 | LON beta1 length after reception in $t_{bit}$ . |

### 39.10.41 USART LON Priority Register

**Name:** FLEX\_US\_LONPRIO  
**Offset:** 0x27C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).  
 This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

|        |    |           |     |     |     |     |     |     |
|--------|----|-----------|-----|-----|-----|-----|-----|-----|
| Bit    | 31 | 30        | 29  | 28  | 27  | 26  | 25  | 24  |
|        |    |           |     |     |     |     |     |     |
| Access |    |           |     |     |     |     |     |     |
| Reset  |    |           |     |     |     |     |     |     |
| Bit    | 23 | 22        | 21  | 20  | 19  | 18  | 17  | 16  |
|        |    |           |     |     |     |     |     |     |
| Access |    |           |     |     |     |     |     |     |
| Reset  |    |           |     |     |     |     |     |     |
| Bit    | 15 | 14        | 13  | 12  | 11  | 10  | 9   | 8   |
|        |    | NPS[6:0]  |     |     |     |     |     |     |
| Access |    | R/W       | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |    | 0         | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7  | 6         | 5   | 4   | 3   | 2   | 1   | 0   |
|        |    | PSNB[6:0] |     |     |     |     |     |     |
| Access |    | R/W       | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |    | 0         | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 14:8 – NPS[6:0] LON Node Priority Slot**

| Value | Description         |
|-------|---------------------|
| 0–127 | Node priority slot. |

**Bits 6:0 – PSNB[6:0] LON Priority Slot Number**

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 0–127 | Number of priority slots in the LON network configuration. |

**39.10.42 USART LON IDT Tx Register**

**Name:** FLEX\_US\_IDTTX  
**Offset:** 0x280  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

|        |              |     |     |     |     |     |     |     |

|------------|-------------------------------------------------------|
| 0–16777215 | LON indeterminate time after reception in $t_{bit}$ . |

### 39.10.44 USART IC DIFF Register

**Name:** FLEX\_US\_ICDIFF  
**Offset:** 0x288  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

|        |    |    |    |    |             |     |     |     |
|--------|----|----|----|----|-------------|-----|-----|-----|

|        |    |        |    |         |    |    |   |         |
|--------|----|--------|----|---------|----|----|---|---------|
| Bit    | 15 | 14     | 13 | 12      | 11 | 10 | 9 | 8       |
|        |    | CMPPAR |    | CMPMODE |    |    |   | VAL1[8] |
| Access |    | R/W    |    | R/W     |    |    |   | R/W     |
| Reset  |    | 0      |    | 0       |    |    |   | 0       |

|        |           |     |     |     |     |     |     |     |
|--------|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 7         | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | VAL1[7:0] |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

## Bits 24:16 – VAL2[8:0] Second Comparison Value for Received Character

| Value | Description                                                                                                                               |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 0–511 | The received character must be lower than or equal to the value of VAL2 and higher than or equal to VAL1 to set the FLEX_US_CSR.CMP flag. |

## Bit 14 – CMPPAR Compare Parity

| Value | Description                                                                                                                   |
|-------|-------------------------------------------------------------------------------------------------------------------------------|
| 0     | The parity is not checked and a bad parity cannot prevent from waking up the system.                                          |
| 1     | The parity is checked and a matching condition on data can be cancelled by an error on parity bit, so no wakeup is performed. |

## Bit 12 – CMPMODE Comparison Mode

| Value | Name            | Description                                                        |
|-------|-----------------|--------------------------------------------------------------------|
| 0     | FLAG_ONLY       | Any character is received and comparison function drives CMP flag. |
| 1     | START_CONDITION | Comparison condition must be met to start reception.               |
| 2     | FILTER          | Comparison must be met to receive the current data only            |

## Bits 8:0 – VAL1[8:0] First Comparison Value for Received Character

| Value | Description                                                                                                                               |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 0–511 | The received character must be higher than or equal to the value of VAL1 and lower than or equal to VAL2 to set the FLEX_US_CSR.CMP flag. |

## 39.10.46 USART FIFO Mode Register

**Name:** FLEX\_US\_FMR  
**Offset:** 0x2A0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register reads '0' if the FIFO is disabled (see FLEX\_US\_CR to enable/disable the internal FIFO).

|        |       |    |                |     |     |     |             |     |
|--------|-------|----|----------------|-----|-----|-----|-------------|-----|
| Bit    | 31    | 30 | 29             | 28  | 27  | 26  | 25          | 24  |
|        |       |    | RXFTHRES2[5:0] |     |     |     |             |     |
| Access |       |    | R/W            | R/W | R/W | R/W | R/W         | R/W |
| Reset  |       |    | 0              | 0   | 0   | 0   | 0           | 0   |
| Bit    | 23    | 22 | 21             | 20  | 19  | 18  | 17          | 16  |
|        |       |    | RXFTHRES[5:0]  |     |     |     |             |     |
| Access |       |    | R/W            | R/W | R/W | R/W | R/W         | R/W |
| Reset  |       |    | 0              | 0   | 0   | 0   | 0           | 0   |
| Bit    | 15    | 14 | 13             | 12  | 11  | 10  | 9           | 8   |
|        |       |    | TXFTHRES[5:0]  |     |     |     |             |     |
| Access |       |    | R/W            | R/W | R/W | R/W | R/W         | R/W |
| Reset  |       |    | 0              | 0   | 0   | 0   | 0           | 0   |
| Bit    | 7     | 6  | 5              | 4   | 3   | 2   | 1           | 0   |
|        | FRTSC |    | RXRDYM[1:0]    |     |     |     | TXRDYM[1:0] |     |
| Access | R/W   |    | R/W            | R/W |     |     | R/W         | R/W |
| Reset  | 0     |    | 0              | 0   |     |     | 0           | 0   |

## Bits 29:24 – RXFTHRES2[5:0] Receive FIFO Threshold 2

| Value | Description                                                                                                                                                                                        |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–16  | Defines the Receive FIFO threshold 2 value (number of data). The FLEX_US_FESR.RXFTHF2 flag will be set when Receive FIFO goes from “above” threshold state to “equal to or below” threshold state. |

## Bits 21:16 – RXFTHRES[5:0] Receive FIFO Threshold

| Value | Description                                                                                                                                                                                     |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–16  | Defines the Receive FIFO threshold value (number of data). The FLEX_US_FESR.RXFTHF flag will be set when Receive FIFO goes from “below” threshold state to “equal to or above” threshold state. |

## Bits 13:8 – TXFTHRES[5:0] Transmit FIFO Threshold

| Value | Description                                                                                                                                                                                       |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–16  | Defines the Transmit FIFO threshold value (number of data). The FLEX_US_FESR.TXFTHF flag will be set when Transmit FIFO goes from “above” threshold state to “equal to or below” threshold state. |

## Bit 7 – FRTSC FIFO RTS Pin Control enable (Hardware Handshaking mode only)

See [Hardware Handshaking](#) for details.

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | RTS pin is not controlled by Receive FIFO thresholds. |
| 1     | RTS pin is controlled by Receive FIFO thresholds.     |

## Bits 5:4 – RXRDYM[1:0] Receiver Ready Mode

If FIFOs are enabled, the FLEX\_US\_CSR.RXRDY flag behaves as follows.

| Value | Name      | Description                                                                        |
|-------|-----------|------------------------------------------------------------------------------------|
| 0     | ONE_DATA  | RXRDY will be at level ‘1’ when at least one unread data is in the Receive FIFO.   |
| 1     | TWO_DATA  | RXRDY will be at level ‘1’ when at least two unread data are in the Receive FIFO.  |
| 2     | FOUR_DATA | RXRDY will be at level ‘1’ when at least four unread data are in the Receive FIFO. |

**Bits 1:0 – TXRDYM[1:0] Transmitter Ready Mode**

If FIFOs are enabled, the FLEX\_US\_CSR.TXRDY flag behaves as follows.

| Value | Name      | Description                                                                            |
|-------|-----------|----------------------------------------------------------------------------------------|
| 0     | ONE_DATA  | TXRDY will be at level '1' when at least one data can be written in the Transmit FIFO  |
| 1     | TWO_DATA  | TXRDY will be at level '1' when at least two data can be written in the Transmit FIFO  |
| 2     | FOUR_DATA | TXRDY will be at level '1' when at least four data can be written in the Transmit FIFO |

### 39.10.47 USART FIFO Level Register

**Name:** FLEX\_US\_FLR  
**Offset:** 0x2A4  
**Reset:** 0x00000000  
**Property:** Read-only

This register reads '0' if the FIFO is disabled (see FLEX\_US\_CR to enable/disable the internal FIFO).

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |           |    |    |    |    |    |

| Bit    | 7 | 6 | 5         | 4 | 3 | 2 | 1 | 0 |
|        |   |   | TXFL[5:0] |   |   |   |   |   |
| Access |   |   | R         | R | R | R | R | R |
| Reset  |   |   | 0         | 0 | 0 | 0 | 0 | 0 |

#### Bits 21:16 – RXFL[5:0] Receive FIFO Level

| Value | Description                                              |
|-------|----------------------------------------------------------|
| 0     | There is no unread data in the Receive FIFO.             |
| 1–16  | Indicates the number of unread data in the Receive FIFO. |

#### Bits 5:0 – TXFL[5:0] Transmit FIFO Level

| Value | Description                                        |
|-------|----------------------------------------------------|
| 0     | There is no data in the Transmit FIFO.             |
| 1–16  | Indicates the number of data in the Transmit FIFO. |

39.10.48 USART FIFO Interrupt Enable Register

Name: FLEX\_US\_FIER  
Offset: 0x2A8  
Reset: -  
Property: Write-only

|        |         |         |        |       |       |        |         |       |

### 39.10.50 USART FIFO Interrupt Mask Register

**Name:** FLEX\_US\_FIMR  
**Offset:** 0x2B0  
**Reset:** 0x00000000  
**Property:** Read-only

This register reads '0' if the FIFO is disabled (see FLEX\_US\_CR to enable/disable the internal FIFO).

|        |         |         |        |       |        |        |         |       |

| Reset  |         |         |        |       |        |        |         |         |
| Bit    | 15      | 14      | 13     | 12    | 11     | 10     | 9       | 8       |
| Access |         |         |        |       |        |        | RXFTHF2 | TXFLOCK |
| Reset  |         |         |        |       |        |        | 0       | 0       |
| Bit    | 7       | 6       | 5      | 4     | 3      | 2      | 1       | 0       |
| Access | RXFPTEF | TXFPTEF | RXFTHF | RXFFF | RXFEEF | TXFTHF | TXFFF   | TXFEF   |
| Reset  | 0       | 0       | 0      | 0     | 0      | 0      | 0       | 0       |

## Bit 9 – RXFTHF2 Receive FIFO Threshold Flag 2 (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description                                                                                                     |
|-------|-----------------------------------------------------------------------------------------------------------------|
| 0     | Number of unread data in Receive FIFO is above RXFTHRES threshold.                                              |
| 1     | Number of unread data in Receive FIFO has reached RXFTHRES2 threshold since the last RSTSTA command was issued. |

## Bit 8 – TXFLOCK Transmit FIFO Lock

| Value | Description                      |
|-------|----------------------------------|
| 0     | The Transmit FIFO is not locked. |
| 1     | The Transmit FIFO is locked.     |

## Bit 7 – RXFPTEF Receive FIFO Pointer Error Flag

See [39.7.11.9. FIFO Pointer Error](#) for details.

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | No Receive FIFO pointer occurred.                            |
| 1     | Receive FIFO pointer error occurred. Receiver must be reset. |

## Bit 6 – TXFPTEF Transmit FIFO Pointer Error Flag

See [39.7.11.9. FIFO Pointer Error](#) for details.

| Value | Description                                                      |
|-------|------------------------------------------------------------------|
| 0     | No Transmit FIFO pointer occurred.                               |
| 1     | Transmit FIFO pointer error occurred. Transceiver must be reset. |

## Bit 5 – RXFTHF Receive FIFO Threshold Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description                                                                                                    |
|-------|----------------------------------------------------------------------------------------------------------------|
| 0     | Number of unread data in Receive FIFO is below RXFTHRES threshold.                                             |
| 1     | Number of unread data in Receive FIFO has reached RXFTHRES threshold since the last RSTSTA command was issued. |

**Bit 4 – RXFFF** Receive FIFO Full Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description                                                            |
|-------|------------------------------------------------------------------------|
| 0     | Receive FIFO is not empty.                                             |
| 1     | Receive FIFO has been filled since the last RSTSTA command was issued. |

**Bit 3 – RXFEF** Receive FIFO Empty Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description                                                             |
|-------|-------------------------------------------------------------------------|
| 0     | Receive FIFO is not empty.                                              |
| 1     | Receive FIFO has been emptied since the last RSTSTA command was issued. |

**Bit 2 – TXFTHF** Transmit FIFO Threshold Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description                                                                                              |
|-------|----------------------------------------------------------------------------------------------------------|
| 0     | Number of data in Transmit FIFO is above TXFTHRES threshold.                                             |
| 1     | Number of data in Transmit FIFO has reached TXFTHRES threshold since the last RSTSTA command was issued. |

**Bit 1 – TXFFF** Transmit FIFO Full Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description                                                             |
|-------|-------------------------------------------------------------------------|
| 0     | Transmit FIFO is not full.                                              |
| 1     | Transmit FIFO has been filled since the last RSTSTA command was issued. |

**Bit 0 – TXFEF** Transmit FIFO Empty Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description                                                              |
|-------|--------------------------------------------------------------------------|
| 0     | Transmit FIFO is not empty.                                              |
| 1     | Transmit FIFO has been emptied since the last RSTSTA command was issued. |

| Reset  |              |    |    |    |    |    |    | 0    |

## Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                                      |
|----------|--------|--------------------------------------------------------------------------------------------------|
| 0x555341 | PASSWD | Writing any other value in this field aborts the write operation of bit WPEN. Always reads as 0. |

## Bit 0 – WPEN Write Protection Enable

See [USART Register Write Protection](#) for the list of registers that can be write-protected.

| Value | Description                                                                                                 |
|-------|-------------------------------------------------------------------------------------------------------------|
| 0     | Disables the write protection on configuration registers if WPKEY corresponds to 0x555341 ("USA" in ASCII). |
| 1     | Enables the write protection on configuration registers if WPKEY corresponds to 0x555341 ("USA" in ASCII).  |

**39.10.53 USART Write Protection Status Register**

**Name:** FLEX\_US\_WPSR  
**Offset:** 0x2E8  
**Reset:** 0x00000000  
**Property:** Read-only

If enabled in the SFR module (default is disabled), a debugger read access on FLEX\_US\_WPSR does not clear the WPVS flag.

|        |             |    |    |    |    |    |    |      |
|--------|-------------|----|----|----|----|----|----|------|
| Bit    | 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        |             |    |    |    |    |    |    |      |
| Access |             |    |    |    |    |    |    |      |
| Reset  |             |    |    |    |    |    |    |      |

|        | WPVSR[15:8] |    |    |    |    |    |    |      |
| Access | R           | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8    |
|        | WPVSR[7:0]  |    |    |    |    |    |    |      |
| Access | R           | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7           | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        |             |    |    |    |    |    |    | WPVS |
| Access |             |    |    |    |    |    |    | R    |
| Reset  |             |    |    |    |    |    |    | 0    |

**Bits 23:8 – WPVSR[15:0] Write Protection Violation Source**

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS Write Protection Violation Status**

| Value | Description                                                                                                                                                                                                       |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protection violation has occurred since the last read of FLEX_US_WPSR.                                                                                                                                   |
| 1     | A write protection violation has occurred since the last read of FLEX_US_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

### 39.10.54 SPI Control Register

**Name:** FLEX\_SPI\_CR  
**Offset:** 0x400  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the [SPI Write Protection Mode Register](#).

|        |         |        |    |    |    |    |    |          |
|--------|---------|--------|----|----|----|----|----|----------|
| Bit    | 31      | 30     | 29 | 28 | 27 | 26 | 25 | 24       |
|        | FIFODIS | FIFOEN |    |    |    |    |    | LASTXFER |
| Access | W       | W      |    |    |    |    |    | W        |

|--------|----|----|----|--------|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12     | 11 | 10 | 9 | 8 |
|        |    |    |    | REQCLR |    |    |   |   |
| Access |    |    |    | W      |    |    |   |   |
| Reset  |    |    |    | –      |    |    |   |   |

|        |       |   |   |   |   |   |        |       |
|--------|-------|---|---|---|---|---|--------|-------|
| Bit    | 7     | 6 | 5 | 4 | 3 | 2 | 1      | 0     |
|        | SWRST |   |   |   |   |   | SPIDIS | SPIEN |
| Access | W     |   |   |   |   |   | W      | W     |
| Reset  | –     |   |   |   |   |   | –      | –     |

#### Bit 31 – FIFODIS FIFO Disable

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | No effect.                              |
| 1     | Disables the Transmit and Receive FIFOs |

#### Bit 30 – FIFOEN FIFO Enable

| Value | Description                            |
|-------|----------------------------------------|
| 0     | No effect.                             |
| 1     | Enables the Transmit and Receive FIFOs |

#### Bit 24 – LASTXFER Last Transfer

See [Peripheral Selection](#) for more details.

| Value | Description                                                                                                                                                                                                                                                    |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                                                     |
| 1     | The current NPCS will be de-asserted after the character written in TD has been transferred. When CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed. |

#### Bit 17 – RXFCLR Receive FIFO Clear

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | Empties the Receive FIFO. |

#### Bit 16 – TXFCLR Transmit FIFO Clear

| Value | Description |
|-------|-------------|
| 0     | No effect.  |

| Value | Description                |
|-------|----------------------------|
| 1     | Empties the Transmit FIFO. |

**Bit 12 – REQCLR** Request to Clear the Comparison Trigger

| Value | Description                                             |
|-------|---------------------------------------------------------|
| 0     | No effect.                                              |
| 1     | Restarts the comparison trigger to enable FLEX_SPI_RDR. |

**Bit 7 – SWRST** SPI Software Reset

The SPI is in Slave mode after software reset.

| Value | Description                                                                            |
|-------|----------------------------------------------------------------------------------------|
| 0     | No effect.                                                                             |
| 1     | Resets the SPI. A software-triggered hardware reset of the SPI interface is performed. |

**Bit 1 – SPIDIS** SPI Disable

If a transfer is in progress when SPIDIS is set, the SPI completes the transmission of the shifter register and does not start any new transfer, even if the FLEX\_US\_THR is loaded.

All pins are set in Input mode after completion of the transmission in progress, if any.

| Value | Description       |
|-------|-------------------|
| 0     | No effect.        |
| 1     | Disables the SPI. |

**Bit 0 – SPIEN** SPI Enable

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No effect.                                    |
| 1     | Enables the SPI to transfer and receive data. |

## 39.10.55 SPI Mode Register

**Name:** FLEX\_SPI\_MR  
**Offset:** 0x404  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

|        |             |     |       |         |           |        |     |      |
|--------|-------------|-----|-------|---------|-----------|--------|-----|------|
| Bit    | 31          | 30  | 29    | 28      | 27        | 26     | 25  | 24   |
|        | DLYBCS[7:0] |     |       |         |           |        |     |      |
| Access | R/W         | R/W | R/W   | R/W     | R/W       | R/W    | R/W | R/W  |
| Reset  | 0           | 0   | 0     | 0       | 0         | 0      | 0   | 0    |
| Bit    | 23          | 22  | 21    | 20      | 19        | 18     | 17  | 16   |
|        | PCS[3:0]    |     |       |         |           |        |     |      |
| Access |             |     |       |         | R/W       | R/W    | R/W | R/W  |
| Reset  |             |     |       |         | 0         | 0      | 0   | 0    |
| Bit    | 15          | 14  | 13    | 12      | 11        | 10     | 9   | 8    |
|        | CMPMODE     |     |       |         |           |        |     |      |
| Access |             |     |       | R/W     |           |        |     |      |
| Reset  |             |     |       | 0       |           |        |     |      |
| Bit    | 7           | 6   | 5     | 4       | 3         | 2      | 1   | 0    |
|        | LLB         |     | WDRBT | MODFDIS | BR SRCCLK | PCSDEC | PS  | MSTR |
| Access | R/W         |     | R/W   | R/W     | R/W       | R/W    | R/W | R/W  |
| Reset  | 0           |     | 0     | 0       | 0         | 0      | 0   | 0    |

**Bits 31:24 – DLYBCS[7:0]** Delay Between Chip Selects

This field defines the delay between the inactivation and the activation of NPCS. The DLYBCS time guarantees nonoverlapping chip selects and solves bus contentions in case of peripherals having long data float times.

If DLYBCS is  $\leq 6$ , six peripheral clock periods are inserted by default.

Otherwise, the following equations determine the delay:

If FLEX\_SPI\_MR.BRSRCCLK = 0:  $\text{DLYBCS} = \text{Delay Between Chip Selects} \times f_{\text{peripheral clock}}$

If FLEX\_SPI\_MR.BRSRCCLK = 1:  $\text{DLYBCS} = \text{Delay Between Chip Selects} \times f_{\text{GCLK}}$

**Bits 19:16 – PCS[3:0]** Peripheral Chip Select

This field is only used if fixed peripheral select is active (PS = 0).

If PCSDEC = 0:

PCS = xxx0 NPCS[3:0] = 1110

PCS = xx01 NPCS[3:0] = 1101

PCS = x011 NPCS[3:0] = 1011

PCS = 0111 NPCS[3:0] = 0111

PCS = 1111 forbidden (no peripheral is selected)

(x = don't care)

If PCSDEC = 1:

NPCS[3:0] output signals = PCS

**Bit 12 – CMPMODE** Comparison Mode

| Value | Name            | Description                                                                                         |
|-------|-----------------|-----------------------------------------------------------------------------------------------------|
| 0     | FLAG_ONLY       | Any character is received and comparison function drives CMP flag.                                  |
| 1     | START_CONDITION | Comparison condition must be met to start reception of all incoming characters until REQCLR is set. |

**Bit 7 – LLB Local Loopback Enable**

LLB controls the local loopback on the data shift register for testing in Master mode only (MISO is internally connected on MOSI).

| Value | Description                   |
|-------|-------------------------------|
| 0     | Local loopback path disabled. |
| 1     | Local loopback path enabled.  |

**Bit 5 – WDRBT Wait Data Read Before Transfer**

| Value | Description                                                                                                                                                |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No Effect. In Master mode, a transfer can be initiated regardless of the FLEX_SPI_RDR state.                                                               |
| 1     | In Master mode, a transfer can start only if FLEX_SPI_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception. |

**Bit 4 – MODFDIS Mode Fault Detection**

| Value | Description                       |
|-------|-----------------------------------|
| 0     | Mode fault detection is enabled.  |
| 1     | Mode fault detection is disabled. |

**Bit 3 – BSRCLK Bit Rate Source Clock**

If the bit BSRCLK = 1, the FLEX\_SPI\_CSRx.SCBR field must be programmed with a value greater than 1.

| Value | Name       | Description                                                                                                              |
|-------|------------|--------------------------------------------------------------------------------------------------------------------------|
| 0     | PERIPH_CLK | The peripheral clock is the source clock for the bit rate generation.                                                    |
| 1     | GCLK       | GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock. |

**Bit 2 – PCSDEC Chip Select Decode**

When PCSDEC equals one, up to 15 Chip Select signals can be generated with the four NPCS lines using an external 4- to 16-bit decoder. The Chip Select registers define the characteristics of the 15 chip selects, with the following rules:

FLEX\_SPI\_CSR0 defines peripheral chip select signals 0 to 3.

FLEX\_SPI\_CSR1 defines peripheral chip select signals 4 to 7.

FLEX\_SPI\_CSR2 defines peripheral chip select signals 8 to 11.

FLEX\_SPI\_CSR3 defines peripheral chip select signals 12 to 14.

| Value | Description                                                              |
|-------|--------------------------------------------------------------------------|
| 0     | The chip selects are directly connected to a peripheral device.          |
| 1     | The four NPCS chip select lines are connected to a 4- to 16-bit decoder. |

**Bit 1 – PS Peripheral Select**

| Value | Description                |
|-------|----------------------------|
| 0     | Fixed Peripheral Select    |
| 1     | Variable Peripheral Select |

**Bit 0 – MSTR Master/Slave Mode**

| Value | Description            |
|-------|------------------------|
| 0     | SPI is in Slave mode.  |
| 1     | SPI is in Master mode. |

### 39.10.56 SPI Receive Data Register

**Name:** FLEX\_SPI\_RDR  
**Offset:** 0x408  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FLEX\_SPI\_CR.FIFOEN) and FLEX\_SPI\_FMR.RXRDYM = 0, see [SPI Single Data Mode](#) for details.

By default, any debugger or software read access to FLEX\_SPI\_RDR clears the FLEX\_SPI\_SR.RDRF flag. To prevent this flag from being cleared on debugger read access, a specific bit must be enabled in the SFR module.

|        |          |    |    |    |          |    |    |    |
|--------|----------|----|----|----|----------|----|----|----|
| Bit    | 31       | 30 | 29 | 28 | 27       | 26 | 25 | 24 |
|        |          |    |    |    |          |    |    |    |
| Access |          |    |    |    |          |    |    |    |

#### Bits 19:16 – PCS[3:0] Peripheral Chip Select

In Master mode only, these bits indicate the value on the NPCS pins at the end of a transfer. Otherwise, these bits are read as zero.

**Note:** When using Variable Peripheral Select mode (FLEX\_SPI\_MR.PS = 1), it is mandatory to set the FLEX\_SPI\_MR.WDRBT bit to 1 if the PCS field must be processed in FLEX\_SPI\_RDR.

#### Bits 15:0 – RD[15:0] Receive Data

Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

**39.10.57 SPI Receive Data Register (FIFO Multiple Data, 8-bit)****Name:** FLEX\_SPI\_RDR (FIFO\_MULTI\_DATA\_8)**Offset:** 0x408**Reset:** 0x00000000**Property:** Read-only

If FIFO is enabled (FLEX\_SPI\_CR.FIFOEN) and FLEX\_SPI\_FMR.RXRDYM > 0, see [SPI Multiple Data Mode](#) for details.

If enabled in the SFR module (default is disabled), a debugger read access does not modify the Receive FIFO status.

**Bits 0:15, 16:31 – RDx Receive Data**

First unread data in the Receive FIFO. Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

### 39.10.59 SPI Transmit Data Register

**Name:** FLEX\_SPI\_TDR  
**Offset:** 0x40C  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FLEX\_SPI\_CR.FIFOEN) and FLEX\_SPI\_FMR.TXRDYM = 0, see [39.8.6.6. SPI Single Data Mode](#) for details.

|        |          |    |    |    |    |          |    |          |

| Access | W        | W  | W  | W  | W  | W        | W  | W        |
| Reset  | –        | –  | –  | –  | –  | –        | –  | –        |

#### Bit 24 – LASTXFER Last Transfer

This field is only used if variable peripheral select is active (FLEX\_SPI\_MR.PS = 1).

| Value | Description                                                                                                                                                                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                                                         |
| 1     | The current NPCS is de-asserted after the transfer of the character written in TD. When FLEX_SPI_CSRx.CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed. |

#### Bits 19:16 – PCS[3:0] Peripheral Chip Select

This field is only used if variable peripheral select is active (FLEX\_SPI\_MR.PS = 1).

If FLEX\_SPI\_MR.PCSDEC = 0:

PCS = xxx0 NPCS[3:0] = 1110

PCS = xx01 NPCS[3:0] = 1101

PCS = x011 NPCS[3:0] = 1011

PCS = 0111 NPCS[3:0] = 0111

PCS = 1111 forbidden (no peripheral is selected)

(x = don't care)

If FLEX\_SPI\_MR.PCSDEC = 1:

NPCS[3:0] output signals = PCS

#### Bits 15:0 – TD[15:0] Transmit Data

Data to be transmitted by the SPI Interface is stored in this register. Information to be transmitted must be written to the transmit data register in a right-justified format.

**39.10.60 SPI Transmit Data Register (FIFO Multiple Data, 8- to 16-bit)****Name:** FLEX\_SPI\_TDR (FIFO\_MULTI\_DATA)**Offset:** 0x40C**Reset:** –**Property:** Write-only

If FIFO is enabled (FLEX\_SPI\_CR.FIFOEN) and FLEX\_SPI\_FMR.TXRDYM > 0, see Section 1.8.7.7 “SPI Multiple Data Mode” for details.

| Reset  | –         | –  | –  | –  | –  | –  | –  | –  |

**Bits 0:15, 16:31 – TDx Transmit Data**

Next data to write in the Transmit FIFO. Information to be transmitted must be written to this register in a right-justified format.

## 39.10.61 SPI Status Register

**Name:** FLEX\_SPI\_SR  
**Offset:** 0x410  
**Reset:** 0x00000000  
**Property:** Read-only

By default, any debugger or software read access to FLEX\_SPI\_SR clears the MODF, OVRES, NSSR, UNDES, and CMP flags. To prevent these flags from being cleared on debugger read access, a specific bit must be enabled in the SFR module.

|        |         |         |        |       |       |        |       |       |

## Bit 31 – RXFPTEF Receive FIFO Pointer Error Flag

See [39.8.6.8. FIFO Pointer Error](#) for details.

This bit reads '0' if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO).

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | No Receive FIFO pointer occurred                            |
| 1     | Receive FIFO pointer error occurred. Receiver must be reset |

## Bit 30 – TXFPTEF Transmit FIFO Pointer Error Flag

See [39.8.6.8. FIFO Pointer Error](#) for details.

This bit reads '0' if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO).

| Value | Description                                                     |
|-------|-----------------------------------------------------------------|
| 0     | No Transmit FIFO pointer occurred                               |
| 1     | Transmit FIFO pointer error occurred. Transceiver must be reset |

## Bit 29 – RXFTHF Receive FIFO Threshold Flag

This bit reads '0' if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO).

| Value | Description                                                                                                                                     |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Number of unread data in Receive FIFO is below RXFTHRES threshold or RXFTH flag has been cleared.                                               |
| 1     | Number of unread data in Receive FIFO has reached RXFTHRES threshold (changing states from "below threshold" to "equal to or above threshold"). |

## Bit 28 – RXFFF Receive FIFO Full Flag

This bit reads '0' if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO).

| Value | Description                                                               |
|-------|---------------------------------------------------------------------------|
| 0     | Receive FIFO is not empty or RXFE flag has been cleared.                  |
| 1     | Receive FIFO has been filled (changing states from “not full” to “full”). |

**Bit 27 – RXFEF** Receive FIFO Empty Flag

This bit reads '0' if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO).

| Value | Description                                                                  |
|-------|------------------------------------------------------------------------------|
| 0     | Receive FIFO is not empty or RXFE flag has been cleared.                     |
| 1     | Receive FIFO has been emptied (changing states from “not empty” to “empty”). |

**Bit 26 – TXFTHF** Transmit FIFO Threshold Flag (cleared on read)

This bit reads '0' if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO).

| Value | Description                                                                                        |
|-------|----------------------------------------------------------------------------------------------------|
| 0     | Number of data in Transmit FIFO is above TXFTHRES threshold.                                       |
| 1     | Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of FLEX_SPI_SR. |

**Bit 25 – TXFFF** Transmit FIFO Full Flag (cleared on read)

This bit reads '0' if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO).

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | Transmit FIFO is not full or TXFF flag has been cleared.          |
| 1     | Transmit FIFO has been filled since the last read of FLEX_SPI_SR. |

**Bit 24 – TXFEF** Transmit FIFO Empty Flag (cleared on read)

This bit reads '0' if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO).

| Value | Description                                                        |
|-------|--------------------------------------------------------------------|
| 0     | Transmit FIFO is not empty.                                        |
| 1     | Transmit FIFO has been emptied since the last read of FLEX_SPI_SR. |

**Bit 16 – SPIENS** SPI Enable Status

| Value | Description      |
|-------|------------------|
| 0     | SPI is disabled. |
| 1     | SPI is enabled.  |

**Bit 12 – SFERR** Slave Frame Error (cleared on read)

| Value | Description                                                                                               |
|-------|-----------------------------------------------------------------------------------------------------------|
| 0     | There is no frame error detected for a slave access since the last read of FLEX_SPI_SR.                   |
| 1     | In Slave mode, the chip select raised while the character defined in FLEX_SPI_CSR0.BITS was not complete. |

**Bit 11 – CMP** Comparison Status (cleared on read)

| Value | Description                                                                                                                                   |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No received character matched the comparison criteria programmed in VAL1 and VAL2 fields in FLEX_SPI_CMPR since the last read of FLEX_SPI_SR. |
| 1     | A received character matched the comparison criteria since the last read of FLEX_SPI_SR.                                                      |

**Bit 10 – UNDES** Underrun Error Status (Slave mode only) (cleared on read)

| Value | Description                                                                                          |
|-------|------------------------------------------------------------------------------------------------------|
| 0     | No underrun has been detected since the last read of FLEX_SPI_SR.                                    |
| 1     | A transfer starts whereas no data has been loaded in FLEX_SPI_TDR, cleared when FLEX_SPI_SR is read. |

**Bit 9 – TXEMPTY** Transmission Registers Empty (cleared by writing FLEX\_SPI\_TDR)

| Value | Description                                                                                                                           |
|-------|---------------------------------------------------------------------------------------------------------------------------------------|
| 0     | As soon as data is written in FLEX_SPI_TDR.                                                                                           |
| 1     | FLEX_SPI_TDR and internal shift register are empty. If a transfer delay has been defined, TXEMPTY is set after the end of this delay. |

**Bit 8 – NSSR** NSS Rising (cleared on read)

| Value | Description                                                            |
|-------|------------------------------------------------------------------------|
| 0     | No rising edge detected on NSS pin since the last read of FLEX_SPI_SR. |
| 1     | A rising edge occurred on NSS pin since the last read of FLEX_SPI_SR.  |

**Bit 3 – OVRES** Overrun Error Status (cleared on read)

An overrun occurs when FLEX\_SPI\_RDR is loaded at least twice from the shift register since the last read of FLEX\_SPI\_RDR.

| Value | Description                                                      |
|-------|------------------------------------------------------------------|
| 0     | No overrun has been detected since the last read of FLEX_SPI_SR. |
| 1     | An overrun has occurred since the last read of FLEX_SPI_SR.      |

**Bit 2 – MODF** Mode Fault Error (cleared on read)

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | No mode fault has been detected since the last read of FLEX_SPI_SR. |
| 1     | A mode fault occurred since the last read of FLEX_SPI_SR.           |

**Bit 1 – TDRE** Transmit Data Register Empty (cleared by writing FLEX\_SPI\_TDR)

When FIFOs are disabled:

0: Data has been written to FLEX\_SPI\_TDR and not yet transferred to the internal shift register.

1: The last data written to FLEX\_SPI\_TDR has been transferred to the internal shift register.

TDRE is cleared when the SPI is disabled or at reset. Enabling the SPI sets the TDRE flag.

When FIFOs are enabled:

0: Transmit FIFO cannot accept more data.

1: Transmit FIFO can accept data; one or more data can be written according to TXRDYM field configuration.

TDRE behavior with FIFOs enabled is illustrated in [39.8.6.5. TXEMPTY, TDRE and RDRF Behavior](#).

**Bit 0 – RDRF** Receive Data Register Full (cleared by reading FLEX\_SPI\_RDR)

When FIFOs are disabled:

0: No data has been received since the last read of FLEX\_SPI\_RDR.

1: Data has been received and the received data has been transferred from the internal shift register to FLEX\_SPI\_RDR since the last read of FLEX\_SPI\_RDR.

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RDRF behavior with FIFOs enabled is illustrated in [39.8.6.5. TXEMPTY, TDRE and RDRF Behavior](#).

### 39.10.62 SPI Interrupt Enable Register

**Name:** FLEX\_SPI\_IER  
**Offset:** 0x414  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [SPI Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |         |         |        |       |       |        |         |       |
|--------|---------|---------|--------|-------|-------|--------|---------|-------|
| Bit    | 31      | 30      | 29     | 28    | 27    | 26     | 25      | 24    |
|        | RXFPTEF | TXFPTEF | RXFTHF | RXFFF | RXFEF | TXFTHF | TXFFF   | TXFEF |
| Access | W       | W       | W      | W     | W     | W      | W       | W     |
| Reset  | –       | –       | –      | –     | –     | –      | –       | –     |
| Bit    | 23      | 22      | 21     | 20    | 19    | 18     | 17      | 16    |
| Access |         |         |        |       |       |        |         |       |
| Reset  |         |         |        |       |       |        |         |       |
| Bit    | 15      | 14      | 13     | 12    | 11    | 10     | 9       | 8     |
|        |         |         |        |       | CMP   | UNDES  | TXEMPTY | NSSR  |
| Access |         |         |        |       | W     | W      | W       | W     |
| Reset  |         |         |        |       | –     | –      | –       | –     |

| Access |         |         |        |       | W     | W      | W       | W     |
| Reset  |         |         |        |       | –     | –      | –       | –     |

**Bit 31 – RXFPTEF** RXFPTEF Interrupt Enable

**Bit 30 – TXFPTEF** TXFPTEF Interrupt Enable

**Bit 29 – RXFTHF** RXFTHF Interrupt Enable

**Bit 28 – RXFFF** RXFFF Interrupt Enable

**Bit 27 – RXFEF** RXFEF Interrupt Enable

**Bit 26 – TXFTHF** TXFTHF Interrupt Enable

**Bit 25 – TXFFF** TXFFF Interrupt Enable

**Bit 24 – TXFEF** TXFEF Interrupt Enable

**Bit 11 – CMP** Comparison Interrupt Enable

**Bit 10 – UNDES** Underrun Error Interrupt Enable

**Bit 9 – TXEMPTY** Transmission Registers Empty Enable

**Bit 8 – NSSR** NSS Rising Interrupt Enable

**Bit 3 – OVRES** Overrun Error Interrupt Enable

**Bit 2 – MODF** Mode Fault Error Interrupt Enable

**Bit 1 – TDRE** SPI Transmit Data Register Empty Interrupt Enable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Enable

### 39.10.63 SPI Interrupt Disable Register

**Name:** FLEX\_SPI\_IDR

**Offset:** 0x418

**Reset:** –

**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [SPI Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|        |         |         |        |       |       |        |         |       |
|--------|---------|---------|--------|-------|-------|--------|---------|-------|
| Bit    | 31      | 30      | 29     | 28    | 27    | 26     | 25      | 24    |
|        | RXFPTEF | TXFPTEF | RXFTHF | RXFFF | RXFEF | TXFTHF | TXFFF   | TXFEF |
| Access | W       | W       | W      | W     | W     | W      | W       | W     |
| Reset  | –       | –       | –      | –     | –     | –      | –       | –     |
| Bit    | 23      | 22      | 21     | 20    | 19    | 18     | 17      | 16    |
| Access |         |         |        |       |       |        |         |       |
| Reset  |         |         |        |       |       |        |         |       |
| Bit    | 15      | 14      | 13     | 12    | 11    | 10     | 9       | 8     |
|        |         |         |        |       | CMP   | UNDES  | TXEMPTY | NSSR  |
| Access |         |         |        |       | W     | W      | W       | W     |
| Reset  |         |         |        |       | –     | –      | –       | –     |

|        |         |         |        |       | OVRES | MODF   | TDRE    | RDRF  |
| Access |         |         |        |       | W     | W      | W       | W     |
| Reset  |         |         |        |       | –     | –      | –       | –     |

**Bit 31 – RXFPTEF** RXFPTEF Interrupt Disable

**Bit 30 – TXFPTEF** TXFPTEF Interrupt Disable

**Bit 29 – RXFTHF** RXFTHF Interrupt Disable

**Bit 28 – RXFFF** RXFFF Interrupt Disable

**Bit 27 – RXFEF** RXFEF Interrupt Disable

**Bit 26 – TXFTHF** TXFTHF Interrupt Disable

**Bit 25 – TXFFF** TXFFF Interrupt Disable

**Bit 24 – TXFEF** TXFEF Interrupt Disable

**Bit 11 – CMP** Comparison Interrupt Disable

**Bit 10 – UNDES** Underrun Error Interrupt Disable

**Bit 9 – TXEMPTY** Transmission Registers Empty Disable

**Bit 8 – NSSR** NSS Rising Interrupt Disable

**Bit 3 – OVRES** Overrun Error Interrupt Disable

**Bit 2 – MODF** Mode Fault Error Interrupt Disable

**Bit 1 – TDRE** SPI Transmit Data Register Empty Interrupt Disable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Disable

**39.10.64 SPI Interrupt Mask Register**

**Name:** FLEX\_SPI\_IMR  
**Offset:** 0x41C  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

|        |         |         |        |       |       |        |         |       |

**Bit 2 – MODF** Mode Fault Error Interrupt Mask

**Bit 1 – TDRE** SPI Transmit Data Register Empty Interrupt Mask

**Bit 0 – RDRF** Receive Data Register Full Interrupt Mask

## 39.10.65 SPI Chip Select Register

**Name:** FLEX\_SPI\_CSRx  
**Offset:** 0x0430 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

FLEX\_SPI\_CSRx must be written even if the user wants to use the default reset values. The BITS field is not updated with the translated value unless the register is written.

|        |             |     |     |     |       |        |       |      |

**Bits 31:24 – DLYBCT[7:0]** Delay Between Consecutive Transfers

This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.

When DLYBCT = 0, no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers.

Otherwise, the following equations determine the delay:

If FLEX\_SPI\_MR.BSRCCLK = 0:  $DLYBCT = \text{Delay Between Consecutive Transfers} \times f_{\text{peripheral clock}} / 32$

If FLEX\_SPI\_MR.BSRCCLK = 1:  $DLYBCT = \text{Delay Between Consecutive Transfers} \times f_{\text{GCLK}} / 32$

**Bits 23:16 – DLYBS[7:0]** Delay Before SPCK

This field defines the delay from NPCS falling edge (activation) to the first valid SPCK transition.

When DLYBS = 0, the delay is half the SPCK clock period.

Otherwise, the following equations determine the delay:

If FLEX\_SPI\_MR.BSRCCLK = 0:  $DLYBS = \text{Delay Before SPCK} \times f_{\text{peripheral clock}}$

If FLEX\_SPI\_MR.BSRCCLK = 1:  $DLYBS = \text{Delay Before SPCK} \times f_{\text{GCLK}}$

**Bits 15:8 – SCBR[7:0]** Serial Clock Bit Rate

In Master mode, the SPI Interface uses a modulus counter to derive the SPCK bit rate from the clock defined by the bit BSRCLK. The bit rate is selected by writing a value from 1 to 255 in the SCBR field. The following equations determine the SPCK bit rate:

If FLEX\_SPI\_MR.BSRCCLK = 0:  $SCBR = f_{\text{peripheral clock}} / \text{SPCK Bit Rate}$

If FLEX\_SPI\_MR.BSRCCLK = 1:  $SCBR = f_{\text{GCLK}} / \text{SPCK Bit Rate}$

Programming the SCBR field to 0 is forbidden. Triggering a transfer while SCBR is at 0 can lead to unpredictable results.

If BRSRCCLK = 1 in FLEX\_SPI\_MR, SCBR must be programmed with a value greater than 1.

At reset, SCBR is 0 and the user has to program it at a valid value before performing the first transfer.

**Note:** If one of the FLEX\_SPI\_CSRx.SCBR fields is set to 1, the other FLEX\_SPI\_CSRx.SCBR fields must be set to 1 as well, if they are used to process transfers. If they are not used to transfer data, they can be set at any value.

#### Bits 7:4 – BITS[3:0] Bits Per Transfer

See [Note](#).

The BITS field determines the number of data bits transferred. Reserved values should not be used.

| Value | Name     | Description          |
|-------|----------|----------------------|
| 0     | 8_BIT    | 8 bits for transfer  |
| 1     | 9_BIT    | 9 bits for transfer  |
| 2     | 10_BIT   | 10 bits for transfer |
| 3     | 11_BIT   | 11 bits for transfer |
| 4     | 12_BIT   | 12 bits for transfer |
| 5     | 13_BIT   | 13 bits for transfer |
| 6     | 14_BIT   | 14 bits for transfer |
| 7     | 15_BIT   | 15 bits for transfer |
| 8     | 16_BIT   | 16 bits for transfer |
| 9–15  | Reserved |                      |

#### Bit 3 – CSAAT Chip Select Active After Transfer

| Value | Description                                                                                                                                                   |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The Peripheral Chip Select Line rises as soon as the last transfer is achieved.                                                                               |
| 1     | The Peripheral Chip Select does not rise after the last transfer is achieved. It remains active until a new transfer is requested on a different chip select. |

#### Bit 2 – CSNAAT Chip Select Not Active After Transfer (Ignored if CSAAT = 1)

If FLEX\_SPI\_MR.BSRCCLK = 0:  $\frac{DLYBCS}{f_{\text{peripheral clock}}}$  (if DLYBCS ≠ 0)

If FLEX\_SPI\_MR.BSRCCLK = 1:  $\frac{DLYBCS}{f_{GCLK}}$

If DLYBCS < 6, a minimum of six periods is introduced.

| Value | Description                                                                                                                                                                                 |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The Peripheral Chip Select does not rise between two transfers if the FLEX_SPI_TDR is reloaded before the end of the first transfer and if the two transfers occur on the same Chip Select. |
| 1     | The Peripheral Chip Select rises systematically after each transfer performed on the same slave. It remains inactive after the end of transfer for a minimal duration of:                   |

#### Bit 1 – NCPHA Clock Phase

NCPHA determines which edge of SPCK causes data to change and which edge causes data to be captured. NCPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

| Value | Description                                                                              |
|-------|------------------------------------------------------------------------------------------|
| 0     | Data are changed on the leading edge of SPCK and captured on the following edge of SPCK. |
| 1     | Data are captured on the leading edge of SPCK and changed on the following edge of SPCK. |

#### Bit 0 – CPOL Clock Polarity

CPOL is used to determine the inactive state value of the serial clock (SPCK). It is used with NCPHA to produce the required clock/data relationship between master and slave devices.

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | The inactive state value of SPCK is logic level zero. |
| 1     | The inactive state value of SPCK is logic level one.  |

## 39.10.66 SPI FIFO Mode Register

**Name:** FLEX\_SPI\_FMR  
**Offset:** 0x440  
**Reset:** 0x00000000  
**Property:** Read/Write

This register reads '0' if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO)

|        |    |    |               |     |     |     |             |     |
|--------|----|----|---------------|-----|-----|-----|-------------|-----|
| Bit    | 31 | 30 | 29            | 28  | 27  | 26  | 25          | 24  |
|        |    |    | RXFTHRES[5:0] |     |     |     |             |     |
| Access |    |    | R/W           | R/W | R/W | R/W | R/W         | R/W |
| Reset  |    |    | 0             | 0   | 0   | 0   | 0           | 0   |
| Bit    | 23 | 22 | 21            | 20  | 19  | 18  | 17          | 16  |
|        |    |    | TXFTHRES[5:0] |     |     |     |             |     |
| Access |    |    | R/W           | R/W | R/W | R/W | R/W         | R/W |
| Reset  |    |    | 0             | 0   | 0   | 0   | 0           | 0   |
| Bit    | 15 | 14 | 13            | 12  | 11  | 10  | 9           | 8   |
| Access |    |    |               |     |     |     |             |     |
| Reset  |    |    |               |     |     |     |             |     |
| Bit    | 7  | 6  | 5             | 4   | 3   | 2   | 1           | 0   |
|        |    |    | RXRDYM[1:0]   |     |     |     | TXRDYM[1:0] |     |
| Access |    |    | R/W           | R/W |     |     | R/W         | R/W |
| Reset  |    |    | 0             | 0   |     |     | 0           | 0   |

## Bits 29:24 – RXFTHRES[5:0] Receive FIFO Threshold

| Value | Description                                                                                                                                                                                   |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–8   | Defines the Receive FIFO threshold value (number of data). The FLEX_SPI_SR.RXFTH flag will be set when Receive FIFO goes from “below” threshold state to “equal to or above” threshold state. |

## Bits 21:16 – TXFTHRES[5:0] Transmit FIFO Threshold

| Value | Description                                                                                                                                                                                     |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–8   | Defines the Transmit FIFO threshold value (number of data). The FLEX_SPI_SR.TXFTH flag will be set when Transmit FIFO goes from “above” threshold state to “equal to or below” threshold state. |

## Bits 5:4 – RXRDYM[1:0] Receive Data Register Full Mode

If FIFOs are enabled, the FLEX\_SPI\_SR.RDRF flag behaves as follows.

| Value | Name      | Description                                                                                                                                                                                          |
|-------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | ONE_DATA  | RDRF will be at level '1' when at least one unread data is in the Receive FIFO.                                                                                                                      |
| 1     | TWO_DATA  | RDRF will be at level '1' when at least two unread data are in the Receive FIFO.<br>Cannot be used when FLEX_SPI_MR.MSTR = 1, or if FLEX_SPI_MR.PS = 1.                                              |
| 2     | FOUR_DATA | RDRF will be at level '1' when at least four unread data are in the Receive FIFO.<br>Cannot be used when FLEX_SPI_CSRx.BITS is greater than 0, or if FLEX_SPI_MR.MSTR = 1, or if FLEX_SPI_MR.PS = 1. |

## Bits 1:0 – TXRDYM[1:0] Transmit Data Register Empty Mode

If FIFOs are enabled, the FLEX\_SPI\_SR.TDRE flag behaves as follows.

| Value | Name     | Description                                                                                                                    |
|-------|----------|--------------------------------------------------------------------------------------------------------------------------------|
| 0     | ONE_DATA | TDRE will be at level '1' when at least one data can be written in the Transmit FIFO.                                          |
| 1     | TWO_DATA | TDRE will be at level '1' when at least two data can be written in the Transmit FIFO.<br>Cannot be used if FLEX_SPI_MR.PS = 1. |

### 39.10.67 SPI FIFO Level Register

**Name:** FLEX\_SPI\_FLR  
**Offset:** 0x444  
**Reset:** 0x00000000  
**Property:** Read-only

This register reads '0' if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO).

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |           |    |    |    |    |    |

|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |           |   |   |   |   |   |
|--------|---|---|-----------|---|---|---|---|---|
| Bit    | 7 | 6 | 5         | 4 | 3 | 2 | 1 | 0 |
|        |   |   | TXFL[5:0] |   |   |   |   |   |
| Access |   |   | R         | R | R | R | R | R |
| Reset  |   |   | 0         | 0 | 0 | 0 | 0 | 0 |

#### Bits 21:16 – RXFL[5:0] Receive FIFO Level

| Value | Description                                              |
|-------|----------------------------------------------------------|
| 0     | There is no unread data in the Receive FIFO.             |
| 1–8   | Indicates the number of unread data in the Receive FIFO. |

#### Bits 5:0 – TXFL[5:0] Transmit FIFO Level

| Value | Description                                        |
|-------|----------------------------------------------------|
| 0     | There is no data in the Transmit FIFO.             |
| 1–8   | Indicates the number of data in the Transmit FIFO. |

### 39.10.68 SPI Comparison Register

**Name:** FLEX\_SPI\_CMPR  
**Offset:** 0x448  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

|        |            |     |     |     |     |     |     |     |
|--------|------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31         | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | VAL2[15:8] |     |     |     |     |     |     |     |
| Access | R/W        | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0          | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 23         | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | VAL2[7:0]  |     |     |     |     |     |     |     |
| Access | R/W        | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0          | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15         | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | VAL1[15:8] |     |     |     |     |     |     |     |
| Access | R/W        | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0          | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7          | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | VAL1[7:0]  |     |     |     |     |     |     |     |
| Access | R/W        | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0          | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 31:16 – VAL2[15:0] Second Comparison Value for Received Character

| Value   | Description                                                                                                                                |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 0–65535 | The received character must be lower than or equal to the value of VAL2 and higher than or equal to VAL1 to set the FLEX_SPI_CSR.CMP flag. |

#### Bits 15:0 – VAL1[15:0] First Comparison Value for Received Character

| Value   | Description                                                                                                                               |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 0–65535 | The received character must be higher than or equal to the value of VAL1 and lower than or equal to VAL2 to set the FLEX_SPI_SR.CMP flag. |

## 39.10.69 SPI Write Protection Mode Register

**Name:** FLEX\_SPI\_WPMR  
**Offset:** 0x4E4  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |              |    |    |    |    |        |        |      |
|--------|--------------|----|----|----|----|--------|--------|------|

## Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                                                          |
|----------|--------|----------------------------------------------------------------------------------------------------------------------|
| 0x535049 | PASSWD | Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN. Always reads as 0. |

## Bit 2 – WPCREN Write Protection Control Enable

| Value | Description                                                                                          |
|-------|------------------------------------------------------------------------------------------------------|
| 0     | Disables the write protection on control register if WPKEY corresponds to 0x535049 ("SPI" in ASCII). |
| 1     | Enables the write protection on control register if WPKEY corresponds to 0x535049 ("SPI" in ASCII).  |

## Bit 1 – WPITEN Write Protection Interrupt Enable

| Value | Description                                                                                             |
|-------|---------------------------------------------------------------------------------------------------------|
| 0     | Disables the write protection on interrupt registers if WPKEY corresponds to 0x535049 ("SPI" in ASCII). |
| 1     | Enables the write protection on interrupt registers if WPKEY corresponds to 0x535049 ("SPI" in ASCII).  |

## Bit 0 – WPEN Write Protection Enable

See [39.8.7. SPI Register Write Protection](#) for the list of registers that can be write-protected.

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | Disables the write protection if WPKEY corresponds to 0x535049 ("SPI" in ASCII). |
| 1     | Enables the write protection if WPKEY corresponds to 0x535049 ("SPI" in ASCII).  |

**39.10.70 SPI Write Protection Status Register**

**Name:** FLEX\_SPI\_WPSR  
**Offset:** 0x4E8  
**Reset:** 0x00000000  
**Property:** Read-only

By default, any debugger or software read access to FLEX\_US\_WPSR clears the WPVS flag. To prevent this flag from being cleared on debugger read access, a specific bit must be enabled in the SFR module.

|        |            |    |    |    |    |    |    |      |
|--------|------------|----|----|----|----|----|----|------|
| Bit    | 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        |            |    |    |    |    |    |    |      |
| Access |            |    |    |    |    |    |    |      |
| Reset  |            |    |    |    |    |    |    |      |
| Bit    | 23         | 22 | 21 | 20 | 19 | 18 | 17 | 16   |
|        |            |    |    |    |    |    |    |      |
| Access |            |    |    |    |    |    |    |      |
| Reset  |            |    |    |    |    |    |    |      |
| Bit    | 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8    |
|        | WPVSR[7:0] |    |    |    |    |    |    |      |
| Access | R          | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7          | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        |            |    |    |    |    |    |    | WPVS |
| Access |            |    |    |    |    |    |    | R    |
| Reset  |            |    |    |    |    |    |    | 0    |

**Bits 15:8 – WPVSR[7:0] Write Protection Violation Source**

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS Write Protection Violation Status**

| Value | Description                                                                                                                                                                                                     |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protect violation has occurred since the last read of FLEX_SPI_WPSR.                                                                                                                                   |
| 1     | A write protect violation has occurred since the last read of FLEX_SPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

## 39.10.71 TWI Control Register

**Name:** FLEX\_TWI\_CR  
**Offset:** 0x600  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the [TWI Write Protection Mode Register](#).

| Reset  | –     | –     | –     | –    | –     | –    | –    | –     |

## Bit 29 – FIFODIS FIFO Disable

| Value | Description                            |
|-------|----------------------------------------|
| 0     | No effect.                             |
| 1     | Disable the Transmit and Receive FIFOs |

## Bit 28 – FIFOEN FIFO Enable

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Enable the Transmit and Receive FIFOs |

## Bit 26 – LOCKCLR Lock Clear

| Value | Description             |
|-------|-------------------------|
| 0     | No effect.              |
| 1     | Clear the TWI FSM lock. |

## Bit 24 – THRCLR Transmit Holding Register Clear

| Value | Description                                                      |
|-------|------------------------------------------------------------------|
| 0     | No effect.                                                       |
| 1     | Clear the Transmit Holding Register and set TXRDY, TXCOMP flags. |

## Bit 17 – ACMDIS Alternative Command Mode Disable

| Value | Description                        |
|-------|------------------------------------|
| 0     | No effect.                         |
| 1     | Alternative Command mode disabled. |

**Bit 16 – ACMEN** Alternative Command Mode Enable

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No effect.                        |
| 1     | Alternative Command mode enabled. |

**Bit 15 – CLEAR** Bus CLEAR Command

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | No effect.                                           |
| 1     | If Master mode is enabled, send a bus clear command. |

**Bit 14 – PECRQ** PEC Request

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | No effect.                                |
| 1     | A PEC check or transmission is requested. |

**Bit 13 – PECDIS** Packet Error Checking Disable

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | No effect.                                     |
| 1     | SMBus PEC (CRC) generation and check disabled. |

**Bit 12 – PECEN** Packet Error Checking Enable

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No effect.                                    |
| 1     | SMBus PEC (CRC) generation and check enabled. |

**Bit 11 – SMBDIS** SMBus Mode Disabled

| Value | Description          |
|-------|----------------------|
| 0     | No effect.           |
| 1     | SMBus mode disabled. |

**Bit 10 – SMBEN** SMBus Mode Enabled

| Value | Description                        |
|-------|------------------------------------|
| 0     | No effect.                         |
| 1     | If SMBDIS = 0, SMBus mode enabled. |

**Bit 9 – HSDIS** TWI High-Speed Mode Disabled

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | High-speed mode disabled. |

**Bit 8 – HSEN** TWI High-Speed Mode Enabled

| Value | Description              |
|-------|--------------------------|
| 0     | No effect.               |
| 1     | High-speed mode enabled. |

**Bit 7 – SWRST** Software Reset

| Value | Description                   |
|-------|-------------------------------|
| 0     | No effect.                    |
| 1     | Equivalent to a system reset. |

**Bit 6 – QUICK** SMBus Quick Command

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 0     | No effect.                                                 |
| 1     | If Master mode is enabled, an SMBus Quick Command is sent. |

**Bit 5 – SVDIS** TWI Slave Mode Disabled

| Value | Description                                                                                                                                                                                                                           |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                            |
| 1     | Slave mode is disabled. The shifter and holding characters (if it contains data) are transmitted in the case of a read operation. In a write operation, the character being transferred must be completely received before disabling. |

**Bit 4 – SVEN TWI Slave Mode Enabled**

Switching from Master to Slave mode is only permitted when TXCOMP = 1.

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | No effect.                                           |
| 1     | Enables the Slave mode (SVDIS must be written to 0). |

**Bit 3 – MSDIS TWI Master Mode Disabled**

| Value | Description                                                                                                                                                                                                                                                         |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                                                          |
| 1     | The Master mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in case of write operation. In read operation, the character being transferred must be completely received before disabling. |

**Bit 2 – MSEN TWI Master Mode Enabled**

Switching from Slave to Master mode is only permitted when TXCOMP = 1.

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | No effect.                                            |
| 1     | Enables the Master mode (MSDIS must be written to 0). |

**Bit 1 – STOP Send a STOP Condition**

| Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 1     | STOP condition is sent just after completing the current byte transmission in Master Read mode. <ul style="list-style-type: none"> <li>– In single data byte master read, both START and STOP must be set.</li> <li>– In multiple data bytes master read, the STOP must be set after the last data received but one.</li> <li>– In Master Read mode, if a NACK bit is received, the STOP is automatically performed.</li> <li>– In master data write operation, a STOP condition will be sent after the transmission of the current data is finished.</li> </ul> |

**Bit 0 – START Send a START Condition**

This action is necessary when the TWI peripheral needs to read data from a slave. When configured in Master mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding Register (FLEX\_TWI\_THR).

| Value | Description                                                                                                                         |
|-------|-------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                          |
| 1     | A frame beginning with a START bit is transmitted according to the features defined in the TWI Master Mode Register (FLEX_TWI_MMR). |

**39.10.72 TWI Control Register (FIFO\_ENABLED)****Name:** FLEX\_TWI\_CR (FIFO\_ENABLED)**Offset:** 0x600**Reset:** –**Property:** Write-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit), see [39.9.6.8. TWI Multiple Data Mode](#) for details.

This register can only be written if the WPCREN bit is cleared in the [TWI Write Protection Mode Register](#).

**Bit 29 – FIFODIS FIFO Disable**

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | No effect.                              |
| 1     | Disable the Transmit and Receive FIFOs. |

**Bit 28 – FIFOEN FIFO Enable**

| Value | Description                            |
|-------|----------------------------------------|
| 0     | No effect.                             |
| 1     | Enable the Transmit and Receive FIFOs. |

**Bit 26 – TXFLCLR Transmit FIFO Lock CLEAR**

| Value | Description                    |
|-------|--------------------------------|
| 0     | No effect.                     |
| 1     | Clears the Transmit FIFO Lock. |

**Bit 25 – RXFCLR Receive FIFO Clear**

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | Empties the Receive FIFO. |

**Bit 24 – TXFCLR Transmit FIFO Clear**

| Value | Description                |
|-------|----------------------------|
| 0     | No effect.                 |
| 1     | Empties the Transmit FIFO. |

**Bit 17 – ACMDIS** Alternative Command Mode Disable

| Value | Description                        |
|-------|------------------------------------|
| 0     | No effect.                         |
| 1     | Alternative Command mode disabled. |

**Bit 16 – ACMEN** Alternative Command Mode Enable

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No effect.                        |
| 1     | Alternative Command mode enabled. |

**Bit 15 – CLEAR** Bus CLEAR Command

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | No effect.                                           |
| 1     | If Master mode is enabled, send a bus clear command. |

**Bit 14 – PECRQ** PEC Request

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | No effect.                                |
| 1     | A PEC check or transmission is requested. |

**Bit 13 – PECDIS** Packet Error Checking Disable

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | No effect.                                     |
| 1     | SMBus PEC (CRC) generation and check disabled. |

**Bit 12 – PECEN** Packet Error Checking Enable

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No effect.                                    |
| 1     | SMBus PEC (CRC) generation and check enabled. |

**Bit 11 – SMBDIS** SMBus Mode Disabled

| Value | Description          |
|-------|----------------------|
| 0     | No effect.           |
| 1     | SMBus mode disabled. |

**Bit 10 – SMBEN** SMBus Mode Enabled

| Value | Description                        |
|-------|------------------------------------|
| 0     | No effect.                         |
| 1     | If SMBDIS = 0, SMBus mode enabled. |

**Bit 9 – HSDIS** TWI High-Speed Mode Disabled

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | High-speed mode disabled. |

**Bit 8 – HSEN** TWI High-Speed Mode Enabled

| Value | Description              |
|-------|--------------------------|
| 0     | No effect.               |
| 1     | High-speed mode enabled. |

**Bit 7 – SWRST** Software Reset

| Value | Description                   |
|-------|-------------------------------|
| 0     | No effect.                    |
| 1     | Equivalent to a system reset. |

**Bit 6 – QUICK** SMBus Quick Command

| Value | Description                                               |
|-------|-----------------------------------------------------------|
| 0     | No effect.                                                |
| 1     | If Master mode is enabled, a SMBus Quick Command is sent. |

**Bit 5 – SVDIS TWI Slave Mode Disabled**

| Value | Description                                                                                                                                                                                                                           |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                            |
| 1     | Slave mode is disabled. The shifter and holding characters (if it contains data) are transmitted in the case of a read operation. In a write operation, the character being transferred must be completely received before disabling. |

**Bit 4 – SVEN TWI Slave Mode Enabled**

Switching from Master to Slave mode is only permitted when TXCOMP = 1.

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | No effect.                                           |
| 1     | Enables the Slave mode (SVDIS must be written to 0). |

**Bit 3 – MSDIS TWI Master Mode Disabled**

| Value | Description                                                                                                                                                                                                                                                                 |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                                                                  |
| 1     | The Master mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in the case of a write operation. In a read operation, the character being transferred must be completely received before disabling. |

**Bit 2 – MSEN TWI Master Mode Enabled**

Switching from Slave to Master mode is only permitted when TXCOMP = 1.

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | No effect.                                            |
| 1     | Enables the Master mode (MSDIS must be written to 0). |

**Bit 1 – STOP Send a STOP Condition**

| Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 1     | STOP condition is sent just after completing the current byte transmission in Master Read mode. <ul style="list-style-type: none"> <li>– In single data byte master read, both START and STOP must be set.</li> <li>– In multiple data bytes master read, the STOP must be set after the last data received but one.</li> <li>– In Master Read mode, if a NACK bit is received, the STOP is automatically performed.</li> <li>– In master data write operation, a STOP condition will be sent after the transmission of the current data is finished.</li> </ul> |

**Bit 0 – START Send a START Condition**

This action is necessary when the TWI peripheral needs to read data from a slave. When configured in Master mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding Register (FLEX\_TWI\_THR).

| Value | Description                                                                                                                         |
|-------|-------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                          |
| 1     | A frame beginning with a START bit is transmitted according to the features defined in the TWI Master Mode Register (FLEX_TWI_MMR). |

**Bit 24 – NOAP** No Auto-Stop On NACK Error

| Value | Description                                                                  |
|-------|------------------------------------------------------------------------------|
| 0     | A stop condition is sent automatically upon Not-Acknowledge error detection. |
| 1     | No automatic action is performed upon Not-Acknowledge error detection.       |

**Bits 22:16 – DADR[6:0]** Device Address

The device address is used to access slave devices in Read or Write mode. Those bits are only used in Master mode.

**Bit 12 – MREAD** Master Read Direction

| Value | Description             |
|-------|-------------------------|
| 0     | Master write direction. |
| 1     | Master read direction.  |

**Bits 9:8 – IADRSZ[1:0]** Internal Device Address Size

| Value | Name   | Description                        |
|-------|--------|------------------------------------|
| 0     | NONE   | No internal device address         |
| 1     | 1_BYTE | One-byte internal device address   |
| 2     | 2_BYTE | Two-byte internal device address   |
| 3     | 3_BYTE | Three-byte internal device address |

## 39.10.74 TWI Slave Mode Register

**Name:** FLEX\_TWI\_SMR  
**Offset:** 0x608  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TWI Write Protection Mode Register](#).

|        |       |           |      |       |      |      |     |        |

| Reset  | 0     | 0         | 0    | 0     | 0    | 0    |     | 0      |

## Bits 22:16 – SADR[6:0] Slave Address

The slave device address is used in Slave mode in order to be accessed by master devices in Read or Write mode.

SADR must be programmed before enabling the Slave mode or after a general call. Writes at other times have no effect.

## Bits 14:8 – MASK[6:0] Slave Address Mask

A mask can be applied on the slave device address in Slave mode in order to allow multiple address answer. For each bit of the MASK field set to one, the corresponding SADR bit will be masked.

If the MASK field is set to 0, no mask is applied to the SADR field.

## Bit 7 – SNIFF Slave Sniffer Mode

| Value | Description                     |
|-------|---------------------------------|
| 0     | Slave Sniffer mode is disabled. |
| 1     | Slave Sniffer mode is enabled.  |

## Bit 6 – SCLWSDIS Clock Wait State Disable

| Value | Description                                                                                |
|-------|--------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                 |
| 1     | Clock stretching disabled in Slave mode, OVRE and UNRE will indicate overrun and underrun. |

## Bit 5 – BSEL TWI Bus Selection

| Value | Description                                                                          |
|-------|--------------------------------------------------------------------------------------|
| 0     | TWI analyzes the TWCK and TWD pins from its TWI bus.                                 |
| 1     | TWI analyzes the TWCK pins TWD from consecutive index TWI peripheral of the product. |

**Bit 4 – SADAT** Slave Address Treated as Data

When Slave Sniffer Mode is enabled, the slave address is always received as data in FLEX\_TWI\_RHR and SADAT has no effect.

| Value | Description                                                                                                     |
|-------|-----------------------------------------------------------------------------------------------------------------|
| 0     | Slave address is handled normally (will not trig RXRDY flag and will not fill FLEX_TWI_RHR upon reception).     |
| 1     | Slave address is handled as data field, RXRDY will be set and FLEX_TWI_RHR filled upon slave address reception. |

**Bit 3 – SMHH** SMBus Host Header

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | Acknowledge of the SMBus Host Header disabled. |
| 1     | Acknowledge of the SMBus Host Header enabled.  |

**Bit 2 – SMDA** SMBus Default Address

| Value | Description                                        |
|-------|----------------------------------------------------|
| 0     | Acknowledge of the SMBus Default Address disabled. |
| 1     | Acknowledge of the SMBus Default Address enabled.  |

**Bit 0 – NACKEN** Slave Receiver Data Phase NACK Enable

| Value | Description                                                                            |
|-------|----------------------------------------------------------------------------------------|
| 0     | Normal value to be returned in the ACK cycle of the data phase in Slave Receiver mode. |
| 1     | NACK value to be returned in the ACK cycle of the data phase in Slave Receiver mode.   |

39.10.75 TWI Internal Address Register

Name: FLEX\_TWI\_IADR  
Offset: 0x60C  
Reset: 0x00000000  
Property: Read/Write

|        |             |     |     |     |     |     |     |     |

| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

Bits 23:0 – IADR[23:0] Internal Address  
0, 1, 2 or 3 bytes depending on IADRSZ.

### 39.10.76 TWI Clock Waveform Generator Register

**Name:** FLEX\_TWI\_CWGR  
**Offset:** 0x610  
**Reset:** 0x00000000  
**Property:** Read/Write

FLEX\_TWI\_CWGR is only used in Master mode.

|        |            |     |     |          |            |     |     |     |

| Access |            |     |     | R/W      |            | R/W | R/W | R/W |
| Reset  |            |     |     | 0        |            | 0   | 0   | 0   |
| Bit    | 15         | 14  | 13  | 12       | 11         | 10  | 9   | 8   |
|        | CHDIV[7:0] |     |     |          |            |     |     |     |
| Access | R/W        | R/W | R/W | R/W      | R/W        | R/W | R/W | R/W |
| Reset  | 0          | 0   | 0   | 0        | 0          | 0   | 0   | 0   |
| Bit    | 7          | 6   | 5   | 4        | 3          | 2   | 1   | 0   |
|        | CLDIV[7:0] |     |     |          |            |     |     |     |
| Access | R/W        | R/W | R/W | R/W      | R/W        | R/W | R/W | R/W |
| Reset  | 0          | 0   | 0   | 0        | 0          | 0   | 0   | 0   |

#### Bits 29:24 – HOLD[5:0] TWD Hold Time Versus TWCK Falling

If High-speed mode is selected TWD is internally modified on the TWCK falling edge to meet the I<sup>2</sup>C specified maximum hold time, else if High-speed mode is not configured TWD is kept unchanged after TWCK falling edge for a period of  $(HOLD + 3) \times t_{\text{peripheral clock}}$ .

#### Bit 20 – BRSRCCLK Bit Rate Source Clock

| Value | Name       | Description                                                                                                              |
|-------|------------|--------------------------------------------------------------------------------------------------------------------------|
| 0     | PERIPH_CLK | The peripheral clock is the source clock for the bit rate generation.                                                    |
| 1     | GCLK       | GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock. |

#### Bits 18:16 – CKDIV[2:0] Clock Divider

The CKDIV is used to increase both SCL high and low periods.

#### Bits 15:8 – CHDIV[7:0] Clock High Divider

The SCL high period is defined as follows:

If FLEX\_TWI\_FILTR.FILT = 0

- If BRSRCCLK = 0:  $CHDIV = ((t_{\text{high}}/t_{\text{peripheral clock}}) - 3)/2^{\text{CKDIV}}$
- If BRSRCCLK = 1:  $CHDIV = (t_{\text{high}}/t_{\text{ext\_ck}})/2^{\text{CKDIV}}$

If FLEX\_TWI\_FILTR.FILT = 1

- If BRSRCCLK = 0:  $CHDIV = ((t_{\text{high}}/t_{\text{peripheral clock}}) - 3 - (\text{THRES}+1))/2^{\text{CKDIV}}$
- If BRSRCCLK = 1:  $CHDIV = ((t_{\text{high}} - (\text{THRES}+1) \times t_{\text{peripheral clock}})/t_{\text{ext\_ck}})/2^{\text{CKDIV}}$

**Bits 7:0 – CLDIV[7:0] Clock Low Divider**

The SCL low period is defined as follows:

If FLEX\_TWI\_FILTR.FILT = 0

- If BRSRCCLK = 0:  $CLDIV = ((t_{low}/t_{\text{peripheral clock}}) - 3)/2^{CKDIV}$
- If BRSRCCLK = 1:  $CLDIV = (t_{low}/t_{\text{ext\_ck}})/2^{CKDIV}$

If FLEX\_TWI\_FILTR.FILT = 1

- If BRSRCCLK = 0:  $CLDIV = ((t_{low}/t_{\text{peripheral clock}}) - 3 - (THRES+1))/2^{CKDIV}$
- If BRSRCCLK = 1:  $CLDIV = ((t_{low} - (THRES+1) * t_{\text{peripheral clock}})/t_{\text{ext\_ck}})/2^{CKDIV}$

**39.10.77 TWI Status Register**

**Name:** FLEX\_TWI\_SR  
**Offset:** 0x620  
**Reset:** 0x0300F009  
**Property:** Read-only

If enabled in the SFR module (default is disabled), a debugger read access does not clear the clear-on-read flags.

**Bit 26 – SR Start Repeated**

| Value | Description                                                                |
|-------|----------------------------------------------------------------------------|
| 0     | No repeated start has been detected since last FLEX_TWI_SR read.           |
| 1     | At least one repeated start has been detected since last FLEX_TWI_SR read. |

**Bit 25 – SDA SDA Line Value**

| Value | Description                    |
|-------|--------------------------------|
| 0     | SDA line sampled value is '0'. |
| 1     | SDA line sampled value is '1'. |

**Bit 24 – SCL SCL Line Value**

| Value | Description                    |
|-------|--------------------------------|
| 0     | SCL line sampled value is '0'. |
| 1     | SCL line sampled value is '1'. |

**Bit 23 – LOCK TWI Lock Due to Frame Errors**

| Value | Description                                                                                                                                           |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The TWI is not locked.                                                                                                                                |
| 1     | The TWI is locked due to frame errors (see <a href="#">39.9.3.12. Handling Errors in Alternative Command</a> and <a href="#">39.9.6. TWI FIFOs</a> ). |

**Bit 21 – SMBHHM SMBus Host Header Address Match (cleared on read)**

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | No SMBus Host Header Address received.    |
| 1     | A SMBus Host Header Address was received. |

**Bit 20 – SMBDAM** SMBus Default Address Match (cleared on read)

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No SMBus Default Address received.    |
| 1     | A SMBus Default Address was received. |

**Bit 19 – PECERR** PEC Error (cleared on read)

| Value | Description                  |
|-------|------------------------------|
| 0     | No SMBus PEC error occurred. |
| 1     | A SMBus PEC error occurred.  |

**Bit 18 – TOUT** Timeout Error (cleared on read)

| Value | Description                |
|-------|----------------------------|
| 0     | No SMBus timeout occurred. |
| 1     | SMBus timeout occurred.    |

**Bit 17 – SMBAF** SMBus Alert Flag (cleared on read)

| Value | Description                                        |
|-------|----------------------------------------------------|
| 0     | No SMBus slave drives the SMBALERT line.           |
| 1     | At least one SMBus slave drives the SMBALERT line. |

**Bit 16 – MACK** Master Code Acknowledge (cleared on read)

MACK used in Slave mode:

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No master code has been received. |
| 1     | A master code has been received.  |

**Bit 11 – EOSACC** End Of Slave Access (cleared on read)

This bit is only used in Slave mode.

EOSACC behavior can be seen in figures [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

| Value | Description                                                                                       |
|-------|---------------------------------------------------------------------------------------------------|
| 0     | A slave access is being performing.                                                               |
| 1     | The Slave Access is finished. End Of Slave Access is automatically set as soon as SVACC is reset. |

**Bit 10 – SCLWS** Clock Wait State

This bit is only used in Slave mode.

SCLWS behavior can be seen in figures [Clock Stretching in Read Mode](#) and [Clock Stretching in Write Mode](#).

| Value | Description                                                                                                                                |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The clock is not stretched.                                                                                                                |
| 1     | The clock is stretched. FLEX_TWI_THR / FLEX_TWI_RHR buffer is not filled / emptied before the transmission / reception of a new character. |

**Bit 9 – ARBLST** Arbitration Lost (cleared on read)

This bit is only used in Master mode.

| Value | Description                                                                                                           |
|-------|-----------------------------------------------------------------------------------------------------------------------|
| 0     | Arbitration won.                                                                                                      |
| 1     | Arbitration lost. Another master of the TWI bus has won the multi-master arbitration. TXCOMP is set at the same time. |

**Bit 8 – NACK** Not Acknowledged (cleared on read)

NACK used in Master mode:

0: Each data byte has been correctly received by the far-end side TWI slave component.

1: A data or address byte has not been acknowledged by the slave component. Set at the same time as TXCOMP.

NACK used in Slave Read mode:

0: Each data byte has been correctly received by the master.

1: In Read mode, a data byte has not been acknowledged by the master. When NACK is set, the user must not fill FLEX\_TWI\_THR even if TXRDY is set, because it means that the master will stop the data transfer or reinitiate it..

Note that in Slave Write mode, all data are acknowledged by the TWI.

#### Bit 7 – UNRE Underrun Error (cleared on read)

This bit is only used in Slave mode if clock stretching is disabled.

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | FLEX_TWI_THR has been filled on time.     |
| 1     | FLEX_TWI_THR has not been filled on time. |

#### Bit 6 – OVRE Overrun Error (cleared on read)

This bit is only used in Slave mode if clock stretching is disabled.

| Value | Description                                                                                        |
|-------|----------------------------------------------------------------------------------------------------|
| 0     | FLEX_TWI_RHR has not been loaded while RXRDY was set.                                              |
| 1     | FLEX_TWI_RHR has been loaded while RXRDY was set. Reset by read in FLEX_TWI_SR when TXCOMP is set. |

#### Bit 5 – GACC General Call Access (cleared on read)

This bit is only used in Slave mode.

GACC behavior can be seen in figure [Master Performs a General Call](#).

| Value | Description                                                                                                                                                                                             |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No general call has been detected.                                                                                                                                                                      |
| 1     | A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes. |

#### Bit 4 – SVACC Slave Access

This bit is only used in Slave mode.

SVACC behavior can be seen in figures [Read Access Ordered by a Master](#), [Write Access Ordered by a Master](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

| Value | Description                                                                                                                                         |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | TWI is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected.                                                  |
| 1     | Indicates that the address decoding sequence has matched (a master has sent SADR). SVACC remains high until a NACK or a STOP condition is detected. |

#### Bit 3 – SVREAD Slave Read

This bit is only used in Slave mode. When SVACC is low (no slave access has been detected) SVREAD is irrelevant.

SVREAD behavior can be seen in figures [Read Access Ordered by a Master](#), [Write Access Ordered by a Master](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

| Value | Description                                             |
|-------|---------------------------------------------------------|
| 0     | Indicates that a write access is performed by a master. |
| 1     | Indicates that a read access is performed by a master.  |

#### Bit 2 – TXRDY Transmit Holding Register Ready (cleared by writing FLEX\_TWI\_THR)

TXRDY used in Master mode:

0: The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into FLEX\_TWI\_THR.

1: As soon as a data byte is transferred from FLEX\_TWI\_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWI).

TXRDY behavior in Master mode can be seen in figures [Master Write with One Data Byte](#), [Master Write with Multiple Data Bytes](#) and [Master Write with One Byte Internal Address and Multiple Data Bytes](#).

TXRDY used in Slave mode:

0: As soon as data is written in FLEX\_TWI\_THR, until this data has been transmitted and acknowledged (ACK or NACK).

1: Indicates that FLEX\_TWI\_THR is empty and that data has been transmitted and acknowledged. If TXRDY is high and if a NACK has been detected, the transmission will be stopped. Thus when TRDY = NACK = 1, the user must not fill FLEX\_TWI\_THR to avoid losing it.

TXRDY behavior in Slave mode can be seen in figures [Read Access Ordered by a Master, Clock Stretching in Read Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

TXRDY behavior with FIFOs enabled is illustrated in [TXRDY and RXRDY Behavior](#).

#### Bit 1 – RXRDY Receive Holding Register Ready (cleared when reading FLEX\_TWI\_RHR)

When FIFOs are disabled:

0: No character has been received since the last FLEX\_TWI\_RHR read operation.

1: A byte has been received in FLEX\_TWI\_RHR since the last read.

RXRDY behavior in Master mode can be seen in figure [Master Read with Multiple Data Bytes](#).

RXRDY behavior in Slave mode can be seen in figures [Write Access Ordered by a Master, Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RXRDY behavior with FIFO enabled is illustrated in [TXRDY and RXRDY Behavior](#).

#### Bit 0 – TXCOMP Transmission Completed (cleared by writing FLEX\_TWI\_THR)

TXCOMP used in Master mode:

0: During the length of the current frame.

1: When both the holding register and the internal shifter are empty and STOP condition has been sent.

TXCOMP behavior in Master mode can be seen in figures [Master Write with One Byte Internal Address and Multiple Data Bytes](#) and [Master Read with Multiple Data Bytes](#).

TXCOMP used in Slave mode:

0: As soon as a Start is detected.

1: After a Stop or a Repeated Start + an address different from SADR is detected.

TXCOMP behavior in Slave mode can be seen in figures [Clock Stretching in Read Mode](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

**39.10.78 TWI Status Register (FIFO ENABLED)**

**Name:** FLEX\_TWI\_SR (FIFO\_ENABLED)  
**Offset:** 0x620  
**Reset:** 0x0300F009  
**Property:** Read-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit), see [TWI Multiple Data Mode](#) for details.

If enabled in the SFR module (default is disabled), a debugger read access does not clear the clear-on-read flags.

|        |    |    |    |    |    |    |     |     |

| Reset  | 0    | 0    | 0    | 0     | 1      | 0     | 0     | 1      |

**Bit 26 – SR Start Repeated**

| Value | Description                                                                |
|-------|----------------------------------------------------------------------------|
| 0     | No repeated start has been detected since last FLEX_TWI_SR read.           |
| 1     | At least one repeated start has been detected since last FLEX_TWI_SR read. |

**Bit 25 – SDA SDA Line Value**

| Value | Description                    |
|-------|--------------------------------|
| 0     | SDA line sampled value is '0'. |
| 1     | SDA line sampled value is '1'. |

**Bit 24 – SCL SCL Line Value**

| Value | Description                    |
|-------|--------------------------------|
| 0     | SCL line sampled value is '0'. |
| 1     | SCL line sampled value is '1'. |

**Bit 23 – TXFLOCK Transmit FIFO Lock**

| Value | Description                      |
|-------|----------------------------------|
| 0     | The Transmit FIFO is not locked. |
| 1     | The Transmit FIFO is locked.     |

**Bit 21 – SMBHHM SMBus Host Header Address Match (cleared on read)**

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | No SMBus Host Header Address received.    |
| 1     | A SMBus Host Header Address was received. |

**Bit 20 – SMBDAM** SMBus Default Address Match (cleared on read)

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No SMBus Default Address received.    |
| 1     | A SMBus Default Address was received. |

**Bit 19 – PECERR** PEC Error (cleared on read)

| Value | Description                  |
|-------|------------------------------|
| 0     | No SMBus PEC error occurred. |
| 1     | A SMBus PEC error occurred.  |

**Bit 18 – TOUT** Timeout Error (cleared on read)

| Value | Description                |
|-------|----------------------------|
| 0     | No SMBus timeout occurred. |
| 1     | SMBus timeout occurred.    |

**Bit 17 – SMBAF** SMBus Alert Flag (cleared on read)

| Value | Description                                        |
|-------|----------------------------------------------------|
| 0     | No SMBus slave drives the SMBALERT line.           |
| 1     | At least one SMBus slave drives the SMBALERT line. |

**Bit 16 – MACK** Master Code Acknowledge (cleared on read)

MACK used in Slave mode:

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No master code has been received. |
| 1     | A master code has been received.  |

**Bit 11 – EOSACC** End Of Slave Access (cleared on read)

This bit is only used in Slave mode.

EOSACC behavior can be seen in figures [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

| Value | Description                                                                                       |
|-------|---------------------------------------------------------------------------------------------------|
| 0     | A Slave Access is being performed.                                                                |
| 1     | The Slave Access is finished. End Of Slave Access is automatically set as soon as SVACC is reset. |

**Bit 10 – SCLWS** Clock Wait State

This bit is only used in Slave mode.

SCLWS behavior can be seen in figures [Clock Stretching in Read Mode](#) and [Clock Stretching in Write Mode](#).

| Value | Description                                                                                                                                |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The clock is not stretched.                                                                                                                |
| 1     | The clock is stretched. FLEX_TWI_THR / FLEX_TWI_RHR buffer is not filled / emptied before the transmission / reception of a new character. |

**Bit 9 – ARBLST** Arbitration Lost (cleared on read)

This bit is only used in Master mode.

| Value | Description                                                                                                           |
|-------|-----------------------------------------------------------------------------------------------------------------------|
| 0     | Arbitration won.                                                                                                      |
| 1     | Arbitration lost. Another master of the TWI bus has won the multi-master arbitration. TXCOMP is set at the same time. |

**Bit 8 – NACK** Not Acknowledged (cleared on read)

NACK used in Master mode:

0: Each data byte has been correctly received by the far-end side TWI slave component.

1: A data or address byte has not been acknowledged by the slave component. Set at the same time as TXCOMP.

NACK used in Slave Read mode:

0: Each data byte has been correctly received by the master.

1: In Read mode, a data byte has not been acknowledged by the master. When NACK is set the user must not fill FLEX\_TWI\_THR even if TXRDY is set, because it means that the master will stop the data transfer or re initiate it.

Note that in Slave Write mode all data are acknowledged by the TWI.

#### Bit 7 – UNRE Underrun Error (cleared on read)

This bit is only used in Slave mode if clock stretching is disabled.

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | FLEX_TWI_THR has been filled on time.     |
| 1     | FLEX_TWI_THR has not been filled on time. |

#### Bit 6 – OVRE Overrun Error (cleared on read)

This bit is only used in Slave mode if clock stretching is disabled.

| Value | Description                                                                                        |
|-------|----------------------------------------------------------------------------------------------------|
| 0     | FLEX_TWI_RHR has not been loaded while RXRDY was set.                                              |
| 1     | FLEX_TWI_RHR has been loaded while RXRDY was set. Reset by read in FLEX_TWI_SR when TXCOMP is set. |

#### Bit 5 – GACC General Call Access (cleared on read)

This bit is only used in Slave mode.

GACC behavior can be seen in figure [Master Performs a General Call](#).

| Value | Description                                                                                                                                                                                             |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No general call has been detected.                                                                                                                                                                      |
| 1     | A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes. |

#### Bit 4 – SVACC Slave Access

This bit is only used in Slave mode.

SVACC behavior can be seen in figures [Read Access Ordered by a Master](#), [Write Access Ordered by a Master](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

| Value | Description                                                                                                                                         |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | TWI is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected.                                                  |
| 1     | Indicates that the address decoding sequence has matched (a master has sent SADR). SVACC remains high until a NACK or a STOP condition is detected. |

#### Bit 3 – SVREAD Slave Read

This bit is only used in Slave mode. When SVACC is low (no slave access has been detected) SVREAD is irrelevant.

SVREAD behavior can be seen in figures [Read Access Ordered by a Master](#), [Write Access Ordered by a Master](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

| Value | Description                                             |
|-------|---------------------------------------------------------|
| 0     | Indicates that a write access is performed by a master. |
| 1     | Indicates that a read access is performed by a master.  |

#### Bit 2 – TXRDY Transmit Holding Register Ready (cleared by writing FLEX\_TWI\_THR)

TXRDY used in Master mode:

0: The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into FLEX\_TWI\_THR.

1: As soon as a data byte is transferred from FLEX\_TWI\_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWI).

TXRDY behavior in Master mode can be seen in figures [Master Write with One Data Byte](#), [Master Write with Multiple Data Bytes](#) and [Master Write with One Byte Internal Address and Multiple Data Bytes](#).

TXRDY used in Slave mode:

0: As soon as data is written in FLEX\_TWI\_THR, until this data has been transmitted and acknowledged (ACK or NACK).

1: Indicates that FLEX\_TWI\_THR is empty and that data has been transmitted and acknowledged.

If TXRDY is high and if a NACK has been detected, the transmission will be stopped. Thus when TRDY = NACK = 1, the user must not fill FLEX\_TWI\_THR to avoid losing it.

TXRDY behavior in Slave mode can be seen in figures [Read Access Ordered by a Master, Clock Stretching in Read Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

TXRDY behavior with FIFOs enabled is illustrated in [TXRDY and RXRDY Behavior](#).

#### Bit 1 – RXRDY Receive Holding Register Ready (cleared when reading FLEX\_TWI\_RHR)

When FIFOs are disabled:

0: No character has been received since the last FLEX\_TWI\_RHR read operation.

1: A byte has been received in FLEX\_TWI\_RHR since the last read.

RXRDY behavior in Master mode can be seen in figure [Master Read with Multiple Data Bytes](#).

RXRDY behavior in Slave mode can be seen in figures [Write Access Ordered by a Master, Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RXRDY behavior with FIFO enabled is illustrated in [TXRDY and RXRDY Behavior](#).

#### Bit 0 – TXCOMP Transmission Completed (cleared by writing FLEX\_TWI\_THR)

TXCOMP used in Master mode:

0: During the length of the current frame.

1: When both holding register and internal shifter are empty and STOP condition has been sent.

TXCOMP behavior in Master mode can be seen in figures [Master Write with One Byte Internal Address and Multiple Data Bytes](#) and [Master Read with Multiple Data Bytes](#).

TXCOMP used in Slave mode:

0: As soon as a Start is detected.

1: After a Stop or a Repeated Start + an address different from SADR is detected.

TXCOMP behavior in Slave mode can be seen in figures [Clock Stretching in Read Mode](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

### 39.10.79 TWI Interrupt Enable Register

**Name:** FLEX\_TWI\_IER  
**Offset:** 0x624  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TWI Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| Bit    | 31     | 30     | 29     | 28     | 27     | 26     | 25     | 24     |
| Access |        |        |        |        |        |        |        |        |

**Bit 21 – SMBHHM** SMBus Host Header Address Match Interrupt Enable

**Bit 20 – SMBDAM** SMBus Default Address Match Interrupt Enable

**Bit 19 – PECERR** PEC Error Interrupt Enable

**Bit 18 – TOUT** Timeout Error Interrupt Enable

**Bit 16 – MCACK** Master Code Acknowledge Interrupt Enable

**Bit 15 – TXBUFE** Transmit Buffer Empty Interrupt Enable

**Bit 14 – RXBUFF** Receive Buffer Full Interrupt Enable

**Bit 13 – ENDTX** End of Transmit Buffer Interrupt Enable

**Bit 12 – ENDRX** End of Receive Buffer Interrupt Enable

**Bit 11 – EOSACC** End Of Slave Access Interrupt Enable

**Bit 10 – SCL\_WS** Clock Wait State Interrupt Enable

**Bit 9 – ARBLST** Arbitration Lost Interrupt Enable

**Bit 8 – NACK** Not Acknowledge Interrupt Enable

**Bit 7 – UNRE** Underrun Error Interrupt Enable

**Bit 6 – OVRE** Overrun Error Interrupt Enable

**Bit 5 – GACC** General Call Access Interrupt Enable

**Bit 4 – SVACC** Slave Access Interrupt Enable

**Bit 2 – TXRDY** Transmit Holding Register Ready Interrupt Enable

**Bit 1 – RXRDY** Receive Holding Register Ready Interrupt Enable

**Bit 0 – TXCOMP** Transmission Completed Interrupt Enable

### 39.10.80 TWI Interrupt Disable Register

**Name:** FLEX\_TWI\_IDR

**Offset:** 0x628

**Reset:** –

**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TWI Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|        |        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| Bit    | 31     | 30     | 29     | 28     | 27     | 26     | 25     | 24     |
|        |        |        |        |        |        |        |        |        |
| Access |        |        |        |        |        |        |        |        |
| Reset  |        |        |        |        |        |        |        |        |
| Bit    | 23     | 22     | 21     | 20     | 19     | 18     | 17     | 16     |

**Bit 8 – NACK** Not Acknowledge Interrupt Disable

**Bit 7 – UNRE** Underrun Error Interrupt Disable

**Bit 6 – OVRE** Overrun Error Interrupt Disable

**Bit 5 – GACC** General Call Access Interrupt Disable

**Bit 4 – SVACC** Slave Access Interrupt Disable

**Bit 2 – TXRDY** Transmit Holding Register Ready Interrupt Disable

**Bit 1 – RXRDY** Receive Holding Register Ready Interrupt Disable

**Bit 0 – TXCOMP** Transmission Completed Interrupt Disable

### 39.10.81 TWI Interrupt Mask Register

**Name:** FLEX\_TWI\_IMR  
**Offset:** 0x62C  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |        |        |        |      |    |       |

**Bit 21 – SMBHHM** SMBus Host Header Address Match Interrupt Mask

**Bit 20 – SMBDAM** SMBus Default Address Match Interrupt Mask

**Bit 19 – PECERR** PEC Error Interrupt Mask

**Bit 18 – TOUT** Timeout Error Interrupt Mask

**Bit 16 – MCACK** Master Code Acknowledge Interrupt Mask

**Bit 15 – TXBUFE** Transmit Buffer Empty Interrupt Mask

**Bit 14 – RXBUFF** Receive Buffer Full Interrupt Mask

**Bit 13 – ENDTX** End of Transmit Buffer Interrupt Mask

**Bit 12 – ENDRX** End of Receive Buffer Interrupt Mask

**Bit 11 – EOSACC** End Of Slave Access Interrupt Mask

**Bit 10 – SCL\_WS** Clock Wait State Interrupt Mask

**Bit 9 – ARBLST** Arbitration Lost Interrupt Mask

**Bit 8 – NACK** Not Acknowledge Interrupt Mask

**Bit 7 – UNRE** Underrun Error Interrupt Mask

**Bit 6 – OVRE** Overrun Error Interrupt Mask

**Bit 5 – GACC** General Call Access Interrupt Mask

**Bit 4 – SVACC** Slave Access Interrupt Mask

**Bit 2 – TXRDY** Transmit Holding Register Ready Interrupt Mask

**Bit 1 – RXRDY** Receive Holding Register Ready Interrupt Mask

**Bit 0 – TXCOMP** Transmission Completed Interrupt Mask

### 39.10.82 TWI Receive Holding Register

**Name:** FLEX\_TWI\_RHR  
**Offset:** 0x630  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FLEX\_TWI\_CR.FIFOEN bit) and FLEX\_TWI\_FMR.RXRDYM = 0, see [TWI Single Data Mode](#) for details.

If enabled in the SFR module (default is disabled), a debugger read access does not clear the FLEX\_TWI\_SR.RXRDY flag.

|        |             |    |    |             |    |        |             |    |
|--------|-------------|----|----|-------------|----|--------|-------------|----|
| Bit    | 31          | 30 | 29 | 28          | 27 | 26     | 25          | 24 |

#### Bits 12:11 – ASTATE[1:0] Acknowledge State (Slave Sniffer Mode only)

| Value | Name  | Description                                                          |
|-------|-------|----------------------------------------------------------------------|
| 0     | NONE  | No Acknowledge or Nacknowledge detected after previously logged data |
| 1     | ACK   | Acknowledge (A) detected after previously logged data                |
| 2     | NACK  | Nacknowledge (NA) detected after previously logged data              |
| 3     | UNDEF | Not defined                                                          |

#### Bit 10 – PSTATE Stop State (Slave Sniffer Mode only)

| Value | Description                                      |
|-------|--------------------------------------------------|
| 0     | No STOP (P) detected after previous logged data. |
| 1     | Stop detected (P) after previous logged data.    |

#### Bits 9:8 – SSTATE[1:0] Start State (Slave Sniffer Mode only)

| Value | Name    | Description                                       |
|-------|---------|---------------------------------------------------|
| 0     | NOSTART | No START detected with the logged data            |
| 1     | START   | START (S) detected with the logged data           |
| 2     | RSTART  | Repeated START (Sr) detected with the logged data |
| 3     | UNDEF   | Not defined                                       |

#### Bits 7:0 – RXDATA[7:0] Master or Slave Receive Holding Data

**39.10.83 TWI Receive Holding Register (FIFO Enabled)****Name:** FLEX\_TWI\_RHR (FIFO\_ENABLED)**Offset:** 0x630**Reset:** 0x00000000**Property:** Read-only

If FIFO is enabled (FLEX\_TWI\_CR.FIFOEN bit) and FLEX\_TWI\_FMR.RXRDYM > 0, see [TWI Multiple Data Mode](#) for details.

If enabled in the SFR module (default is disabled), a debugger read access does not modify the Receive FIFO.

| Bit    | 15         | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | TLOWS[7:0] |     |     |     |     |     |     |     |
| Access | R/W        | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0          | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7          | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | PRESC[3:0] |     |     |     |     |     |     |     |
| Access |            |     |     |     | R/W | R/W | R/W | R/W |
| Reset  |            |     |     |     | 0   | 0   | 0   | 0   |

**Bits 31:24 – THMAX[7:0]** Clock High Maximum Cycles

Clock cycles in clock high maximum count. Prescaled by PRESC. Used for bus free detection. Used to time THIGH:MAX.

**Bits 23:16 – TLOWM[7:0]** Master Clock Stretch Maximum Cycles

| Value | Description                                                                                     |
|-------|-------------------------------------------------------------------------------------------------|
| 0     | TLOW:MEXT timeout check disabled.                                                               |
| 1–255 | Clock cycles in master maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:MEXT. |

**Bits 15:8 – TLOWS[7:0]** Slave Clock Stretch Maximum Cycles

| Value | Description                                                                                    |
|-------|------------------------------------------------------------------------------------------------|
| 0     | TLOW:SEXT timeout check disabled.                                                              |
| 1–255 | Clock cycles in slave maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:SEXT. |

**Bits 3:0 – PRESC[3:0]** SMBus Clock Prescaler

Used to specify how to prescale the TLOWS, TLOWM and THMAX counters in SMBTR. Counters are prescaled according to the following formula:  $\text{PRESC} = \text{Log}(f_{\text{MCK}} / f_{\text{Prescaled}}) / \text{Log}(2) - 1$

## 39.10.87 TWI Alternative Command Register

**Name:** FLEX\_TWI\_ACR  
**Offset:** 0x640  
**Reset:** 0x00000000  
**Property:** Read/Write

| Access | R/W        | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0          | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

## Bit 25 – NPEC Next PEC Request (SMBus Mode only)

| Value | Description                                |
|-------|--------------------------------------------|
| 0     | The next transfer does not use a PEC byte. |
| 1     | The next transfer uses a PEC byte.         |

## Bit 24 – NDIR Next Transfer Direction

| Value | Description      |
|-------|------------------|
| 0     | Write direction. |
| 1     | Read direction.  |

## Bits 23:16 – NDATAL[7:0] Next Data Length

| Value | Description                                                            |
|-------|------------------------------------------------------------------------|
| 0     | No data to send (see <a href="#">39.9.3.11. Alternative Command</a> ). |
| 1–255 | Number of bytes to send for the next transfer.                         |

## Bit 9 – PEC PEC Request (SMBus Mode only)

| Value | Description                           |
|-------|---------------------------------------|
| 0     | The transfer does not use a PEC byte. |
| 1     | The transfer uses a PEC byte.         |

## Bit 8 – DIR Transfer Direction

| Value | Description      |
|-------|------------------|
| 0     | Write direction. |
| 1     | Read direction.  |

## Bits 7:0 – DATAL[7:0] Data Length

| Value | Description                                                            |
|-------|------------------------------------------------------------------------|
| 0     | No data to send (see <a href="#">39.9.3.11. Alternative Command</a> ). |
| 1–255 | Number of bytes to send during the transfer.                           |

### 39.10.88 TWI Filter Register

**Name:** FLEX\_TWI\_FILTR  
**Offset:** 0x644  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |     |            |     |
|--------|----|----|----|----|----|-----|------------|-----|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10  | 9          | 8   |
|        |    |    |    |    |    |     | THRES[2:0] |     |
| Access |    |    |    |    |    | R/W | R/W        | R/W |
| Reset  |    |    |    |    |    | 0   | 0          | 0   |

|        |   |   |   |   |   |   |        |      |

| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1      | 0    |
|        |   |   |   |   |   |   | PADFEN | FILT |
| Access |   |   |   |   |   |   | R/W    | R/W  |
| Reset  |   |   |   |   |   |   | 0      | 0    |

#### Bits 10:8 – THRES[2:0] Digital Filter Threshold

| Value | Description                                                                                                     |
|-------|-----------------------------------------------------------------------------------------------------------------|
| 0     | No filtering applied on TWI inputs.                                                                             |
| 1–7   | Maximum pulse width of spikes which will be suppressed by the input filter, defined in peripheral clock cycles. |

#### Bit 1 – PADFEN PAD Filter Enable

| Value | Description                                                                                      |
|-------|--------------------------------------------------------------------------------------------------|
| 0     | PAD analog filter is disabled.                                                                   |
| 1     | PAD analog filter is enabled. (The analog filter must be enabled if High-speed mode is enabled.) |

#### Bit 0 – FILT RX Digital Filter

TWI digital input filtering follows a majority decision based on three samples from SDA/SCL lines at peripheral clock frequency.

| Value | Description                                                      |
|-------|------------------------------------------------------------------|
| 0     | No filtering applied on TWI inputs.                              |
| 1     | TWI input filtering is active. (Only in Standard and Fast modes) |

## 39.10.89 TWI FIFO Mode Register

**Name:** FLEX\_TWI\_FMR  
**Offset:** 0x650  
**Reset:** 0x00000000  
**Property:** Read/Write

This register reads '0' if the FIFO is disabled (see FLEX\_TWI\_CR to enable/disable the internal FIFO). This register can only be written if the WPEN bit is cleared in the [TWI Write Protection Mode Register](#).

|        |               |    |             |     |     |     |             |     |
|--------|---------------|----|-------------|-----|-----|-----|-------------|-----|
| Bit    | 31            | 30 | 29          | 28  | 27  | 26  | 25          | 24  |
|        | RXFTHRES[5:0] |    |             |     |     |     |             |     |
| Access |               |    | R/W         | R/W | R/W | R/W | R/W         | R/W |
| Reset  |               |    | 0           | 0   | 0   | 0   | 0           | 0   |
| Bit    | 23            | 22 | 21          | 20  | 19  | 18  | 17          | 16  |
|        | TXFTHRES[5:0] |    |             |     |     |     |             |     |
| Access |               |    | R/W         | R/W | R/W | R/W | R/W         | R/W |
| Reset  |               |    | 0           | 0   | 0   | 0   | 0           | 0   |
| Bit    | 15            | 14 | 13          | 12  | 11  | 10  | 9           | 8   |
| Access |               |    |             |     |     |     |             |     |
| Reset  |               |    |             |     |     |     |             |     |
| Bit    | 7             | 6  | 5           | 4   | 3   | 2   | 1           | 0   |
|        |               |    | RXRDYM[1:0] |     |     |     | TXRDYM[1:0] |     |
| Access |               |    | R/W         | R/W |     |     | R/W         | R/W |
| Reset  |               |    | 0           | 0   |     |     | 0           | 0   |

## Bits 29:24 – RXFTHRES[5:0] Receive FIFO Threshold

| Value | Description                                                                                                                                                                                    |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–8   | Defines the Receive FIFO threshold value (number of data). The FLEX_TWI_FSR.RXFTH flag will be set when Receive FIFO goes from “below” threshold state to “equal to or above” threshold state. |

## Bits 21:16 – TXFTHRES[5:0] Transmit FIFO Threshold

| Value | Description                                                                                                                                                                                      |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–8   | Defines the Transmit FIFO threshold value (number of data). The FLEX_TWI_FSR.TXFTH flag will be set when Transmit FIFO goes from “above” threshold state to “equal to or below” threshold state. |

## Bits 5:4 – RXRDYM[1:0] Receiver Ready Mode

If FIFOs are enabled, the FLEX\_TWI\_SR.RXRDY flag behaves as follows.

| Value | Name      | Description                                                                       |
|-------|-----------|-----------------------------------------------------------------------------------|
| 0     | ONE_DATA  | RXRDY will be at level '1' when at least one unread data is in the Receive FIFO   |
| 1     | TWO_DATA  | RXRDY will be at level '1' when at least two unread data are in the Receive FIFO  |
| 2     | FOUR_DATA | RXRDY will be at level '1' when at least four unread data are in the Receive FIFO |

## Bits 1:0 – TXRDYM[1:0] Transmitter Ready Mode

If FIFOs are enabled, the FLEX\_TWI\_SR.TXRDY flag behaves as follows.

| Value | Name      | Description                                                                            |
|-------|-----------|----------------------------------------------------------------------------------------|
| 0     | ONE_DATA  | TXRDY will be at level '1' when at least one data can be written in the Transmit FIFO  |
| 1     | TWO_DATA  | TXRDY will be at level '1' when at least two data can be written in the Transmit FIFO  |
| 2     | FOUR_DATA | TXRDY will be at level '1' when at least four data can be written in the Transmit FIFO |

### 39.10.90 TWI FIFO Level Register

**Name:** FLEX\_TWI\_FLR  
**Offset:** 0x654  
**Reset:** 0x00000000  
**Property:** Read-only

This register reads '0' if the FIFO is disabled (see FLEX\_TWI\_CR to enable/disable the internal FIFO).

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |           |    |    |    |    |    |
|--------|----|----|-----------|----|----|----|----|----|
| Bit    | 23 | 22 | 21        | 20 | 19 | 18 | 17 | 16 |
|        |    |    | RXFL[5:0] |    |    |    |    |    |

| Bit    | 7 | 6 | 5         | 4 | 3 | 2 | 1 | 0 |
|        |   |   | TXFL[5:0] |   |   |   |   |   |
| Access |   |   | R         | R | R | R | R | R |
| Reset  |   |   | 0         | 0 | 0 | 0 | 0 | 0 |

#### Bits 21:16 – RXFL[5:0] Receive FIFO Level

| Value | Description                                              |
|-------|----------------------------------------------------------|
| 0     | There is no unread data in the Receive FIFO.             |
| 1–8   | Indicates the number of unread data in the Receive FIFO. |

#### Bits 5:0 – TXFL[5:0] Transmit FIFO Level

| Value | Description                                        |
|-------|----------------------------------------------------|
| 0     | There is no data in the Transmit FIFO.             |
| 1–8   | Indicates the number of data in the Transmit FIFO. |

**39.10.91 TWI FIFO Status Register**

**Name:** FLEX\_TWI\_FSR  
**Offset:** 0x660  
**Reset:** 0x00000000  
**Property:** Read-only

This register reads '0' if the FIFO is disabled (see FLEX\_TWI\_CR to enable/disable the internal FIFO)

|        |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |         |         |        |       |       |        |       |       |
|--------|---------|---------|--------|-------|-------|--------|-------|-------|
| Bit    | 7       | 6       | 5      | 4     | 3     | 2      | 1     | 0     |
|        | RXFPTEF | TXFPTEF | RXFTHF | RXFFF | RXFEF | TXFTHF | TXFFF | TXFEF |
| Access | R       | R       | R      | R     | R     | R      | R     | R     |
| Reset  | 0       | 0       | 0      | 0     | 0     | 0      | 0     | 0     |

**Bit 7 – RXFPTEF** Receive FIFO Pointer Error Flag

See [39.9.6.10. FIFO Pointer Error](#) for details.

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | No Receive FIFO pointer occurred.                            |
| 1     | Receive FIFO pointer error occurred. Receiver must be reset. |

**Bit 6 – TXFPTEF** Transmit FIFO Pointer Error Flag

See [39.9.6.10. FIFO Pointer Error](#) for details.

| Value | Description                                                      |
|-------|------------------------------------------------------------------|
| 0     | No Transmit FIFO pointer occurred.                               |
| 1     | Transmit FIFO pointer error occurred. Transceiver must be reset. |

**Bit 5 – RXFTHF** Receive FIFO Threshold Flag

| Value | Description                                                                                               |
|-------|-----------------------------------------------------------------------------------------------------------|
| 0     | Number of unread data in Receive FIFO is below RXFTHRES threshold.                                        |
| 1     | Number of unread data in Receive FIFO has reached RXFTHRES threshold since the last read of FLEX_TWI_FSR. |

**Bit 4 – RXFFF** Receive FIFO Full Flag

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | Receive FIFO is not empty.                                        |
| 1     | Receive FIFO has been filled since the last read of FLEX_TWI_FSR. |

**Bit 3 – RXFEF** Receive FIFO Empty Flag

| Value | Description                                                        |
|-------|--------------------------------------------------------------------|
| 0     | Receive FIFO is not empty.                                         |
| 1     | Receive FIFO has been emptied since the last read of FLEX_TWI_FSR. |

**Bit 2 – TXFTHF** Transmit FIFO Threshold Flag (cleared on read)

| Value | Description                                                                                         |
|-------|-----------------------------------------------------------------------------------------------------|
| 0     | Number of data in Transmit FIFO is above TXFTHRES threshold.                                        |
| 1     | Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of FLEX_TWI_FSR. |

**Bit 1 – TXFFF** Transmit FIFO Full Flag (cleared on read)

| Value | Description                                                        |
|-------|--------------------------------------------------------------------|
| 0     | Transmit FIFO is not full.                                         |
| 1     | Transmit FIFO has been filled since the last read of FLEX_TWI_FSR. |

**Bit 0 – TXFEF** Transmit FIFO Empty Flag (cleared on read)

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | Transmit FIFO is not empty.                                         |
| 1     | Transmit FIFO has been emptied since the last read of FLEX_TWI_FSR. |

**39.10.92 TWI FIFO Interrupt Enable Register**

**Name:** FLEX\_TWI\_FIER  
**Offset:** 0x664  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TWI Write Protection Mode Register](#).

|        |         |         |        |       |       |        |       |       |
|--------|---------|---------|--------|-------|-------|--------|-------|-------|

**39.10.94 TWI FIFO Interrupt Mask Register**

**Name:** FLEX\_TWI\_FIMR  
**Offset:** 0x66C  
**Reset:** 0x00000000  
**Property:** Read-only

This register reads '0' if the FIFO is disabled (see FLEX\_TWI\_CR to enable/disable the internal FIFO).

## Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                                                             |
|----------|--------|-------------------------------------------------------------------------------------------------------------------------|
| 0x545749 | PASSWD | Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN.<br>Always reads as 0. |

## Bit 2 – WPCREN Write Protection Control Enable

| Value | Description                                                                                          |
|-------|------------------------------------------------------------------------------------------------------|
| 0     | Disables the write protection on control register if WPKEY corresponds to 0x545749 ("TWI" in ASCII). |
| 1     | Enables the write protection on control register if WPKEY corresponds to 0x545749 ("TWI" in ASCII).  |

## Bit 1 – WPITEN Write Protection Interrupt Enable

| Value | Description                                                                                             |
|-------|---------------------------------------------------------------------------------------------------------|
| 0     | Disables the write protection on interrupt registers if WPKEY corresponds to 0x545749 ("TWI" in ASCII). |
| 1     | Enables the write protection on interrupt registers if WPKEY corresponds to 0x545749 ("TWI" in ASCII).  |

## Bit 0 – WPEN Write Protection Enable

See [TWI Register Write Protection](#) for the list of registers that can be write-protected.

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | Disables the write protection if WPKEY corresponds to 0x545749 ("TWI" in ASCII). |
| 1     | Enables the write protection if WPKEY corresponds to 0x545749 ("TWI" in ASCII).  |

**39.10.96 TWI Write Protection Status Register**

**Name:** FLEX\_TWI\_WPSR  
**Offset:** 0x6E8  
**Reset:** 0x00000000  
**Property:** Read-only

If enabled in the SFR module (default is disabled), a debugger read access does not clear the WPVS flag.

|        |              |    |    |    |    |    |    |      |
|--------|--------------|----|----|----|----|----|----|------|
| Bit    | 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        | WPVSR[23:16] |    |    |    |    |    |    |      |
| Access | R            | R  | R  | R  | R  | R  | R  | R    |

|        | WPVSR[15:8]  |    |    |    |    |    |    |      |
| Access | R            | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8    |
|        | WPVSR[7:0]   |    |    |    |    |    |    |      |
| Access | R            | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        |              |    |    |    |    |    |    | WPVS |
| Access |              |    |    |    |    |    |    | R    |
| Reset  |              |    |    |    |    |    |    | 0    |

**Bits 31:8 – WPVSR[23:0] Write Protection Violation Source**

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS Write Protect Violation Status**

| Value | Description                                                                                                                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No Write Protection Violation has occurred since the last read of FLEX_TWI_WPSR.                                                                                                                                   |
| 1     | A Write Protection Violation has occurred since the last read of FLEX_TWI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

## 40. Controller Area Network (MCAN)

### 40.1 Description

The Controller Area Network (MCAN) performs communication according to ISO 11898-1:2015 and to Bosch CAN FD specification. Additional transceiver hardware is required for connection to the physical layer.

All functions concerning the handling of messages are implemented by the Rx Handler and the Tx Handler. The Rx Handler manages message acceptance filtering, the transfer of received messages from the CAN core to the Message RAM, as well as providing receive message status information. The Tx Handler is responsible for the transfer of transmit messages from the Message RAM to the CAN core, as well as providing transmit status information.

Acceptance filtering is implemented by a combination of up to 128 filter elements, where each element can be configured as a range, as a bit mask, or as a dedicated ID filter.

### 40.2 Embedded Characteristics

- Compliant with CAN Protocol Version 2.0 Part A, B and ISO 11898-1
- CAN FD with up to 64 Data Bytes Supported
- CAN Error Logging
- AUTOSAR Optimized
- SAE J1939 Optimized
- Improved Acceptance Filtering
- Two Configurable Receive FIFOs
- Separate Signalling on Reception of High Priority Messages
- Up to 64 Dedicated Receive Buffers
- Up to 32 Dedicated Transmit Buffers
- Configurable Transmit FIFO
- Configurable Transmit Queue
- Configurable Transmit Event FIFO
- Direct Message RAM Access for Processor
- Multiple MCANs May Share the Same Message RAM
- Programmable Loop-back Test Mode
- Maskable Module Interrupts
- Support for Asynchronous CAN and System Bus Clocks
- Power-down Support
- Debug on CAN Support

## 40.3 Block Diagram

Figure 40-1. MCAN Block Diagram

**Note:** Refer to section “Power Management Controller (PMC)” for details about the bus-independent clock (GCLK).

## 40.4 Product Dependencies

### 40.4.1 I/O Lines

The pins used to interface to the compliant external devices can be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the CAN pins to their peripheral functions.

### 40.4.2 Power Management

The MCAN can be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the MCAN clock.

In order to achieve a stable function of the MCAN, the system bus clock must always be faster than or equal to the CAN clock.

It is recommended to use the CAN clock at frequencies of 20, 40 or 80 MHz. To achieve these frequencies, PMC GCLK must select PLLA OR PLLB and the appropriate divider. GCLK allows the system bus and processor clock to be modified without affecting the bit rate communication.

### 40.4.3 Interrupt Sources

The two MCAN interrupt lines (MCAN\_INT0, MCAN\_INT1) are connected on internal sources of the Interrupt Controller.

Using the MCAN interrupts requires the Interrupt Controller to be programmed first.

Interrupt sources can be routed either to MCAN\_INT0 or to MCAN\_INT1. By default, all interrupt sources are routed to interrupt line MCAN\_INT0/1. By programming MCAN\_ILE.EINT0 and MCAN\_ILE.EINT1, the interrupt sources can be enabled or disabled separately.

#### 40.4.4 Address Configuration

The LSBs [bits 15:2] for each section of the CAN Message RAM are configured in the respective buffer configuration registers as detailed in [Message RAM](#).

The MSBs [bits 31:16] of the CAN Message RAM for CAN0 and CAN1 are configured in SFR\_CANx registers.

#### 40.4.5 Timestamping

Timestamping uses the value of CV in the Timer Counter channel 0 register (TC\_CV0). TC0 may use the generic clock (GCLK) from the Power Management Controller. Refer to the section "Timer Counter (TC)" for more details about clock source selection.

### 40.5 Functional Description

#### 40.5.1 Operating Modes

##### 40.5.1.1 Software Initialization

Software initialization is started by setting bit MCAN\_CCCR.INIT, either by software or by a hardware reset, when an uncorrected bit error was detected in the Message RAM, or by going Bus\_Off. While MCAN\_CCCR.INIT is set, message transfer from and to the CAN bus is stopped and the status of the CAN bus output CANTX is recessive (HIGH). The counters of the Error Management Logic EML are unchanged. Setting MCAN\_CCCR.INIT does not change any configuration register. Resetting MCAN\_CCCR.INIT finishes the software initialization. Afterwards the Bit Stream Processor BSP synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of 11 consecutive recessive bits ( $\equiv$  Bus\_Idle) before it can take part in bus activities and start the message transfer.

Access to the MCAN configuration registers is only enabled when both bits MCAN\_CCCR.INIT and MCAN\_CCCR.CCE are set (protected write).

MCAN\_CCCR.CCE can only be configured when MCAN\_CCCR.INIT = '1'. MCAN\_CCCR.CCE is automatically cleared when MCAN\_CCCR.INIT = '0'.

The following registers are cleared when MCAN\_CCCR.CCE = '1':

- High Priority Message Status (MCAN\_HPMS)
- Receive FIFO 0 Status (MCAN\_RXF0S)
- Receive FIFO 1 Status (MCAN\_RXF1S)
- Transmit FIFO/Queue Status (MCAN\_TXFQS)
- Transmit Buffer Request Pending (MCAN\_TXBRP)
- Transmit Buffer Transmission Occurred (MCAN\_TXBTO)
- Transmit Buffer Cancellation Finished (MCAN\_TXBCF)
- Transmit Event FIFO Status (MCAN\_TXEFS)

The Timeout Counter value MCAN\_TOCV.TOC is loaded with the value configured by MCAN\_TOCC.TOP when MCAN\_CCCR.CCE = '1'.

In addition, the state machines of the Tx Handler and Rx Handler are held in idle state while MCAN\_CCCR.CCE = '1'.

The following registers are only writeable while MCAN\_CCCR.CCE = '0'

- Transmit Buffer Add Request (MCAN\_TXBAR)
- Transmit Buffer Cancellation Request (MCAN\_TXBCR)

MCAN\_CCCR.TEST and MCAN\_CCCR.MON can only be set when MCAN\_CCCR.INIT = '1' and MCAN\_CCCR.CCE = '1'. Both bits may be cleared at any time. MCAN\_CCCR.DAR can only be configured when MCAN\_CCCR.INIT = '1' and MCAN\_CCCR.CCE = '1'.

#### 40.5.1.2 Normal Operation

Once the MCAN is initialized and MCAN\_CCCR.INIT is cleared, the MCAN synchronizes itself to the CAN bus and is ready for communication.

After passing the acceptance filtering, received messages including Message ID and DLC are stored into a dedicated Rx Buffer or into Rx FIFO 0 or Rx FIFO 1.

For messages to be transmitted, dedicated Tx Buffers and/or a Tx FIFO or a Tx Queue can be initialized or updated. Automated transmission on reception of remote frames is not implemented.

#### 40.5.1.3 CAN FD Operation

There are two variants in the CAN FD frame format, first the CAN FD frame without bit rate switching where the data field of a CAN frame may be longer than 8 bytes. The second variant is the CAN FD frame where control field, data field, and CRC field of a CAN frame are transmitted with a higher bit rate than the beginning and the end of the frame.

The previously reserved bit in CAN frames with 11-bit identifiers and the first previously reserved bit in CAN frames with 29-bit identifiers will now be decoded as FDF bit. FDF = recessive signifies a CAN FD frame, FDF = dominant signifies a Classic CAN frame. In a CAN FD frame, the two bits following FDF, res and BRS, decide whether the bit rate inside of this CAN FD frame is switched. A CAN FD bit rate switch is signified by res = dominant and BRS = recessive. The coding of res = recessive is reserved for future expansion of the protocol. In case the MCAN receives a frame with FDF = recessive and res = recessive, it will signal a Protocol Exception Event by setting bit MCAN\_PSR.PXE. When Protocol Exception Handling is enabled (MCAN\_CCCR.PXHD = 0), this causes the operation state to change from Receiver (MCAN\_PSR.ACT = 2) to Integrating (MCAN\_PSR.ACT = 00) at the next sample point. In case Protocol Exception Handling is disabled (MCAN\_CCCR.PXHD = 1), the MCAN will treat a recessive res bit as an form error and will respond with an error frame.

CAN FD operation is enabled by programming CCCR.FDOE. In case CCCR.FDOE = '1', transmission and reception of CAN FD frames is enabled. Transmission and reception of Classic CAN frames is always possible. Whether a CAN FD frame or a Classic CAN frame is transmitted can be configured via bit FDF in the respective Tx Buffer element. With CCCR.FDOE = '0', received frames are interpreted as Classic CAN frames, which leads to the transmission of an error frame when receiving a CAN FD frame. When CAN FD operation is disabled, no CAN FD frames are transmitted even if bit FDF of a Tx Buffer element is set. CCCR.FDOE and CCCR.BRSE can only be changed while CCCR.INIT and CCCR.CCE are both set.

With MCAN\_CCCR.FDOE = 0, the setting of bits FDF and BRS is ignored and frames are transmitted in Classic CAN format. With MCAN\_CCCR.FDOE = 1 and MCAN\_CCCR.BRSE = 0, only bit FDF of a Tx Buffer element is evaluated. With MCAN\_CCCR.FDOE = 1 and MCAN\_CCCR.BRSE = 1, transmission of CAN FD frames with bit rate switching is enabled. All Tx Buffer elements with bits FDF and BRS set are transmitted in CAN FD format with bit rate switching.

A mode change during CAN operation is only recommended under the following conditions:

- The failure rate in the CAN FD data phase is significant higher than in the CAN FD arbitration phase. In this case disable the CAN FD bit rate switching option for transmissions.
- During system startup all nodes are transmitting according to ISO11898-1 until it is verified that they are able to communicate in CAN FD format. If this is true, all nodes switch to CAN FD operation.
- Wake-up messages in CAN Partial Networking have to be transmitted in Classic CAN format.
- End-of-line programming in case not all nodes are CAN FD-capable. Non-CAN FD nodes are held in Silent mode until programming has completed. Then all nodes revert to Classic CAN communication.

In the CAN FD format, the coding of the DLC differs from the standard CAN format. The DLC codes 0 to 8 have the same coding as in standard CAN, the codes 9 to 15, which in standard CAN all code a data field of 8 bytes, are coded according to the table below.

**Table 40-1.** Coding of DLC in CAN FD

| DLC                  | 9  | 10 | 11 | 12 | 13 | 14 | 15 |
|----------------------|----|----|----|----|----|----|----|
| Number of Data Bytes | 12 | 16 | 20 | 24 | 32 | 48 | 64 |

In CAN FD frames, the bit timing will be switched inside the frame, after the BRS (Bit Rate Switch) bit, if this bit is recessive. Before the BRS bit, in the CAN FD arbitration phase, the nominal CAN bit timing is used as defined by the Nominal Bit Timing and Prescaler register (MCAN\_NBTP). In the following CAN FD data phase, the data phase CAN bit timing is used as defined by the FastData Bit Timing and Prescaler register (MCAN\_DBTP). The bit timing reverts back from the data phase timing at the CRC delimiter or when an error is detected, whichever occurs first.

The maximum configurable bit rate in the CAN FD data phase depends on the CAN core clock frequency. Example: with a CAN clock frequency of 20 MHz and the shortest configurable bit time of  $4 t_q$ , the bit rate in the data phase is 5 Mbit/s.

In both data frame formats, CAN FD and CAN FD with bit rate switching, the value of the bit ESI (Error Status Indicator) is determined by the transmitter's error state at the start of the transmission. If the transmitter is error passive, ESI is transmitted recessive, else it is transmitted dominant.

#### 40.5.1.4 Transmitter Delay Compensation

During the data phase of a CAN FD transmission only one node is transmitting, all others are receivers. The length of the bus line has no impact. When transmitting via pin CANTX the protocol controller receives the transmitted data from its local CAN transceiver via pin CANRX. The received data is delayed by the transmitter delay. In case this delay is greater than TSEG1 (time segment before sample point), a bit error is detected. In order to enable a data phase bit time that is even shorter than the transmitter delay, the delay compensation is introduced. Without delay compensation, the bit rate in the data phase of a CAN FD frame is limited by the delay.

##### 40.5.1.4.1 Description

The MCAN protocol unit has implemented a delay compensation mechanism to compensate the delay, thereby enabling transmission with higher bit rates during the CAN FD data phase independent of the delay of a specific CAN transceiver.

To check for bit errors during the data phase, the delayed transmit data is compared against the received data at the secondary sample point. If a bit error is detected, the transmitter will react to this bit error at the next following regular sample point. During arbitration phase the delay compensation is always disabled.

The transmitter delay compensation enables configurations where the data bit time is shorter than the transmitter delay, it is described in detail in the new ISO11898-1. It is enabled by setting bit MCAN\_DBTP.TDC.

The received bit is compared against the transmitted bit at the SSP. The SSP position is defined as the sum of the measured delay from the MCAN's transmit output CANTX through the transceiver to the receive input CANRX plus the transmitter delay compensation offset as configured by MCAN\_TDCR.TDCO. The transmitter delay compensation offset is used to adjust the position of the SSP inside the received bit (e.g. half of the bit time in the data phase). The position of the secondary sample point is rounded down to the next integer number of CAN core clock periods.

MCAN\_PSR.TDCV shows the actual transmitter delay compensation value. MCAN\_PSR.TDCV is cleared when MCAN\_CCCR.INIT is set and is updated at each transmission of an FD frame while MCAN\_DBTP.TDC is set.

The following boundary conditions have to be considered for the delay compensation implemented in the MCAN:

- The sum of the measured delay from CANTX to CANRX and the configured delay compensation offset MCAN\_TDCR.TDCO has to be less than 6 bit times in the data phase.
- The sum of the measured delay from CANTX to CANRX and the configured delay compensation offset MCAN\_TDCR.TDCO has to be less or equal 127 CAN core clock periods. In case this sum exceeds 127 CAN core clock periods, the maximum value of 127 CAN core clock periods is used for delay compensation.
- The data phase ends at the sample point of the CRC delimiter, that stops checking of receive bits at the SSPs.

#### 40.5.1.4.2 Transmitter Delay Measurement

If transmitter delay compensation is enabled by programming MCAN\_DBTP.TDC = '1', the measurement is started within each transmitted CAN FD frame at the falling edge of bit FDF to bit res. The measurement is stopped when this edge is seen at the receive input CANRX of the transmitter.

The resolution of this measurement is one mtq.

**Figure 40-2.** Transmitter Delay Measurement

To avoid that a dominant glitch inside the received FDF bit ends the delay compensation measurement before the falling edge of the received res bit, resulting in a too early SSP position, the use of a transmitter delay compensation filter window can be enabled by programming MCAN\_TDCR.TDCF.

This defines a minimum value for the SSP position. Dominant edges on CANRX, that would result in an earlier SSP position are ignored for transmitter delay measurement. The measurement is stopped when the SSP position is at least MCAN\_TDCR.TDCF AND CANRX is low.

#### 40.5.1.5 Restricted Operation Mode

In Restricted Operation mode, the node is able to receive data and remote frames and to give acknowledge to valid frames, but it does not send data frames, remote frames, active error frames, or overload frames. In case of an error condition or overload condition, it does not send dominant bits, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication. The error counters are not incremented. The processor can set the MCAN into Restricted Operation mode by setting bit MCAN\_CCCR.ASM. The bit can only be set by the processor when both MCAN\_CCCR.CCE and MCAN\_CCCR.INIT are set to '1'. The bit can be reset by the processor at any time.

Restricted Operation mode is automatically entered when the Tx Handler was not able to read data from the Message RAM in time. To leave Restricted Operation mode, the processor has to reset MCAN\_CCCR.ASM.

The Restricted Operation mode can be used in applications that adapt themselves to different CAN bit rates. In this case the application tests different bit rates and leaves the Restricted Operation mode after it has received a valid frame.

**Note:** The Restricted Operation Mode must not be combined with the Loop Back mode (internal or external).

#### 40.5.1.6 Bus Monitoring Mode

The MCAN is set in Bus Monitoring mode by setting MCAN\_CCCR.MON. In Bus Monitoring mode (see ISO11898-1, 10.12 Bus monitoring), the MCAN is able to receive valid data frames and valid remote frames, but cannot start a transmission. In this mode, it sends only recessive bits on the CAN bus. If the MCAN is required to send a dominant bit (ACK bit, overload flag, active error flag), the bit is rerouted internally so that the MCAN monitors this dominant bit, although the CAN bus may remain in recessive state. In Bus Monitoring mode, the Tx Buffer Request Pending register (MCAN\_TXBRP) is held in reset state.

The Bus Monitoring mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits. The figure below shows the connection of signals CANTX and CANRX to the MCAN in Bus Monitoring mode.

**Figure 40-3.** Pin Control in Bus Monitoring Mode

#### 40.5.1.7 Disabled Automatic Retransmission

According to the CAN Specification (see ISO11898-1, 6.3.3 Recovery Management), the MCAN provides means for automatic retransmission of frames that have lost arbitration or that have been disturbed by errors during transmission. By default automatic retransmission is enabled. To support time-triggered communication as described in ISO 11898-1, chapter 9.2, the automatic retransmission may be disabled via MCAN\_CCCR.DAR.

##### 40.5.1.7.1 Frame Transmission in DAR Mode

In DAR mode, all transmissions are automatically cancelled after they start on the CAN bus. A Tx Buffer's Tx Request Pending bit TXBRP.TRPx is reset after successful transmission, when a transmission has not yet been started at the point of cancellation, has been aborted due to lost arbitration, or when an error occurred during frame transmission.

- Successful transmission:  
Corresponding Tx Buffer Transmission Occurred bit MCAN\_TXBTO.TOx set  
Corresponding Tx Buffer Cancellation Finished bit MCAN\_TXBCF.CFx not set
- Successful transmission in spite of cancellation:  
Corresponding Tx Buffer Transmission Occurred bit MCAN\_TXBTO.TOx set  
Corresponding Tx Buffer Cancellation Finished bit MCAN\_TXBCF.CFx set
- Arbitration lost or frame transmission disturbed:  
Corresponding Tx Buffer Transmission Occurred bit MCAN\_TXBTO.TOx not set

Corresponding Tx Buffer Cancellation Finished bit MCAN\_TXBCF.CFx set

In case of a successful frame transmission, and if storage of Tx events is enabled, a Tx Event FIFO element is written with Event Type ET = "10" (transmission in spite of cancellation).

#### 40.5.1.8 Power-down (Sleep Mode)

The MCAN can be set into Power-down mode via bit MCAN\_CCCR.CSR.

When all pending transmission requests have completed, the MCAN waits until bus idle state is detected. Then the MCAN sets MCAN\_CCCR.INIT to prevent any further CAN transfers. Now the MCAN acknowledges that it is ready for power down by setting to one the bit MCAN\_CCCR.CSA. In this state, before the clocks are switched off, further register accesses can be made. A write access to MCAN\_CCCR.INIT will have no effect. Now the bus clock (peripheral clock) and the CAN core clock may be switched off.

To leave Power-down mode, the application has to turn on the MCAN clocks before clearing CC Control Register flag MCAN\_CCCR.CSR. The MCAN will acknowledge this by clearing MCAN\_CCCR.CSA. The application can then restart CAN communication by clearing the bit CCCR.INIT.

#### 40.5.1.9 Test Modes

To enable write access to the MCAN Test register (MCAN\_TEST) (see Section 7.6), bit MCAN\_CCCR.TEST must be set. This allows the configuration of the test modes and test functions.

Four output functions are available for the CAN transmit pin CANTX by programming MCAN\_TEST.TX. Additionally to its default function – the serial data output – it can drive the CAN Sample Point signal to monitor the MCAN's bit timing and it can drive constant dominant or recessive values. The actual value at pin CANRX can be read from MCAN\_TEST.RX. Both functions can be used to check the CAN bus' physical layer.

Due to the synchronization mechanism between CAN clock and system bus clock domain, there may be a delay of several system bus clock periods between writing to MCAN\_TEST.TX until the new configuration is visible at output pin CANTX. This applies also when reading input pin CANRX via MCAN\_TEST.RX.

**Note:** Test modes should be used for production tests or self-test only. The software control for pin CANTX interferes with all CAN protocol functions. It is not recommended to use test modes for application.

##### 40.5.1.9.1 External Loop Back Mode

The MCAN can be set in External Loop Back mode by setting the bit MCAN\_TEST.LBCK. In Loop Back mode, the MCAN treats its own transmitted messages as received messages and stores them (if they pass acceptance filtering) into an Rx Buffer or an Rx FIFO. The figure below shows the connection of signals CANTX and CANRX to the MCAN in External Loop Back mode.

This mode is provided for hardware self-test. To be independent from external stimulation, the MCAN ignores acknowledge errors (recessive bit sampled in the acknowledge slot of a data/remote frame) in Loop Back mode. In this mode, the MCAN performs an internal feedback from its Tx output to its Rx input. The actual value of the CANRX input pin is disregarded by the MCAN. The transmitted messages can be monitored at the CANTX pin.

##### 40.5.1.9.2 Internal Loop Back Mode

Internal Loop Back mode is entered by setting bits MCAN\_TEST.LBCK and MCAN\_CCCR.MON. This mode can be used for a "Hot Selftest", meaning the MCAN can be tested without affecting a running CAN system connected to the pins CANTX and CANRX. In this mode, pin CANRX is disconnected from the MCAN, and pin CANTX is held recessive. The figure below shows the connection of CANTX and CANRX to the MCAN when Internal Loop Back mode is enabled.

**Figure 40-4.** Pin Control in Loop Back Modes

### 40.5.2 Timestamp Generation

For timestamp generation, the MCAN supplies a 16-bit wrap-around counter. A prescaler TSCC.TCP can be configured to clock the counter in multiples of CAN bit times (1...16). The counter is readable via MCAN\_TSCV.TSC. A write access to the Timestamp Counter Value register (MCAN\_TSCV) resets the counter to zero. When the timestamp counter wraps around, the interrupt flag MCAN\_IR.TSW is set.

On start of frame reception / transmission, the counter value is captured and stored into the timestamp section of an Rx Buffer / Rx FIFO (RXTS[15:0]) or Tx Event FIFO (TXTS[15:0]) element.

By programming bit MCAN\_TSCC.TSS, an external 16-bit timestamp can be used. See Section 5.5 "Timestamping" for details.

### 40.5.3 Timeout Counter

To signal timeout conditions for Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO, the MCAN supplies a 16-bit Timeout Counter. It operates as down-counter and uses the same prescaler controlled by TSCC.TCP as the Timestamp Counter. The Timeout Counter is configured via the Timeout Counter Configuration register (MCAN\_TOCC). The actual counter value can be read from MCAN\_TOCV.TOC. The Timeout Counter can only be started while MCAN\_CCCR.INIT = '0'. It is stopped when MCAN\_CCCR.INIT = '1', e.g. when the MCAN enters Bus\_Off state.

The operating mode is selected by MCAN\_TOCC.TOS. When operating in Continuous mode, the counter starts when MCAN\_CCCR.INIT is reset. A write to MCAN\_TOCV presets the counter to the value configured by MCAN\_TOCC.TOP and continues down-counting.

When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCAN\_TOCC.TOP. Down-counting is started when the first FIFO element is stored. Writing to MCAN\_TOCV has no effect.

When the counter reaches zero, interrupt flag MCAN\_IR.TOO is set. In Continuous mode, the counter is immediately restarted at MCAN\_TOCC.TOP.

**Note:** The clock signal for the Timeout Counter is derived from the CAN Core's sample point signal. Therefore the point in time where the Timeout Counter is decremented may vary due to the synchronization / re-synchronization mechanism of the CAN Core. If the bit rate switch feature in CAN FD is used, the timeout counter is clocked differently in arbitration and data field.

### 40.5.4 Rx Handling

The Rx Handler controls the acceptance filtering, the transfer of received messages to the Rx Buffers or to one of the two Rx FIFOs, as well as the Rx FIFO's Put and Get Indices.

#### 40.5.4.1 Acceptance Filtering

The MCAN offers the possibility to configure two sets of acceptance filters, one for standard identifiers and one for extended identifiers. These filters can be assigned to an Rx Buffer or to Rx FIFO 0,1. For acceptance filtering each list of filters is executed from element #0 until the first matching element. Acceptance filtering stops at the first matching element. The following filter elements are not evaluated for this message.

The main features are:

- Each filter element can be configured as
  - range filter (from - to)
  - filter for one or two dedicated IDs
  - classic bit mask filter
- Each filter element is configurable for acceptance or rejection filtering
- Each filter element can be enabled / disabled individually
- Filters are checked sequentially, execution stops with the first matching filter element

Related configuration registers are:

- Global Filter Configuration (MCAN\_GFC)
- Standard ID Filter Configuration (MCAN\_SIDFC)
- Extended ID Filter Configuration (MCAN\_XIDFC)
- Extended ID and Mask (MCAN\_XIDAM)

Depending on the configuration of the filter element (SFEC/EFEC) a match triggers one of the following actions:

- Store received frame in FIFO 0 or FIFO 1
- Store received frame in Rx Buffer
- Store received frame in Rx Buffer and generate pulse at filter event pin
- Reject received frame
- Set High Priority Message interrupt flag (MCAN\_IR.HPM)
- Set High Priority Message interrupt flag (MCAN\_IR.HPM) and store received frame in FIFO 0 or FIFO 1

Acceptance filtering is started after the complete identifier has been received. After acceptance filtering has completed, and if a matching Rx Buffer or Rx FIFO has been found, the Message Handler starts writing the received message data in portions of 32 bit to the matching Rx Buffer or Rx FIFO. If the CAN protocol controller has detected an error condition (e.g. CRC error), this message is discarded with the following impact on the effected Rx Buffer or Rx FIFO:

- Rx Buffer  
New Data flag of matching Rx Buffer is not set, but Rx Buffer (partly) overwritten with received data. For error type, see MCAN\_PSR.LEC and MCAN\_PSR.DLEC.
- Rx FIFO  
Put index of matching Rx FIFO is not updated, but related Rx FIFO element (partly) overwritten with received data. For error type, see MCAN\_PSR.LEC and MCAN\_PSR.DLEC. In case the matching Rx FIFO is operated in Overwrite mode, the boundary conditions described in [Rx FIFO Overwrite Mode](#) have to be considered.

**Note:** When an accepted message is written to one of the two Rx FIFOs, or into an Rx Buffer, the unmodified received identifier is stored independent of the filter(s) used. The result of the acceptance filter process is strongly depending on the sequence of configured filter elements.

#### 40.5.4.1.1 Range Filter

The filter matches for all received frames with Message IDs in the range defined by SF1ID/SF2ID resp. EF1ID/EF2ID.

There are two possibilities when range filtering is used together with extended frames:

- EFT = "00": The Message ID of received frames is ANDed with MCAN\_XIDAM before the range filter is applied.
- EFT = "11": MCAN\_XIDAM is not used for range filtering.

#### 40.5.4.1.2 Filter for Specific IDs

A filter element can be configured to filter for one or two specific Message IDs. To filter for one specific Message ID, the filter element has to be configured with SF1ID = SF2ID resp. EF1ID = EF2ID.

#### 40.5.4.1.3 Classic Bit Mask Filter

Classic bit mask filtering is intended to filter groups of Message IDs by masking single bits of a received Message ID. With classic bit mask filtering SF1ID/EF1ID is used as Message ID filter, while SF2ID/EF2ID is used as filter mask.

A zero bit at the filter mask will mask out the corresponding bit position of the configured ID filter, e.g. the value of the received Message ID at that bit position is not relevant for acceptance filtering. Only those bits of the received Message ID where the corresponding mask bits are one are relevant for acceptance filtering.

In case all mask bits are one, a match occurs only when the received Message ID and the Message ID filter are identical. If all mask bits are zero, all Message IDs match.

#### 40.5.4.1.4 Standard Message ID Filtering

The figure below shows the flow for standard Message ID (11-bit Identifier) filtering. The Standard Message ID Filter element is described in [40.5.7.5. Standard Message ID Filter Element](#).

Controlled by MCAN\_GFC and MCAN\_SIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

**Figure 40-5.** Standard Message ID Filter Path

### Extended Message ID Filtering

The figure below shows the flow for extended Message ID (29-bit Identifier) filtering. The Extended Message ID Filter element is described in [40.5.7.6. Extended Message ID Filter Element](#).

Controlled by MCAN\_GFC and MCAN\_XIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

MCAN\_XIDAM is ANDed with the received identifier before the filter list is executed.

**Figure 40-6.** Extended Message ID Filter Path

#### 40.5.4.2 Rx FIFOs

Rx FIFO 0 and Rx FIFO 1 can be configured to hold up to 64 elements each. Configuration of the two Rx FIFOs is done via the Rx FIFO 0 Configuration register (MCAN\_RXF0C) and the Rx FIFO 1 Configuration register (MCAN\_RXF1C).

Received messages that passed acceptance filtering are transferred to the Rx FIFO as configured by the matching filter element. For a description of the filter mechanisms available for Rx FIFO 0 and Rx FIFO 1, see [Acceptance Filtering](#). The Rx FIFO element is described in [Rx Buffer and FIFO Element](#).

To avoid an Rx FIFO overflow, the Rx FIFO watermark can be used. When the Rx FIFO fill level reaches the Rx FIFO watermark configured by MCAN\_RXFnC.FnWM, interrupt flag MCAN\_IR.RFnW is set. When the Rx FIFO Put Index reaches the Rx FIFO Get Index, an Rx FIFO Full condition is signalled by MCAN\_RXFnS.FnF. In addition, the interrupt flag MCAN\_IR.RFnF is set.

**Figure 40-7.** Rx FIFO Status

When reading from an Rx FIFO, Rx FIFO Get Index  $\text{MCAN\_RXFnS.FnGI} \times \text{FIFO Element Size}$  has to be added to the corresponding Rx FIFO start address  $\text{MCAN\_RXFnC.FnSA}$ .

**Table 40-2.** Rx Buffer / FIFO Element Size

| $\text{MCAN\_RXESC.RBDS}[2:0]$<br>$\text{MCAN\_RXESC.FnDS}[2:0]$ | Data Field<br>[bytes] | FIFO Element Size<br>[RAM words] |
|------------------------------------------------------------------|-----------------------|----------------------------------|
| 0                                                                | 8                     | 4                                |
| 1                                                                | 12                    | 5                                |
| 2                                                                | 16                    | 6                                |
| 3                                                                | 20                    | 7                                |
| 4                                                                | 24                    | 8                                |
| 5                                                                | 32                    | 10                               |
| 6                                                                | 48                    | 14                               |
| 7                                                                | 64                    | 18                               |

#### 40.5.4.2.1 Rx FIFO Blocking Mode

The Rx FIFO Blocking mode is configured by  $\text{MCAN\_RXFnC.FnOM} = '0'$ . This is the default operating mode for the Rx FIFOs.

When an Rx FIFO full condition is reached ( $\text{MCAN\_RXFnS.FnPI} = \text{MCAN\_RXFnS.FnGI}$ ), no further messages are written to the corresponding Rx FIFO until at least one message has been read out and the Rx FIFO Get Index has been incremented. An Rx FIFO full condition is signalled by  $\text{MCAN\_RXFnS.FnF} = '1'$ . In addition, the interrupt flag  $\text{MCAN\_IR.RFnF}$  is set.

In case a message is received while the corresponding Rx FIFO is full, this message is discarded and the message lost condition is signalled by  $\text{MCAN\_RXFnS.RFnL} = '1'$ . In addition, the interrupt flag  $\text{MCAN\_IR.RFnL}$  is set.

#### 40.5.4.2.2 Rx FIFO Overwrite Mode

The Rx FIFO Overwrite mode is configured by  $\text{MCAN\_RXFnC.FnOM} = '1'$ .

When an Rx FIFO full condition ( $\text{MCAN\_RXFnS.FnPI} = \text{MCAN\_RXFnS.FnGI}$ ) is signalled by  $\text{MCAN\_RXFnS.FnF} = '1'$ , the next message accepted for the FIFO will overwrite the oldest FIFO message. Put and get index are both incremented by one.

When an Rx FIFO is operated in Overwrite mode and an Rx FIFO full condition is signalled, reading of the Rx FIFO elements should start at least at get index + 1. The reason for that is, that it might happen, that a received message is written to the Message RAM (put index) while the processor is reading from the Message RAM (get index). In this case inconsistent data may be read from the respective Rx FIFO element. Adding an offset to the get index when reading from the Rx FIFO avoids this problem. The offset depends on how fast the processor accesses the Rx FIFO. The figure below shows an offset of two with respect to the get index when reading the Rx FIFO. In this case the two messages stored in element 1 and 2 are lost.

**Figure 40-8.** Rx FIFO Overflow Handling

After reading from the Rx FIFO, the number of the last element read has to be written to the Rx FIFO Acknowledge Index MCAN\_RXFnA.FnA. This increments the get index to that element number. In case the put index has not been incremented to this Rx FIFO element, the Rx FIFO full condition is reset (MCAN\_RXFnS.FnF = '0').

#### 40.5.4.3 Dedicated Rx Buffers

The MCAN supports up to 64 dedicated Rx Buffers. The start address of the dedicated Rx Buffer section is configured via MCAN\_RXBC.RBSA.

For each Rx Buffer, a Standard or Extended Message ID Filter Element with SFEC / EFEC = 7 and SFID2 / EFID2[10:9] = 0 has to be configured.

After a received message has been accepted by a filter element, the message is stored into the Rx Buffer in the Message RAM referenced by the filter element. The format is the same as for an Rx FIFO element. In addition, the flag MCAN\_IR.DRX (Message stored in dedicated Rx Buffer) in MCAN\_IR is set.

**Table 40-3.** Example Filter Configuration for Rx Buffers

| Filter Element | SFID1[10:0]<br>EFID1[28:0] | SFID2[10:9]<br>EFID2[10:9] | SFID2[5:0]<br>EFID2[5:0] |
|----------------|----------------------------|----------------------------|--------------------------|
| 0              | ID message 1               | 0                          | 0                        |
| 1              | ID message 2               | 0                          | 1                        |
| 2              | ID message 3               | 0                          | 2                        |

After the last word of a matching received message has been written to the Message RAM, the respective New Data flag in the New Data 1 register (MCAN\_NDAT1) and New Data 2 register

(MCAN\_NDAT2) is set. As long as the New Data flag is set, the respective Rx Buffer is locked against updates from received matching frames. The New Data flags have to be reset by the processor by writing a '1' to the respective bit position.

While an Rx Buffer's New Data flag is set, a Message ID Filter Element referencing this specific Rx Buffer will not match, causing the acceptance filtering to continue. Following Message ID Filter Elements may cause the received message to be stored into another Rx Buffer, or into an Rx FIFO, or the message may be rejected, depending on filter configuration.

#### 40.5.4.3.1 Rx Buffer Handling

- Reset interrupt flag IR.DRX
- Read New Data registers
- Read messages from Message RAM
- Reset New Data flags of processed messages

#### 40.5.4.4 Debug on CAN Support

Debug messages are stored into Rx Buffers. For debug handling three consecutive Rx buffers (e.g. #61, #62, #63) have to be used for storage of debug messages A, B, and C. The format is the same as for an Rx Buffer or an Rx FIFO element (see [Rx Buffer and FIFO Element](#)).

Advantage: Fixed start address for the DMA transfers (relative to MCAN\_RXBC.RBSA), no additional configuration required.

For filtering of debug messages Standard / Extended Filter Elements with SFEC / EFEC = '111' have to be set up. Messages matching these filter elements are stored into the Rx Buffers addressed by SFID2 / EFID2[5:0].

After message C has been stored, the DMA request output m\_can\_dma\_req is activated and the three messages can be read from the Message RAM under DMA control. The RAM words holding the debug messages will not be changed by the MCAN while m\_can\_dma\_req is activated. The behavior is similar to that of an Rx Buffer with its New Data flag set.

After the DMA has completed, the MCAN is prepared to receive the next set of debug messages.

##### 40.5.4.4.1 Filtering for Debug Messages

Filtering for debug messages is done by configuring one Standard / Extended Message ID Filter Element for each of the three debug messages. To enable a filter element to filter for debug messages SFEC / EFEC has to be programmed to "111". In this case fields SFID1 / SFID2 and EFID1 / EFID2 have a different meaning. While SFID2 / EFID2[10:9] controls the debug message handling state machine, SFID2 / EFID2[5:0] controls the location for storage of a received debug message.

When a debug message is stored, neither the respective New Data flag nor MCAN\_IR.DRX are set. The reception of debug messages can be monitored via RXF1S.DMS.

**Table 40-4.** Example Filter Configuration for Debug Messages

| Filter Element | SFID1[10:0]<br>EFID1[28:0] | SFID2[10:9]<br>EFID2[10:9] | SFID2[5:0]<br>EFID2[5:0] |
|----------------|----------------------------|----------------------------|--------------------------|
| 0              | ID debug message A         | 1                          | 11 1101                  |
| 1              | ID debug message B         | 2                          | 11 1110                  |
| 2              | ID debug message C         | 3                          | 11 1111                  |

##### 40.5.4.4.2 Debug Message Handling

The debug message handling state machine ensures that debug messages are stored to three consecutive Rx Buffers in the correct order. If some messages are missing, the process is restarted. The DMA request is activated only when all three debug messages A, B, C have been received in the correct order.

The status of the debug message handling state machine is signalled via MCAN\_RXF1S.DMS.

**Figure 40-9.** Debug Message Handling State Machine

T0: reset m\_can\_dma\_req output, enable reception of debug messages A, B, and C

T1: reception of debug message A

T2: reception of debug message A

T3: reception of debug message C

T4: reception of debug message B

T5: reception of debug messages A, B

T6: reception of debug message C

T7: DMA transfer completed

T8: reception of debug message A,B,C (message rejected)

#### 40.5.5 Tx Handling

The Tx Handler handles transmission requests for the dedicated Tx Buffers, the Tx FIFO, and the Tx Queue. It controls the transfer of transmit messages to the CAN Core, the Put and Get Indices, and the Tx Event FIFO. Up to 32 Tx Buffers can be set up for message transmission. The CAN mode for transmission (Classic CAN or CAN FD) can be configured separately for each Tx Buffer element. The Tx Buffer element is described in [Tx Buffer Element](#). The table below describes the possible configurations for frame transmission.

**Table 40-5.** Possible Configurations for Frame Transmission

| MCAN_CCCR |      | Tx Buffer Element |         | Frame Transmission            |
|-----------|------|-------------------|---------|-------------------------------|
| BRSE      | FDOE | FDF               | BRS     |                               |
| ignored   | 0    | ignored           | ignored | Classic CAN                   |
| 0         | 1    | 0                 | ignored | Classic CAN                   |
| 0         | 1    | 1                 | ignored | FD without bit rate switching |
| 1         | 1    | 0                 | ignored | Classic CAN                   |
| 1         | 1    | 1                 | 0       | FD without bit rate switching |
| 1         | 1    | 1                 | 1       | FD with bit rate switching    |

**Note:** AUTOSAR requires at least three Tx Queue Buffers and support of transmit cancellation.

The Tx Handler starts a Tx scan to check for the highest priority pending Tx request (Tx Buffer with lowest Message ID) when MCAN\_TXBRP is updated, or when a transmission has been started.

#### 40.5.5.1 Transmit Pause

The transmit pause feature is intended for use in CAN systems where the CAN message identifiers are (permanently) specified to specific values and cannot easily be changed. These message identifiers may have a higher CAN arbitration priority than other defined messages, while in a specific application their relative arbitration priority should be inverse. This may lead to a case where one ECU sends a burst of CAN messages that cause another ECU's CAN messages to be delayed because that other messages have a lower CAN arbitration priority.

If e.g. CAN ECU-1 has the transmit pause feature enabled and is requested by its application software to transmit four messages, it will, after the first successful message transmission, wait for two CAN bit times of bus idle before it is allowed to start the next requested message. If there are other ECUs with pending messages, those messages are started in the idle time, they would not need to arbitrate with the next message of ECU-1. After having received a message, ECU-1 is allowed to start its next transmission as soon as the received message releases the CAN bus.

The transmit pause feature is controlled by bit MCAN\_CCCR.TXP. If the bit is set, the MCAN will, each time it has successfully transmitted a message, pause for two CAN bit times before starting the next transmission. This enables other CAN nodes in the network to transmit messages even if their messages have lower prior identifiers. Default is transmit pause disabled (MCAN\_CCCR.TXP = '0').

This feature looses up burst transmissions coming from a single node and it protects against "babbling idiot" scenarios where the application program erroneously requests too many transmissions.

#### 40.5.5.2 Dedicated Tx Buffers

Dedicated Tx Buffers are intended for message transmission under complete control of the processor. Each dedicated Tx Buffer is configured with a specific Message ID. In case that multiple Tx Buffers are configured with the same Message ID, the Tx Buffer with the lowest buffer number is transmitted first.

If the data section has been updated, a transmission is requested by an Add Request via MCAN\_TXBAR.ARn. The requested messages arbitrate internally with messages from an optional Tx FIFO or Tx Queue and externally with messages on the CAN bus, and are sent out according to their Message ID.

A dedicated Tx Buffer allocates Element Size 32-bit words in the Message RAM (see the table below). Therefore the start address of a dedicated Tx Buffer in the Message RAM is calculated by adding transmit buffer index (0...31) × Element Size to the Tx Buffer Start Address TXBC.TBSA.

**Table 40-6.** Tx Buffer / FIFO / Queue Element Size

| TXESC.TBDS[2:0] | Data Field<br>[bytes] | Element Size<br>[RAM words] |
|-----------------|-----------------------|-----------------------------|
| 0               | 8                     | 4                           |
| 1               | 12                    | 5                           |
| 2               | 16                    | 6                           |
| 3               | 20                    | 7                           |
| 4               | 24                    | 8                           |
| 5               | 32                    | 10                          |
| 6               | 48                    | 14                          |
| 7               | 64                    | 18                          |

#### 40.5.5.3 Tx FIFO

Tx FIFO operation is configured by programming MCAN\_TXBC.TFQM to '0'. Messages stored in the Tx FIFO are transmitted starting with the message referenced by the Get Index MCAN\_TXFQS.TFGI. After each transmission the Get Index is incremented cyclically until the Tx FIFO is empty. The Tx FIFO enables transmission of messages with the same Message ID from different Tx Buffers in the

order these messages have been written to the Tx FIFO. The MCAN calculates the Tx FIFO Free Level `MCAN_TXFQS.TFFL` as difference between Get and Put Index. It indicates the number of available (free) Tx FIFO elements.

New transmit messages have to be written to the Tx FIFO starting with the Tx Buffer referenced by the Put Index `MCAN_TXFQS.TFQPI`. An Add Request increments the Put Index to the next free Tx FIFO element. When the Put Index reaches the Get Index, Tx FIFO Full (`MCAN_TXFQS.TFQF = '1'`) is signalled. In this case no further messages should be written to the Tx FIFO until the next message has been transmitted and the Get Index has been incremented.

When a single message is added to the Tx FIFO, the transmission is requested by writing a '1' to the `TXBAR` bit related to the Tx Buffer referenced by the Tx FIFO's Put Index.

When multiple (n) messages are added to the Tx FIFO, they are written to n consecutive Tx Buffers starting with the Put Index. The transmissions are then requested via `MCAN_TXBAR`. The Put Index is then cyclically incremented by n. The number of requested Tx buffers should not exceed the number of free Tx Buffers as indicated by the Tx FIFO Free Level.

When a transmission request for the Tx Buffer referenced by the Get Index is cancelled, the Get Index is incremented to the next Tx Buffer with pending transmission request and the Tx FIFO Free Level is recalculated. When transmission cancellation is applied to any other Tx Buffer, the Get Index and the FIFO Free Level remain unchanged.

A Tx FIFO element allocates Element Size 32-bit words in the Message RAM (see the table [Table 40-6](#)). Therefore the start address of the next available (free) Tx FIFO Buffer is calculated by adding Tx FIFO/Queue Put Index `MCAN_TXFQS.TFQPI` ( $0 \dots 31$ )  $\times$  Element Size to the Tx Buffer Start Address `MCAN_TXBC.TBSA`.

#### 40.5.5.4 Tx Queue

Tx Queue operation is configured by programming `MCAN_TXBC.TFQM` to '1'. Messages stored in the Tx Queue are transmitted starting with the message with the lowest Message ID (highest priority). In case that multiple Queue Buffers are configured with the same Message ID, the Queue Buffer with the lowest buffer number is transmitted first.

New messages have to be written to the Tx Buffer referenced by the Put Index `MCAN_TXFQS.TFQPI`. An Add Request cyclically increments the Put Index to the next free Tx Buffer. In case that the Tx Queue is full (`MCAN_TXFQS.TFQF = '1'`), the Put Index is not valid and no further message should be written to the Tx Queue until at least one of the requested messages has been sent out or a pending transmission request has been cancelled.

The application may use register `MCAN_TXBRP` instead of the Put Index and may place messages to any Tx Buffer without pending transmission request.

A Tx Queue Buffer allocates Element Size 32-bit words in the Message RAM (see the table [Tx Buffer / FIFO / Queue Element Size](#)). Therefore the start address of the next available (free) Tx Queue Buffer is calculated by adding Tx FIFO/Queue Put Index `MCAN_TXFQS.TFQPI` ( $0 \dots 31$ )  $\times$  Element Size to the Tx Buffer Start Address `MCAN_TXBC.TBSA`.

#### 40.5.5.5 Mixed Dedicated Tx Buffers / Tx FIFO

In this case the Tx Buffers section in the Message RAM is subdivided into a set of dedicated Tx Buffers and a Tx FIFO. The number of dedicated Tx Buffers is configured by `MCAN_TXBC.NDTB`. The number of Tx Buffers assigned to the Tx FIFO is configured by `MCAN_TXBC.TFQS`. In case `MCAN_TXBC.TFQS` is programmed to zero, only dedicated Tx Buffers are used.

**Figure 40-10.** Example of Mixed Configuration Dedicated Tx Buffers / Tx FIFO

Tx prioritization:

- Scan dedicated Tx Buffers and oldest pending Tx FIFO Buffer (referenced by MCAN\_TXFS.TFGI)
- Buffer with lowest Message ID gets highest priority and is transmitted next

#### 40.5.5.6 Mixed Dedicated Tx Buffers / Tx Queue

In this case the Tx Buffers section in the Message RAM is subdivided into a set of dedicated Tx Buffers and a Tx Queue. The number of dedicated Tx Buffers is configured by MCAN\_TXBC.NDTB. The number of Tx Queue Buffers is configured by MCAN\_TXBC.TFQS. In case MCAN\_TXBC.TFQS is programmed to zero, only dedicated Tx Buffers are used.

**Figure 40-11.** Example of Mixed Configuration Dedicated Tx Buffers / Tx Queue

Tx prioritization:

- Scan all Tx Buffers with activated transmission request
- Tx Buffer with lowest Message ID gets highest priority and is transmitted next

#### 40.5.5.7 Transmit Cancellation

The MCAN supports transmit cancellation. This feature is especially intended for gateway applications and AUTOSAR-based applications. To cancel a requested transmission from a dedicated Tx Buffer or a Tx Queue Buffer, the processor has to write a '1' to the corresponding bit position (=number of Tx Buffer) of register MCAN\_TXBCR. Transmit cancellation is not intended for Tx FIFO operation.

Successful cancellation is signalled by setting the corresponding bit of register MCAN\_TXBCF to '1'.

In case a transmit cancellation is requested while a transmission from a Tx Buffer is already ongoing, the corresponding TXBRP bit remains set as long as the transmission is in progress. If the transmission was successful, the corresponding MCAN\_TXBTO and MCAN\_TXBCF bits are set. If the transmission was not successful, it is not repeated and only the corresponding MCAN\_TXBCF bit is set.

**Note:** In case a pending transmission is cancelled immediately before this transmission could have been started, there follows a short time window where no transmission is started even if another message is also pending in this node. This may enable another node to transmit a message which may have a lower priority than the second message in this node.

#### 40.5.5.8 Tx Event Handling

To support Tx event handling the MCAN has implemented a Tx Event FIFO. After the MCAN has transmitted a message on the CAN bus, Message ID and timestamp are stored in a Tx Event FIFO element. To link a Tx event to a Tx Event FIFO element, the Message Marker from the transmitted Tx Buffer is copied into the Tx Event FIFO element.

The Tx Event FIFO can be configured to a maximum of 32 elements. The Tx Event FIFO element is described in [Debug on CAN Support](#).

When a Tx Event FIFO full condition is signalled by IR.TEFF, no further elements are written to the Tx Event FIFO until at least one element has been read out and the Tx Event FIFO Get Index has been incremented. In case a Tx event occurs while the Tx Event FIFO is full, this event is discarded and interrupt flag MCAN\_IR.TEFL is set.

To avoid a Tx Event FIFO overflow, the Tx Event FIFO watermark can be used. When the Tx Event FIFO fill level reaches the Tx Event FIFO watermark configured by MCAN\_TXEFC.EFWM, interrupt flag MCAN\_IR.TEFW is set.

When reading from the Tx Event FIFO, two times the Tx Event FIFO Get Index MCAN\_TXEFS.EFGI has to be added to the Tx Event FIFO start address MCAN\_TXEFC.EFSA.

#### 40.5.6 FIFO Acknowledge Handling

The Get Indices of Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO are controlled by writing to the corresponding FIFO Acknowledge Index in the registers MCAN\_RXF0A, MCAN\_RXF1A and MCAN\_TXEFA. Writing to the FIFO Acknowledge Index will set the FIFO Get Index to the FIFO Acknowledge Index plus one and thereby updates the FIFO Fill Level. There are two use cases:

When only a single element has been read from the FIFO (the one being pointed to by the Get Index), this Get Index value is written to the FIFO Acknowledge Index.

When a sequence of elements has been read from the FIFO, it is sufficient to write the FIFO Acknowledge Index only once at the end of that read sequence (value: Index of the last element read), to update the FIFO's Get Index.

Due to the fact that the processor has free access to the MCAN's Message RAM, special care has to be taken when reading FIFO elements in an arbitrary order (Get Index not considered). This might be useful when reading a High Priority Message from one of the two Rx FIFOs. In this case the FIFO's Acknowledge Index should not be written because this would set the Get Index to a wrong position and also alters the FIFO's Fill Level. In this case some of the older FIFO elements would be lost.

**Note:** The application has to ensure that a valid value is written to the FIFO Acknowledge Index. The MCAN does not check for erroneous values.

#### 40.5.7 Message RAM

##### 40.5.7.1 Message RAM Configuration

The Message RAM has a width of 32 bits. The MCAN module can be configured to allocate up to 4352 words in the Message RAM. It is not necessary to configure each of the sections listed in the figure below, nor is there any restriction with respect to the sequence of the sections.

When operated in CAN FD mode, the required Message RAM size depends on the element size configured for Rx FIFO0, Rx FIFO1, Rx Buffers, and Tx Buffers via MCAN\_RXESC.F0DS, MCAN\_RXESC.F1DS, MCAN\_RXESC.RBDS, and MCAN\_TXESC.TBDS.

**Figure 40-12.** Message RAM Configuration

When the MCAN addresses the Message RAM, it addresses 32-bit words, not single bytes. The configurable start addresses are 32-bit word addresses; i.e., only bits 15 to 2 are evaluated, the two least significant bits are ignored.

**Note:** The MCAN does not check for erroneous configuration of the Message RAM. The configuration of the start addresses of the different sections and the number of elements of each section must be checked carefully to avoid falsification or loss of data.

#### 40.5.7.2 Rx Buffer and FIFO Element

Up to 64 Rx Buffers and two Rx FIFOs can be configured in the Message RAM. Each Rx FIFO section can be configured to store up to 64 received messages. The structure of a Rx Buffer / FIFO element is shown in the table below. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register MCAN\_RXESC.

|     | 31       | 30        | 29  | 28       | 27 | 26 | 25 | 24 | 23                 | 22 | 21  | 20  | 19       | 18 | 17 | 16 | 15                 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7                  | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| R1  | ANMF     | FIDX[6:0] |     |          |    |    |    |    |                    | -  | FDF | BRS | DLC[3:0] |    |    |    | RXTS[15:0]         |    |    |    |    |    |   |   |                    |   |   |   |   |   |   |   |
| R2  | DB3[7:0] |           |     |          |    |    |    |    | DB2[7:0]           |    |     |     |          |    |    |    | DB1[7:0]           |    |    |    |    |    |   |   | DB0[7:0]           |   |   |   |   |   |   |   |
| R3  | DB7[7:0] |           |     |          |    |    |    |    | DB6[7:0]           |    |     |     |          |    |    |    | DB5[7:0]           |    |    |    |    |    |   |   | DB4[7:0]           |   |   |   |   |   |   |   |
| ... | ..       |           |     |          |    |    |    |    | ...                |    |     |     |          |    |    |    | ...                |    |    |    |    |    |   |   | ...                |   |   |   |   |   |   |   |
| Rn  | DBm[7:0] |           |     |          |    |    |    |    | DBm-1[7:0]DBM[7:0] |    |     |     |          |    |    |    | DBm-2[7:0]DBM[7:0] |    |    |    |    |    |   |   | DBm-3[7:0]DBM[7:0] |   |   |   |   |   |   |   |

- **R0 Bit 31 ESI:** Error State Indicator  
0: Transmitting node is error active.  
1: Transmitting node is error passive.
- **R0 Bit 30 XTD:** Extended Identifier  
Signals to the processor whether the received frame has a standard or extended identifier.  
0: 11-bit standard identifier.  
1: 29-bit extended identifier.
- **R0 Bit 29 RTR:** Remote Transmission Request

Signals to the processor whether the received frame is a data frame or a remote frame.

0: Received frame is a data frame.

1: Received frame is a remote frame.

**Note:** There are no remote frames in CAN FD format. In case a CAN FD frame was received (FDF = 1), bit RTR reflects the state of the reserved bit r1.

• **R0 Bits 28:0 ID[28:0]:** Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

• **R1 Bit 31 ANMF:** Accepted Non-matching Frame

Acceptance of non-matching frames may be enabled via MCAN\_GFC.ANFS and MCAN\_GFC.ANFE.

0: Received frame matching filter index FIDX.

1: Received frame did not match any Rx filter element.

• **R1 Bits 30:24 FIDX[6:0]:** Filter Index

0-127: Index of matching Rx acceptance filter element (invalid if ANMF = '1').  
Range is 0 to MCAN\_SIDFC.LSS - 1 resp. MCAN\_XIDFC.LSE - 1.

• **R1 Bit 21 FDF:** FD Format

0: Standard frame format.

1: CAN FD frame format (new DLC-coding and CRC).

• **R1 Bit 20 BRS:** Bit Rate Switch

0: Frame received without bit rate switching.

1: Frame received with bit rate switching.

**Note:**

Bits ESI, FDF, and BRS are only evaluated when CAN FD operation is enabled (MCAN\_CCCR.FDOE = 1). Bit BRS is only evaluated when in addition MCAN\_CCCR.BRSE = 1.

• **R1 Bits 19:16 DLC[3:0]:** Data Length Code

0-8: CAN + CAN FD: received frame has 0-8 data bytes.

9-15: CAN: received frame has 8 data bytes.

9-15: CAN FD: received frame has 12/16/20/24/32/48/64 data bytes.

• **R1 Bits 15:0 RXTS[15:0]:** Rx Timestamp

Timestamp Counter value captured on start of frame reception. Resolution depending on configuration of the Timestamp Counter Prescaler MCAN\_TSCC.TCP.

• **R2 Bits 31:24 DB3[7:0]:** Data Byte 3

• **R2 Bits 23:16 DB2[7:0]:** Data Byte 2

• **R2 Bits 15:8 DB1[7:0]:** Data Byte 1

• **R2 Bits 7:0 DB0[7:0]:** Data Byte 0

• **R3 Bits 31:24 DB7[7:0]:** Data Byte 7

• **R3 Bits 23:16 DB6[7:0]:** Data Byte 6

• **R3 Bits 15:8 DB5[7:0]:** Data Byte 5

• **R3 Bits 7:0 DB4[7:0]:** Data Byte 4

... ..

- **Rn Bits 31:24 DBm[7:0]:** Data Byte m
- **Rn Bits 23:16 DBm-1[7:0]:** Data Byte m-1
- **Rn Bits 15:8 DBm-2[7:0]:** Data Byte m-2
- **Rn Bits 7:0 DBm-3[7:0]:** Data Byte m-3

**Note:** Depending on the configuration of the element size (MCAN\_RXESC), between two and sixteen 32-bit words (Rn = 3 ..17) are used for storage of a CAN message's data field.

#### 40.5.7.3 Tx Buffer Element

The Tx Buffers section can be configured to hold dedicated Tx Buffers as well as a Tx FIFO / Tx Queue. In case that the Tx Buffers section is shared by dedicated Tx buffers and a Tx FIFO / Tx Queue, the dedicated Tx Buffers start at the beginning of the Tx Buffers section followed by the buffers assigned to the Tx FIFO or Tx Queue. The Tx Handler distinguishes between dedicated Tx Buffers and Tx FIFO / Tx Queue by evaluating the Tx Buffer configuration TXBC.TFQS and TXBC.NDTB. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register TXESC.

|     | 31       | 30  | 29  | 28       | 27 | 26 | 25 | 24 | 23                 | 22 | 21  | 20  | 19       | 18 | 17 | 16 | 15                 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7                  | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |  |  |  |  |

- **T0 Bit 30 ESI:** Error State Indicator

0: ESI bit in CAN FD format depends only on error passive flag

1: ESI bit in CAN FD format transmitted recessive

**Note:** The ESI bit of the transmit buffer is or'ed with the error passive flag to decide the value of the ESI bit in the transmitted FD frame. As required by the CAN FD protocol specification, an error active node may optionally transmit the ESI bit recessive, but an error passive node will always transmit the ESI bit recessive. This feature can be used in gateway applications when a message from an error passive node is routed to another CAN network.

- **T0 Bit 30 XTD:** Extended Identifier

0: 11-bit standard identifier.

1: 29-bit extended identifier.

- **T0 Bit 29 RTR:** Remote Transmission Request

0: Transmit data frame.

1: Transmit remote frame.

**Note:** When RTR = 1, the MCAN transmits a remote frame according to ISO11898-1, even if MCAN\_CCCR.FDOE enables the transmission in CAN FD format.

- **T0 Bits 28:0 ID[28:0]:** Identifier

Standard or extended identifier depending on bit XTD. A standard identifier has to be written to ID[28:18].

- **T1 Bits 31:24 MM[7:0]:** Message Marker

Written by processor during Tx Buffer configuration. Copied into Tx Event FIFO element for identification of Tx message status.

• **T1 Bit 23 EFC:** Event FIFO Control

0: Do not store Tx events.

1: Store Tx events.

• **T1 Bit 21 FDF:** FD Format

0: Frame transmitted in Classic CAN format

1: Frame transmitted in CAN FD format

• **T1 Bit 20 BRS:** Bit Rate Switching

0: CAN FD frames transmitted without bit rate switching

1: CAN FD frames transmitted with bit rate switching

**Note:**

Bits ESI, FDF, and BRS are only evaluated when CAN FD operation is enabled (MCAN\_CCCR.FDOE = 1). Bit BRS is only evaluated when in addition MCAN\_CCCR.BRSE = 1.

• **T1 Bits 19:16 DLC[3:0]:** Data Length Code

0-8: CAN + CAN FD: transmit frame has 0-8 data bytes.

9-15: CAN: transmit frame has 8 data bytes.

9-15: CAN FD: transmit frame has 12/16/20/24/32/48/64 data bytes.

• **T2 Bits 31:24 DB3[7:0]:** Data Byte 3

• **T2 Bits 23:16 DB2[7:0]:** Data Byte 2

• **T2 Bits 15:8 DB1[7:0]:** Data Byte 1

• **T2 Bits 7:0 DB0[7:0]:** Data Byte 0

• **T3 Bits 31:24 DB7[7:0]:** Data Byte 7

• **T3 Bits 23:16 DB6[7:0]:** Data Byte 6

• **T3 Bits 15:8 DB5[7:0]:** Data Byte 5

• **T3 Bits 7:0 DB4[7:0]:** Data Byte 4

... ..

• **Tn Bits 31:24 DBm[7:0]:** Data Byte m

• **Tn Bits 23:16 DBm-1[7:0]:** Data Byte m-1

• **Tn Bits 15:8 DBm-2[7:0]:** Data Byte m-2

• **Tn Bits 7:0 DBm-3[7:0]:** Data Byte m-3

**Note:** Depending on the configuration of the element size (MCAN\_TXESC), between two and sixteen 32-bit words (Tn = 3 ..17) are used for storage of a CAN message's data field.

#### 40.5.7.4 Tx Event FIFO Element

Each element stores information about transmitted messages. By reading the Tx Event FIFO the processor gets this information in the order the messages were transmitted. Status information about the Tx Event FIFO can be obtained from register TXEFS.

|    |     |     |     |          |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |  |  |  |  |  |  |
|----|-----|-----|-----|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|--|--|--|--|--|--|

|    |         |         |     |     |          |            |
|----|---------|---------|-----|-----|----------|------------|
| E1 | MM[6:0] | ET[1:0] | FDF | BRS | DLC[3:0] | TXTS[15:0] |
|----|---------|---------|-----|-----|----------|------------|

- **E0 Bit 31 ESI:** Error State Indicator  
0: Transmitting node is error active.  
1: Transmitting node is error passive.
- **E0 Bit 30 XTD:** Extended Identifier  
0: 11-bit standard identifier.  
1: 29-bit extended identifier.
- **E0 Bit 29 RTR:** Remote Transmission Request  
0: Data frame transmitted.  
1: Remote frame transmitted.
- **E0 Bits 28:0 ID[28:0]:** Identifier  
Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].
- **E1 Bits 31:24 MM[7:0]:** Message Marker  
Copied from Tx Buffer into Tx Event FIFO element for identification of Tx message status.
- **E1 Bit 23:22 ET[1:0]:** Event Type  
0: Reserved  
1: Tx event  
2: Transmission in spite of cancellation (always set for transmissions in DAR mode)  
3: Reserved
- **E1 Bit 21 FDF:** FD Format  
0: Standard frame format.  
1: CAN FD frame format (new DLC-coding and CRC).
- **E1 Bit 20 BRS:** Bit Rate Switch  
0: Frame transmitted without bit rate switching.  
1: Frame transmitted with bit rate switching.
- **E1 Bits 19:16 DLC[3:0]:** Data Length Code  
0-8: CAN + CAN FD: frame with 0-8 data bytes transmitted.  
9-15: CAN: frame with 8 data bytes transmitted.  
9-15: CAN FD: frame with 12/16/20/24/32/48/64 data bytes transmitted
- **E1 Bits 15:0 TXTS[15:0]:** Tx Timestamp  
Timestamp Counter value captured on start of frame transmission. Resolution depending on configuration of the Timestamp Counter Prescaler MCAN\_TSCC.TCP.

#### 40.5.7.5 Standard Message ID Filter Element

Up to 128 filter elements can be configured for 11-bit standard IDs. When accessing a Standard Message ID Filter element, its address is the Filter List Standard Start Address MCAN\_SIDFC.FLSSA plus the index of the filter element (0...127).

|    |          |    |           |    |             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |             |   |   |   |   |   |   |   |   |   |   |
|----|----------|----|-----------|----|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------------|---|---|---|---|---|---|---|---|---|---|
|    | 31       | 30 | 29        | 28 | 27          | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10          | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| S0 | SFT[2:0] |    | SFEC[2:0] |    | SFID2[10:0] |    |    |    |    |    |    |    |    |    | -  |    |    |    |    |    |    | SFID1[10:0] |   |   |   |   |   |   |   |   |   |   |

• **Bits 31:30 SFT[1:0]:** Standard Filter Type

| Value | Description                                      |
|-------|--------------------------------------------------|
| 0     | Range filter from SF1ID to SF2ID (SF2ID ≥ SF1ID) |
| 1     | Dual ID filter for SF1ID or SF2ID                |
| 2     | Classic filter: SF1ID = filter, SF2ID = mask     |
| 3     | Reserved                                         |

• **Bit 29:27 SFEC[2:0]:** Standard Filter Element Configuration

All enabled filter elements are used for acceptance filtering of standard frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If SFEC = “100”, “101”, or “110” a match sets interrupt flag MCAN\_IR.HPM and, if enabled, an interrupt is generated. In this case register HPMS is updated with the status of the priority match.

| Value | Description                                                                 |
|-------|-----------------------------------------------------------------------------|
| 0     | Disable filter element                                                      |
| 1     | Store in Rx FIFO 0 if filter matches                                        |
| 2     | Store in Rx FIFO 1 if filter matches                                        |
| 3     | Reject ID if filter matches                                                 |
| 4     | Set priority if filter matches                                              |
| 5     | Set priority and store in FIFO 0 if filter matches                          |
| 6     | Set priority and store in FIFO 1 if filter matches                          |
| 7     | Store into Rx Buffer or as debug message, configuration of SFT[1:0] ignored |

• **Bits 26:16 SFID1[10:0]:** Standard Filter ID 1

First ID of standard ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of a standard message to be stored. The received identifiers must match exactly, no masking mechanism is used.

• **Bits 10:0 SFID2[10:0]:** Standard Filter ID 2

This field has a different meaning depending on the configuration of SFEC:

- SFEC = “001”...“110”–Second ID of standard ID filter element
- SFEC = “111”–Filter for Rx Buffers or for debug messages

SFID2[10:9] decides whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.

| Value | Description                  |
|-------|------------------------------|
| 0     | Store message in a Rx buffer |
| 1     | Debug Message A              |
| 2     | Debug Message B              |
| 3     | Debug Message C              |

SFID2[5:0] defines the index of the dedicated Rx Buffer element to which a matching message is stored.

#### 40.5.7.6 Extended Message ID Filter Element

Up to 64 filter elements can be configured for 29-bit extended IDs. When accessing an Extended Message ID Filter element, its address is the Filter List Extended Start Address MCAN\_XIDFC.FLESA plus two times the index of the filter element (0...63).

|  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|--|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
|  | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

|    |           |   |            |
|----|-----------|---|------------|
| F0 | EFEC[2:0] |   | EFID[28:0] |
| F1 | EFT[1:0]  | I | EFID[28:0] |

• **F0 Bit 31:29 EFEC[2:0]:** Extended Filter Element Configuration

All enabled filter elements are used for acceptance filtering of extended frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If EFEC = "100", "101", or "110", a match sets the interrupt flag MCAN\_IR.HPM and, if enabled, an interrupt is generated. In this case, register MCAN\_HPMS is updated with the status of the priority match.

| Value | Description                                                                 |
|-------|-----------------------------------------------------------------------------|
| 0     | Disable filter element                                                      |
| 1     | Store in Rx FIFO 0 if filter matches                                        |
| 2     | Store in Rx FIFO 1 if filter matches                                        |
| 3     | Reject ID if filter matches                                                 |
| 4     | Set priority if filter matches                                              |
| 5     | Set priority and store in FIFO 0 if filter matches                          |
| 6     | Set priority and store in FIFO 1 if filter matches                          |
| 7     | Store into Rx Buffer or as debug message, configuration of EFT[1:0] ignored |

• **F0 Bits 28:0 EFID1[28:0]:** Extended Filter ID 1

First ID of extended ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of an extended message to be stored. The received identifiers must match exactly, only MCAN\_XIDAM masking mechanism (see [Extended Message ID Filtering](#)) is used.

• **F1 Bits 31:30 EFT[1:0]:** Extended Filter Type

| Value | Description                                                                   |
|-------|-------------------------------------------------------------------------------|
| 0     | Range filter from EF1ID to EF2ID (EF2ID ≥ EF1ID)                              |
| 1     | Dual ID filter for EF1ID or EF2ID                                             |
| 2     | Classic filter: EF1ID = filter, EF2ID = mask                                  |
| 3     | Range filter from EF1ID to EF2ID (EF2ID ≥ EF1ID), MCAN_XIDAM mask not applied |

• **F1 Bits 28:0 EFID2[28:0]:** Extended Filter ID 2

This field has a different meaning depending on the configuration of EFEC:

- EFEC = "001"... "110" – Second ID of extended ID filter element
- EFEC = "111" – Filter for Rx Buffers or for debug messages

EFID2[10:9] decides whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.

| Value | Description                   |
|-------|-------------------------------|
| 0     | Store message in an Rx buffer |
| 1     | Debug Message A               |
| 2     | Debug Message B               |
| 3     | Debug Message C               |

EFID2[5:0] defines the index of the dedicated Rx Buffer element to which a matching message is stored.

#### 40.5.8 Hardware Reset Description

After hardware reset, the registers of the MCAN hold the reset values listed in the register descriptions. Additionally the Bus\_Off state is reset and the output CANTX is set to recessive (HIGH). The value 0x0001 (MCAN\_CCCR.INIT = '1') in the CC Control register enables software initialization. The MCAN does not influence the CAN bus until the processor resets MCAN\_CCCR.INIT to '0'.

#### 40.5.9 Access to Reserved Register Addresses

In case the application software accesses one of the reserved addresses in the MCAN register map (read or write access), interrupt flag MCAN\_IR.ARA is set and, if enabled, the selected interrupt line is risen.

## 40.6 Register Summary

| Offset              | Name      | Bit Pos. | 7           | 6           | 5    | 4           | 3    | 2         | 1        | 0    |  |

Bits 31:0 – CSV[31:0] Customer-specific Value  
Customer-specific value.

- Bits 12:8 – DTSEG1[4:0]** Data Time Segment Before Sample Point  
0: Forbidden.  
1 to 31: The duration of time segment is  $t_q \times (DTSEG1 + 1)$ .
- Bits 7:4 – DTSEG2[3:0]** Data Time Segment After Sample Point  
The duration of time segment is  $t_q \times (DTSEG2 + 1)$ .
- Bits 2:0 – DSJW[2:0]** Data (Re) Synchronization Jump Width  
The duration of a synchronization jump is  $t_q \times (DSJW + 1)$ .

#### 40.6.4 MCAN Test Register

**Name:** MCAN\_TEST  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

Write access to the Test Register has to be enabled by setting bit MCAN\_CCCR.TEST to '1'.

All MCAN Test Register functions are set to their reset values when bit MCAN\_CCCR.TEST is cleared.

Loop Back mode and software control of pin CANTX are hardware test modes. Programming of TX ≠ 0 disturbs the message transfer on the CAN bus.

The reset value for MCAN\_TEST.RX is undefined.

|        |    |         |    |      |    |    |    |    |

##### Bit 7 – RX Receive Pin (read-only)

Monitors the actual value of pin CANRX.

The reset value for this bit is undefined.

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | The CAN bus is dominant (CANRX = '0').  |
| 1     | The CAN bus is recessive (CANRX = '1'). |

##### Bits 6:5 – TX[1:0] Control of Transmit Pin (read/write)

| Value | Name                    | Description                                                                            |
|-------|-------------------------|----------------------------------------------------------------------------------------|
| 0     | RESET                   | Reset value, CANTX controlled by the CAN Core, updated at the end of the CAN bit time. |
| 1     | SAMPLE_POINT_MONITORING | Sample Point can be monitored at pin CANTX.                                            |
| 2     | DOMINANT                | Dominant ('0') level at pin CANTX.                                                     |
| 3     | RECESSIVE               | Recessive ('1') at pin CANTX.                                                          |

##### Bit 4 – LBCK Loop Back Mode (read/write)

0 (DISABLED): Reset value. Loop Back mode is disabled.

1 (ENABLED): Loop Back mode is enabled (see [Test Modes](#)).

40.6.5 MCAN RAM Watchdog Register

**Name:** MCAN\_RWD  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read/Write

The RAM Watchdog monitors the Message RAM response time. A Message RAM access via the MCAN's Generic Master Interface starts the Message RAM Watchdog Counter with the value configured by MCAN\_RWD.WDC. The counter is reloaded with MCAN\_RWD.WDC when the Message RAM signals successful completion by activating its READY output. In case there is no response from the Message RAM until the counter has counted down to zero, the counter stops and interrupt flag MCAN\_IR.WDI is set. The RAM Watchdog Counter is clocked by the system bus clock (peripheral clock).

|        |          |     |     |     |     |     |     |     |

| Reset  | 0        | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 15:8 – WDV[7:0]** Watchdog Value (read-only)  
Watchdog Counter Value for the current message located in RAM.

**Bits 7:0 – WDC[7:0]** Watchdog Configuration (read/write)  
Start value of the Message RAM Watchdog Counter. The counter is disabled when WDC is cleared.

## 40.6.6 MCAN CC Control Register

**Name:** MCAN\_CCCR  
**Offset:** 0x18  
**Reset:** 0x00000001  
**Property:** Read/Write

|        |      |     |      |      |     |     |      |      |
|--------|------|-----|------|------|-----|-----|------|------|
| Bit    | 31   | 30  | 29   | 28   | 27  | 26  | 25   | 24   |
| Access |      |     |      |      |     |     |      |      |
| Reset  |      |     |      |      |     |     |      |      |
| Bit    | 23   | 22  | 21   | 20   | 19  | 18  | 17   | 16   |
| Access |      |     |      |      |     |     |      |      |
| Reset  |      |     |      |      |     |     |      |      |
| Bit    | 15   | 14  | 13   | 12   | 11  | 10  | 9    | 8    |
| Access | NISO | TXP | EFBI | PXHD |     |     | BRSE | FDOE |
| Reset  | R/W  | R/W | R/W  | R/W  |     |     | R/W  | R/W  |
| Reset  | 0    | 0   | 0    | 0    |     |     | 0    | 0    |
| Bit    | 7    | 6   | 5    | 4    | 3   | 2   | 1    | 0    |
| Access | TEST | DAR | MON  | CSR  | CSA | ASM | CCE  | INIT |
| Reset  | R/W  | R/W | R/W  | R/W  | R   | R/W | R/W  | R/W  |
| Reset  | 0    | 0   | 0    | 0    | 0   | 0   | 0    | 1    |

### Bit 15 – NISO Non-ISO Operation

If this bit is set, the MCAN uses the CAN FD frame format as specified by the Bosch CAN FD Specification V1.0.

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | CAN FD frame format according to ISO11898-1 (default).            |
| 1     | CAN FD frame format according to Bosch CAN FD Specification V1.0. |

### Bit 14 – TXP Transmit Pause (read/write, write protection)

If this bit is set, the MCAN pauses for two CAN bit times before starting the next transmission after itself has successfully transmitted a frame (see [Tx Handling](#)).

| Value | Description              |
|-------|--------------------------|
| 0     | Transmit pause disabled. |
| 1     | Transmit pause enabled.  |

### Bit 13 – EFBI Edge Filtering during Bus Integration (read/write, write protection)

| Value | Description                                                                                                 |
|-------|-------------------------------------------------------------------------------------------------------------|
| 0     | Edge filtering is disabled.                                                                                 |
| 1     | Edge filtering is enabled. Two consecutive dominant tq required to detect an edge for hard synchronization. |

### Bit 12 – PXHD Protocol Exception Event Handling (read/write, write protection)

| Value | Description                           |
|-------|---------------------------------------|
| 0     | Protocol exception handling enabled.  |
| 1     | Protocol exception handling disabled. |

### Bit 9 – BRSE Bit Rate Switching Enable (read/write, write protection)

0 (DISABLED): Bit rate switching for transmissions disabled.  
1 (ENABLED): Bit rate switching for transmissions enabled.

**Bit 8 – FDOE** CAN FD Operation Enable (read/write, write protection)

0 (DISABLED): FD operation disabled.

1 (ENABLED): FD operation enabled.

**Bit 7 – TEST** Test Mode Enable (read/write, write protection against '1')

0 (DISABLED): Normal operation, MCAN\_TEST register holds reset values.

1 (ENABLED): Test mode, write access to MCAN\_TEST register enabled.

**Bit 6 – DAR** Disable Automatic Retransmission (read/write, write protection)

0 (AUTO\_RETX): Automatic retransmission of messages not transmitted successfully enabled.

1 (NO\_AUTO\_RETX): Automatic retransmission disabled.

**Bit 5 – MON** Bus Monitoring Mode (read/write, write protection against '1')

0 (DISABLED): Bus Monitoring mode is disabled.

1 (ENABLED): Bus Monitoring mode is enabled.

**Bit 4 – CSR** Clock Stop Request (read/write)

0 (NO\_CLOCK\_STOP): No clock stop is requested.

1 (CLOCK\_STOP): Clock stop requested. When clock stop is requested, first INIT and then CSA will be set after all pending transfer requests have been completed and the CAN bus reached idle.

**Bit 3 – CSA** Clock Stop Acknowledge (read-only)

| Value | Description                                                                            |
|-------|----------------------------------------------------------------------------------------|
| 0     | No clock stop acknowledged.                                                            |
| 1     | MCAN may be set in power down by stopping the peripheral clock and the CAN core clock. |

**Bit 2 – ASM** Restricted Operation Mode (read/write, write protection against '1')For a description of the Restricted Operation mode see [Restricted Operation Mode](#).

0 (NORMAL): Normal CAN operation.

1 (RESTRICTED): Restricted Operation mode active.

**Bit 1 – CCE** Configuration Change Enable (read/write, write protection)

0 (PROTECTED): The processor has no write access to the protected configuration registers.

1 (CONFIGURABLE): The processor has write access to the protected configuration registers (while MCAN\_CCCR.INIT = '1').

**Bit 0 – INIT** Initialization (read/write)

Due to the synchronization mechanism between the two clock domains, there may be a delay until the value written to INIT can be read back. Therefore the programmer has to ensure that the previous value written to INIT has been accepted by reading INIT before setting INIT to a new value.

0 (DISABLED): Normal operation.

1 (ENABLED): Initialization is started.

## 40.6.7 MCAN Nominal Bit Timing and Prescaler Register

**Name:** MCAN\_NBTP  
**Offset:** 0x1C  
**Reset:** 0x06000A03  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN\_CCCR.

The CAN bit time may be programmed in the range of 4 to 385 time quanta. The CAN time quantum may be programmed in the range of 1 to 512 CAN core clock periods.  $t_q = t_{\text{core clock}} \times (\text{NBRP} + 1)$ .

NTSEG1 is the sum of Prop\_Seg and Phase\_Seg1. NTSEG2 is Phase\_Seg2.

Therefore the length of the bit time is (programmed values)  $[\text{NTSEG1} + \text{NTSEG2} + 3] t_q$   
or (functional values)  $[\text{Sync\_Seg} + \text{Prop\_Seg} + \text{Phase\_Seg1} + \text{Phase\_Seg2}] t_q$ .

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

With a CAN core clock frequency of 8 MHz, the reset value of 0x06000A03 configures the MCAN for a bit rate of 500 kbit/s.

|        |             |             |     |     |     |     |     |         |
|--------|-------------|-------------|-----|-----|-----|-----|-----|---------|
| Bit    | 31          | 30          | 29  | 28  | 27  | 26  | 25  | 24      |
|        | NSJW[6:0]   |             |     |     |     |     |     | NBRP[8] |
| Access | R/W         | R/W         | R/W | R/W | R/W | R/W | R/W | R/W     |
| Reset  | 0           | 0           | 0   | 0   | 0   | 1   | 1   | 0       |
| Bit    | 23          | 22          | 21  | 20  | 19  | 18  | 17  | 16      |
|        | NBRP[7:0]   |             |     |     |     |     |     |         |
| Access | R/W         | R/W         | R/W | R/W | R/W | R/W | R/W | R/W     |
| Reset  | 0           | 0           | 0   | 0   | 0   | 0   | 0   | 0       |
| Bit    | 15          | 14          | 13  | 12  | 11  | 10  | 9   | 8       |
|        | NTSEG1[7:0] |             |     |     |     |     |     |         |
| Access | R/W         | R/W         | R/W | R/W | R/W | R/W | R/W | R/W     |
| Reset  | 0           | 0           | 0   | 0   | 1   | 0   | 1   | 0       |
| Bit    | 7           | 6           | 5   | 4   | 3   | 2   | 1   | 0       |
|        |             | NTSEG2[6:0] |     |     |     |     |     |         |
| Access |             | R/W         | R/W | R/W | R/W | R/W | R/W | R/W     |
| Reset  |             | 0           | 0   | 0   | 0   | 0   | 1   | 1       |

**Bits 31:25 – NSJW[6:0]** Nominal (Re) Synchronization Jump Width  
0 to 127: The duration of a synchronization jump is  $t_q \times (\text{NSJW} + 1)$ .

**Bits 24:16 – NBRP[8:0]** Nominal Bit Rate Prescaler  
0 to 511: The value by which the oscillator frequency is divided for generating the CAN time quanta. The CAN time is built up from a multiple of this quanta. CAN time quantum ( $t_q$ ) =  $t_{\text{core clock}} \times (\text{NBRP} + 1)$

**Bits 15:8 – NTSEG1[7:0]** Nominal Time Segment Before Sample Point

| Value    | Description                                                        |
|----------|--------------------------------------------------------------------|
| 0        | Reserved; do not use.                                              |
| 1 to 255 | The duration of time segment is $t_q \times (\text{NTSEG1} + 1)$ . |

**Bits 6:0 – NTSEG2[6:0]** Nominal Time Segment After Sample Point

| Value    | Description                                                        |
|----------|--------------------------------------------------------------------|
| 0        | Reserved; do not use.                                              |
| 1 to 127 | The duration of time segment is $t_q \times (\text{NTSEG2} + 1)$ . |

40.6.8 MCAN Timestamp Counter Configuration Register

Name: MCAN\_TSCC  
Offset: 0x20  
Reset: 0x00000000  
Property: Read/Write

For a description of the Timestamp Counter see [Timestamp Generation](#).

With CAN FD, an external counter is required for timestamp generation (TSS = 2).

**Bits 19:16 – TCP[3:0] Timestamp Counter Prescaler**  
Configures the timestamp and timeout counters time unit in multiples of CAN bit times [ 1...16 ].  
The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

**Bits 1:0 – TSS[1:0] Timestamp Select**

| Value | Name          | Description                                          |
|-------|---------------|------------------------------------------------------|
| 0     | ALWAYS_0      | Timestamp counter value always 0x0000                |
| 1     | TCP_INC       | Timestamp counter value incremented according to TCP |
| 2     | EXT_TIMESTAMP | External timestamp counter value used                |
| 3     | ALWAYS_0      | Timestamp counter value always 0x0000                |

40.6.9 MCAN Timestamp Counter Value Register

Name: MCAN\_TSCV  
Offset: 0x24  
Reset: 0x00000000  
Property: Read/Write

|        |           |     |     |     |     |     |     |     |
|--------|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31        | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |           |     |     |     |     |     |     |     |
| Access |           |     |     |     |     |     |     |     |
| Reset  |           |     |     |     |     |     |     |     |
| Bit    | 23        | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        |           |     |     |     |     |     |     |     |
| Access |           |     |     |     |     |     |     |     |
| Reset  |           |     |     |     |     |     |     |     |
| Bit    | 15        | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | TSC[15:8] |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7         | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | TSC[7:0]  |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 15:0 – TSC[15:0]** Timestamp Counter (cleared on write)  
The internal/external Timestamp Counter value is captured on start of frame (both Receive and Transmit). When MCAN\_TSCC.TSS = 1, the Timestamp Counter is incremented in multiples of CAN bit times [ 1...16 ] depending on the configuration of MCAN\_TSCC.TCP. A wrap around sets interrupt flag MCAN\_IR.TSW. Write access resets the counter to zero.  
When MCAN\_TSCC.TSS = 2, TSC reflects the external Timestamp Counter value. Thus a write access has no impact.  
**Note:** A “wrap around” is a change of the Timestamp Counter value from non-zero to zero not caused by write access to MCAN\_TSCV.

#### 40.6.10 MCAN Timeout Counter Configuration Register

**Name:** MCAN\_TOCC  
**Offset:** 0x28  
**Reset:** 0xFFFF0000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

For a description of the Timeout Counter, see [Timeout Counter](#).

|        |           |     |     |     |     |          |     |      |
|--------|-----------|-----|-----|-----|-----|----------|-----|------|
| Bit    | 31        | 30  | 29  | 28  | 27  | 26       | 25  | 24   |
|        | TOP[15:8] |     |     |     |     |          |     |      |

| Access |           |     |     |     |     |          |     |      |
| Reset  |           |     |     |     |     |          |     |      |
| Bit    | 7         | 6   | 5   | 4   | 3   | 2        | 1   | 0    |
|        |           |     |     |     |     | TOS[1:0] |     | ETOC |
| Access |           |     |     |     |     | R/W      | R/W | R/W  |
| Reset  |           |     |     |     |     | 0        | 0   | 0    |

##### Bits 31:16 – TOP[15:0] Timeout Period

Start value of the Timeout Counter (down-counter). Configures the Timeout Period.

##### Bits 2:1 – TOS[1:0] Timeout Select

When operating in Continuous mode, a write to MCAN\_TOCV presets the counter to the value configured by MCAN\_TOCC.TOP and continues down-counting. When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCAN\_TOCC.TOP. Down-counting is started when the first FIFO element is stored.

| Value | Name           | Description                           |
|-------|----------------|---------------------------------------|
| 0     | CONTINUOUS     | Continuous operation.                 |
| 1     | TX_EV_TIMEOUT  | Timeout controlled by Tx Event FIFO.  |
| 2     | RX0_EV_TIMEOUT | Timeout controlled by Receive FIFO 0. |
| 3     | RX1_EV_TIMEOUT | Timeout controlled by Receive FIFO 1. |

##### Bit 0 – ETOC Enable Timeout Counter

0 (NO\_TIMEOUT): Timeout Counter disabled.

1 (TOS\_CONTROLLED): Timeout Counter enabled.

For use of timeout function with CAN FD, see [Timeout Counter](#).

40.6.11 MCAN Timeout Counter Value Register

Name: MCAN\_TOCV  
Offset: 0x2C  
Reset: 0x0000FFFF  
Property: Read/Write

**Bits 15:0 – TOC[15:0]** Timeout Counter (cleared on write)  
The Timeout Counter is decremented in multiples of CAN bit times [ 1...16 ] depending on the configuration of MCAN\_TSCC.TCP. When decremented to zero, interrupt flag MCAN\_IR.TOO is set and the Timeout Counter is stopped. Start and reset/restart conditions are configured via MCAN\_TOCC.TOS.

## 40.6.12 MCAN Error Counter Register

**Name:** MCAN\_ECR  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read-only

When MCAN\_CCCR.ASM is set, the CAN protocol controller does not increment TEC and REC when a CAN protocol error is detected, but CEL is still incremented.

|        |          |          |    |    |    |    |    |    |
|--------|----------|----------|----|----|----|----|----|----|
| Bit    | 31       | 30       | 29 | 28 | 27 | 26 | 25 | 24 |
|        |          |          |    |    |    |    |    |    |
| Access |          |          |    |    |    |    |    |    |
| Reset  |          |          |    |    |    |    |    |    |

| Access | R        | R        | R  | R  | R  | R  | R  | R  |
| Reset  | 0        | 0        | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 15       | 14       | 13 | 12 | 11 | 10 | 9  | 8  |
|        | RP       | REC[6:0] |    |    |    |    |    |    |
| Access | R        | R        | R  | R  | R  | R  | R  | R  |
| Reset  | 0        | 0        | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7        | 6        | 5  | 4  | 3  | 2  | 1  | 0  |
|        | TEC[7:0] |          |    |    |    |    |    |    |
| Access | R        | R        | R  | R  | R  | R  | R  | R  |
| Reset  | 0        | 0        | 0  | 0  | 0  | 0  | 0  | 0  |

### Bits 23:16 – CEL[7:0] CAN Error Logging (cleared on read)

The counter is incremented each time when a CAN protocol error causes the Transmit Error Counter or the Receive Error Counter to be incremented. It is reset by read access to CEL. The counter stops at 0xFF; the next increment of TEC or REC sets interrupt flag IR.ELO.

### Bit 15 – RP Receive Error Passive

| Value | Description                                                           |
|-------|-----------------------------------------------------------------------|
| 0     | The Receive Error Counter is below the error passive level of 128.    |
| 1     | The Receive Error Counter has reached the error passive level of 128. |

### Bits 14:8 – REC[6:0] Receive Error Counter

Actual state of the Receive Error Counter, values between 0 and 127.

### Bits 7:0 – TEC[7:0] Transmit Error Counter

Actual state of the Transmit Error Counter, values between 0 and 255.

### 40.6.13 MCAN Protocol Status Register

**Name:** MCAN\_PSR  
**Offset:** 0x44  
**Reset:** 0x00000707  
**Property:** Read-only

|        |    |           |      |          |      |           |    |    |
|--------|----|-----------|------|----------|------|-----------|----|----|

| Access |    | PXE       | RFDF | RBRS     | RESI | DLEC[2:0] |    |    |
| Reset  |    | R         | R    | R        | R    | R         | R  | R  |
| Reset  |    | 0         | 0    | 0        | 0    | 1         | 1  | 1  |
| Bit    | 7  | 6         | 5    | 4        | 3    | 2         | 1  | 0  |
| Access | BO | EW        | EP   | ACT[1:0] |      | LEC[2:0]  |    |    |
| Reset  | R  | R         | R    | R        | R    | R         | R  | R  |
| Reset  | 0  | 0         | 0    | 0        | 0    | 1         | 1  | 1  |

#### Bits 22:16 – TDCV[6:0] Transmitter Delay Compensation Value

0 to 127: Position of the secondary sample point, in CAN core clock periods, defined by the sum of the measured delay from CANTX to CANRX and MCAN\_TDCR.TDCO.

#### Bit 14 – PXE Protocol Exception Event (cleared on read)

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | No protocol exception event occurred since last read access |
| 1     | Protocol exception event occurred                           |

#### Bit 13 – RFDF Received a CAN FD Message (cleared on read)

This bit is set independently from acceptance filtering.

| Value | Description                                                              |
|-------|--------------------------------------------------------------------------|
| 0     | Since this bit was reset by the CPU, no CAN FD message has been received |
| 1     | Message in CAN FD format with FDF flag set has been received             |

#### Bit 12 – RBRS BRS Flag of Last Received CAN FD Message (cleared on read)

This bit is set together with RFDF, independently from acceptance filtering.

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | Last received CAN FD message did not have its BRS flag set. |
| 1     | Last received CAN FD message had its BRS flag set.          |

#### Bit 11 – RESI ESI Flag of Last Received CAN FD Message (cleared on read)

This bit is set together with RFDF, independently from acceptance filtering.

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | Last received CAN FD message did not have its ESI flag set. |
| 1     | Last received CAN FD message had its ESI flag set.          |

**Bits 10:8 – DLEC[2:0] Data Phase Last Error Code (set to 111 on read)**

Type of last error that occurred in the data phase of a CAN FD format frame with its BRS flag set.

Coding is the same as for LEC. This field will be cleared to zero when a CAN FD format frame with its BRS flag set has been transferred (reception or transmission) without error.

**Bit 7 – BO Bus\_Off Status**

| Value | Description                   |
|-------|-------------------------------|
| 0     | The MCAN is not Bus_Off.      |
| 1     | The MCAN is in Bus_Off state. |

**Bit 6 – EW Warning Status**

| Value | Description                                                              |
|-------|--------------------------------------------------------------------------|
| 0     | Both error counters are below the Error_Warning limit of 96.             |
| 1     | At least one of error counter has reached the Error_Warning limit of 96. |

**Bit 5 – EP Error Passive**

| Value | Description                                                                                                                                        |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The MCAN is in the Error_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected. |
| 1     | The MCAN is in the Error_Passive state.                                                                                                            |

**Bits 4:3 – ACT[1:0] Activity**

Monitors the CAN communication state of the CAN module.

| Value | Name          | Description                                |
|-------|---------------|--------------------------------------------|
| 0     | SYNCHRONIZING | Node is synchronizing on CAN communication |
| 1     | IDLE          | Node is neither receiver nor transmitter   |
| 2     | RECEIVER      | Node is operating as receiver              |
| 3     | TRANSMITTER   | Node is operating as transmitter           |

**Bits 2:0 – LEC[2:0] Last Error Code (set to 111 on read)**

The LEC indicates the type of the last error to occur on the CAN bus. This field is cleared when a message has been transferred (reception or transmission) without error.

| Value | Name        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | NO_ERROR    | No error occurred since LEC has been reset by successful reception or transmission.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 1     | STUFF_ERROR | More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed.                                                                                                                                                                                                                                                                                                                                                                                            |
| 2     | FORM_ERROR  | A fixed format part of a received frame has the wrong format.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 3     | ACK_ERROR   | The message transmitted by the MCAN was not acknowledged by another node.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 4     | BIT1_ERROR  | During transmission of a message (with the exception of the arbitration field), the device tried to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant.                                                                                                                                                                                                                                                                                                         |
| 5     | BIT0_ERROR  | During transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device tried to send a dominant level (data or identifier bit logical value '0'), but the monitored bus value was recessive. During Bus_Off recovery, this status is set each time a sequence of 11 recessive bits has been monitored. This enables the processor to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed). |
| 6     | CRC_ERROR   | The CRC check sum of a received message was incorrect. The CRC of an incoming message does not match the CRC calculated from the received data.                                                                                                                                                                                                                                                                                                                                                          |
| 7     | NO_CHANGE   | Any read access to the Protocol Status Register re-initializes the LEC to '7'. When the LEC shows value '7', no CAN bus event was detected since the last processor read access to the Protocol Status Register.                                                                                                                                                                                                                                                                                         |

40.6.14 MCAN Transmitter Delay Compensation Register

Name: MCAN\_TDCR  
Offset: 0x48  
Reset: 0x00000000  
Property: Read/Write

|        |    |           |     |     |     |     |     |     |
|--------|----|-----------|-----|-----|-----|-----|-----|-----|
| Bit    | 31 | 30        | 29  | 28  | 27  | 26  | 25  | 24  |

| Access |    | R/W       | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |    | 0         | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7  | 6         | 5   | 4   | 3   | 2   | 1   | 0   |
|        |    | TDCF[6:0] |     |     |     |     |     |     |
| Access |    | R/W       | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |    | 0         | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 14:8 – TDCO[6:0]** Transmitter Delay Compensation Offset  
0 to 127: Offset value, in CAN core clock periods, defining the distance between the measured delay from CANTX to CANRX and the secondary sample point.

**Bits 6:0 – TDCF[6:0]** Transmitter Delay Compensation Filter  
0 to 127: defines the minimum value for the SSP position, in CAN core clock periods. Dominant edges on CANRX that would result in an earlier SSP position are ignored for transmitter delay measurement. The feature is enabled when TDCF is configured to a value greater than TDCO.

**40.6.15 MCAN Interrupt Register**

**Name:** MCAN\_IR  
**Offset:** 0x50  
**Reset:** 0x00000000  
**Property:** Read/Write

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register. The configuration of IE controls whether an interrupt is generated. The configuration of ILS controls on which interrupt line an interrupt is signalled.

**Bit 29 – ARA Access to Reserved Address**

| Value | Description                            |
|-------|----------------------------------------|
| 0     | No access to reserved address occurred |
| 1     | Access to reserved address occurred    |

**Bit 28 – PED Protocol Error in Data Phase**

| Value | Description                                                               |
|-------|---------------------------------------------------------------------------|
| 0     | No protocol error in data phase                                           |
| 1     | Protocol error in data phase detected (MCAN_PSR.DLEC differs from 0 or 7) |

**Bit 27 – PEA Protocol Error in Arbitration Phase**

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 0     | No protocol error in arbitration phase                                          |
| 1     | Protocol error in arbitration phase detected (MCAN_PSR.LEC differs from 0 or 7) |

**Bit 26 – WDI Watchdog Interrupt**

| Value | Description                                      |
|-------|--------------------------------------------------|
| 0     | No Message RAM Watchdog event occurred.          |
| 1     | Message RAM Watchdog event due to missing READY. |

**Bit 25 – BO Bus\_Off Status**

| Value | Description               |
|-------|---------------------------|
| 0     | Bus_Off status unchanged. |
| 1     | Bus_Off status changed.   |

#### Bit 24 – EW Warning Status

| Value | Description                     |
|-------|---------------------------------|
| 0     | Error_Warning status unchanged. |
| 1     | Error_Warning status changed.   |

#### Bit 23 – EP Error Passive

| Value | Description                     |
|-------|---------------------------------|
| 0     | Error_Passive status unchanged. |
| 1     | Error_Passive status changed.   |

#### Bit 22 – ELO Error Logging Overflow

| Value | Description                                     |
|-------|-------------------------------------------------|
| 0     | CAN Error Logging Counter did not overflow.     |
| 1     | Overflow of CAN Error Logging Counter occurred. |

#### Bit 19 – DRX Message stored to Dedicated Receive Buffer

The flag is set whenever a received message has been stored into a dedicated Receive Buffer.

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | No Receive Buffer updated.                                  |
| 1     | At least one received message stored into a Receive Buffer. |

#### Bit 18 – TOO Timeout Occurred

| Value | Description      |
|-------|------------------|
| 0     | No timeout.      |
| 1     | Timeout reached. |

#### Bit 17 – MRAF Message RAM Access Failure

The flag is set, when the Rx Handler

- has not completed acceptance filtering or storage of an accepted message until the arbitration field of the following message has been received. In this case acceptance filtering or message storage is aborted and the Rx Handler starts processing of the following message.
- was not able to write a message to the Message RAM. In this case message storage is aborted.

In both cases the FIFO put index is not updated resp. the New Data flag for a dedicated Receive Buffer is not set, a partly stored message is overwritten when the next message is stored to this location.

The flag is also set when the Tx Handler was not able to read a message from the Message RAM in time. In this case message transmission is aborted. In case of a Tx Handler access failure the MCAN is switched into Restricted Operation mode (see [Restricted Operation Mode](#)). To leave Restricted Operation mode, the processor has to reset MCAN\_CCCR.ASM.

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | No Message RAM access failure occurred. |
| 1     | Message RAM access failure occurred.    |

#### Bit 16 – TSW Timestamp Wraparound

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No timestamp counter wrap-around. |
| 1     | Timestamp counter wrapped around. |

#### Bit 15 – TEFL Tx Event FIFO Element Lost

| Value | Description                    |
|-------|--------------------------------|
| 0     | No Tx Event FIFO element lost. |

| Value | Description                                                                             |
|-------|-----------------------------------------------------------------------------------------|
| 1     | Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero. |

#### Bit 14 – TEFF Tx Event FIFO Full

| Value | Description             |
|-------|-------------------------|
| 0     | Tx Event FIFO not full. |
| 1     | Tx Event FIFO full.     |

#### Bit 13 – TEFW Tx Event FIFO Watermark Reached

| Value | Description                                 |
|-------|---------------------------------------------|
| 0     | Tx Event FIFO fill level below watermark.   |
| 1     | Tx Event FIFO fill level reached watermark. |

#### Bit 12 – TEFN Tx Event FIFO New Entry

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | Tx Event FIFO unchanged.                |
| 1     | Tx Handler wrote Tx Event FIFO element. |

#### Bit 11 – TFE Tx FIFO Empty

| Value | Description        |
|-------|--------------------|
| 0     | Tx FIFO non-empty. |
| 1     | Tx FIFO empty.     |

#### Bit 10 – TCF Transmission Cancellation Finished

| Value | Description                            |
|-------|----------------------------------------|
| 0     | No transmission cancellation finished. |
| 1     | Transmission cancellation finished.    |

#### Bit 9 – TC Transmission Completed

| Value | Description                |
|-------|----------------------------|
| 0     | No transmission completed. |
| 1     | Transmission completed.    |

#### Bit 8 – HPM High Priority Message

| Value | Description                        |
|-------|------------------------------------|
| 0     | No high priority message received. |
| 1     | High priority message received.    |

#### Bit 7 – RF1L Receive FIFO 1 Message Lost

| Value | Description                                                                               |
|-------|-------------------------------------------------------------------------------------------|
| 0     | No Receive FIFO 1 message lost.                                                           |
| 1     | Receive FIFO 1 message lost, also set after write attempt to Receive FIFO 1 of size zero. |

#### Bit 6 – RF1F Receive FIFO 1 Full

| Value | Description              |
|-------|--------------------------|
| 0     | Receive FIFO 1 not full. |
| 1     | Receive FIFO 1 full.     |

#### Bit 5 – RF1W Receive FIFO 1 Watermark Reached

| Value | Description                                  |
|-------|----------------------------------------------|
| 0     | Receive FIFO 1 fill level below watermark.   |
| 1     | Receive FIFO 1 fill level reached watermark. |

#### Bit 4 – RF1N Receive FIFO 1 New Message

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | No new message written to Receive FIFO 1. |
| 1     | New message written to Receive FIFO 1.    |

**Bit 3 – RF0L** Receive FIFO 0 Message Lost

| Value | Description                                                                               |
|-------|-------------------------------------------------------------------------------------------|
| 0     | No Receive FIFO 0 message lost.                                                           |
| 1     | Receive FIFO 0 message lost, also set after write attempt to Receive FIFO 0 of size zero. |

**Bit 2 – RF0F** Receive FIFO 0 Full

| Value | Description              |
|-------|--------------------------|
| 0     | Receive FIFO 0 not full. |
| 1     | Receive FIFO 0 full.     |

**Bit 1 – RF0W** Receive FIFO 0 Watermark Reached

| Value | Description                                  |
|-------|----------------------------------------------|
| 0     | Receive FIFO 0 fill level below watermark.   |
| 1     | Receive FIFO 0 fill level reached watermark. |

**Bit 0 – RF0N** Receive FIFO 0 New Message

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | No new message written to Receive FIFO 0. |
| 1     | New message written to Receive FIFO 0.    |

## 40.6.16 MCAN Interrupt Enable Register

**Name:** MCAN\_IE  
**Offset:** 0x54  
**Reset:** 0x00000000  
**Property:** Read/Write

The following configuration values are valid for all listed bit names of this register:

0: Disables the corresponding interrupt.

1: Enables the corresponding interrupt.

|        |    |    |      |      |      |      |     |     |
|--------|----|----|------|------|------|------|-----|-----|
| Bit    | 31 | 30 | 29   | 28   | 27   | 26   | 25  | 24  |
|        |    |    | ARAE | PEDE | PEAE | WDIE | BOE | EWE |
| Access |    |    | R/W  | R/W  | R/W  | R/W  | R/W | R/W |

- Bit 0 – RF0NE** Receive FIFO 0 New Message Interrupt Enable

## 40.6.17 MCAN Interrupt Line Select Register

**Name:** MCAN\_ILS  
**Offset:** 0x58  
**Reset:** 0x00000000  
**Property:** Read/Write

The Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the Interrupt Register to one of the two module interrupt lines.

0: Interrupt assigned to interrupt line MCAN\_INT0.

1: Interrupt assigned to interrupt line MCAN\_INT1.

40.6.18 MCAN Interrupt Line Enable

**Name:** MCAN\_ILE  
**Offset:** 0x5C  
**Reset:** 0x00000000  
**Property:** Read/Write

Each of the two interrupt lines to the processor can be enabled/disabled separately by programming bits EINT0 and EINT1.

Bit 1 – EINT1 Enable Interrupt Line 1

| Value | Description                        |
|-------|------------------------------------|
| 0     | Interrupt line MCAN_INT1 disabled. |
| 1     | Interrupt line MCAN_INT1 enabled.  |

Bit 0 – EINT0 Enable Interrupt Line 0

| Value | Description                        |
|-------|------------------------------------|
| 0     | Interrupt line MCAN_INT0 disabled. |
| 1     | Interrupt line MCAN_INT0 enabled.  |

## 40.6.19 MCAN Global Filter Configuration

**Name:** MCAN\_GFC  
**Offset:** 0x80  
**Reset:** 0x00000000  
**Property:** Read/Write

Global settings for Message ID filtering. The Global Filter Configuration controls the filter path for standard and extended messages as illustrated in [Standard Message ID Filter Path](#) and [Extended Message ID Filter Path](#).

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

|        |    |    |           |     |           |     |      |      |
|--------|----|----|-----------|-----|-----------|-----|------|------|
| Bit    | 31 | 30 | 29        | 28  | 27        | 26  | 25   | 24   |
| Access |    |    |           |     |           |     |      |      |
| Reset  |    |    |           |     |           |     |      |      |
| Bit    | 23 | 22 | 21        | 20  | 19        | 18  | 17   | 16   |
| Access |    |    |           |     |           |     |      |      |
| Reset  |    |    |           |     |           |     |      |      |
| Bit    | 15 | 14 | 13        | 12  | 11        | 10  | 9    | 8    |
| Access |    |    |           |     |           |     |      |      |
| Reset  |    |    |           |     |           |     |      |      |
| Bit    | 7  | 6  | 5         | 4   | 3         | 2   | 1    | 0    |
| Access |    |    | ANFS[1:0] |     | ANFE[1:0] |     | RRFS | RRFE |
| Reset  |    |    | R/W       | R/W | R/W       | R/W | R/W  | R/W  |
|        |    |    | 0         | 0   | 0         | 0   | 0    | 0    |

### Bits 5:4 – ANFS[1:0] Accept Non-matching Frames Standard

Defines how received messages with 11-bit IDs that do not match any element of the filter list are treated.

| Value | Name      | Description         |
|-------|-----------|---------------------|
| 0     | RX_FIFO_0 | Accept in Rx FIFO 0 |
| 1     | RX_FIFO_1 | Accept in Rx FIFO 1 |
| 2–3   | REJECTED  | Message rejected    |

### Bits 3:2 – ANFE[1:0] Accept Non-matching Frames Extended

Defines how received messages with 29-bit IDs that do not match any element of the filter list are treated.

| Value | Name      | Description         |
|-------|-----------|---------------------|
| 0     | RX_FIFO_0 | Accept in Rx FIFO 0 |
| 1     | RX_FIFO_1 | Accept in Rx FIFO 1 |
| 2–3   | REJECTED  | Message rejected    |

### Bit 1 – RRFS Reject Remote Frames Standard

0 (FILTER): Filter remote frames with 11-bit standard IDs.

1 (REJECT): Reject all remote frames with 11-bit standard IDs.

### Bit 0 – RRFE Reject Remote Frames Extended

0 (FILTER): Filter remote frames with 29-bit extended IDs.

1 (REJECT): Reject all remote frames with 29-bit extended IDs.

## 40.6.20 MCAN Standard ID Filter Configuration

**Name:** MCAN\_SIDFC  
**Offset:** 0x84  
**Reset:** 0x00000000  
**Property:** Read/Write

Settings for 11-bit standard Message ID filtering. The Standard ID Filter Configuration controls the filter path for standard messages as illustrated in [Standard Message ID Filter Path](#).

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

|        |             |     |     |     |     |     |     |     |
|--------|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31          | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
| Access |             |     |     |     |     |     |     |     |
| Reset  |             |     |     |     |     |     |     |     |
| Bit    | 23          | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | LSS[7:0]    |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15          | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | FLSSA[13:6] |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7           | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | FLSSA[5:0]  |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W |     |     |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   |     |     |

### Bits 23:16 – LSS[7:0] List Size Standard

>128: Values greater than 128 are interpreted as 128.

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | No standard Message ID filter.                 |
| 1–128 | Number of standard Message ID filter elements. |

### Bits 15:2 – FLSSA[13:0] Filter List Standard Start Address

Start address of standard Message ID filter list (32-bit word address, see [Message RAM Configuration](#)).

Write FLSSA with the bits [15:2] of the 32-bit address.

## 40.6.21 MCAN Extended ID Filter Configuration

**Name:** MCAN\_XIDFC  
**Offset:** 0x88  
**Reset:** 0x00000000  
**Property:** Read/Write

Settings for 29-bit extended Message ID filtering. The Extended ID Filter Configuration controls the filter path for standard messages as described in [Extended Message ID Filter Path](#).

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

|        |             |     |     |     |          |     |     |     |
|--------|-------------|-----|-----|-----|----------|-----|-----|-----|
| Bit    | 31          | 30  | 29  | 28  | 27       | 26  | 25  | 24  |
|        |             |     |     |     |          |     |     |     |
| Access |             |     |     |     |          |     |     |     |
| Reset  |             |     |     |     |          |     |     |     |
| Bit    | 23          | 22  | 21  | 20  | 19       | 18  | 17  | 16  |
|        |             |     |     |     | LSE[6:0] |     |     |     |
| Access |             | R/W | R/W | R/W | R/W      | R/W | R/W | R/W |
| Reset  |             | 0   | 0   | 0   | 0        | 0   | 0   | 0   |
| Bit    | 15          | 14  | 13  | 12  | 11       | 10  | 9   | 8   |
|        | FLESA[13:6] |     |     |     |          |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W      | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0        | 0   | 0   | 0   |
| Bit    | 7           | 6   | 5   | 4   | 3        | 2   | 1   | 0   |
|        | FLESA[5:0]  |     |     |     |          |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W      | R/W |     |     |
| Reset  | 0           | 0   | 0   | 0   | 0        | 0   |     |     |

### Bits 22:16 – LSE[6:0] List Size Extended

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | No extended Message ID filter.                 |
| 1–64  | Number of extended Message ID filter elements. |
| >64   | Values greater than 64 are interpreted as 64.  |

### Bits 15:2 – FLESA[13:0] Filter List Extended Start Address

Start address of extended Message ID filter list (32-bit word address, see [Message RAM Configuration](#)).

Write FLESA with the bits [15:2] of the 32-bit address.

40.6.22 MCAN Extended ID AND Mask

**Name:** MCAN\_XIDAM  
**Offset:** 0x90  
**Reset:** 0x1FFFFFFF  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

|        |             |     |     |     |     |     |     |     |

**Bits 28:0 – EIDM[28:0] Extended ID Mask**  
For acceptance filtering of extended frames the Extended ID AND Mask is ANDed with the Message ID of a received frame. Intended for masking of 29-bit IDs in SAE J1939. With the reset value of all bits set to one the mask is not active.

## 40.6.23 MCAN High Priority Message Status

**Name:** MCAN\_HPMS  
**Offset:** 0x94  
**Reset:** 0x00000000  
**Property:** Read-only

This register is updated every time a Message ID filter element configured to generate a priority event matches. This can be used to monitor the status of incoming high priority messages and to enable fast access to these messages.

### Bit 15 – FLST Filter List

Indicates the filter list of the matching filter element.

| Value | Description          |
|-------|----------------------|
| 0     | Standard filter list |
| 1     | Extended filter list |

### Bits 14:8 – FIDX[6:0] Filter Index

Index of matching filter element. Range is 0 to MCAN\_SIDFC.LSS - 1 resp. MCAN\_XIDFC.LSE - 1.

### Bits 7:6 – MSI[1:0] Message Storage Indicator

| Value | Name        | Description               |
|-------|-------------|---------------------------|
| 0     | NO_FIFO_SEL | No FIFO selected.         |
| 1     | LOST        | FIFO message lost.        |
| 2     | FIFO_0      | Message stored in FIFO 0. |
| 3     | FIFO_1      | Message stored in FIFO 1. |

### Bits 5:0 – BIDX[5:0] Buffer Index

Index of Receive FIFO element to which the message was stored. Only valid when MSI[1] = '1'.

40.6.24 MCAN New Data 1

Name: MCAN\_NDAT1  
Offset: 0x98  
Reset: 0x00000000  
Property: Read/Write

| Reset  | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    |

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – NDx New Data

The register holds the New Data flags of Receive Buffers 0 to 31. The flags are set when the respective Receive Buffer has been updated from a received frame. The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register.

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | Receive Buffer not updated              |
| 1     | Receive Buffer updated from new message |

| Reset  | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – ND<sub>x</sub> New Data**

The register holds the New Data flags of Receive Buffers 32 to 63. The flags are set when the respective Receive Buffer has been updated from a received frame. The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register.

| Value | Description                              |
|-------|------------------------------------------|
| 0     | Receive Buffer not updated.              |
| 1     | Receive Buffer updated from new message. |

#### 40.6.26 MCAN Receive FIFO 0 Configuration

**Name:** MCAN\_RXFOC  
**Offset:** 0xA0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

|        |            |          |           |     |     |     |     |     |

|        | F0SA[5:0]  |          |           |     |     |     |     |     |
| Access | R/W        | R/W      | R/W       | R/W | R/W | R/W |     |     |
| Reset  | 0          | 0        | 0         | 0   | 0   | 0   |     |     |

##### Bit 31 – F0OM FIFO 0 Operation Mode

FIFO 0 can be operated in Blocking or in Overwrite mode (see [Rx FIFOs](#)).

| Value | Description            |
|-------|------------------------|
| 0     | FIFO 0 Blocking mode.  |
| 1     | FIFO 0 Overwrite mode. |

##### Bits 30:24 – F0WM[6:0] Receive FIFO 0 Watermark

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | Watermark interrupt disabled.                                |
| 1–64  | Level for Receive FIFO 0 watermark interrupt (MCAN_IR.RF0W). |
| >64   | Watermark interrupt disabled.                                |

##### Bits 22:16 – F0S[6:0] Receive FIFO 0 Size

The Receive FIFO 0 elements are indexed from 0 to F0S-1.

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No Receive FIFO 0                             |
| 1–64  | Number of Receive FIFO 0 elements.            |
| >64   | Values greater than 64 are interpreted as 64. |

##### Bits 15:2 – F0SA[13:0] Receive FIFO 0 Start Address

Start address of Receive FIFO 0 in Message RAM (32-bit word address, see [Message RAM Configuration](#)).

Write F0SA with the bits [15:2] of the 32-bit address.

## 40.6.27 MCAN Receive FIFO 0 Status

**Name:** MCAN\_RXF0S  
**Offset:** 0xA4  
**Reset:** 0x00000000  
**Property:** Read-only

|        |    |    |    |    |    |    |      |     |

|--------|---|---|---|---|---|---|-----------|---|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1         | 0 |
|        |   |   |   |   |   |   | F0FL[6:0] |   |
| Access |   | R | R | R | R | R | R         | R |
| Reset  |   | 0 | 0 | 0 | 0 | 0 | 0         | 0 |

### Bit 25 – RF0L Receive FIFO 0 Message Lost

This bit is a copy of interrupt flag MCAN\_IR.RF0L. When MCAN\_IR.RF0L is reset, this bit is also reset. Overwriting the oldest message when MCAN\_RXF0C.FOOM = '1' will not set this flag.

| Value | Description                                                                              |
|-------|------------------------------------------------------------------------------------------|
| 0     | No Receive FIFO 0 message lost                                                           |
| 1     | Receive FIFO 0 message lost, also set after write attempt to Receive FIFO 0 of size zero |

### Bit 24 – F0F Receive FIFO 0 Full

| Value | Description              |
|-------|--------------------------|
| 0     | Receive FIFO 0 not full. |
| 1     | Receive FIFO 0 full.     |

### Bits 21:16 – F0PI[5:0] Receive FIFO 0 Put Index

Receive FIFO 0 write index pointer, range 0 to 63.

### Bits 13:8 – F0GI[5:0] Receive FIFO 0 Get Index

Receive FIFO 0 read index pointer, range 0 to 63.

### Bits 6:0 – F0FL[6:0] Receive FIFO 0 Fill Level

Number of elements stored in Receive FIFO 0, range 0 to 64.

40.6.28 MCAN Receive FIFO 0 Acknowledge

Name: MCAN\_RXF0A  
Offset: 0xA8  
Reset: 0x00000000  
Property: Read/Write

**Bits 5:0 – F0AI[5:0]** Receive FIFO 0 Acknowledge Index  
After the processor has read a message or a sequence of messages from Receive FIFO 0 it has to write the buffer index of the last element read from Receive FIFO 0 to F0AI. This will set the Receive FIFO 0 Get Index MCAN\_RXF0S.F0GI to F0AI + 1 and update the FIFO 0 Fill Level MCAN\_RXF0S.F0FL.

40.6.29 MCAN Receive Buffer Configuration

Name: MCAN\_RXBC  
Offset: 0xAC  
Reset: 0x00000000  
Property: Read/Write

|        |            |     |     |     |     |     |     |     |
|--------|------------|-----|-----|-----|-----|-----|-----|-----|

**Bits 15:2 – RBSA[13:0]** Receive Buffer Start Address  
Configures the start address of the Receive Buffers section in the Message RAM (32-bit word address, see [Message RAM Configuration](#)). Also used to reference debug messages A,B,C.  
Write RBSA with the bits [15:2] of the 32-bit address.

### 40.6.30 MCAN Receive FIFO 1 Configuration

**Name:** MCAN\_RXF1C  
**Offset:** 0xB0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

|        |            |          |           |     |     |     |     |     |

| Reset  | 0          | 0        | 0         | 0   | 0   | 0   |     |     |

#### Bit 31 – F1OM FIFO 1 Operation Mode

FIFO 1 can be operated in Blocking or in Overwrite mode (see [Rx FIFOs](#)).

| Value | Description            |
|-------|------------------------|
| 0     | FIFO 1 Blocking mode.  |
| 1     | FIFO 1 Overwrite mode. |

#### Bits 30:24 – F1WM[6:0] Receive FIFO 1 Watermark

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | Watermark interrupt disabled                                 |
| 1–64  | Level for Receive FIFO 1 watermark interrupt (MCAN_IR.RF1W). |
| >64   | Watermark interrupt disabled.                                |

#### Bits 22:16 – F1S[6:0] Receive FIFO 1 Size

The elements in Receive FIFO 1 are indexed from 0 to F1S - 1.

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No Receive FIFO 1                             |
| 1–64  | Number of elements in Receive FIFO 1.         |
| >64   | Values greater than 64 are interpreted as 64. |

#### Bits 15:2 – F1SA[13:0] Receive FIFO 1 Start Address

Start address of Receive FIFO 1 in Message RAM (32-bit word address, see [Message RAM Configuration](#)).

Write F1SA with the bits [15:2] of the 32-bit address.

### 40.6.31 MCAN Receive FIFO 1 Status

**Name:** MCAN\_RXF1S  
**Offset:** 0xB4  
**Reset:** 0x00000000  
**Property:** Read-only

|        |          |    |    |    |    |    |      |     |
|--------|----------|----|----|----|----|----|------|-----|
| Bit    | 31       | 30 | 29 | 28 | 27 | 26 | 25   | 24  |
|        | DMS[1:0] |    |    |    |    |    | RF1L | F1F |
| Access | R        | R  |    |    |    |    | R    | R   |
| Reset  | 0        | 0  |    |    |    |    | 0    | 0   |

|        |    |    |           |    |    |    |    |    |

| Bit    | 23 | 22 | 21        | 20 | 19 | 18 | 17 | 16 |
|        |    |    | F1PI[5:0] |    |    |    |    |    |
| Access |    |    | R         | R  | R  | R  | R  | R  |
| Reset  |    |    | 0         | 0  | 0  | 0  | 0  | 0  |

|        |    |    |           |    |    |    |   |   |
|--------|----|----|-----------|----|----|----|---|---|
| Bit    | 15 | 14 | 13        | 12 | 11 | 10 | 9 | 8 |
|        |    |    | F1GI[5:0] |    |    |    |   |   |
| Access |    |    | R         | R  | R  | R  | R | R |
| Reset  |    |    | 0         | 0  | 0  | 0  | 0 | 0 |

|        |   |           |   |   |   |   |   |   |
|--------|---|-----------|---|---|---|---|---|---|
| Bit    | 7 | 6         | 5 | 4 | 3 | 2 | 1 | 0 |
|        |   | F1FL[6:0] |   |   |   |   |   |   |
| Access |   | R         | R | R | R | R | R | R |
| Reset  |   | 0         | 0 | 0 | 0 | 0 | 0 | 0 |

#### Bits 31:30 – DMS[1:0] Debug Message Status

| Value | Name    | Description                                                               |
|-------|---------|---------------------------------------------------------------------------|
| 0     | IDLE    | Idle state, wait for reception of debug messages, DMA request is cleared. |
| 1     | MSG_A   | Debug message A received.                                                 |
| 2     | MSG_AB  | Debug messages A, B received.                                             |
| 3     | MSG_ABC | Debug messages A, B, C received, DMA request is set.                      |

#### Bit 25 – RF1L Receive FIFO 1 Message Lost

This bit is a copy of interrupt flag IR.RF1L. When IR.RF1L is reset, this bit is also reset. Overwriting the oldest message when MCAN\_RXF1C.F1OM = '1' will not set this flag.

| Value | Description                                                                               |
|-------|-------------------------------------------------------------------------------------------|
| 0     | No Receive FIFO 1 message lost.                                                           |
| 1     | Receive FIFO 1 message lost, also set after write attempt to Receive FIFO 1 of size zero. |

#### Bit 24 – F1F Receive FIFO 1 Full

| Value | Description              |
|-------|--------------------------|
| 0     | Receive FIFO 1 not full. |
| 1     | Receive FIFO 1 full.     |

#### Bits 21:16 – F1PI[5:0] Receive FIFO 1 Put Index

Receive FIFO 1 write index pointer, range 0 to 63.

#### Bits 13:8 – F1GI[5:0] Receive FIFO 1 Get Index

Receive FIFO 1 read index pointer, range 0 to 63.

#### Bits 6:0 – F1FL[6:0] Receive FIFO 1 Fill Level

Number of elements stored in Receive FIFO 1, range 0 to 64.

40.6.32 MCAN Receive FIFO 1 Acknowledge

Name: MCAN\_RXF1A  
Offset: 0xB8  
Reset: 0x00000000  
Property: Read/Write

**Bits 5:0 – F1AI[5:0]** Receive FIFO 1 Acknowledge Index  
After the processor has read a message or a sequence of messages from Receive FIFO 1 it has to write the buffer index of the last element read from Receive FIFO 1 to F1AI. This will set the Receive FIFO 1 Get Index MCAN\_RXF1S.F1GI to F1AI + 1 and update the FIFO 1 Fill Level MCAN\_RXF1S.F1FL.

### 40.6.33 MCAN Receive Buffer / FIFO Element Size Configuration

**Name:** MCAN\_RXESC  
**Offset:** 0xBC  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

Configures the number of data bytes belonging to a Receive Buffer / Receive FIFO element. Data field sizes >8 bytes are intended for CAN FD operation only.

In case the data field size of an accepted CAN frame exceeds the data field size configured for the matching Receive Buffer or Receive FIFO, only the number of bytes as configured by MCAN\_RXESC are stored to the Receive Buffer resp. Receive FIFO element. The rest of the frame's data field is ignored.

|        |    |           |     |     |    |           |           |     |
|--------|----|-----------|-----|-----|----|-----------|-----------|-----|
| Bit    | 31 | 30        | 29  | 28  | 27 | 26        | 25        | 24  |
|        |    |           |     |     |    |           |           |     |
| Access |    |           |     |     |    |           |           |     |
| Reset  |    |           |     |     |    |           |           |     |

|        |    |           |     |     |    |           |           |     |
| Access |    |           |     |     |    |           |           |     |
| Reset  |    |           |     |     |    |           |           |     |
| Bit    | 15 | 14        | 13  | 12  | 11 | 10        | 9         | 8   |
|        |    |           |     |     |    |           | RBDS[2:0] |     |
| Access |    |           |     |     |    | R/W       | R/W       | R/W |
| Reset  |    |           |     |     |    | 0         | 0         | 0   |
| Bit    | 7  | 6         | 5   | 4   | 3  | 2         | 1         | 0   |
|        |    | F1DS[2:0] |     |     |    | F0DS[2:0] |           |     |
| Access |    | R/W       | R/W | R/W |    | R/W       | R/W       | R/W |
| Reset  |    | 0         | 0   | 0   |    | 0         | 0         | 0   |

#### Bits 10:8 – RBDS[2:0] Receive Buffer Data Field Size

| Value | Name    | Description        |
|-------|---------|--------------------|
| 0     | 8_BYTE  | 8-byte data field  |
| 1     | 12_BYTE | 12-byte data field |
| 2     | 16_BYTE | 16-byte data field |
| 3     | 20_BYTE | 20-byte data field |
| 4     | 24_BYTE | 24-byte data field |
| 5     | 32_BYTE | 32-byte data field |
| 6     | 48_BYTE | 48-byte data field |
| 7     | 64_BYTE | 64-byte data field |

#### Bits 6:4 – F1DS[2:0] Receive FIFO 1 Data Field Size

| Value | Name    | Description        |
|-------|---------|--------------------|
| 0     | 8_BYTE  | 8-byte data field  |
| 1     | 12_BYTE | 12-byte data field |
| 2     | 16_BYTE | 16-byte data field |
| 3     | 20_BYTE | 20-byte data field |
| 4     | 24_BYTE | 24-byte data field |
| 5     | 32_BYTE | 32-byte data field |

| Value | Name    | Description        |
|-------|---------|--------------------|
| 6     | 48_BYTE | 48-byte data field |
| 7     | 64_BYTE | 64-byte data field |

**Bits 2:0 – F0DS[2:0] Receive FIFO 0 Data Field Size**

| Value | Name    | Description        |
|-------|---------|--------------------|
| 0     | 8_BYTE  | 8-byte data field  |
| 1     | 12_BYTE | 12-byte data field |
| 2     | 16_BYTE | 16-byte data field |
| 3     | 20_BYTE | 20-byte data field |
| 4     | 24_BYTE | 24-byte data field |
| 5     | 32_BYTE | 32-byte data field |
| 6     | 48_BYTE | 48-byte data field |
| 7     | 64_BYTE | 64-byte data field |

#### 40.6.34 MCAN Tx Buffer Configuration

**Name:** MCAN\_TXBC  
**Offset:** 0xC0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

The sum of TFQS and NDTB may not exceed 32. There is no check for erroneous configurations. The Tx Buffers section in the Message RAM starts with the dedicated Tx Buffers.

|        |            |      |           |     |     |     |     |     |
|--------|------------|------|-----------|-----|-----|-----|-----|-----|
| Bit    | 31         | 30   | 29        | 28  | 27  | 26  | 25  | 24  |
|        |            | TFQM | TFQS[5:0] |     |     |     |     |     |
| Access |            | R/W  | R/W       | R/W | R/W | R/W | R/W | R/W |
| Reset  |            | 0    | 0         | 0   | 0   | 0   | 0   | 0   |
| Bit    | 23         | 22   | 21        | 20  | 19  | 18  | 17  | 16  |
|        |            |      | NDTB[5:0] |     |     |     |     |     |
| Access |            |      | R/W       | R/W | R/W | R/W | R/W | R/W |
| Reset  |            |      | 0         | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15         | 14   | 13        | 12  | 11  | 10  | 9   | 8   |
|        | TBSA[13:6] |      |           |     |     |     |     |     |
| Access | R/W        | R/W  | R/W       | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0          | 0    | 0         | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7          | 6    | 5         | 4   | 3   | 2   | 1   | 0   |
|        | TBSA[5:0]  |      |           |     |     |     |     |     |
| Access | R/W        | R/W  | R/W       | R/W | R/W | R/W |     |     |
| Reset  | 0          | 0    | 0         | 0   | 0   | 0   |     |     |

##### Bit 30 – TFQM Tx FIFO/Queue Mode

| Value | Description         |
|-------|---------------------|
| 0     | Tx FIFO operation.  |
| 1     | Tx Queue operation. |

##### Bits 29:24 – TFQS[5:0] Transmit FIFO/Queue Size

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No Tx FIFO/Queue.                             |
| 1–32  | Number of Tx Buffers used for Tx FIFO/Queue.  |
| >32   | Values greater than 32 are interpreted as 32. |

##### Bits 21:16 – NDTB[5:0] Number of Dedicated Transmit Buffers

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No dedicated Tx Buffers.                      |
| 1–32  | Number of dedicated Tx Buffers.               |
| >32   | Values greater than 32 are interpreted as 32. |

##### Bits 15:2 – TBSA[13:0] Tx Buffers Start Address

Start address of Tx Buffers section in Message RAM (32-bit word address, see [Message RAM Configuration](#)).

Write TBSA with the bits [15:2] of the 32-bit address.

#### 40.6.35 MCAN Tx FIFO/Queue Status

**Name:** MCAN\_TXFQS  
**Offset:** 0xC4  
**Reset:** 0x00000000  
**Property:** Read-only

The Tx FIFO/Queue status is related to the pending Tx requests listed in register MCAN\_TXBRP. Therefore the effect of Add/Cancellation requests may be delayed due to a running Tx scan (MCAN\_TXBRP not yet updated).

In case of mixed configurations where dedicated Tx Buffers are combined with a Tx FIFO or a Tx Queue, the Put and Get Indices indicate the number of the Tx Buffer starting with the first dedicated Tx Buffers.

Example: For a configuration of 12 dedicated Tx Buffers and a Tx FIFO of 20 Buffers a Put Index of 15 points to the fourth buffer of the Tx FIFO.

##### Bit 21 – TFQF Tx FIFO/Queue Full

| Value | Description             |
|-------|-------------------------|
| 0     | Tx FIFO/Queue not full. |
| 1     | Tx FIFO/Queue full.     |

##### Bits 20:16 – TFQPI[4:0] Tx FIFO/Queue Put Index

Tx FIFO/Queue write index pointer, range 0 to 31.

##### Bits 12:8 – TFGI[4:0] Tx FIFO Get Index

Tx FIFO read index pointer, range 0 to 31. Read as zero when Tx Queue operation is configured (MCAN\_TXBC.TFQM = '1').

##### Bits 5:0 – TFFL[5:0] Tx FIFO Free Level

Number of consecutive free Tx FIFO elements starting from TFGI, range 0 to 32. Read as zero when Tx Queue operation is configured (MCAN\_TXBC.TFQM = '1').

40.6.36 MCAN Tx Buffer Element Size Configuration

**Name:** MCAN\_TXESC  
**Offset:** 0xC8  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

Configures the number of data bytes belonging to a Tx Buffer element. Data field sizes > 8 bytes are intended for CAN FD operation only.

In case the data length code DLC of a Tx Buffer element is configured to a value higher than the Tx Buffer data field size MCAN\_TXESC.TBDS, the bytes not defined by the Tx Buffer are transmitted as "0xCC" (padding bytes).

Bits 2:0 – TBDS[2:0] Tx Buffer Data Field Size

| Value | Name    | Description         |
|-------|---------|---------------------|
| 0     | 8_BYTE  | 8-byte data field   |
| 1     | 12_BYTE | 12-byte data field  |
| 2     | 16_BYTE | 16-byte data field  |
| 3     | 20_BYTE | 20-byte data field  |
| 4     | 24_BYTE | 24-byte data field  |
| 5     | 32_BYTE | 32-byte data field  |
| 6     | 48_BYTE | 48- byte data field |
| 7     | 64_BYTE | 64-byte data field  |

**40.6.37 MCAN Transmit Buffer Request Pending**

**Name:** MCAN\_TXBRP  
**Offset:** 0xCC  
**Reset:** 0x00000000  
**Property:** Read-only

MCAN\_TXBRP bits which are set while a Tx scan is in progress are not considered during this particular Tx scan. In case a cancellation is requested for such a Tx Buffer, this Add Request is cancelled immediately, the corresponding MCAN\_TXBRP bit is reset.

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – TRPx Transmission Request Pending for Buffer x**

Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via register MCAN\_TXBAR. The bits are reset after a requested transmission has completed or has been cancelled via register MCAN\_TXBCR.

TXBRP bits are set only for those Tx Buffers configured via MCAN\_TXBC. After a MCAN\_TXBRP bit has been set, a Tx scan (see [Tx Handling](#)) is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID).

A cancellation request resets the corresponding transmission request pending bit of register MCAN\_TXBRP. In case a transmission has already been started when a cancellation is requested, this is done at the end of the transmission, regardless whether the transmission was successful or not. The cancellation request bits are reset directly after the corresponding TXBRP bit has been reset.

After a cancellation has been requested, a finished cancellation is signalled via MCAN\_TXBCF.

- after successful transmission together with the corresponding MCAN\_TXBTO bit.
- when the transmission has not yet been started at the point of cancellation.
- when the transmission has been aborted due to lost arbitration.
- when an error occurred during frame transmission.

In DAR mode, all transmissions are automatically cancelled if they are not successful. The corresponding MCAN\_TXBCF bit is set for all unsuccessful transmissions.

| Value | Description                     |
|-------|---------------------------------|
| 0     | No transmission request pending |
| 1     | Transmission request pending    |

## 40.6.38 MCAN Transmit Buffer Add Request

**Name:** MCAN\_TXBAR  
**Offset:** 0xD0  
**Reset:** 0x00000000  
**Property:** Read/Write

If an add request is applied for a Transmit Buffer with pending transmission request (corresponding MCAN\_TXBRP bit already set), this Add Request is ignored.

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – ARx Add Request for Transmit Buffer x**

Each Transmit Buffer has its own Add Request bit. Writing a '1' will set the corresponding Add Request bit; writing a '0' has no impact. This enables the processor to set transmission requests for multiple Transmit Buffers with one write to MCAN\_TXBAR. MCAN\_TXBAR bits are set only for those Transmit Buffers configured via TXBC. When no Transmit scan is running, the bits are reset immediately, else the bits remain set until the Transmit scan process has completed.

| Value | Description                    |
|-------|--------------------------------|
| 0     | No transmission request added. |
| 1     | Transmission requested added.  |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – CFX Cancellation Finished for Transmit Buffer x**

Each Transmit Buffer has its own Cancellation Finished bit. The bits are set when the corresponding MCAN\_TXBRP bit is cleared after a cancellation was requested via MCAN\_TXBCR. In case the corresponding MCAN\_TXBRP bit was not set at the point of cancellation, CF is set immediately. The bits are reset when a new transmission is requested by writing a '1' to the corresponding bit of register MCAN\_TXBAR.

| Value | Description                            |
|-------|----------------------------------------|
| 0     | No transmit buffer cancellation.       |
| 1     | Transmit buffer cancellation finished. |

## 40.6.42 MCAN Transmit Buffer Transmission Interrupt Enable

#### Bits 29:24 – EFWM[5:0] Event FIFO Watermark

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | Watermark interrupt disabled.                               |
| 1–32  | Level for Tx Event FIFO watermark interrupt (MCAN_IR.TEFW). |
| >32   | Watermark interrupt disabled.                               |

#### Bits 21:16 – EFS[5:0] Event FIFO Size

The Tx Event FIFO elements are indexed from 0 to EFS - 1.

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | Tx Event FIFO disabled.                       |
| 1–32  | Number of Tx Event FIFO elements.             |
| >32   | Values greater than 32 are interpreted as 32. |

#### Bits 15:2 – EFSA[13:0] Event FIFO Start Address

Start address of Tx Event FIFO in Message RAM (32-bit word address, see [Message RAM Configuration](#)).

Write EFSA with the bits [15:2] of the 32-bit address.

## 40.6.45 MCAN Tx Event FIFO Status

### Bit 25 – TEFL Tx Event FIFO Element Lost

This bit is a copy of interrupt flag MCAN\_IR.TEFL. When MCAN\_IR.TEFL is reset, this bit is also reset.

| Value | Description                                                                             |
|-------|-----------------------------------------------------------------------------------------|
| 0     | No Tx Event FIFO element lost.                                                          |
| 1     | Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero. |

### Bit 24 – EFF Event FIFO Full

| Value | Description             |
|-------|-------------------------|
| 0     | Tx Event FIFO not full. |
| 1     | Tx Event FIFO full.     |

### Bits 20:16 – EFPI[4:0] Event FIFO Put Index

Tx Event FIFO write index pointer, range 0 to 31.

### Bits 12:8 – EFGI[4:0] Event FIFO Get Index

Tx Event FIFO read index pointer, range 0 to 31.

### Bits 5:0 – EFFL[5:0] Event FIFO Fill Level

Number of elements stored in Tx Event FIFO, range 0 to 32.

40.6.46 MCAN Tx Event FIFO Acknowledge

Name: MCAN\_TXEFA  
Offset: 0xF8  
Reset: 0x00000000  
Property: Read/Write

**Bits 4:0 – EFAI[4:0]** Event FIFO Acknowledge Index  
After the processor has read an element or a sequence of elements from the Tx Event FIFO, it has to write the index of the last element read from Tx Event FIFO to EFAI. This will set the Tx Event FIFO Get Index MCAN\_TXEFS.EFGI to EFAI + 1 and update the FIFO 0 Fill Level MCAN\_TXEFS.EFFL.

## 41. Timer Counter (TC)

### 41.1 Description

A Timer Counter (TC) module includes three identical TC channels. The number of implemented TC modules is device-specific.

Each TC channel can be independently programmed to perform a wide range of functions including frequency measurement, event counting, interval measurement, pulse generation, delay timing and pulse width modulation.

Each channel has three external clock inputs, five internal clock inputs and two multipurpose input/output signals which can be configured by the user. Each channel drives an internal interrupt signal which can be programmed to generate processor interrupts.

The TC embeds a quadrature decoder (QDEC) connected in front of the timers and driven by TIOA0, TIOB0 and TIOB1 inputs. When enabled, the QDEC performs the input lines filtering, decoding of quadrature signals and connects to the timers/counters in order to read the position and speed of the motor through the user interface.

The TC block has the following two global registers which act upon all TC channels:

- Block Control register (TC\_BCR) — Allows channels to be started simultaneously with the same instruction
- Block Mode register (TC\_BMR) — Defines the external clock inputs for each channel, allowing them to be chained

### 41.2 Embedded Characteristics

- Total of twelve Channels
- 32-bit Channel Size
- Wide Range of Functions Including:
  - Frequency measurement
  - Event counting
  - Interval measurement
  - Pulse generation
  - Delay timing
  - Pulse Width Modulation
  - Up/down capabilities
  - Quadrature decoder
  - 2-bit Gray up/down count for stepper motor
- Each Channel is User-Configurable and Contains:
  - Three external clock inputs
  - Five Internal clock inputs
  - Two multipurpose input/output signals acting as trigger event
  - Trigger/capture events can be directly synchronized by PWM signals
- Internal Interrupt Signal
- Read of the Capture Registers by the DMAC
- Compare Event Fault Generation for PWM
- Register Write Protection

## 41.3 Block Diagram

**Table 41-1.** Timer Counter Clock Assignment

| Name                        | Definition |
|-----------------------------|------------|
| TIMER_CLOCK1                | GCLK       |
| TIMER_CLOCK2                | MCK/8      |
| TIMER_CLOCK3                | MCK/32     |
| TIMER_CLOCK4                | MCK/128    |
| TIMER_CLOCK5 <sup>(1)</sup> | SLCK       |

1. When SLCK is selected for Peripheral Clock (CSS = 0 in PMC Master Clock register), SLCK input is equivalent to Peripheral Clock.
2. The GCLK frequency must be at least three times lower than peripheral clock frequency.

**Figure 41-1.** Timer Counter Block Diagram

**Note:**

The QDEC connections are detailed in [Predefined Connection of the Quadrature Decoder with Timer Counters](#).

**Table 41-2.** Channel Signal Description

| Signal Name   | Description                                                                    |
|---------------|--------------------------------------------------------------------------------|
| XC0, XC1, XC2 | External Clock Inputs                                                          |

.....continued

| Signal Name | Description                                                |
|-------------|------------------------------------------------------------|
| INT         | Interrupt Signal Output (internal signal)                  |
| SYNC        | Synchronization Input Signal (from configuration register) |

## 41.4 Pin List

Table 41-3. Pin List

| Pin Name    | Description          | Type  |
|-------------|----------------------|-------|
| TCLK0-TCLK2 | External Clock Input | Input |
| TIOA0-TIOA2 | I/O Line A           | I/O   |
| TIOB0-TIOB2 | I/O Line B           | I/O   |

## 41.5 Product Dependencies

### 41.5.1 I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the TC pins to their peripheral functions.

### 41.5.2 Power Management

The TC is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the Timer Counter clock of each channel.

### 41.5.3 Interrupt Sources

The TC has an interrupt line per channel connected to the interrupt controller. Handling the TC interrupt requires programming the interrupt controller before configuring the TC.

### 41.5.4 Synchronization Inputs from PWM

The TC has trigger/capture inputs internally connected to the PWM. Refer to [“Synchronization with PWM”](#) and to the implementation of the Pulse Width Modulation (PWM) in this product.

### 41.5.5 Fault Output

The TC has the FAULT output internally connected to the fault input of PWM. Refer to [“Fault Mode”](#) and to the implementation of the Pulse Width Modulation (PWM) in this product.

## 41.6 Functional Description

### 41.6.1 Description

All channels of the Timer Counter are independent and identical in operation except when the QDEC is enabled. The registers for channel programming are listed in [41.7. Register Summary](#).

### 41.6.2 32-bit Counter

Each 32-bit channel is organized around a 32-bit counter. The value of the counter is incremented at each positive edge of the selected clock. When the counter has reached the value  $2^{32}-1$  and passes to zero, an overflow occurs and the COVFS bit in the Interrupt Status register (TC\_SR) is set.

The current value of the counter is accessible in real time by reading the Counter Value register (TC\_CV). The counter can be reset by a trigger. In this case, the counter value passes to zero on the next valid edge of the selected clock.

### 41.6.3 Clock Selection

At block level, input clock signals of each channel can be connected either to the external inputs TCLKx, or to the internal I/O signals TIOAx for chaining<sup>(1)</sup> by programming the Block Mode register (TC\_BMR). See [Clock Chaining Selection](#).

Each channel can independently select an internal or external clock source for its counter<sup>(2)</sup>:

- External clock signals: XC0, XC1 or XC2
- Internal clock signals: GCLK, MCK/8, MCK/32, MCK/128, SLCK

This selection is made by the TCCLKS bits in the Channel Mode register (TC\_CMRx).

The selected clock can be inverted with TC\_CMRx.CLKI. This allows counting on the opposite edges of the clock.

The burst function allows the clock to be validated when an external signal is high. The BURST parameter in the TC\_CMRx defines this signal (none, XC0, XC1, XC2). See [Clock Selection](#).

#### Notes:

1. In Waveform mode, to chain two timers, it is mandatory to initialize some parameters:
  - Configure TIOx outputs to 1 or 0 by writing the required value to TC\_CMRx.ASWTRG.
  - Bit TC\_BCR.SYNC must be written to 1 to start the channels at the same time.
2. In all cases, if an external clock or asynchronous internal clock GCLK is used, the duration of each of its levels must be longer than the peripheral clock period, so the clock frequency will be at least 2.5 times lower than the peripheral clock.

**Figure 41-2.** Clock Chaining Selection

Figure 41-3. Clock Selection

#### 41.6.4 Clock Control

The clock of each counter can be controlled in two different ways: it can be enabled/disabled and started/stopped, as shown in the following figure.

- The clock can be enabled or disabled by the user with the CLKEN and the CLKDIS commands in the Channel Control register (TC\_CCR). In Capture mode it can be disabled by an RB load event if TC\_CMRx.LDBDIS is set to '1'. In Waveform mode, it can be disabled by an RC Compare event if TC\_CMRx.CPCDIS is set to '1'. When disabled, the start or the stop actions have no effect: only a CLKEN command in the TC\_CCR can reenale the clock. When the clock is enabled, TC\_SR.CLKSTA is set.
- The clock can also be started or stopped: a trigger (software, synchro, external or compare) always starts the clock. The clock can be stopped by an RB load event in Capture mode (TC\_CMRx.LDBSTOP = 1) or an RC compare event in Waveform mode (TC\_CMRx.CPCSTOP = 1). The start and the stop commands are effective only if the clock is enabled.

### Figure 41-4. Clock Control

### 41.6.5 Operating Modes

Each channel can operate independently in two different modes:

- Capture mode provides measurement on signals.
- Waveform mode provides wave generation.

The TC operating mode is programmed with TC\_CMRx.WAVE.

In Capture mode, TIOAx and TIOBx are configured as inputs.

In Waveform mode, TIOAx is always configured to be an output and TIOBx is an output if it is not selected to be the external trigger.

### 41.6.6 Trigger

A trigger resets the counter and starts the counter clock. Three types of triggers are common to both modes, and a fourth external trigger is available to each mode.

Regardless of the trigger used, it will be taken into account at the following active edge of the selected clock. This means that the counter value can be read differently from zero just after a trigger, especially when a low frequency signal is selected as the clock.

The following triggers are common to both modes:

- **Software Trigger:** Each channel has a software trigger, available by setting TC\_CCR.SWTRG.
- **SYNC:** Each channel has a synchronization signal SYNC. When asserted, this signal has the same effect as a software trigger. The SYNC signals of all channels are asserted simultaneously by writing TC\_BCR with SYNC set.
- **Compare RC Trigger:** RC is implemented in each channel and can provide a trigger when the counter value matches the RC value if TC\_CMRx.CPCTRG is set.

The channel can also be configured to have an external trigger. In Capture mode, the external trigger signal can be selected between TIOAx and TIOBx. In Waveform mode, an external event can be programmed on one of the following signals: TIOBx, XC0, XC1 or XC2. This external event can then be programmed to perform a trigger by setting TC\_CMRx.ENETRГ.

If an external trigger is used, the duration of the pulses must be longer than the peripheral clock period in order to be detected.

#### 41.6.7 Capture Mode

Capture mode is entered by clearing TC\_CMRx.WAVE.

Capture mode allows the TC channel to perform measurements such as pulse timing, frequency, period, duty cycle and phase on TIOAx and TIOBx signals which are considered as inputs.

Figure 41-6 shows the configuration of the TC channel when programmed in Capture mode.

#### 41.6.8 Capture Registers A and B

Registers A and B (TC\_RA and TC\_RB) are used as capture registers. They can be loaded with the counter value when a programmable event occurs on the signal TIOAx.

TC\_CMRx.LDRA defines the TIOAx selected edge for the loading of TC\_RA, and TC\_CMRx.LDRB defines the TIOAx selected edge for the loading of TC\_RB.

The subsampling ratio defined by TC\_CMRx.SBSMPLR is applied to these selected edges, so that the loading of Register A and Register B occurs once every 1, 2, 4, 8 or 16 selected edges.

TC\_RA is loaded only if it has not been loaded since the last trigger or if TC\_RB has been loaded since the last loading of TC\_RA.

TC\_RB is loaded only if TC\_RA has been loaded since the last trigger or the last loading of TC\_RB.

Loading TC\_RA or TC\_RB before the read of the last value loaded sets TC\_SR.LOVR5. In this case, the old value is overwritten.

When DMA is used (on channel 0), the Register AB (TC\_RAB) address must be configured as source address of the transfer. TC\_RAB provides the next unread value from TC\_RA and TC\_RB. It may be read by the DMA after a request has been triggered upon loading TC\_RA or TC\_RB.

#### 41.6.9 Transfer with DMAC in Capture Mode

The DMAC can perform access from the TC to system memory in Capture mode only.

The following figure illustrates how TC\_RA and TC\_RB can be loaded in the system memory without processor intervention.

**Figure 41-5.** Example of Transfer with DMAC in Capture Mode

ETRGEDG = 1, LDRA = 1, LDRB = 2, ABETRG = 0

T1, T2, T3, T4 = System Bus load dependent ( $t_{min} = 8$  Peripheral Clocks)

ETRGEDG = 3, LDRA = 3, LDRB = 0, ABETRG = 0

T1, T2, T3, T4 = System Bus load dependent ( $t_{min} = 8$  Peripheral Clocks)

#### 41.6.10 Trigger Conditions

In addition to the SYNC signal, the software trigger and the RC compare trigger, an external trigger can be defined.

The ABETRG bit in the TC\_CMRR selects TIOAx or TIOBx input signal as an external trigger or the trigger signal from the output comparator of the PWM module. The External Trigger Edge Selection parameter (ETRGEDG field in TC\_CMRR) defines the edge (rising, falling, or both) detected to generate an external trigger. If ETRGEDG = 0 (none), the external trigger is disabled.

**Figure 41-6. Capture Mode**

#### 41.6.11 Waveform Mode

Waveform mode is entered by setting the TC\_CMRx.WAVE bit.

In Waveform mode, the TC channel generates one or two PWM signals with the same frequency and independently programmable duty cycles, or generates different types of one-shot or repetitive pulses.

In this mode, TIOAx is configured as an output and TIOBx is defined as an output if it is not used as an external event (EEVT parameter in TC\_CMR).

[Waveform Mode](#) shows the configuration of the TC channel when programmed in Waveform operating mode.

#### 41.6.12 Waveform Selection

Depending on the WAVSEL parameter in TC\_CMR, the behavior of TC\_CV varies.

With any selection, TC\_RA, TC\_RB and TC\_RC can all be used as compare registers.

RA Compare is used to control the TIOAx output, RB Compare is used to control the TIOBx output (if correctly configured) and RC Compare is used to control TIOAx and/or TIOBx outputs.

Figure 41-7. Waveform Mode

#### 41.6.12.1 WAVSEL = 00

When WAVSEL = 00, the value of TC\_CV is incremented from 0 to  $2^{32}-1$ . Once  $2^{32}-1$  has been reached, the value of TC\_CV is reset. Incrementation of TC\_CV starts again and the cycle continues.

An external event trigger or a software trigger can reset the value of TC\_CV. It is important to note that the trigger may occur at any time.

Refer to the figures below.

RC Compare cannot be programmed to generate a trigger in this configuration. At the same time, RC Compare can stop the counter clock (CPCSTOP = 1 in TC\_CMR) and/or disable the counter clock (CPCDIS = 1 in TC\_CMR).

**Figure 41-8. WAVSEL = 00 without Trigger**

**Figure 41-9. WAVSEL = 00 with Trigger**

#### 41.6.12.2 WAVSEL = 10

When WAVSEL = 10, the value of TC\_CV is incremented from 0 to the value of RC, then automatically reset on a RC Compare. Once the value of TC\_CV has been reset, it is then incremented and so on.

It is important to note that TC\_CV can be reset at any time by an external event or a software trigger if both are programmed correctly.

Refer to the figures below.

In addition, RC Compare can stop the counter clock (CPCSTOP = 1 in TC\_CMR) and/or disable the counter clock (CPCDIS = 1 in TC\_CMR).

**Figure 41-10. WAVSEL = 10 without Trigger**

**Figure 41-11. WAVSEL = 10 with Trigger**

#### 41.6.12.3 WAVSEL = 01

When WAVSEL = 01, the value of TC\_CV is incremented from 0 to  $2^{32}-1$ . Once  $2^{32}-1$  is reached, the value of TC\_CV is decremented to 0, then reincremented to  $2^{32}-1$  and so on.

A trigger such as an external event or a software trigger can modify TC\_CV at any time. If a trigger occurs while TC\_CV is incrementing, TC\_CV then decrements. If a trigger is received while TC\_CV is decrementing, TC\_CV then increments.

Refer to the figures below.

RC Compare cannot be programmed to generate a trigger in this configuration.

At the same time, RC Compare can stop the counter clock (CPCSTOP = 1) and/or disable the counter clock (CPCDIS = 1).

**Figure 41-12.** WAVSEL = 01 without Trigger

**Figure 41-13.** WAVSEL = 01 with Trigger

#### 41.6.12.4 WAVSEL = 11

When WAVSEL = 11, the value of TC\_CV is incremented from 0 to RC. Once RC is reached, the value of TC\_CV is decremented to 0, then reincremented to RC and so on.

A trigger such as an external event or a software trigger can modify TC\_CV at any time. If a trigger occurs while TC\_CV is incrementing, TC\_CV then decrements. If a trigger is received while TC\_CV is decrementing, TC\_CV then increments.

Refer to the figures below.

RC Compare can stop the counter clock (CPCSTOP = 1) and/or disable the counter clock (CPCDIS = 1).

**Figure 41-14.** WAVSEL = 11 without Trigger

**Figure 41-15.** WAVSEL = 11 with Trigger

#### 41.6.13 External Event/Trigger Conditions

An external event can be programmed to be detected on one of the clock sources (XC0, XC1, XC2) or TIOBx. The external event selected can then be used as a trigger.

The event trigger is selected using TC\_CMR.EEVT. The trigger edge (rising, falling or both) for each of the possible external triggers is defined in TC\_CMR.EEVTEDG. If EEVTEDG is cleared (none), no external event is defined.

If TIOBx is defined as an external event signal (EEVT = 0), TIOBx is no longer used as an output and the compare register B is not used to generate waveforms and subsequently no IRQs. In this case, the TC channel can only generate a waveform on TIOAx.

When an external event is defined, it can be used as a trigger by setting TC\_CMR.ENETRIG.

As in Capture mode, the SYNC signal and the software trigger are also available as triggers. RC Compare can also be used as a trigger depending on the parameter WAVSEL.

#### 41.6.14 Synchronization with PWM

The inputs TIOAx/TIOBx can be bypassed, and thus channel trigger/capture events can be directly driven by the independent PWM module.

PWM comparator outputs (internal signals without dead-time insertion - OCx), respectively source of the PWMH/L[2:0] outputs, are routed to the internal TC inputs. These specific TC inputs are multiplexed with TIOA/B input signal to drive the internal trigger/capture events.

The selection is made in the Extended Mode register (TC\_EMR) fields TRIGSRCA and TRIGSRCB (see [“TC Extended Mode Register”](#)).

Each channel of the TC module can be synchronized by a different PWM channel as described in the following figure.

**Figure 41-16. Synchronization with PWM**

#### 41.6.15 Output Controller

The output controller defines the output level changes on TIOAx and TIOBx following an event. TIOBx control is used only if TIOBx is defined as output (not as an external event).

The following events control TIOAx and TIOBx:

- Software trigger
- External event
- RC compare

RA Compare controls TIOAx, and RB Compare controls TIOBx. Each of these events can be programmed to set, clear or toggle the output as defined in the corresponding parameter in TC\_CMx.

## 41.6.16 Quadrature Decoder

### 41.6.16.1 Description

The quadrature decoder (QDEC) is driven by TIOA0, TIOB0 and TIOB1 input pins and drives the timer counter of channel 0 and 1. Channel 2 can be used as a time base in case of speed measurement requirements (refer to [Predefined Connection of the Quadrature Decoder with Timer Counters](#)).

When writing a '0' to TC\_BMR.QDEN, the QDEC is bypassed and the IO pins are directly routed to the timer counter function.

TIOA0 and TIOB0 are to be driven by the two dedicated quadrature signals from a rotary sensor mounted on the shaft of the off-chip motor.

A third signal from the rotary sensor can be processed through pin TIOB1 and is typically dedicated to be driven by an index signal if it is provided by the sensor. This signal is not required to decode the quadrature signals PHA, PHB.

TC\_CMx.TCCLKS must be configured to select XC0 input (i.e., 0x101). Field TC0XC0S has no effect as soon as the QDEC is enabled.

Either speed or position/revolution can be measured. Position channel 0 accumulates the edges of PHA, PHB input signals giving a high accuracy on motor position whereas channel 1 accumulates the index pulses of the sensor, therefore the number of rotations. Concatenation of both values provides a high level of precision on motion system position.

In Speed mode, position cannot be measured but revolution can be measured.

Inputs from the rotary sensor can be filtered prior to downstream processing. Accommodation of input polarity, phase definition and other factors are configurable.

Interruptions can be generated on different events.

A compare function (using TC\_RC) is available on channel 0 (speed/position) or channel 1 (rotation) and can generate an interrupt by means of TC\_SRx.CPCS.

**Figure 41-17.** Predefined Connection of the Quadrature Decoder with Timer Counters

#### 41.6.16.2 Input Preprocessing

Input preprocessing consists of capabilities to take into account rotary sensor factors such as polarities and phase definition followed by configurable digital filtering.

Each input can be negated and swapping PHA, PHB is also configurable.

TC\_BMR. MAXFILT is used to configure a minimum duration for which the pulse is stated as valid. When the filter is active, pulses with a duration lower than  $(MAXFILT + 1) \times t_{\text{peripheral clock}}$  are not passed to downstream logic.

The value of  $(MAXFILT + 1) \times t_{\text{peripheral clock}}$  must not be greater than 10% of the minimum pulse on PHA, PHB or index when the rotary encoder speed is at its maximum. This speed depends on the application.

Figure 41-18. Input Stage

Input filtering can efficiently remove spurious pulses that might be generated by the presence of particulate contamination on the optical or magnetic disk of the rotary sensor.

Spurious pulses can also occur in environments with high levels of electromagnetic interference. Or, simply if vibration occurs even when rotation is fully stopped and the shaft of the motor is in such a position that the beginning of one of the reflective or magnetic bars on the rotary sensor disk is aligned with the light or magnetic (Hall) receiver cell of the rotary sensor. Any vibration can make the PHA, PHB signals toggle for a short duration.

**Figure 41-19. Filtering Examples**

#### 41.6.16.3 Direction Status and Change Detection

After filtering, the quadrature signals are analyzed to extract the rotation direction and edges of the two quadrature signals detected in order to be counted by TC logic downstream.

The direction status can be directly read at anytime in the TC\_QISR. The polarity of the direction flag status depends on the configuration written in TC\_BMR. INVA, INVB, INVIDX, SWAP modify the polarity of DIR flag.

Any change in rotation direction is reported in the TC\_QISR and can generate an interrupt.

The direction change condition is reported as soon as two consecutive edges on a phase signal have sampled the same value on the other phase signal and there is an edge on the other signal. The two consecutive edges of one phase signal sampling the same value on other phase signal is not sufficient to declare a direction change, as particulate contamination may mask one or more reflective bars on the optical or magnetic disk of the sensor. Refer to the following figure for waveforms.

**Figure 41-20.** Rotation Change Detection

The direction change detection is disabled when TC\_BMR.QDTRANS is set. In this case, the DIR flag report must not be used.

A quadrature error is also reported by the QDEC via TC\_QISR.QERR. This error is reported if the time difference between two edges on PHA, PHB is lower than a predefined value. This predefined value is configurable and corresponds to  $(TC\_BMR.MAXFILT + 1) \times t_{\text{peripheral clock}}$  ns. After being filtered, there is no reason to have two edges closer than  $(TC\_BMR.MAXFILT + 1) \times t_{\text{peripheral clock}}$  ns under normal mode of operation.

**Figure 41-21. Quadrature Error Detection**

MAXFILT must be tuned according to several factors such as the peripheral clock frequency, type of rotary sensor and rotation speed to be achieved.

#### 41.6.16.4 Position and Rotation Measurement

When TC\_BMR.POSEN is set, the motor axis position is processed on channel 0 (by means of the PHA, PHB edge detections) and the number of motor revolutions are recorded on channel 1 if the IDX signal is provided on the TIOB1 input. If no IDX signal is available, the internal counter can be cleared for each revolution if the number of counts per revolution is configured in TC\_RC0.RC and the TC\_CMR.CPCTRG bit is written to '1'. The position measurement can be read in the TC\_CV0 register and the rotation measurement can be read in the TC\_CV1 register.

Channel 0 and 1 must be configured in Capture mode (TC\_CMR0.WAVE = 0). 'Rising edge' must be selected as the External Trigger Edge (TC\_CMR.ETRGE = 0x01) and 'TIOAx' must be selected as the External Trigger (TC\_CMR.ABETRG = 0x1). The process must be started by configuring TC\_CCR.CLKEN and TC\_CCR.SWTRG.

In parallel, the number of edges are accumulated on TC channel 0 and can be read on the TC\_CV0 register.

Therefore, the accurate position can be read on both TC\_CV registers and concatenated to form a 32-bit word.

The TC channel 0 is cleared for each increment of IDX count value.

Depending on the quadrature signals, the direction is decoded and allows to count up or down in TC channels 0 and 1. The direction status is reported on TC\_QISR.

#### 41.6.16.5 Speed Measurement

When TC\_BMR.SPEEDEN is set, the speed measure is enabled on channel 0.

A time base must be defined on channel 2 by writing the TC\_RC2 period register. Channel 2 must be configured in Waveform mode (WAVE bit set) in TC\_CMR2. The WAVSEL field must be defined with 0x10 to clear the counter by comparison and matching with TC\_RC value. Field ACPC must be defined at 0x11 to toggle TIOAx output.

This time base is automatically fed back to TIOAx of channel 0 when QDEN and SPEEDEN are set.

Channel 0 must be configured in Capture mode (WAVE = 0 in TC\_CMR0). TC\_CMR0.ABETRG must be configured at 1 to select TIOAx as a trigger for this channel.

EDGTRG must be set to 0x01, to clear the counter on a rising edge of the TIOAx signal and field LDRA must be set accordingly to 0x01, to load TC\_RA0 at the same time as the counter is cleared (LDRB must be set to 0x01). As a consequence, at the end of each time base period the differentiation required for the speed calculation is performed.

The process must be started by configuring bits CLKEN and SWTRG in the TC\_CCR.

The speed can be read on field RA in TC\_RA0.

Channel 1 can still be used to count the number of revolutions of the motor.

#### 41.6.16.6 Detecting a Missing Index Pulse

To detect a missing index pulse due contamination, dust, etc., the TC\_SR0.CPCS flag can be used. It is also possible to assert the interrupt line if the TC\_SR0.CPCS flag is enabled as a source of the interrupt by writing a '1' to TC\_IER0.CPCS.

The TC\_RC0.RC field must be written with the nominal number of counts per revolution provided by the rotary encoder, plus a margin to eliminate potential noise (e.g., if nominal count per revolution is 1024, then TC\_RC0.RC=1026).

If the index pulse is missing, the timer value is not cleared and the nominal value is exceeded, then the comparator on the RC triggers an event, TC\_SR0.CPCS=1, and the interrupt line is asserted if TC\_IER0.CPCS=1.

The missing index pulse detection is only valid if the bit TC\_QISR.DIRCHG=0.

#### 41.6.16.7 Detecting Contamination/Dust at Rotary Encoder Low Speed

The contamination/dust that can be filtered when the rotary encoder speed is high may not be filtered at low speed, thus creating unsolicited direction change, etc.

At low speed, even a minor contamination may appear as a long pulse, and thus not filtered and processed as a standard quadrature encoder pulse.

This contamination can be detected by using the similar method as the missing index detection.

A contamination exists on a phase line if TC\_SR.CPCS = 1 and TC\_QISR.DIRCHG = 1 when there is no solicited change of direction.

#### 41.6.17 2-bit Gray Up/Down Counter for Stepper Motor

Each channel can be independently configured to generate a 2-bit Gray count waveform on corresponding TIOAx, TIOBx outputs by means of TC\_SMMRx.GCEN.

Up or Down count can be defined by writing TC\_SMMRx.DOWN.

It is mandatory to configure the channel in Waveform mode in the TC\_CMR.

The period of the counters can be programmed in TC\_RCx.

**Figure 41-22.** 2-bit Gray Up/Down Counter

#### 41.6.18 Fault Mode

At any time, the TC\_RCx registers can be used to perform a comparison on the respective current channel counter value (TC\_CVx) with the value of TC\_RCx register.

The CPCSx flags can be set accordingly and an interrupt can be generated.

This interrupt is processed but requires an unpredictable amount of time to be achieved the required action.

It is possible to trigger the FAULT output of the TIMER1 with CPCS from TC\_SR0 and/or CPCS from TC\_SR1. Each source can be independently enabled/disabled in the TC\_FMR.

This can be useful to detect an overflow on speed and/or position when QDEC is processed and to act immediately by using the FAULT output.

**Figure 41-23.** Fault Output Generation

#### 41.6.19 Register Write Protection

To prevent any single software error from corrupting TC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [TC Write Protection Mode Register](#) (TC\_WPMR).

The Timer Counter clock of the first channel must be enabled to access TC\_WPMR.

The following registers can be write-protected when WPEN is set:

- [TC Block Mode Register](#)
- [TC Channel Mode Register Capture Mode](#)
- [TC Channel Mode Register Waveform Mode](#)
- [TC Fault Mode Register](#)
- [TC Stepper Motor Mode Register](#)
- [TC Register A](#)
- [TC Register B](#)
- [TC Register C](#)
- [TC Extended Mode Register](#)

## 41.7 Register Summary

**Note:** The register TC\_CMCR has two modes, Capture Mode and Waveform Mode. In this register summary, both modes are displayed

| Offset | Name     | Bit Pos. | 7           | 6           | 5             | 4          | 3         | 2           | 1             | 0        |
|--------|----------|----------|-------------|-------------|---------------|------------|-----------|-------------|---------------|----------|
| 0x00   | TC_CCR0  | 7:0      |             |             |               |            |           | SWTRG       | CLKDIS        | CLKEN    |
|        |          | 15:8     |             |             |               |            |           |             |               |          |
|        |          | 23:16    |             |             |               |            |           |             |               |          |
|        |          | 31:24    |             |             |               |            |           |             |               |          |

### 41.7.1 TC Channel Control Register

**Name:** TC\_CCRx  
**Offset:** 0x00 + x\*0x40 [x=0..2]  
**Reset:** –  
**Property:** Write-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |   |   |   |       |        |       |
|--------|---|---|---|---|---|-------|--------|-------|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2     | 1      | 0     |
|        |   |   |   |   |   | SWTRG | CLKDIS | CLKEN |
| Access |   |   |   |   |   | W     | W      | W     |
| Reset  |   |   |   |   |   | –     | –      | –     |

#### Bit 2 – SWTRG Software Trigger Command

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 0     | No effect.                                                                      |
| 1     | A software trigger is performed: the counter is reset and the clock is started. |

#### Bit 1 – CLKDIS Counter Clock Disable Command

| Value | Description         |
|-------|---------------------|
| 0     | No effect.          |
| 1     | Disables the clock. |

#### Bit 0 – CLKEN Counter Clock Enable Command

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Enables the clock if CLKDIS is not 1. |

**41.7.2 TC Channel Mode Register: Capture Mode**

**Name:** TC\_CMRx  
**Offset:** 0x04 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can be written only if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |    |              |         |            |           |        |              |     |
|--------|----|--------------|---------|------------|-----------|--------|--------------|-----|
| Bit    | 31 | 30           | 29      | 28         | 27        | 26     | 25           | 24  |
| Access |    |              |         |            |           |        |              |     |
| Reset  |    |              |         |            |           |        |              |     |
| Bit    | 23 | 22           | 21      | 20         | 19        | 18     | 17           | 16  |
| Access |    | SBSMPLR[2:0] |         |            | LDRB[1:0] |        | LDRA[1:0]    |     |
| Reset  |    | R/W          | R/W     | R/W        | R/W       | R/W    | R/W          | R/W |
| Bit    | 15 | 14           | 13      | 12         | 11        | 10     | 9            | 8   |
| Access |    | WAVE         | CPCTRG  |            |           | ABETRG | ETRGEDG[1:0] |     |
| Reset  |    | R/W          | R/W     |            |           | R/W    | R/W          | R/W |
| Bit    | 7  | 6            | 5       | 4          | 3         | 2      | 1            | 0   |
| Access |    | LDBDIS       | LDBSTOP | BURST[1:0] |           | CLKI   | TCCLKS[2:0]  |     |
| Reset  |    | R/W          | R/W     | R/W        | R/W       | R/W    | R/W          | R/W |

**Bits 22:20 – SBSMPLR[2:0] Loading Edge Subsampling Ratio**

| Value | Name      | Description                                      |
|-------|-----------|--------------------------------------------------|
| 0     | ONE       | Load a Capture register each selected edge.      |
| 1     | HALF      | Load a Capture register every 2 selected edges.  |
| 2     | FOURTH    | Load a Capture register every 4 selected edges.  |
| 3     | EIGHTH    | Load a Capture register every 8 selected edges.  |
| 4     | SIXTEENTH | Load a Capture register every 16 selected edges. |

**Bits 19:18 – LDRB[1:0] RB Loading Edge Selection**

| Value | Name    | Description           |
|-------|---------|-----------------------|
| 0     | NONE    | None                  |
| 1     | RISING  | Rising edge of TIOAx  |
| 2     | FALLING | Falling edge of TIOAx |
| 3     | EDGE    | Each edge of TIOAx    |

**Bits 17:16 – LDRA[1:0] RA Loading Edge Selection**

| Value | Name    | Description           |
|-------|---------|-----------------------|
| 0     | NONE    | None                  |
| 1     | RISING  | Rising edge of TIOAx  |
| 2     | FALLING | Falling edge of TIOAx |
| 3     | EDGE    | Each edge of TIOAx    |

**Bit 15 – WAVE Waveform Mode**

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | Capture mode is enabled.                             |
| 1     | Capture mode is disabled (Waveform mode is enabled). |

**Bit 14 – CPCTRG RC Compare Trigger Enable**

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | RC Compare has no effect on the counter and its clock.      |
| 1     | RC Compare resets the counter and starts the counter clock. |

**Bit 10 – ABETRG TIOAx or TIOBx External Trigger Selection**

| Value | Description                           |
|-------|---------------------------------------|
| 0     | TIOBx is used as an external trigger. |
| 1     | TIOAx is used as an external trigger. |

**Bits 9:8 – ETRGEDG[1:0] External Trigger Edge Selection**

| Value | Name    | Description                                   |
|-------|---------|-----------------------------------------------|
| 0     | NONE    | The clock is not gated by an external signal. |
| 1     | RISING  | Rising edge                                   |
| 2     | FALLING | Falling edge                                  |
| 3     | EDGE    | Each edge                                     |

**Bit 7 – LDBDIS Counter Clock Disable with RB Loading**

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | Counter clock is not disabled when RB loading occurs. |
| 1     | Counter clock is disabled when RB loading occurs.     |

**Bit 6 – LDBSTOP Counter Clock Stopped with RB Loading**

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | Counter clock is not stopped when RB loading occurs. |
| 1     | Counter clock is stopped when RB loading occurs.     |

**Bits 5:4 – BURST[1:0] Burst Signal Selection**

| Value | Name | Description                                   |
|-------|------|-----------------------------------------------|
| 0     | NONE | The clock is not gated by an external signal. |
| 1     | XC0  | XC0 is ANDed with the selected clock.         |
| 2     | XC1  | XC1 is ANDed with the selected clock.         |
| 3     | XC2  | XC2 is ANDed with the selected clock.         |

**Bit 3 – CLKI Clock Invert**

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | Counter is incremented on rising edge of the clock.  |
| 1     | Counter is incremented on falling edge of the clock. |

**Bits 2:0 – TCCLKS[2:0] Clock Selection**

To operate at maximum peripheral clock frequency, refer to [“TC Extended Mode Register”](#).

| Value | Name         | Description                                              |
|-------|--------------|----------------------------------------------------------|
| 0     | TIMER_CLOCK1 | Clock selected: internal GCLK clock signal (from PMC)    |
| 1     | TIMER_CLOCK2 | Clock selected: internal MCK/8 clock signal (from PMC)   |
| 2     | TIMER_CLOCK3 | Clock selected: internal MCK/32 clock signal (from PMC)  |
| 3     | TIMER_CLOCK4 | Clock selected: internal MCK/128 clock signal (from PMC) |
| 4     | TIMER_CLOCK5 | Clock selected: internal SLCK clock signal (from PMC)    |
| 5     | XC0          | Clock selected: XC0                                      |
| 6     | XC1          | Clock selected: XC1                                      |
| 7     | XC2          | Clock selected: XC2                                      |

**41.7.3 TC Channel Mode Register: Waveform Mode**

**Name:** TC\_CM Rx  
**Offset:** 0x04 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

**Bits 31:30 – BSWTRG[1:0] Software Trigger Effect on TIOBx**

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

**Bits 29:28 – BEEVT[1:0] External Event Effect on TIOBx**

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

**Bits 27:26 – BCPC[1:0] RC Compare Effect on TIOBx**

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

**Bits 25:24 – BCPB[1:0] RB Compare Effect on TIOBx**

| Value | Name  | Description |
|-------|-------|-------------|
| 0     | NONE  | None        |
| 1     | SET   | Set         |
| 2     | CLEAR | Clear       |

| Value | Name   | Description |
|-------|--------|-------------|
| 3     | TOGGLE | Toggle      |

**Bits 23:22 – ASWTRG[1:0]** Software Trigger Effect on TIOAx

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

**Bits 21:20 – AEEVT[1:0]** External Event Effect on TIOAx

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

**Bits 19:18 – ACPC[1:0]** RC Compare Effect on TIOAx

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

**Bits 17:16 – ACPA[1:0]** RA Compare Effect on TIOAx

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

**Bit 15 – WAVE** Waveform Mode

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | Waveform mode is disabled (Capture mode is enabled). |
| 1     | Waveform mode is enabled.                            |

**Bits 14:13 – WAVSEL[1:0]** Waveform Selection

| Value | Name      | Description                                         |
|-------|-----------|-----------------------------------------------------|
| 0     | UP        | UP mode without automatic trigger on RC Compare     |
| 1     | UPDOWN    | UPDOWN mode without automatic trigger on RC Compare |
| 2     | UP_RC     | UP mode with automatic trigger on RC Compare        |
| 3     | UPDOWN_RC | UPDOWN mode with automatic trigger on RC Compare    |

**Bit 12 – ENETR** External Event Trigger Enable

Whatever the value programmed in ENETR, the selected external event only controls the TIOAx output and TIOBx if not used as input (trigger event input or other input used).

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | The external event has no effect on the counter and its clock.      |
| 1     | The external event resets the counter and starts the counter clock. |

**Bits 11:10 – EEVT[1:0]** External Event Selection

Signal selected as external event.

| Value | Name | Description | TIOB Direction |
|-------|------|-------------|----------------|
| 0     | TIOB | TIOB        | Input          |
| 1     | XC0  | XC0         | Output         |
| 2     | XC1  | XC1         | Output         |

.....continued

| Value | Name | Description | TIOB Direction |
|-------|------|-------------|----------------|
| 3     | XC2  | XC2         | Output         |

**Note:** If TIOB is chosen as the external event signal, it is configured as an input and no longer generates waveforms and subsequently no IRQs.

**Bits 9:8 – EEVTEG[1:0] External Event Edge Selection**

| Value | Name    | Description  |
|-------|---------|--------------|
| 0     | NONE    | None         |
| 1     | RISING  | Rising edge  |
| 2     | FALLING | Falling edge |
| 3     | EDGE    | Each edge    |

**Bit 7 – CPCDIS Counter Clock Disable with RC Compare**

| Value | Description                                            |
|-------|--------------------------------------------------------|
| 0     | Counter clock is not disabled when counter reaches RC. |
| 1     | Counter clock is disabled when counter reaches RC.     |

**Bit 6 – CPCSTOP Counter Clock Stopped with RC Compare**

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | Counter clock is not stopped when counter reaches RC. |
| 1     | Counter clock is stopped when counter reaches RC.     |

**Bits 5:4 – BURST[1:0] Burst Signal Selection**

| Value | Name | Description                                   |
|-------|------|-----------------------------------------------|
| 0     | NONE | The clock is not gated by an external signal. |
| 1     | XC0  | XC0 is ANDed with the selected clock.         |
| 2     | XC1  | XC1 is ANDed with the selected clock.         |
| 3     | XC2  | XC2 is ANDed with the selected clock.         |

**Bit 3 – CLKI Clock Invert**

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | Counter is incremented on rising edge of the clock.  |
| 1     | Counter is incremented on falling edge of the clock. |

**Bits 2:0 – TCCLKS[2:0] Clock Selection**

To operate at maximum peripheral clock frequency, refer to [“TC Extended Mode Register”](#).

| Value | Name         | Description                                              |
|-------|--------------|----------------------------------------------------------|
| 0     | TIMER_CLOCK1 | Clock selected: internal GCLK clock signal (from PMC)    |
| 1     | TIMER_CLOCK2 | Clock selected: internal MCK/8 clock signal (from PMC)   |
| 2     | TIMER_CLOCK3 | Clock selected: internal MCK/32 clock signal (from PMC)  |
| 3     | TIMER_CLOCK4 | Clock selected: internal MCK/128 clock signal (from PMC) |
| 4     | TIMER_CLOCK5 | Clock selected: internal SLCK clock signal (from PMC)    |
| 5     | XC0          | Clock selected: XC0                                      |
| 6     | XC1          | Clock selected: XC1                                      |
| 7     | XC2          | Clock selected: XC2                                      |

#### 41.7.4 TC Stepper Motor Mode Register

**Name:** TC\_SMMRx  
**Offset:** 0x08 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |

| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |   |   |   |   |      |      |
|--------|---|---|---|---|---|---|------|------|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1    | 0    |
|        |   |   |   |   |   |   | DOWN | GCEN |
| Access |   |   |   |   |   |   | R/W  | R/W  |
| Reset  |   |   |   |   |   |   | 0    | 0    |

##### Bit 1 – DOWN Down Count

| Value | Description   |
|-------|---------------|
| 0     | Up counter.   |
| 1     | Down counter. |

##### Bit 0 – GCEN Gray Count Enable

| Value | Description                                                                    |
|-------|--------------------------------------------------------------------------------|
| 0     | TIOAx [x=0..2] and TIOBx [x=0..2] are driven by internal counter of channel x. |
| 1     | TIOAx [x=0..2] and TIOBx [x=0..2] are driven by a 2-bit Gray counter.          |

### 41.7.5 TC Register AB

**Name:** TC\_RABx  
**Offset:** 0x0C + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bits 31:0 – RAB[31:0] Register A or Register B

RAB contains the next unread capture Register A or Register B value in real time. It is usually read by the DMA after a request due to a valid load edge on TIOAx.

When DMA is used, the RAB register address must be configured as source address of the transfer.

### 41.7.6 TC Counter Value Register

**Name:** TC\_CVx  
**Offset:** 0x10 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read-only

|        |           |    |    |    |    |    |    |    |
|--------|-----------|----|----|----|----|----|----|----|
| Bit    | 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

| Access | R         | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7         | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | CV[7:0]   |    |    |    |    |    |    |    |
| Access | R         | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 31:0 – CV[31:0] Counter Value**  
 CV contains the counter value in real time.

**Important:**

For 16-bit channels, CV field size is limited to register bits 15:0.

### 41.7.7 TC Register A

**Name:** TC\_RAx  
**Offset:** 0x14 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register has access Read-only if TC\_CMRx.WAVE = 0, Read/Write if TC\_CMRx.WAVE = 1.  
This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |           |     |     |     |     |     |     |     |
|--------|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31        | 30  | 29  | 28  | 27  | 26  | 25  | 24  |

#### Bits 31:0 – RA[31:0] Register A

RA contains the Register A value in real time.

#### Important:

For 16-bit channels, RA field size is limited to register bits 15:0.

### 41.7.8 TC Register B

**Name:** TC\_RBx  
**Offset:** 0x18 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register has access Read-only if TC\_CMRx.WAVE = 0, Read/Write if TC\_CMRx.WAVE = 1.  
This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |           |     |     |     |     |     |     |     |
|--------|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31        | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | RB[31:24] |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 31:0 – RB[31:0] Register B

RB contains the Register B value in real time.

#### Important:

For 16-bit channels, RB field size is limited to register bits 15:0.

### 41.7.9 TC Register C

**Name:** TC\_RCx  
**Offset:** 0x1C + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |           |     |     |     |     |     |     |     |
|--------|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31        | 30  | 29  | 28  | 27  | 26  | 25  | 24  |

| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |       |       |       |      |      |      |       |       |
|--------|-------|-------|-------|------|------|------|-------|-------|
| Bit    | 7     | 6     | 5     | 4    | 3    | 2    | 1     | 0     |
| Access | ETRGS | LDRBS | LDRAS | CPCS | CPBS | CPAS | LOVRS | COVFS |
| Reset  | R     | R     | R     | R    | R    | R    | R     | R     |
|        | 0     | 0     | 0     | 0    | 0    | 0    | 0     | 0     |

**Bit 18 – MTIOB TIOBx Mirror**

| Value | Description                                                                                         |
|-------|-----------------------------------------------------------------------------------------------------|
| 0     | TIOBx is low. If TC_CM Rx.WAVE = 0, TIOBx pin is low. If TC_CM Rx.WAVE = 1, TIOBx is driven low.    |
| 1     | TIOBx is high. If TC_CM Rx.WAVE = 0, TIOBx pin is high. If TC_CM Rx.WAVE = 1, TIOBx is driven high. |

**Bit 17 – MTIOA TIOAx Mirror**

| Value | Description                                                                                         |
|-------|-----------------------------------------------------------------------------------------------------|
| 0     | TIOAx is low. If TC_CM Rx.WAVE = 0, TIOAx pin is low. If TC_CM Rx.WAVE = 1, TIOAx is driven low.    |
| 1     | TIOAx is high. If TC_CM Rx.WAVE = 0, TIOAx pin is high. If TC_CM Rx.WAVE = 1, TIOAx is driven high. |

**Bit 16 – CLKSTA Clock Enabling Status**

| Value | Description        |
|-------|--------------------|
| 0     | Clock is disabled. |
| 1     | Clock is enabled.  |

**Bit 7 – ETRGS External Trigger Status (cleared on read)**

| Value | Description                                                                   |
|-------|-------------------------------------------------------------------------------|
| 0     | External trigger has not occurred since the last read of the Status Register. |
| 1     | External trigger has occurred since the last read of the Status Register.     |

**Bit 6 – LDRBS RB Loading Status (cleared on read)**

| Value | Description                                                                               |
|-------|-------------------------------------------------------------------------------------------|
| 0     | RB Load has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 1. |
| 1     | RB Load has occurred since the last read of the Status Register, if TC_CM Rx.WAVE = 0.    |

**Bit 5 – LDRAS RA Loading Status (cleared on read)**

| Value | Description                                                                               |
|-------|-------------------------------------------------------------------------------------------|
| 0     | RA Load has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 1. |
| 1     | RA Load has occurred since the last read of the Status Register, if TC_CM Rx.WAVE = 0.    |

**Bit 4 – CPCS RC Compare Status (cleared on read)**

| Value | Description                                                             |
|-------|-------------------------------------------------------------------------|
| 0     | RC Compare has not occurred since the last read of the Status Register. |
| 1     | RC Compare has occurred since the last read of the Status Register.     |

**Bit 3 – CPBS RB Compare Status (cleared on read)**

| Value | Description                                                                                  |
|-------|----------------------------------------------------------------------------------------------|
| 0     | RB Compare has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 0. |
| 1     | RB Compare has occurred since the last read of the Status Register, if TC_CM Rx.WAVE = 1.    |

**Bit 2 – CPAS RA Compare Status (cleared on read)**

| Value | Description                                                                                  |
|-------|----------------------------------------------------------------------------------------------|
| 0     | RA Compare has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 0. |
| 1     | RA Compare has occurred since the last read of the Status Register, if TC_CM Rx.WAVE = 1.    |

**Bit 1 – LOVRS Load Overrun Status (cleared on read)**

| Value | Description                                                                                                                                               |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Load overrun has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 1.                                                            |
| 1     | RA or RB have been loaded at least twice without any read of the corresponding register since the last read of the Status Register, if TC_CM Rx.WAVE = 0. |

**Bit 0 – COVFS Counter Overflow Status (cleared on read)**

| Value | Description                                                                  |
|-------|------------------------------------------------------------------------------|
| 0     | No counter overflow has occurred since the last read of the Status Register. |
| 1     | A counter overflow has occurred since the last read of the Status Register.  |

### 41.7.11 TC Interrupt Enable Register

**Name:** TC\_IERx  
**Offset:** 0x24 + x\*0x40 [x=0..2]  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |       |       |       |      |      |      |       |       |
|--------|-------|-------|-------|------|------|------|-------|-------|
| Bit    | 31    | 30    | 29    | 28   | 27   | 26   | 25    | 24    |
|        |       |       |       |      |      |      |       |       |
| Access |       |       |       |      |      |      |       |       |
| Reset  |       |       |       |      |      |      |       |       |
| Bit    | 23    | 22    | 21    | 20   | 19   | 18   | 17    | 16    |
|        |       |       |       |      |      |      |       |       |
| Access |       |       |       |      |      |      |       |       |
| Reset  |       |       |       |      |      |      |       |       |
| Bit    | 15    | 14    | 13    | 12   | 11   | 10   | 9     | 8     |
|        |       |       |       |      |      |      |       |       |
| Access |       |       |       |      |      |      |       |       |
| Reset  |       |       |       |      |      |      |       |       |
| Bit    | 7     | 6     | 5     | 4    | 3    | 2    | 1     | 0     |
|        | ETRGS | LDRBS | LDRAS | CPCS | CPBS | CPAS | LOVRS | COVFS |
| Access | W     | W     | W     | W    | W    | W    | W     | W     |
| Reset  | –     | –     | –     | –    | –    | –    | –     | –     |

**Bit 7 – ETRGS** External Trigger

**Bit 6 – LDRBS** RB Loading

**Bit 5 – LDRAS** RA Loading

**Bit 4 – CPCS** RC Compare

**Bit 3 – CPBS** RB Compare

**Bit 2 – CPAS** RA Compare

**Bit 1 – LOVRS** Load Overrun

**Bit 0 – COVFS** Counter Overflow

## 41.7.12 TC Interrupt Disable Register

**Name:** TC\_IDRx  
**Offset:** 0x28 + x\*0x40 [x=0..2]  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|        |       |       |       |      |      |      |       |       |
|--------|-------|-------|-------|------|------|------|-------|-------|
| Bit    | 31    | 30    | 29    | 28   | 27   | 26   | 25    | 24    |
|        |       |       |       |      |      |      |       |       |
| Access |       |       |       |      |      |      |       |       |
| Reset  |       |       |       |      |      |      |       |       |
| Bit    | 23    | 22    | 21    | 20   | 19   | 18   | 17    | 16    |
|        |       |       |       |      |      |      |       |       |
| Access |       |       |       |      |      |      |       |       |
| Reset  |       |       |       |      |      |      |       |       |
| Bit    | 15    | 14    | 13    | 12   | 11   | 10   | 9     | 8     |
|        |       |       |       |      |      |      |       |       |
| Access |       |       |       |      |      |      |       |       |
| Reset  |       |       |       |      |      |      |       |       |
| Bit    | 7     | 6     | 5     | 4    | 3    | 2    | 1     | 0     |

| Reset  | –     | –     | –     | –    | –    | –    | –     | –     |

**Bit 7 – ETRGS** External Trigger

**Bit 6 – LDRBS** RB Loading

**Bit 5 – LDRAS** RA Loading

**Bit 4 – CPCS** RC Compare

**Bit 3 – CPBS** RB Compare

**Bit 2 – CPAS** RA Compare

**Bit 1 – LOVRS** Load Overrun

**Bit 0 – COVFS** Counter Overflow

### 41.7.13 TC Interrupt Mask Register

**Name:** TC\_IMRx  
**Offset:** 0x2C + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

|        |       |       |       |      |      |      |       |       |
|--------|-------|-------|-------|------|------|------|-------|-------|
| Bit    | 31    | 30    | 29    | 28   | 27   | 26   | 25    | 24    |

|        |    |    |    |    |    |    |   | NODIVCLK |
| Access |    |    |    |    |    |    |   | R/W      |
| Reset  |    |    |    |    |    |    |   | 0        |

|        |   |   |               |     |   |   |               |     |
|--------|---|---|---------------|-----|---|---|---------------|-----|
| Bit    | 7 | 6 | 5             | 4   | 3 | 2 | 1             | 0   |
|        |   |   | TRIGSRCB[1:0] |     |   |   | TRIGSRCA[1:0] |     |
| Access |   |   | R/W           | R/W |   |   | R/W           | R/W |
| Reset  |   |   | 0             | 0   |   |   | 0             | 0   |

##### Bit 8 – NODIVCLK No Divided Clock

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | The selected clock is defined by field TCCLKS in TC_CMRx.                        |
| 1     | The selected clock is peripheral clock and TCCLKS field (TC_CMRx) has no effect. |

##### Bits 5:4 – TRIGSRCB[1:0] Trigger Source for Input B

| Value | Name           | Description                                                                                                                                                                                                                                                              |
|-------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | EXTERNAL_TIOBx | The trigger/capture input B is driven by external pin TIOBx                                                                                                                                                                                                              |
| 1     | PWMx           | For TC0 to TC10: The trigger/capture input B is driven internally by the comparator output (see <a href="#">Synchronization with PWM</a> ) of the PWMx.<br>For TC11: The trigger/capture input B is driven internally by the GTSUCOMP signal of the Ethernet MAC (GMAC). |

##### Bits 1:0 – TRIGSRCA[1:0] Trigger Source for Input A

| Value | Name           | Description                                                 |
|-------|----------------|-------------------------------------------------------------|
| 0     | EXTERNAL_TIOAx | The trigger/capture input A is driven by external pin TIOAx |
| 1     | PWMx           | The trigger/capture input A is driven internally by PWMx    |

### 41.7.15 TC Block Control Register

**Name:** TC\_BCR  
**Offset:** 0xC0  
**Reset:** –  
**Property:** Write-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |   |   |   |   |   |      |
|--------|---|---|---|---|---|---|---|------|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0    |
|        |   |   |   |   |   |   |   | SYNC |
| Access |   |   |   |   |   |   |   | W    |
| Reset  |   |   |   |   |   |   |   | –    |

#### Bit 0 – SYNC Synchro Command

| Value | Description                                                                                         |
|-------|-----------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                          |
| 1     | Asserts the SYNC signal which generates a software trigger simultaneously for each of the channels. |

**41.7.16 TC Block Mode Register**

**Name:** TC\_BMR  
**Offset:** 0xC4  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |    |    |    |    |    |    |              |     |

| Reset  |   |   | 0            | 0   | 0            | 0   | 0            | 0   |

**Bits 25:20 – MAXFILT[5:0] Maximum Filter**

Pulses with a period shorter than MAXFILT+1 peripheral clock cycles are discarded. For more details on MAXFILT constraints, see [“Input Preprocessing”](#)

| Value | Description                         |
|-------|-------------------------------------|
| 1–63  | Defines the filtering capabilities. |

**Bit 17 – IDXPBH Index Pin is PHB Pin**

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | IDX pin of the rotary sensor must drive TIOA1. |
| 1     | IDX pin of the rotary sensor must drive TIOB0. |

**Bit 16 – SWAP Swap PHA and PHB**

| Value | Description                                             |
|-------|---------------------------------------------------------|
| 0     | No swap between PHA and PHB.                            |
| 1     | Swap PHA and PHB internally, prior to driving the QDEC. |

**Bit 15 – INVIDX Inverted Index**

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | IDX (TIOA1) is directly driving the QDEC. |
| 1     | IDX is inverted before driving the QDEC.  |

**Bit 14 – INVB Inverted PHB**

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | PHB (TIOB0) is directly driving the QDEC. |
| 1     | PHB is inverted before driving the QDEC.  |

### Bit 13 – INVA Inverted PHA

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | PHA (TIOA0) is directly driving the QDEC. |
| 1     | PHA is inverted before driving the QDEC.  |

### Bit 12 – EDGPHA Edge on PHA Count Mode

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | Edges are detected on PHA only.         |
| 1     | Edges are detected on both PHA and PHB. |

### Bit 11 – QDTRANS Quadrature Decoding Transparent

| Value | Description                                                                                                             |
|-------|-------------------------------------------------------------------------------------------------------------------------|
| 0     | Full quadrature decoding logic is active (direction change detected).                                                   |
| 1     | Quadrature decoding logic is inactive (direction change inactive) but input filtering and edge detection are performed. |

### Bit 10 – SPEEDEN Speed Enabled

| Value | Description                                                                        |
|-------|------------------------------------------------------------------------------------|
| 0     | Disabled.                                                                          |
| 1     | Enables the speed measure on channel 0, the time base being provided by channel 2. |

### Bit 9 – POSEN Position Enabled

| Value | Description                                      |
|-------|--------------------------------------------------|
| 0     | Disable position.                                |
| 1     | Enables the position measure on channel 0 and 1. |

### Bit 8 – QDEN Quadrature Decoder Enabled

Quadrature decoding (direction change) can be disabled using QDTRANS bit.  
One of the POSEN or SPEEDEN bits must be also enabled.

| Value | Description                                                        |
|-------|--------------------------------------------------------------------|
| 0     | Disabled.                                                          |
| 1     | Enables the QDEC (filter, edge detection and quadrature decoding). |

### Bits 5:4 – TC2XC2S[1:0] External Clock Signal 2 Selection

| Value | Name  | Description                    |
|-------|-------|--------------------------------|
| 0     | TCLK2 | Signal connected to XC2: TCLK2 |
| 1     | –     | Reserved                       |
| 2     | TIOA0 | Signal connected to XC2: TIOA0 |
| 3     | TIOA1 | Signal connected to XC2: TIOA1 |

### Bits 3:2 – TC1XC1S[1:0] External Clock Signal 1 Selection

| Value | Name  | Description                    |
|-------|-------|--------------------------------|
| 0     | TCLK1 | Signal connected to XC1: TCLK1 |
| 1     | –     | Reserved                       |
| 2     | TIOA0 | Signal connected to XC1: TIOA0 |
| 3     | TIOA2 | Signal connected to XC1: TIOA2 |

### Bits 1:0 – TC0XC0S[1:0] External Clock Signal 0 Selection

| Value | Name  | Description                    |
|-------|-------|--------------------------------|
| 0     | TCLK0 | Signal connected to XC0: TCLK0 |
| 1     | –     | Reserved                       |
| 2     | TIOA1 | Signal connected to XC0: TIOA1 |
| 3     | TIOA2 | Signal connected to XC0: TIOA2 |

#### 41.7.17 TC QDEC Interrupt Enable Register

**Name:** TC\_QIER  
**Offset:** 0xC8  
**Reset:** –  
**Property:** Write-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |

| Access |   |   |   |   |   | W    | W      | W   |
| Reset  |   |   |   |   |   | –    | –      | –   |

##### Bit 2 – QERR Quadrature Error

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | No effect.                                                        |
| 1     | Enables the interrupt when a quadrature error occurs on PHA, PHB. |

##### Bit 1 – DIRCHG Direction Change

| Value | Description                                                            |
|-------|------------------------------------------------------------------------|
| 0     | No effect.                                                             |
| 1     | Enables the interrupt when a change on rotation direction is detected. |

##### Bit 0 – IDX Index

| Value | Description                                                   |
|-------|---------------------------------------------------------------|
| 0     | No effect.                                                    |
| 1     | Enables the interrupt when a rising edge occurs on IDX input. |

#### 41.7.18 TC QDEC Interrupt Disable Register

**Name:** TC\_QIDR  
**Offset:** 0xCC  
**Reset:** –  
**Property:** Write-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |

| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |   |   |   |      |        |     |
|--------|---|---|---|---|---|------|--------|-----|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2    | 1      | 0   |
|        |   |   |   |   |   | QERR | DIRCHG | IDX |
| Access |   |   |   |   |   | W    | W      | W   |
| Reset  |   |   |   |   |   | –    | –      | –   |

##### Bit 2 – QERR Quadrature Error

| Value | Description                                                        |
|-------|--------------------------------------------------------------------|
| 0     | No effect.                                                         |
| 1     | Disables the interrupt when a quadrature error occurs on PHA, PHB. |

##### Bit 1 – DIRCHG Direction Change

| Value | Description                                                             |
|-------|-------------------------------------------------------------------------|
| 0     | No effect.                                                              |
| 1     | Disables the interrupt when a change on rotation direction is detected. |

##### Bit 0 – IDX Index

| Value | Description                                                    |
|-------|----------------------------------------------------------------|
| 0     | No effect.                                                     |
| 1     | Disables the interrupt when a rising edge occurs on IDX input. |

#### 41.7.19 TC QDEC Interrupt Mask Register

**Name:** TC\_QIMR  
**Offset:** 0xD0  
**Reset:** 0x00000000  
**Property:** Read-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |   |   |   |      |        |     |
|--------|---|---|---|---|---|------|--------|-----|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2    | 1      | 0   |
|        |   |   |   |   |   | QERR | DIRCHG | IDX |
| Access |   |   |   |   |   | R    | R      | R   |
| Reset  |   |   |   |   |   | 0    | 0      | 0   |

##### Bit 2 – QERR Quadrature Error

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | The interrupt on quadrature error is disabled. |
| 1     | The interrupt on quadrature error is enabled.  |

##### Bit 1 – DIRCHG Direction Change

| Value | Description                                             |
|-------|---------------------------------------------------------|
| 0     | The interrupt on rotation direction change is disabled. |
| 1     | The interrupt on rotation direction change is enabled.  |

##### Bit 0 – IDX Index

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | The interrupt on IDX input is disabled. |
| 1     | The interrupt on IDX input is enabled.  |

## 41.7.20 TC QDEC Interrupt Status Register

**Name:** TC\_QISR  
**Offset:** 0xD4  
**Reset:** 0x00000000  
**Property:** Read-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |     |
|--------|----|----|----|----|----|----|---|-----|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8   |
|        |    |    |    |    |    |    |   | DIR |
| Access |    |    |    |    |    |    |   | R   |
| Reset  |    |    |    |    |    |    |   | 0   |

|        |   |   |   |   |   |      |        |     |
|--------|---|---|---|---|---|------|--------|-----|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2    | 1      | 0   |
|        |   |   |   |   |   | QERR | DIRCHG | IDX |
| Access |   |   |   |   |   | R    | R      | R   |
| Reset  |   |   |   |   |   | 0    | 0      | 0   |

**Bit 8 – DIR** Direction  
Returns an image of the current rotation direction.

**Bit 2 – QERR** Quadrature Error

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | No quadrature error since the last read of TC_QISR.         |
| 1     | A quadrature error occurred since the last read of TC_QISR. |

**Bit 1 – DIRCHG** Direction Change

| Value | Description                                                     |
|-------|-----------------------------------------------------------------|
| 0     | No change on rotation direction since the last read of TC_QISR. |
| 1     | The rotation direction changed since the last read of TC_QISR.  |

**Bit 0 – IDX** Index

| Value | Description                                               |
|-------|-----------------------------------------------------------|
| 0     | No Index input change since the last read of TC_QISR.     |
| 1     | The IDX input has changed since the last read of TC_QISR. |

#### 41.7.21 TC Fault Mode Register

**Name:** TC\_FMR  
**Offset:** 0xD8  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |   |   |   |   |       |       |
|--------|---|---|---|---|---|---|-------|-------|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1     | 0     |
|        |   |   |   |   |   |   | ENCF1 | ENCF0 |
| Access |   |   |   |   |   |   | R/W   | R/W   |
| Reset  |   |   |   |   |   |   | 0     | 0     |

##### Bit 1 – ENCF1 Enable Compare Fault Channel 1

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | Disables the FAULT output source (CPCS flag) from channel 1. |
| 1     | Enables the FAULT output source (CPCS flag) from channel 1.  |

##### Bit 0 – ENCF0 Enable Compare Fault Channel 0

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | Disables the FAULT output source (CPCS flag) from channel 0. |
| 1     | Enables the FAULT output source (CPCS flag) from channel 0.  |

## 41.7.22 TC Write Protection Mode Register

**Name:** TC\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |              |    |    |    |    |    |    |      |

| Access |              |    |    |    |    |    |    | R/W  |
| Reset  |              |    |    |    |    |    |    | 0    |

### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                                          |
|----------|--------|------------------------------------------------------------------------------------------------------|
| 0x54494D | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0. |

### Bit 0 – WPEN Write Protection Enable

The Timer Counter clock of the first channel must be enabled to access this register.  
See [“Register Write Protection”](#) for a list of registers that can be write-protected and Timer Counter clock conditions.

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | Disables the write protection if WPKEY corresponds to 0x54494D (“TIM” in ASCII). |
| 1     | Enables the write protection if WPKEY corresponds to 0x54494D (“TIM” in ASCII).  |

## 42. Pulse Width Modulation Controller (PWM)

### 42.1 Description

The Pulse Width Modulation Controller (PWM) generates output pulses on 4 channels independently according to parameters defined per channel. Each channel controls two complementary square output waveforms. Characteristics of the output waveforms such as period, duty-cycle, polarity and dead-times (also called dead-bands or non-overlapping times) are configured through the user interface. Each channel selects and uses one of the clocks provided by the clock generator. The clock generator provides several clocks resulting from the division of the PWM peripheral clock. External triggers can be managed to allow output pulses to be modified in real time.

All accesses to the PWM are made through registers mapped on the peripheral bus. All channels integrate a double buffering system in order to prevent an unexpected output waveform while modifying the period, the spread spectrum, the duty-cycle or the dead-times.

Channels can be linked together as synchronous channels to be able to update their duty-cycle or dead-times at the same time.

The update of duty-cycles of synchronous channels can be performed by the DMA Controller channel which offers buffer transfer without processor Intervention.

The PWM includes a spread-spectrum counter to allow a constantly varying period (only for Channel 0). This counter may be useful to minimize electromagnetic interference or to reduce the acoustic noise of a PWM driven motor.

The PWM provides 8 independent comparison units capable of comparing a programmed value to the counter of the synchronous channels (counter of channel 0). These comparisons are intended to generate software interrupts and to trigger DMA Controller transfer requests.

PWM outputs can be overridden synchronously or asynchronously to their channel counter.

The PWM provides a fault protection mechanism with 7 fault inputs, capable to detect a fault condition and to override the PWM outputs asynchronously (outputs forced to '0', '1' or Hi-Z).

For safety usage, some configuration registers are write-protected.

### 42.2 Embedded Characteristics

- 4 Channels
- Common Clock Generator Providing Thirteen Different Clocks
  - A Modulo n Counter Providing Eleven Clocks
  - Two Independent Linear Dividers Working on Modulo n Counter Outputs
- Independent Channels
  - Independent 16-bit Counter for Each Channel
  - Independent Complementary Outputs with 12-bit Dead-Time Generator (Also Called Dead-Band or Non-Overlapping Time) for Each Channel
  - Independent Push-Pull Mode for Each Channel
  - Independent Enable Disable Command for Each Channel
  - Independent Clock Selection for Each Channel
  - Independent Period, Duty-Cycle and Dead-Time for Each Channel
  - Independent Double Buffering of Period, Duty-Cycle and Dead-Times for Each Channel
  - Independent Programmable Selection of The Output Waveform Polarity for Each Channel, with Double Buffering
  - Independent Programmable Center- or Left-aligned Output Waveform for Each Channel

- Independent Output Override for Each Channel
  - Independent Interrupt for Each Channel, at Each Period for Left-Aligned or Center-Aligned Configuration
  - Independent Update Time Selection of Double Buffering Registers (Polarity, Duty Cycle) for Each Channel, at Each Period for Left-Aligned or Center-Aligned Configuration
- External Trigger Input Management (e.g., for DC/DC or Lighting Control)
  - External PWM Reset Mode
  - External PWM Start Mode
  - Cycle-By-Cycle Duty Cycle Mode
  - Leading-Edge Blanking
- 2 2-bit Gray Up/Down Channels for Stepper Motor Control
- Spread Spectrum Counter to Allow a Constantly Varying Duty Cycle (only for Channel 0)
- Synchronous Channel Mode
  - Synchronous Channels Share the Same Counter
  - Mode to Update the Synchronous Channels Registers after a Programmable Number of Periods
  - Synchronous Channels Supports Connection of one DMA Controller Channel Which Offers Buffer Transfer Without Processor Intervention To Update Duty-Cycle Registers
- 2 Independent Events Lines
- 8 Comparison Units Intended to Generate Interrupts, Pulses on Event Lines and DMA Controller Transfer Requests
- 7 Programmable Fault Inputs Providing an Asynchronous Protection of PWM Outputs
  - 3 User Driven through PIO Inputs
  - PMC Driven when Crystal Oscillator Clock Fails
  - Timer/Counter Driven through Configurable Comparison Function
- Register Write Protection

## 42.3 Block Diagram

Figure 42-1. Pulse Width Modulation Controller Block Diagram

**Note:** For a more detailed illustration of the fault protection circuitry, refer to [42.6.2.7. Fault Protection](#).

## 42.4 I/O Lines Description

Each channel outputs two complementary external I/O lines.

**Table 42-1.** I/O Line Description

| Name      | Description                            | Type   |
|-----------|----------------------------------------|--------|
| PWMHx     | PWM Waveform Output High for channel x | Output |
| PWMLx     | PWM Waveform Output Low for channel x  | Output |
| PWMFlx    | PWM Fault Input x                      | Input  |
| PWMEXTRGy | PWM Trigger Input y                    | Input  |

## 42.5 Product Dependencies

### 42.5.1 I/O Lines

The pins used for interfacing the PWM are multiplexed with PIO lines. The programmer must first program the PIO controller to assign the desired PWM pins to their peripheral function. If I/O lines of the PWM are not used by the application, they can be used for other purposes by the PIO controller.

All of the PWM outputs may or may not be enabled. If an application requires only four channels, then only four PIO lines are assigned to PWM outputs.

### 42.5.2 Power Management

The PWM is not continuously clocked. The programmer must first enable the PWM clock in the Power Management Controller (PMC) before using the PWM. However, if the application does not require PWM operations, the PWM clock can be stopped when not needed and be restarted later. In this case, the PWM will resume its operations where it left off.

### 42.5.3 Interrupt Sources

The PWM interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the PWM interrupt requires the Interrupt Controller to be programmed first.

### 42.5.4 Fault Inputs

The PWM has the fault inputs connected to the different modules. Refer to the implementation of these modules within the product for detailed information about the fault generation procedure. The PWM receives faults from:

- PIO inputs
- PMC
- Timer/Counters

**Table 42-2.** Fault Inputs

| Fault Generator | External PWM Fault Input Number | Polarity Level <sup>(1)</sup> | Fault Input ID |
|-----------------|---------------------------------|-------------------------------|----------------|
| <b>PWM0</b>     |                                 |                               |                |
| PIO PA8         | PWMC0_PWMFI0                    | User-defined                  | 0              |
| PIO PA9         | PWMC0_PWMFI1                    | User-defined                  | 1              |

**Note:**

1. FPOL field in PWMC\_FMR.

### 42.6 Functional Description

The PWM controller is primarily composed of a clock generator module and 4 channels.

- Clocked by the peripheral clock, the clock generator module provides 13 clocks.
- Each channel can independently choose one of the clock generator outputs.
- Each channel generates an output waveform with attributes that can be defined independently for each channel through the user interface registers.

#### 42.6.1 PWM Clock Generator

**Figure 42-2.** Functional View of the Clock Generator Block Diagram

The PWM peripheral clock is divided in the clock generator module to provide different clocks available for all channels. Each channel can independently select one of the divided clocks.

The clock generator is divided into different blocks:

- a modulo n counter which provides 11 clocks:

- $f_{\text{peripheral clock}}$
  - $f_{\text{peripheral clock}}/2$
  - $f_{\text{peripheral clock}}/4$
  - $f_{\text{peripheral clock}}/8$
  - $f_{\text{peripheral clock}}/16$
  - $f_{\text{peripheral clock}}/32$
  - $f_{\text{peripheral clock}}/64$
  - $f_{\text{peripheral clock}}/128$
  - $f_{\text{peripheral clock}}/256$
  - $f_{\text{peripheral clock}}/512$
  - $f_{\text{peripheral clock}}/1024$
- two linear dividers (1, 1/2, 1/3, ... 1/255) that provide two separate clocks: clkA and clkB

Each linear divider can independently divide one of the clocks of the modulo n counter. The selection of the clock to be divided is made according to the PREA (PREB) field of the PWM Clock register (PWM\_CLK). The resulting clock clkA (clkB) is the clock selected divided by DIVA (DIVB) field value.

After a reset of the PWM controller, DIVA (DIVB) and PREA (PREB) are set to '0'. This implies that after reset clkA (clkB) are turned off.

At reset, all clocks provided by the modulo n counter are turned off except the peripheral clock. This situation is also true when the PWM peripheral clock is turned off through the Power Management Controller.

**CAUTION** Before using the PWM controller, the programmer must first enable the peripheral clock in the Power Management Controller (PMC).

---

## 42.6.2 PWM Channel

### 42.6.2.1 Channel Block Diagram

Figure 42-3. Functional View of the Channel Block Diagram

Each of the 4 channels is composed of six blocks:

- A clock selector which selects one of the clocks provided by the clock generator (described in [PWM Clock Generator](#)).
- A counter clocked by the output of the clock selector. This counter is incremented or decremented according to the channel configuration and comparators matches. The size of the counter is 16 bits.
- A comparator used to compute the OCx output waveform according to the counter value and the configuration. The counter value can be the one of the channel counter or the one of the channel 0 counter according to SYNCx bit in the [PWM Sync Channels Mode Register](#) (PWM\_SCM).
- A 2-bit configurable Gray counter enables the stepper motor driver. One Gray counter drives 2 channels.
- A dead-time generator providing two complementary outputs (DTOHx/DTOLx) which allows to drive external power control switches safely.
- An output override block that can force the two complementary outputs to a programmed value (OOOHx/OOOLx).
- An asynchronous fault protection mechanism that has the highest priority to override the two complementary outputs (PWMHx/PWMLx) in case of fault detection (outputs forced to '0', '1' or Hi-Z).

#### 42.6.2.2 Comparator

The comparator continuously compares its counter value with the channel period defined by CPRD in the [PWM Channel Period Register](#) (PWM\_CPRDx) and the duty-cycle defined by CDTY in the [PWM Channel Duty Cycle Register](#) (PWM\_CDTYx) to generate an output signal OCx accordingly.

The different properties of the waveform of the output OCx are:

- the clock selection. The channel counter is clocked by one of the clocks provided by the clock generator described in the previous section. This channel parameter is defined in the CPRE field of the [PWM Channel Mode Register](#) (PWM\_CMRx). This field is reset at '0'.

- the waveform period. This channel parameter is defined in the CPRD field of the PWM\_CPRDx register.  
If the waveform is left-aligned, then the output waveform period depends on the counter source clock and can be calculated:  
By using the PWM peripheral clock divided by a given prescaler value "X" (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(X \times \text{CPRD})}{f_{\text{peripheral clock}}}$$

By using the PWM peripheral clock divided by a given prescaler value "X" (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(X \times \text{CPRD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(X \times \text{CPRD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

If the waveform is center-aligned, then the output waveform period depends on the counter source clock and can be calculated:

By using the PWM peripheral clock divided by a given prescaler value "X" (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(2 \times X \times \text{CPRD})}{f_{\text{peripheral clock}}}$$

By using the PWM peripheral clock divided by a given prescaler value "X" (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(2 \times X \times \text{CPRD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or }$$

$$\frac{(2 \times X \times \text{CPRD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

- the waveform duty-cycle. This channel parameter is defined in the CDTY field of the PWM\_CDTYx register.  
If the waveform is left-aligned, then:

$$\text{duty cycle} = \frac{(\text{period} - 1/f_{\text{channel\_x\_clock}} \times \text{CDTY})}{\text{period}}$$

If the waveform is center-aligned, then:

$$\text{duty cycle} = \frac{((\text{period}/2) - 1/f_{\text{channel\_x\_clock}} \times \text{CDTY}))}{(\text{period}/2)}$$

- the waveform polarity. At the beginning of the period, the signal can be at high or low level. This property is defined in the CPOL bit of PWM\_CMRx. By default, the signal starts by a low level. The DPOLI bit in PWM\_CMRx defines the PWM polarity when the channel is disabled (CHIDx = 0 in PWM\_SR). For more details, see the figure *Waveform Properties*.
  - DPOLI = 0: PWM polarity when the channel is disabled is the same as the one defined for the beginning of the PWM period.
  - DPOLI = 1: PWM polarity when the channel is disabled is inverted compared to the one defined for the beginning of the PWM period.

- the waveform alignment. The output waveform can be left- or center-aligned. Center-aligned waveforms can be used to generate non-overlapped waveforms. This property is defined in the CALG bit of PWM\_CMRx. The default mode is left-aligned.

**Figure 42-4.** Non-Overlapped Center-Aligned Waveforms

**Note:** See the figure [Figure 42-5](#) for a detailed description of center-aligned waveforms.

When center-aligned, the channel counter increases up to CPRD and decreases down to 0. This ends the period.

When left-aligned, the channel counter increases up to CPRD and is reset. This ends the period.

Thus, for the same CPRD value, the period for a center-aligned channel is twice the period for a left-aligned channel.

Waveforms are fixed at 0 when:

- CDTY = CPRD and CPOL = 0 (Note that if TRGMODE = MODE3, the PWM waveform switches to 1 at the external trigger event (see [Cycle-By-Cycle Duty Mode](#))).
- CDTY = 0 and CPOL = 1

Waveforms are fixed at 1 (once the channel is enabled) when:

- CDTY = 0 and CPOL = 0
- CDTY = CPRD and CPOL = 1 (Note that if TRGMODE = MODE3, the PWM waveform switches to 0 at the external trigger event (see [Cycle-By-Cycle Duty Mode](#))).

The waveform polarity must be set before enabling the channel. This immediately affects the channel output level.

Modifying CPOL in [PWM Channel Mode Register](#) while the channel is enabled can lead to an unexpected behavior of the device being driven by PWM.

In addition to generating the output signals OCx, the comparator generates interrupts depending on the counter value. When the output waveform is left-aligned, the interrupt occurs at the end of the counter period. When the output waveform is center-aligned, the bit CES of PWM\_CMRx defines when the channel counter interrupt occurs. If CES is set to '0', the interrupt occurs at the end of the counter period. If CES is set to '1', the interrupt occurs at the end of the counter period and at half of the counter period.

The figure below illustrates the counter interrupts depending on the configuration.

Figure 42-5. Waveform Properties

### 42.6.2.3 Trigger Selection for Timer Counter

The PWM controller can be used as a trigger source for the Timer Counter (TC) to achieve the two application examples described below.

#### 42.6.2.3.1 Delay Measurement

To measure the delay between the channel x comparator output (OCx) and the feedback from the bridge driver of the MOSFETs (see the figure below), the bit TCTS in the [PWM Channel Mode Register](#) must be at 0. This defines the comparator output of the channel x as the TC trigger source. The TIOB trigger (TC internal input) is used to start the TC; the TIOA input (from PAD) is used to capture the delay.

**Figure 42-6.** Triggering the TC: Delay Measurement

#### 42.6.2.3.2 Cumulated ON Time Measurement

To measure the cumulated “ON” time of MOSFETs (see the figure below), the bit TCTS of the [PWM Channel Mode Register](#) must be set to 1 to define the counter event (see the figure *Waveform Properties*) as the Timer Counter trigger source.

Figure 42-7. Triggering the TC: Cumulated “ON” Time Measurement

#### 42.6.2.4 2-bit Gray Up/Down Counter for Stepper Motor

A pair of channels may provide a 2-bit Gray count waveform on two outputs. Dead-time generator and other downstream logic can be configured on these channels.

Up or Down Count mode can be configured on-the-fly by means of PWM\_SMMR configuration registers.

When GCEN0 is set to '1', channels 0 and 1 outputs are driven with a Gray counter.

**Figure 42-8.** 2-bit Gray Up/Down Counter

#### 42.6.2.5 Dead-Time Generator

The dead-time generator uses the comparator output OCx to provide the two complementary outputs DTOHx and DTOLx, which allows the PWM macrocell to drive external power control switches safely. When the dead-time generator is enabled by setting the bit DTE to 1 or 0 in the [PWM Channel Mode Register](#) (PWM\_CMRx), dead-times (also called dead-bands or non-overlapping times) are inserted between the edges of the two complementary outputs DTOHx and DTOLx. Note that enabling or disabling the dead-time generator is allowed only if the channel is disabled.

The dead-time is adjustable by the [PWM Channel Dead Time Register](#) (PWM\_DT<sub>x</sub>). Each output of the dead-time generator can be adjusted separately by DTH and DTL. The dead-time values can be updated synchronously to the PWM period by using the [PWM Channel Dead Time Update Register](#) (PWM\_DTUPD<sub>x</sub>).

The dead-time is based on a specific counter which uses the same selected clock that feeds the channel counter of the comparator. Depending on the edge and the configuration of the dead-time, DTOHx and DTOLx are delayed until the counter has reached the value defined by DTH or DTL. An inverted configuration bit (DTHI and DTLI bit in PWM\_CMRx) is provided for each output to invert the dead-time outputs. The following figure shows the waveform of the dead-time generator.

**Figure 42-9. Complementary Output Waveforms****42.6.2.5.1 PWM Push-Pull Mode**

When a PWM channel is configured in Push-Pull mode, the dead-time generator output is managed alternately on each PWM cycle. The polarity of the PWM line during the idle state of the Push-Pull mode is defined by the DPOLI bit in the [PWM Channel Mode Register \(PWM\\_CMRx\)](#). The Push-Pull mode can be enabled separately on each channel by writing a one to bit PPM in the [PWM Channel Mode Register](#).

Figure 42-10. PWM Push-Pull Mode

Figure 42-11. PWM Push-Pull Waveforms: Left-Aligned Mode

Figure 42-12. PWM Push-Pull Waveforms: Center-Aligned Mode

The PWM Push-Pull mode can be useful in transformer-based power converters, such as a half-bridge converter. The Push-Pull mode prevents the transformer core from being saturated by any direct current.

**Figure 42-13.** Half-Bridge Converter Application: No Feedback Regulation

**Figure 42-14.** Half-Bridge Converter Application: Feedback Regulation

#### 42.6.2.6 Output Override

The two complementary outputs DTOHx and DTOLx of the dead-time generator can be forced to a value defined by the software.

**Figure 42-15.** Override Output Selection

The fields OSHx and OSLx in the **PWM Output Selection Register** (PWM\_OS) allow the outputs of the dead-time generator DTOHx and DTOLx to be overridden by the value defined in the fields OOVHx and OOVx in the **PWM Output Override Value Register** (PWM\_OOV).

The set registers **PWM Output Selection Set Register** (PWM\_OSS) and **PWM Output Selection Set Update Register** (PWM\_OSSUPD) enable the override of the outputs of a channel regardless of other channels. In the same way, the clear registers **PWM Output Selection Clear Register** (PWM\_OSC) and **PWM Output Selection Clear Update Register** (PWM\_OSCUPD) disable the override of the outputs of a channel regardless of other channels.

By using buffer registers PWM\_OSSUPD and PWM\_OSCUPD, the output selection of PWM outputs is done synchronously to the channel counter, at the beginning of the next PWM period.

By using registers PWM\_OSS and PWM\_OSC, the output selection of PWM outputs is done asynchronously to the channel counter, as soon as the register is written.

The value of the current output selection can be read in PWM\_OS.

While overriding PWM outputs, the channel counters continue to run, only the PWM outputs are forced to user defined values.

### 42.6.2.7 Fault Protection

7 inputs provide fault protection which can force any of the PWM output pairs to a programmable value. This mechanism has priority over output overriding.

**Figure 42-16. Fault Protection**

The polarity level of the fault inputs is configured by the FPOL field in the **PWM Fault Mode Register** (PWM\_FMR). For fault inputs coming from internal peripherals such as Timer Counter, the polarity level must be FPOL = 1.

The configuration of the Fault Activation mode (FMOD field in PWM\_FMR) depends on the peripheral generating the fault. If the corresponding peripheral does not have "Fault Clear"

management, then the FMODE configuration to use must be FMODE = 1, to avoid spurious fault detection. Refer to the corresponding peripheral documentation for details on handling fault generation.

Fault inputs may or may not be glitch-filtered depending on the FFIL field in PWM\_FMR. When the filter is activated, glitches on fault inputs with a width inferior to the PWM peripheral clock period are rejected.

A fault becomes active as soon as its corresponding fault input has a transition to the programmed polarity level. If the corresponding bit FMODE is set to '0' in PWM\_FMR, the fault remains active as long as the fault input is at this polarity level. If the corresponding FMODE field is set to '1', the fault remains active until the fault input is no longer at this polarity level and until it is cleared by writing the corresponding bit FCLR in the [PWM Fault Clear Register](#) (PWM\_FCR). In the [PWM Fault Status Register](#) (PWM\_FSR), the field FIV indicates the current level of the fault inputs and the field FIS indicates whether a fault is currently active.

Each fault can be taken into account or not by the fault protection mechanism in each channel. To be taken into account in the channel x, the fault y must be enabled by the bit FPEX[y] in the PWM Fault Protection Enable registers (PWM\_FPE1). However, synchronous channels (see [Synchronous Channels](#)) do not use their own fault enable bits, but those of the channel 0 (bits FPE0[y]).

The fault protection on a channel is triggered when this channel is enabled and when any one of the faults that are enabled for this channel is active. It can be triggered even if the PWM peripheral clock is not running but only by a fault input that is not glitch-filtered.

When the fault protection is triggered on a channel, the fault protection mechanism resets the counter of this channel and forces the channel outputs to the values defined by the fields FPVHx and FPLx in the [PWM Fault Protection Value Register 1](#) (PWM\_FPV) and fields FPZHx/FPZLx in the [PWM Fault Protection Value Register 2](#), as shown in the table below. The output forcing is made asynchronously to the channel counter.

**Table 42-3.** Forcing Values of PWM Outputs by Fault Protection

| FPZH/Lx | FPVH/Lx | Forcing Value of PWMH/Lx    |
|---------|---------|-----------------------------|
| 0       | 0       | 0                           |
| 0       | 1       | 1                           |
| 1       | -       | High impedance state (Hi-Z) |

#### CAUTION

- To prevent any unexpected activation of the status flag FSy in PWM\_FSR, the FMODEy bit can be set to '1' only if the FPOLy bit has been previously configured to its final value.
- To prevent any unexpected activation of the Fault Protection on the channel x, the bit FPEX[y] can be set to '1' only if the FPOLy bit has been previously configured to its final value.

If a comparison unit is enabled (see [PWM Comparison Units](#)) and if a fault is triggered in the channel 0, then the comparison cannot match.

As soon as the fault protection is triggered on a channel, an interrupt (different from the interrupt generated at the end of the PWM period) can be generated but only if it is enabled and not masked. The interrupt is reset by reading the interrupt status register, even if the fault which has caused the trigger of the fault protection is kept active.

#### 42.6.2.7.1 Recoverable Fault

The PWM provides a Recoverable Fault mode on fault 1 and 2 (see figure *Fault Protection*).

The recoverable fault signal is an internal signal generated as soon as an external trigger event occurs (see [PWM External Trigger Mode](#)).

When the fault 1 or 2 is defined as a recoverable fault, the corresponding fault input pin is ignored and bits FFIL1/2, FMOD1/2 and FFIL1/2 are not taken into account.

The fault 1 is managed as a recoverable fault by the PWMEXTRG1 input trigger when PWM\_ETRG1.RFEN = 1, PWM\_ENA.CHID1 = 1, and PWM\_ETRG1.TRGMODE ≠ 0.

The fault 2 is managed as a recoverable fault by the PWMEXTRG2 input trigger when PWM\_ETRG2.RFEN = 1, PWM\_ENA.CHID2 = 1, and PWM\_ETRG2.TRGMODE ≠ 0.

Recoverable fault 1 and 2 can be taken into account by all channels by enabling the bit FPEX[1/2] in the PWM Fault Protection Enable registers (PWM\_FPEX). However the synchronous channels (see [Synchronous Channels](#)) do not use their own fault enable bits, but those of the channel 0 (bits FPE0[1/2]).

When a recoverable fault is triggered (according to the PWM\_ETRGx.TRGMODE setting), the PWM counter of the affected channels is not cleared (unlike in the classic fault protection mechanism) but the channel outputs are forced to the values defined by the fields FPVHx and FPVLx in the [PWM Fault Protection Value Register 1](#) (PWM\_FPV), as per table *Forcing Values of PWM Outputs by Fault Protection*. The output forcing is made asynchronously to the channel counter and lasts from the recoverable fault occurrence to the end of the next PWM cycle (if the recoverable fault is no longer present) (see the figure below).

The recoverable fault does not trigger an interrupt. The Fault Status FSy (with y = 1 or 2) is not reported in the [PWM Fault Status Register](#) when the fault y is a recoverable fault.

**Figure 42-17. Recoverable Fault Management**

#### 42.6.2.8 Spread Spectrum Counter

The PWM macrocell includes a spread spectrum counter allowing the generation of a constantly varying duty cycle on the output PWM waveform (only for the channel 0). This feature may be useful to minimize electromagnetic interference or to reduce the acoustic noise of a PWM driven motor.

This is achieved by varying the effective period in a range defined by a spread spectrum value which is programmed by the field SPRD in the [PWM Spread Spectrum Register](#) (PWM\_SSPR). The effective period of the output waveform is the value of the spread spectrum counter added to the programmed waveform period CPRD in the [PWM Channel Period Register](#) (PWM\_CPRD0).

It will cause the effective period to vary from  $CPRD - SPRD$  to  $CPRD + SPRD$ . This leads to a constantly varying duty cycle on the PWM output waveform because the duty cycle value programmed is unchanged.

The value of the spread spectrum counter can change in two ways depending on the bit SPRDM in PWM\_SSPR.

If  $SPRDM = 0$ , the Triangular mode is selected. The spread spectrum counter starts to count from  $-SPRD$  when the channel 0 is enabled or after reset and counts upwards at each period of the channel counter. When it reaches  $SPRD$ , it restarts to count from  $-SPRD$  again.

If  $SPRDM = 1$ , the Random mode is selected. A new random value is assigned to the spread spectrum counter at each period of the channel counter. This random value is between  $-SPRD$  and  $+SPRD$  and is uniformly distributed.

**Figure 42-18.** Spread Spectrum Counter

#### 42.6.2.9 Synchronous Channels

Some channels can be linked together as synchronous channels. They have the same source clock, the same period, the same alignment and are started together. In this way, their counters are synchronized together.

The synchronous channels are defined by the SYNCx bits in the [PWM Sync Channels Mode Register](#) (PWM\_SCM). Only one group of synchronous channels is allowed.

When a channel is defined as a synchronous channel, the channel 0 is also automatically defined as a synchronous channel. This is because the channel 0 counter configuration is used by all the synchronous channels.

If a channel x is defined as a synchronous channel, the fields/bits for the channel 0 are used instead of those of channel x:

- CPRE in PWM\_CMR0 instead of CPRE in PWM\_CMRx (same source clock)
- CPRD in PWM\_CPRD0 instead of CPRD in PWM\_CPRDx (same period)
- CALG in PWM\_CMR0 instead of CALG in PWM\_CMRx (same alignment)

Modifying the fields CPRE, CPRD and CALG of for channels with index greater than 0 has no effect on output waveforms.

Because counters of synchronous channels must start at the same time, they are all enabled together by enabling the channel 0 (by the CHID0 bit in PWM\_ENA register). In the same way, they are all disabled together by disabling channel 0 (by the CHID0 bit in PWM\_DIS register). However, a synchronous channel x different from channel 0 can be enabled or disabled independently from others (by the CHIDx bit in PWM\_ENA and PWM\_DIS registers).

Defining a channel as a synchronous channel while it is an asynchronous channel (by writing the bit SYNCx to '1' while it was at '0') is allowed only if the channel is disabled at this time (CHIDx = 0 in PWM\_SR). In the same way, defining a channel as an asynchronous channel while it is a synchronous channel (by writing the SYNCx bit to '0' while it was '1') is allowed only if the channel is disabled at this time.

The UPDM field (Update Mode) in the PWM\_SCM register selects one of the three methods to update the registers of the synchronous channels:

- Method 1 (UPDM = 0): The period value, the duty-cycle values and the dead-time values must be written by the processor in their respective update registers (respectively PWM\_CPRDUPDx, PWM\_CDTYUPDx and PWM\_DTUPDx). The update is triggered at the next PWM period as soon as the bit UPDULOCK in the [PWM Sync Channels Update Control Register](#) (PWM\_SCUC) is set to '1'.
- Method 2 (UPDM = 1): The period value, the duty-cycle values, the dead-time values and the update period value must be written by the processor in their respective update registers (respectively PWM\_CPRDUPDx, PWM\_CDTYUPDx and PWM\_DTUPD). The update of the period value and of the dead-time values is triggered at the next PWM period as soon as the bit UPDULOCK in the PWM\_SCUC register is set to '1'. The update of the duty-cycle values and the update period value is triggered automatically after an update period defined by the field UPR in the [PWM Sync Channels Update Period Register](#) (PWM\_SCUP).
- Method 3 (UPDM = 2): Same as Method 2 apart from the fact that the duty-cycle values of ALL synchronous channels are written by the DMA Controller. The user can choose to synchronize the DMA Controller transfer request with a comparison match (see [Section 7.3 "PWM Comparison Units"](#)), by the fields PTRM and PTRCS in the PWM\_SCM register. The DMA destination address must be configured to access only the [PWM DMA Register](#) (PWM\_DMAR). The DMA buffer data structure must consist of sequentially repeated duty cycles. The number of duty cycles in each sequence corresponds to the number of synchronized channels. Duty cycles in each sequence must be ordered from the lowest to the highest channel index. The size of the duty cycle is 16 bits.

**Table 42-4.** Summary of the Update of Registers of Synchronous Channels

| Register                          | UPDM = 0                                                                             | UPDM = 1                                                                                                  | UPDM = 2                    |
|-----------------------------------|--------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|-----------------------------|
| Period Value (PWM_CPRDUPDx)       | Write by the processor                                                               |                                                                                                           |                             |
|                                   | Update is triggered at the next PWM period as soon as the bit UPDULOCK is set to '1' |                                                                                                           |                             |
| Dead-Time Values (PWM_DTUPDx)     | Write by the processor                                                               |                                                                                                           |                             |
|                                   | Update is triggered at the next PWM period as soon as the bit UPDULOCK is set to '1' |                                                                                                           |                             |
| Duty-Cycle Values (PWM_CDTYUPDx)  | Write by the processor                                                               | Write by the processor                                                                                    | Write by the DMA Controller |
|                                   | Update is triggered at the next PWM period as soon as the bit UPDULOCK is set to '1' | Update is triggered at the next PWM period as soon as the update period counter has reached the value UPR |                             |
| Update Period Value (PWM_SCUPUPD) | Not applicable                                                                       | Write by the processor                                                                                    |                             |
|                                   | Not applicable                                                                       | Update is triggered at the next PWM period as soon as the update period counter has reached the value UPR |                             |

#### 42.6.2.9.1 Method 1: Manual write of duty-cycle values and manual trigger of the update

In this mode, the update of the period value, the duty-cycle values and the dead-time values must be done by writing in their respective update registers with the processor (respectively PWM\_CPRDUPDx, PWM\_CDTYUPDx and PWM\_DTUPDx).

To trigger the update, the user must use the bit UPDULOCK in the PWM\_SCUC register which allows to update synchronously (at the same PWM period) the synchronous channels:

- If the bit UPDULOCK is set to '1', the update is done at the next PWM period of the synchronous channels.
- If the UPDULOCK bit is not set to '1', the update is locked and cannot be performed.

After writing the UPDULOCK bit to '1', it is held at this value until the update occurs, then it is read 0.

Sequence for Method 1:

1. Select the manual write of duty-cycle values and the manual update by setting the UPDM field to '0' in the PWM\_SCM register.
2. Define the synchronous channels by the SYNCx bits in the PWM\_SCM register.
3. Enable the synchronous channels by writing CHID0 in the PWM\_ENA register.
4. If an update of the period value and/or the duty-cycle values and/or the dead-time values is required, write registers that need to be updated (PWM\_CPRDUPDx, PWM\_CDTYUPDx and PWM\_DTUPDx).
5. Set UPDULOCK to '1' in PWM\_SCUC.
6. The update of the registers will occur at the beginning of the next PWM period. When the UPDULOCK bit is reset, go to [Step 4](#). for new values.

**Figure 42-19.** Method 1 (UPDM = 0)

#### 42.6.2.9.2 Method 2: Manual write of duty-cycle values and automatic trigger of the update

In this mode, the update of the period value, the duty-cycle values, the dead-time values and the update period value must be done by writing in their respective update registers with the processor (respectively PWM\_CPRDUPDx, PWM\_CDTYUPDx, PWM\_DTUPDx and PWM\_SCUPUPD).

To trigger the update of the period value and the dead-time values, the user must use the bit UPDULOCK in the PWM\_SCUC register, which updates synchronously (at the same PWM period) the synchronous channels:

- If the bit UPDULOCK is set to '1', the update is done at the next PWM period of the synchronous channels.
- If the UPDULOCK bit is not set to '1', the update is locked and cannot be performed.

After writing the UPDULOCK bit to '1', it is held at this value until the update occurs, then it is read 0.

The update of the duty-cycle values and the update period is triggered automatically after an update period.

To configure the automatic update, the user must define a value for the update period by the UPR field in the PWM\_SCUP register. The PWM controller waits UPR+1 period of synchronous channels before updating automatically the duty values and the update period value.

The status of the duty-cycle value write is reported in the [PWM Interrupt Status Register 2](#) (PWM\_ISR2) by the following flags:

- **WRDY:** this flag is set to '1' when the PWM Controller is ready to receive new duty-cycle values and a new update period value. It is reset to '0' when the PWM\_ISR2 register is read.

Depending on the interrupt mask in the [PWM Interrupt Mask Register 2](#) (PWM\_IMR2), an interrupt can be generated by these flags.

Sequence for Method 2:

1. Select the manual write of duty-cycle values and the automatic update by setting the field UPDM to '1' in the PWM\_SCM register
2. Define the synchronous channels by the bits SYNCx in the PWM\_SCM register.
3. Define the update period by the field UPR in the PWM\_SCUP register.
4. Enable the synchronous channels by writing CHID0 in the PWM\_ENA register.
5. If an update of the period value and/or of the dead-time values is required, write registers that need to be updated (PWM\_CPRDUPDx, PWM\_DTUPDx), else go to [Step 8](#).
6. Set UPDULOCK to '1' in PWM\_SCUC.
7. The update of these registers will occur at the beginning of the next PWM period. At this moment the bit UPDULOCK is reset, go to [Step 5](#). for new values.
8. If an update of the duty-cycle values and/or the update period is required, check first that write of new update values is possible by polling the flag WRDY (or by waiting for the corresponding interrupt) in PWM\_ISR2.
9. Write registers that need to be updated (PWM\_CDTYUPDx, PWM\_SCUPUPD).
10. The update of these registers will occur at the next PWM period of the synchronous channels when the Update Period is elapsed. Go to [Step 8](#). for new values.

**Figure 42-20. Method 2 (UPDM = 1)**

### 42.6.2.9.3 Method 3: Automatic write of duty-cycle values and automatic trigger of the update

In this mode, the update of the duty cycle values is made automatically by the DMA Controller. The update of the period value, the dead-time values and the update period value must be done by writing in their respective update registers with the processor (respectively PWM\_CPRDUPDx, PWM\_DTUPDx and PWM\_SCUPUPD).

To trigger the update of the period value and the dead-time values, the user must use the bit UPDULOCK which allows to update synchronously (at the same PWM period) the synchronous channels:

- If the bit UPDULOCK is set to '1', the update is done at the next PWM period of the synchronous channels.
- If the UPDULOCK bit is not set to '1', the update is locked and cannot be performed.

After writing the UPDULOCK bit to '1', it is held at this value until the update occurs, then it is read 0.

The update of the duty-cycle values and the update period value is triggered automatically after an update period.

To configure the automatic update, the user must define a value for the Update Period by the field UPR in the PWM\_SCUP register. The PWM controller waits UPR+1 periods of synchronous channels before updating automatically the duty values and the update period value.

Using the DMA Controller removes processor overhead by reducing its intervention during the transfer. This significantly reduces the number of clock cycles required for a data transfer, which improves microcontroller performance.

The DMA Controller must write the duty-cycle values in the synchronous channels index order. For example if the channels 0, 1 and 3 are synchronous channels, the DMA Controller must write the duty-cycle of the channel 0 first, then the duty-cycle of the channel 1, and finally the duty-cycle of the channel 3.

The status of the DMA Controller transfer is reported in PWM\_ISR2 by the following flags:

- WRDY: this flag is set to '1' when the PWM Controller is ready to receive new duty-cycle values and a new update period value. It is reset to '0' when PWM\_ISR2 is read. The user can choose to synchronize the WRDY flag and the DMA Controller transfer request with a comparison match (see [PWM Comparison Units](#)), by the fields PTRM and PTRCS in the PWM\_SCM register.
- UNRE: this flag is set to '1' when the update period defined by the UPR field has elapsed while the whole data has not been written by the Peripheral DMA Controller. It is reset to '0' when PWM\_ISR2 is read.

Depending on the interrupt mask in PWM\_IMR2, an interrupt can be generated by these flags.

Sequence for Method 3:

1. Select the automatic write of duty-cycle values and automatic update by setting the field UPDM to 2 in the PWM\_SCM register.
2. Define the synchronous channels by the bits SYNCx in the PWM\_SCM register.
3. Define the update period by the field UPR in the PWM\_SCUP register.
4. Define when the WRDY flag and the corresponding DMA Controller transfer request must be set in the update period by the PTRM bit and the PTRCS field in the PWM\_SCM register (at the end of the update period or when a comparison matches).
5. Define the DMA Controller transfer settings for the duty-cycle values and enable it in the DMA Controller registers
6. Enable the synchronous channels by writing CHID0 in the PWM\_ENA register.
7. If an update of the period value and/or of the dead-time values is required, write registers that need to be updated (PWM\_CPRDUPDx, PWM\_DTUPDx), else go to [Step 10](#).

8. Set UPDLOCK to '1' in PWM\_SCUC.
9. The update of these registers will occur at the beginning of the next PWM period. At this moment the bit UPDLOCK is reset, go to [Step 7.](#) for new values.
10. If an update of the update period value is required, check first that write of a new update value is possible by polling the flag WRDY (or by waiting for the corresponding interrupt) in PWM\_ISR2, else go to [Step 14.](#)
11. Write the register that needs to be updated (PWM\_SCUPUPD).
12. The update of this register will occur at the next PWM period of the synchronous channels when the Update Period is elapsed. Go to [Step 10.](#) for new values.
13. Wait for the DMA status flag indicating that the buffer transfer is complete. If the transfer has ended, define a new DMA transfer for new duty-cycle values. Go to [Step 5.](#)
14. **Figure 42-21.** Method 3 (UPDM = 2 and PTRM = 0)

**Figure 42-22.** Method 3 (UPDM = 2 and PTRM = 1 and PTRCS = 0)

#### 42.6.2.10 Update Time for Double-Buffering Registers

All channels integrate a double-buffering system in order to prevent an unexpected output waveform while modifying the period, the spread spectrum value, the polarity, the duty-cycle, the dead-times, the output override, and the synchronous channels update period.

This double-buffering system comprises the following update registers:

- [PWM Sync Channels Update Period Update Register](#)
- [PWM Output Selection Set Update Register](#)
- [PWM Output Selection Clear Update Register](#)
- [PWM Spread Spectrum Update Register](#)
- [PWM Channel Duty Cycle Update Register](#)
- [PWM Channel Period Update Register](#)
- [PWM Channel Dead Time Update Register](#)
- [PWM Channel Mode Update Register](#)

When one of these update registers is written to, the write is stored, but the values are updated only at the next PWM period border. In Left-aligned mode (CALG = 0), the update occurs when the channel counter reaches the period value CPRD. In Center-aligned mode, the update occurs when the channel counter value is decremented and reaches the 0 value.

In Center-aligned mode, it is possible to trigger the update of the polarity and the duty-cycle at the next half period border. This mode concerns the following update registers:

- [PWM Channel Duty Cycle Update Register](#)
- [PWM Channel Mode Update Register](#)

The update occurs at the first half period following the write of the update register (either when the channel counter value is incrementing and reaches the period value CPRD, or when the channel counter value is decrementing and reaches the 0 value). To activate this mode, the user must write a one to the bit UPDS in the [PWM Channel Mode Register](#).

### 42.6.3 PWM Comparison Units

The PWM provides 8 independent comparison units able to compare a programmed value with the current value of the channel 0 counter (which is the channel counter of all synchronous channels, “Synchronous Channels”). These comparisons are intended to generate pulses on the event lines, to generate software interrupts and to trigger DMA Controller transfer requests for the synchronous channels (see [Method 3: Automatic write of duty-cycle values and automatic trigger of the update](#)).

**Figure 42-23.** Comparison Unit Block Diagram

The comparison x matches when it is enabled by the bit CEN in the [PWM Comparison x Mode Register](#) (PWM\_CMPMx for the comparison x) and when the counter of the channel 0 reaches the comparison value defined by the field CV in [PWM Comparison x Value Register](#) (PWM\_CMPVx for the comparison x). If the counter of the channel 0 is center-aligned (CALG = 1 in [PWM Channel Mode Register](#)), the bit CVM in PWM\_CMPVx defines if the comparison is made when the counter is counting up or counting down (in Left-alignment mode CALG = 0, this bit is useless).

If a fault is active on the channel 0, the comparison is disabled and cannot match (see [Fault Protection](#)).

The user can define the periodicity of the comparison x by the fields CTR and CPR in PWM\_CMPMx. The comparison is performed periodically once every CPR+1 periods of the counter of the channel 0, when the value of the comparison period counter CPRCNT in PWM\_CMPMx reaches the value defined by CTR. CPR is the maximum value of the comparison period counter CPRCNT. If CPR = CTR = 0, the comparison is performed at each period of the counter of the channel 0.

The comparison x configuration can be modified while the channel 0 is enabled by using the [PWM Comparison x Mode Update Register](#) (PWM\_CMPMUPDx registers for the comparison x). In the same way, the comparison x value can be modified while the channel 0 is enabled by using the [PWM Comparison x Value Update Register](#) (PWM\_CMPVUPDx registers for the comparison x).

The update of the comparison x configuration and the comparison x value is triggered periodically after the comparison x update period. It is defined by the field CUPR in PWM\_CMPMx. The comparison unit has an update period counter independent from the period counter to trigger this update. When the value of the comparison update period counter CUPRCNT (in PWM\_CMPMx) reaches the value defined by CUPR, the update is triggered. The comparison x update period CUPR itself can be updated while the channel 0 is enabled by using the PWM\_CMPMUPDx register.

The write of PWM\_CMPVUPDx must be followed by a write of PWM\_CMPMUPDx.

---

The comparison match and the comparison update can be source of an interrupt, but only if it is enabled and not masked. These interrupts can be enabled by the [PWM Interrupt Enable Register 2](#) and disabled by the [PWM Interrupt Disable Register 2](#). The comparison match interrupt and the comparison update interrupt are reset by reading the [PWM Interrupt Status Register 2](#).

Figure 42-24. Comparison Waveform

42.6.4 PWM Event Lines

The PWM provides 2 independent event lines intended to trigger actions in other peripherals.

A pulse (one cycle of the peripheral clock) is generated on an event line, when at least one of the selected comparisons is matching. The comparisons can be selected or unselected independently by the CSEL bits in the [PWM Event Line x Register](#) (PWM\_ELMRx for the Event Line x).

An example of event generation is provided in the figure [Event Line Generation Waveform \(Example\)](#).

Figure 42-25. Event Line Block Diagram

**Figure 42-26.** Event Line Generation Waveform (Example)

### 42.6.5 PWM External Trigger Mode

The PWM channels 1 and 2 can be configured to use an external trigger for generating specific PWM signals. The external trigger source can be selected through the bit TRGSRC of the [PWM External Trigger Register](#) (see the table below).

**Table 42-5.** External Event Source Selection

| Channel | Trigger Source Selection | Trigger Source                    |
|---------|--------------------------|-----------------------------------|
| 1       | PWM_ETRG1.TRGSRC = 0     | From PWMEXTRG1 input              |
|         | PWM_ETRG1.TRGSRC = 1     | From Analog Comparator Controller |
| 2       | PWM_ETRG2.TRGSRC = 0     | From PWMEXTRG2 input              |
|         | PWM_ETRG2.TRGSRC = 1     | From Analog Comparator Controller |

Each external trigger source can be filtered by writing a one to the TRGFILT bit in the corresponding [PWM External Trigger Register](#) (PWM\_ETRGx).

Each time an external trigger event is detected, the corresponding PWM channel counter value is stored in the MAXCNT field of the PWM\_ETRGx register if it is greater than the previously stored value. Reading the PWM\_ETRGx register will clear the MAXCNT value.

Three different modes are available for channels 1 and 2 depending on the value of the TRGMODE field of the PWM\_ETRGx register:

- TRGMODE = 1: External PWM Reset Mode
- TRGMODE = 2: External PWM Start Mode
- TRGMODE = 3: Cycle-By-Cycle Duty Mode

See the following sections.

This feature is disabled when TRGMODE = 0.

This feature should only be enabled if the corresponding channel is left-aligned (CALG = 0 in [PWM Channel Mode Register](#) of channel 1 or 2) and not managed as a synchronous channel (SYNCx = 0 in

[PWM Sync Channels Mode Register](#) where  $x = 1$  or  $2$ ). Programming the channel to be center-aligned or synchronous while TRGMODE is not 0 could lead to unexpected behavior.

#### 42.6.5.1 External PWM Reset Mode

External PWM Reset mode is selected by programming TRGMODE = 1 in the PWM\_ETRGx register.

In this mode, when an edge is detected on the PWMEXTRGx input, the internal PWM counter is cleared and a new PWM cycle is restarted. The edge polarity can be selected by programming the TRGEDGE bit in the PWM\_ETRGx register. If no trigger event is detected when the internal channel counter has reached the CPRD value in the [PWM Channel Period Register](#), the internal counter is cleared and a new PWM cycle starts.

Note that this mode does not guarantee a constant  $t_{ON}$  or  $t_{OFF}$  time.

**Figure 42-27.** External PWM Reset Mode

##### 42.6.5.1.1 Application Example

The external PWM Reset mode can be used in power factor correction applications.

In the example below, the external trigger input is the PWMEXTRG1 (therefore the PWM channel used for regulation is the channel 1). The PWM channel 1 period (CPRD in the [PWM Channel Period Register](#) of the channel 1) must be programmed so that the TRGIN1 event always triggers before the PWM channel 1 period elapses.

In the figure below, an external circuit (not shown) is required to sense the inductor current  $I_L$ . The internal PWM counter of the channel 1 is cleared when the inductor current falls below a specific threshold ( $I_{REF}$ ). This starts a new PWM period and increases the inductor current.

**Figure 42-28.** External PWM Reset Mode: Power Factor Correction Application

#### 42.6.5.2 External PWM Start Mode

External PWM Start mode is selected by programming  $TRGMODE = 2$  in the  $PWM\_ETRGx$  register.

In this mode, the internal PWM counter can only be reset once it has reached the CPRD value in the [PWM Channel Period Register](#) and when the correct level is detected on the corresponding external trigger input. Both conditions have to be met to start a new PWM period. The active detection level is defined by the bit  $TRGEDGE$  of the  $PWM\_ETRGx$  register.

Note that this mode guarantees a constant  $t_{ON}$  time and a minimum  $t_{OFF}$  time.

**Figure 42-29. External PWM Start Mode**

#### 42.6.5.2.1 Application Example

The external PWM Start mode generates a modulated frequency PWM signal with a constant active level duration ( $t_{ON}$ ) and a minimum inactive level duration (minimum  $t_{OFF}$ ).

The  $t_{ON}$  time is defined by the CDTY value in the [PWM Channel Duty Cycle Register](#). The minimum  $t_{OFF}$  time is defined by  $CDTY - CPRD$  ([PWM Channel Period Register](#)). This mode can be useful in Buck DC/DC Converter applications.

When the output voltage  $V_{OUT}$  is above a specific threshold ( $V_{ref}$ ), the PWM inactive level is maintained as long as  $V_{OUT}$  remains above this threshold. If  $V_{OUT}$  is below this specific threshold, this mode guarantees a minimum  $t_{OFF}$  time required for MOSFET driving (see the figure below).

**Figure 42-30.** External PWM Start Mode: Buck DC/DC Converter

### 42.6.5.3 Cycle-By-Cycle Duty Mode

#### 42.6.5.3.1 Description

Cycle-by-cycle duty mode is selected by programming  $TRGMODE = 3$  in  $PWM\_ETRGx$ .

In this mode, the PWM frequency is constant and is defined by the CPRD value in the [PWM Channel Period Register](#).

An external trigger event has no effect on the PWM output if it occurs while the internal PWM counter value is above the CDTY value of the [PWM Channel Duty Cycle Register](#).

If the internal PWM counter value is below the value of CDTY of the [PWM Channel Duty Cycle Register](#), an external trigger event makes the PWM output inactive.

The external trigger event can be detected on rising or falling edge according to the TRGEDGE bit in  $PWM\_ETRGx$ .

**Figure 42-31. Cycle-By-Cycle Duty Mode****42.6.5.3.2 Application Example**

The figure below illustrates an application example of the Cycle-by-cycle Duty mode.

In an LED string control circuit, Cycle-by-cycle Duty mode can be used to automatically limit the current in the LED string.

**Figure 42-32.** Cycle-By-Cycle Duty Mode: LED String Control

#### 42.6.5.4 Leading-Edge Blanking (LEB)

PWM channels 1 and 2 support leading-edge blanking. Leading-edge blanking masks the external trigger input when a transient occurs on the corresponding PWM output. It masks potential spurious external events due to power transistor switching.

The blanking delay on each external trigger input is configured by programming the LEBDELAYx in the [PWM Leading-Edge Blanking Register](#).

The LEB can be enabled on both the rising and the falling edges for the PWMH and PWML outputs through the bits PWMLFEN, PWMLREN, PWMHFEN, PWMHREN.

Any event on the PWMEXTRGx input which occurs during the blanking time is ignored.

**Figure 42-33. Leading-Edge Blanking**

## 42.6.6 PWM Controller Operations

### 42.6.6.1 Initialization

Before enabling the channels, they must be configured by the software application as described below:

- Unlock User Interface by writing the WPCMD field in PWM\_WPCR.
- Configuration of the clock generator (DIVA, PREA, DIVB, PREB in the PWM\_CLK register if required).
- Selection of the clock for each channel (CPRE field in PWM\_CMRx)
- Configuration of the waveform alignment for each channel (CALG field in PWM\_CMRx)
- Selection of the counter event selection (if CALG = 1) for each channel (CES field in PWM\_CMRx)
- Configuration of the output waveform polarity for each channel (CPOL bit in PWM\_CMRx)
- Configuration of the period for each channel (CPRD in the PWM\_CPRDx register). Writing in PWM\_CPRDx register is possible while the channel is disabled. After validation of the channel, the user must use PWM\_CPRDUPDx register to update PWM\_CPRDx as explained below.
- Configuration of the duty-cycle for each channel (CDTY in the PWM\_CDTYx register). Writing in PWM\_CDTYx register is possible while the channel is disabled. After validation of the channel, the user must use PWM\_CDTYUPDx register to update PWM\_CDTYx as explained below.
- Configuration of the dead-time generator for each channel (DTH and DTL in PWM\_DTx) if enabled (DTE bit in PWM\_CMRx). Writing in the PWM\_DTx register is possible while the channel is disabled. After validation of the channel, the user must use PWM\_DTUPDx register to update PWM\_DTx
- Selection of the synchronous channels (SYNCx in the PWM\_SCM register)
- Selection of the moment when the WRDY flag and the corresponding DMA Controller transfer request are set (PTRM and PTRCS in the PWM\_SCM register)
- Configuration of the Update mode (UPDM in PWM\_SCM register)
- Configuration of the update period (UPR in PWM\_SCUP register) if needed
- Configuration of the comparisons (PWM\_CMPVx and PWM\_CMPMx)
- Configuration of the event lines (PWM\_ELMRx)

- Configuration of the fault inputs polarity (FPOL in PWM\_FMR)
- Configuration of the fault protection (FMOD and FFIL in PWM\_FMR, PWM\_FPV and PWM\_FPE1)
- Enable of the interrupts (writing CHIDx and FCHIDx in PWM\_IER1, and writing WRDY, UNRE, CMPMx and CMPUx in PWM\_IER2)
- Enable of the PWM channels (writing CHIDx in the PWM\_ENA register)

#### 42.6.6.2 Source Clock Selection Criteria

The large number of source clocks can make selection difficult. The relationship between the value in the [PWM Channel Period Register](#) (PWM\_CPRDx) and the [PWM Channel Duty Cycle Register](#) (PWM\_CDTYx) helps the user select the appropriate clock. The event number written in the Period Register gives the PWM accuracy. The Duty-Cycle quantum cannot be lower than 1/CPRDx value. The higher the value of PWM\_CPRDx, the greater the PWM accuracy.

For example, if the user sets 15 (in decimal) in PWM\_CPRDx, the user is able to set a value from between 1 up to 14 in PWM\_CDTYx. The resulting duty-cycle quantum cannot be lower than 1/15 of the PWM period.

#### 42.6.6.3 Changing the Duty-Cycle, the Period and the Dead-Times

It is possible to modulate the output waveform duty-cycle, period and dead-times.

To prevent unexpected output waveform, the user must use the [PWM Channel Duty Cycle Update Register](#) (PWM\_CDTYUPDx), the [PWM Channel Period Update Register](#) (PWM\_CPRDUPDx) and the [PWM Channel Dead Time Update Register](#) (PWM\_DTUPDx) to change waveform parameters while the channel is still enabled.

- If the channel is an asynchronous channel (SYNCx = 0 in [PWM Sync Channels Mode Register](#) (PWM\_SCM)), these registers hold the new period, duty-cycle and dead-times values until the end of the current PWM period and update the values for the next period.
- If the channel is a synchronous channel and update method 0 is selected (SYNCx = 1 and UPDM = 0 in PWM\_SCM register), these registers hold the new period, duty-cycle and dead-times values until the bit UPDULOCK is written at '1' (in [PWM Sync Channels Update Control Register](#) (PWM\_SCUC)) and the end of the current PWM period, then update the values for the next period.
- If the channel is a synchronous channel and update method 1 or 2 is selected (SYNCx = 1 and UPDM = 1 or 2 in PWM\_SCM register):
  - registers PWM\_CPRDUPDx and PWM\_DTUPDx hold the new period and dead-times values until the bit UPDULOCK is written at '1' (in PWM\_SCUC) and the end of the current PWM period, then update the values for the next period.
  - register PWM\_CDTYUPDx holds the new duty-cycle value until the end of the update period of synchronous channels (when UPRCNT is equal to UPR in [PWM Sync Channels Update Period Register](#) (PWM\_SCUP)) and the end of the current PWM period, then updates the value for the next period.

**Note:** If the update registers PWM\_CDTYUPDx, PWM\_CPRDUPDx and PWM\_DTUPDx are written several times between two updates, only the last written value is taken into account.

**Figure 42-34. Synchronized Period, Duty-Cycle and Dead-Time Update**

#### 42.6.6.4 Changing the Update Period of Synchronous Channels

It is possible to change the update period of synchronous channels while they are enabled. See [Method 2: Manual write of duty-cycle values and automatic trigger of the update](#) and [Method 3: Automatic write of duty-cycle values and automatic trigger of the update](#).

To prevent an unexpected update of the synchronous channels registers, the user must use the [PWM Sync Channels Update Period Update Register](#) (PWM\_SCUPUPD) to change the update period of synchronous channels while they are still enabled. This register holds the new value until the end of the update period of synchronous channels (when UPRCNT is equal to UPR in PWM\_SCUP) and the end of the current PWM period, then updates the value for the next period.

#### Notes:

1. If the update register PWM\_SCUPUPD is written several times between two updates, only the last written value is taken into account.
2. Changing the update period does make sense only if there is one or more synchronous channels and if the update method 1 or 2 is selected (UPDM = 1 or 2 in [PWM Sync Channels Mode Register](#)).

**Figure 42-35.** Synchronized Update of Update Period Value of Synchronous Channels

#### 42.6.6.5 Changing the Comparison Value and the Comparison Configuration

It is possible to change the comparison values and the comparison configurations while the channel 0 is enabled (see [PWM Comparison Units](#)).

To prevent unexpected comparison match, the user must use the [PWM Comparison x Value Update Register](#) (PWM\_CMPVUPDx) and the [PWM Comparison x Mode Update Register](#) (PWM\_CMPPMUPDx) to change, respectively, the comparison values and the comparison configurations while the channel 0 is still enabled. These registers hold the new values until the end of the comparison update period (when CUPRCNT is equal to CUPR in [PWM Comparison x Mode Register](#) (PWM\_CMPMx) and the end of the current PWM period, then update the values for the next period.

The write of the register PWM\_CMPVUPDx must be followed by a write of the register PWM\_CMPPMUPDx.

**Note:** If the update registers PWM\_CMPVUPDx and PWM\_CMPPMUPDx are written several times between two updates, only the last written value are taken into account.

**Figure 42-36.** Synchronized Update of Comparison Values and Configurations

#### 42.6.6.6 Interrupt Sources

Depending on the interrupt mask in PWM\_IMR1 and PWM\_IMR2, an interrupt can be generated at the end of the corresponding channel period (CHIDx in the PWM Interrupt Status Register 1 (PWM\_ISR1)), after a fault event (FCHIDx in PWM\_ISR1), after a comparison match (CMPMx in PWM\_ISR2), after a comparison update (CMPUx in PWM\_ISR2) or according to the Transfer mode of the synchronous channels (WRDY and UNRE in PWM\_ISR2).

If the interrupt is generated by the flags CHIDx or FCHIDx, the interrupt remains active until a read operation in PWM\_ISR1 occurs.

If the interrupt is generated by the flags WRDY or UNRE or CMPMx or CMPUx, the interrupt remains active until a read operation in PWM\_ISR2 occurs.

**A channel interrupt is enabled by setting the corresponding bit in PWM\_IER1 and PWM\_IER2. A channel interrupt is disabled by setting the corresponding bit in PWM\_IDR1 and PWM\_IDR2.**

#### 42.6.7 Register Write Protection

To prevent any single software error that may corrupt PWM behavior, the registers listed below can be write-protected by writing the field WPCMD in the [PWM Write Protection Control Register](#) (PWM\_WPCR). They are divided into six groups:

- Register group 0:
  - [PWM Clock Register](#)
- Register group 1:
  - [PWM Disable Register](#)
  - [PWM Interrupt Enable Register 1](#)
  - [PWM Interrupt Disable Register 1](#)
  - [PWM Interrupt Enable Register 2](#)
  - [PWM Interrupt Disable Register 2](#)
- Register group 2:

- PWM Sync Channels Mode Register
- PWM Channel Mode Register
- PWM Stepper Motor Mode Register
- PWM Fault Protection Value Register 2
- PWM Leading-Edge Blanking Register
- PWM Channel Mode Update Register
- Register group 3:
  - PWM Spread Spectrum Register
  - PWM Spread Spectrum Update Register
  - PWM Channel Period Register
  - PWM Channel Period Update Register
- Register group 4:
  - PWM Channel Dead Time Register
  - PWM Channel Dead Time Update Register
- Register group 5:
  - PWM Fault Mode Register
  - PWM Fault Protection Value Register 1

There are two types of write protection:

- SW write protection—can be enabled or disabled by software
- HW write protection—can be enabled by software but only disabled by a hardware reset of the PWM controller

Both types of write protection can be applied independently to a particular register group by means of the WPCMD and WPRGx fields in PWM\_WPCR. If at least one type of write protection is active, the register group is write-protected. The value of field WPCMD defines the action to be performed:

- 0: Disables SW write protection of the register groups of which the bit WPRGx is at '1'
- 1: Enables SW write protection of the register groups of which the bit WPRGx is at '1'
- 2: Enables HW write protection of the register groups of which the bit WPRGx is at '1'

At any time, the user can determine whether SW or HW write protection is active in a particular register group by the fields WPSWS and WPHWS in the [PWM Write Protection Status Register](#) (PWM\_WPSR).

If a write access to a write-protected register is detected, the WPVS flag in PWM\_WPSR is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS and WPVSRC fields are automatically cleared after reading PWM\_WPSR.

## 42.7 Register Summary

| Offset | Name        | Bit Pos. | 7              | 6     | 5     | 4     | 3           | 2      | 1         | 0        |
|--------|-------------|----------|----------------|-------|-------|-------|-------------|--------|-----------|----------|
| 0x00   | PWM_CLK     | 7:0      | DIVA[7:0]      |       |       |       |             |        |           |          |
|        |             | 15:8     |                |       |       |       | PREA[3:0]   |        |           |          |
|        |             | 23:16    | DIVB[7:0]      |       |       |       |             |        |           |          |
|        |             | 31:24    |                |       |       |       | PREB[3:0]   |        |           |          |
| 0x04   | PWM_ENA     | 7:0      |                |       |       |       | CHID3       | CHID2  | CHID1     | CHID0    |
|        |             | 15:8     |                |       |       |       |             |        |           |          |
|        |             | 23:16    |                |       |       |       |             |        |           |          |
|        |             | 31:24    |                |       |       |       |             |        |           |          |
| 0x08   | PWM_DIS     | 7:0      |                |       |       |       | CHID3       | CHID2  | CHID1     | CHID0    |
|        |             | 15:8     |                |       |       |       |             |        |           |          |
|        |             | 23:16    |                |       |       |       |             |        |           |          |
|        |             | 31:24    |                |       |       |       |             |        |           |          |

### 42.7.1 PWM Clock Register

**Name:** PWM\_CLK  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS0 and WPHWS0 are cleared in the [PWM Write Protection Status Register](#).

#### Bits 27:24 – PREB[3:0] CLKB Source Clock Selection

| Value | Name        | Description           |
|-------|-------------|-----------------------|
| 0     | CLK         | Peripheral clock      |
| 1     | CLK_DIV2    | Peripheral clock/2    |
| 2     | CLK_DIV4    | Peripheral clock/4    |
| 3     | CLK_DIV8    | Peripheral clock/8    |
| 4     | CLK_DIV16   | Peripheral clock/16   |
| 5     | CLK_DIV32   | Peripheral clock/32   |
| 6     | CLK_DIV64   | Peripheral clock/64   |
| 7     | CLK_DIV128  | Peripheral clock/128  |
| 8     | CLK_DIV256  | Peripheral clock/256  |
| 9     | CLK_DIV512  | Peripheral clock/512  |
| 10    | CLK_DIV1024 | Peripheral clock/1024 |
| Other | -           | Reserved              |

#### Bits 23:16 – DIVB[7:0] CLKB Divide Factor

| Value | Name      | Description                                                 |
|-------|-----------|-------------------------------------------------------------|
| 0     | CLKB_POFF | CLKB clock is turned off                                    |
| 1     | PREB      | CLKB clock is clock selected by PREB                        |
| 2–255 | PREB_DIV  | CLKB clock is clock selected by PREB divided by DIVB factor |

#### Bits 11:8 – PREA[3:0] CLKA Source Clock Selection

| Value | Name     | Description        |
|-------|----------|--------------------|
| 0     | CLK      | Peripheral clock   |
| 1     | CLK_DIV2 | Peripheral clock/2 |

| Value | Name        | Description           |
|-------|-------------|-----------------------|
| 2     | CLK_DIV4    | Peripheral clock/4    |
| 3     | CLK_DIV8    | Peripheral clock/8    |
| 4     | CLK_DIV16   | Peripheral clock/16   |
| 5     | CLK_DIV32   | Peripheral clock/32   |
| 6     | CLK_DIV64   | Peripheral clock/64   |
| 7     | CLK_DIV128  | Peripheral clock/128  |
| 8     | CLK_DIV256  | Peripheral clock/256  |
| 9     | CLK_DIV512  | Peripheral clock/512  |
| 10    | CLK_DIV1024 | Peripheral clock/1024 |
| Other | -           | Reserved              |

**Bits 7:0 – DIVA[7:0] CLKA Divide Factor**

| Value | Name      | Description                                                 |
|-------|-----------|-------------------------------------------------------------|
| 0     | CLKA_POFF | CLKA clock is turned off                                    |
| 1     | PREA      | CLKA clock is clock selected by PREA                        |
| 2–255 | PREA_DIV  | CLKA clock is clock selected by PREA divided by DIVA factor |

42.7.2 PWM Enable Register

Name: PWM\_ENA  
Offset: 0x04  
Reset: -  
Property: Write-only

Bits 0, 1, 2, 3 – CHIDx Channel ID

| Value | Description                      |
|-------|----------------------------------|
| 0     | No effect.                       |
| 1     | Enable PWM output for channel x. |

42.7.3 PWM Disable Register

Name: PWM\_DIS  
Offset: 0x08  
Reset: -  
Property: Write-only

This register can only be written if bits WPSWS1 and WPHWS1 are cleared in the [PWM Write Protection Status Register](#).

Bits 0, 1, 2, 3 – CHIDx Channel ID

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No effect.                        |
| 1     | Disable PWM output for channel x. |

42.7.4 PWM Status Register

Name: PWM\_SR  
Offset: 0x0C  
Reset: 0x00000000  
Property: Read-only

Bits 0, 1, 2, 3 – CHIDx Channel ID

| Value | Description                           |
|-------|---------------------------------------|
| 0     | PWM output for channel x is disabled. |
| 1     | PWM output for channel x is enabled.  |

42.7.5 PWM Interrupt Enable Register 1

Name: PWM\_IER1  
Offset: 0x10  
Reset: -  
Property: Write-only

This register can only be written if bits WPSWS1 and WPHWS1 are cleared in the [PWM Write Protection Status Register](#).

|        |    |    |    |    |        |        |        |        |

| Access |    |    |    |    | R      | R      | R      | R      |
| Reset  |    |    |    |    | 0      | 0      | 0      | 0      |

Bits 16, 17, 18, 19 – FCHIDx Fault Protection Trigger on Channel x Interrupt Mask

Bits 0, 1, 2, 3 – CHIDx Counter Event on Channel x Interrupt Mask

### 42.7.8 PWM Interrupt Status Register 1

**Name:** PWM\_ISR1  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

**Note:** Reading PWM\_ISR1 automatically clears CHIDx and FCHIDx flags.

|        |    |    |    |    |        |        |        |        |
|--------|----|----|----|----|--------|--------|--------|--------|
| Bit    | 31 | 30 | 29 | 28 | 27     | 26     | 25     | 24     |
|        |    |    |    |    |        |        |        |        |
| Access |    |    |    |    |        |        |        |        |
| Reset  |    |    |    |    |        |        |        |        |
| Bit    | 23 | 22 | 21 | 20 | 19     | 18     | 17     | 16     |
|        |    |    |    |    | FCHID3 | FCHID2 | FCHID1 | FCHID0 |
| Access |    |    |    |    | R      | R      | R      | R      |
| Reset  |    |    |    |    | 0      | 0      | 0      | 0      |
| Bit    | 15 | 14 | 13 | 12 | 11     | 10     | 9      | 8      |
|        |    |    |    |    |        |        |        |        |
| Access |    |    |    |    |        |        |        |        |
| Reset  |    |    |    |    |        |        |        |        |
| Bit    | 7  | 6  | 5  | 4  | 3      | 2      | 1      | 0      |
|        |    |    |    |    | CHID3  | CHID2  | CHID1  | CHID0  |
| Access |    |    |    |    | R      | R      | R      | R      |
| Reset  |    |    |    |    | 0      | 0      | 0      | 0      |

#### Bits 16, 17, 18, 19 – FCHIDx Fault Protection Trigger on Channel x

| Value | Description                                                                   |
|-------|-------------------------------------------------------------------------------|
| 0     | No new trigger of the fault protection since the last read of PWM_ISR1.       |
| 1     | At least one trigger of the fault protection since the last read of PWM_ISR1. |

#### Bits 0, 1, 2, 3 – CHIDx Counter Event on Channel x

| Value | Description                                                              |
|-------|--------------------------------------------------------------------------|
| 0     | No new counter event has occurred since the last read of PWM_ISR1.       |
| 1     | At least one counter event has occurred since the last read of PWM_ISR1. |

### 42.7.9 PWM Sync Channels Mode Register

**Name:** PWM\_SCM  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the [PWM Write Protection Status Register](#).

|        |            |     |     |      |       |       |           |       |

#### Bits 23:21 – PTRCS[2:0] DMA Controller Transfer Request Comparison Selection

Selection of the comparison used to set the flag WRDY and the corresponding DMA Controller transfer request.

#### Bit 20 – PTRM DMA Controller Transfer Request Mode

| UPDM | PTRM | WRDY Flag and DMA Controller Transfer Request                                                                                                                                    |
|------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    | x    | The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> and the DMA transfer request are never set to '1'.                                                              |
| 1    | x    | The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> is set to '1' as soon as the update period is elapsed, the DMA Controller transfer request is never set to '1'. |
| 2    | 0    | The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> and the DMA transfer request are set to '1' as soon as the update period is elapsed.                            |
|      | 1    | The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> and the DMA transfer request are set to '1' as soon as the selected comparison matches.                         |

#### Bits 17:16 – UPDM[1:0] Synchronous Channels Update Mode

| Value | Name  | Description                                                                                                                                           |
|-------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | MODE0 | Manual write of double buffer registers and manual update of synchronous channels <sup>1</sup> (1).                                                   |
| 1     | MODE1 | Manual write of double buffer registers and automatic update of synchronous channels <sup>2</sup> (2).                                                |
| 2     | MODE2 | The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> and the DMA transfer request are set to '1' as soon as the update period is elapsed. |

**Notes:**

1. The update occurs at the beginning of the next PWM period, when the UPDULOCK bit in [PWM Sync Channels Update Control Register](#) is set.
2. The update occurs when the Update Period is elapsed.

**Bits 0, 1, 2, 3 – SYNCx Synchronous Channel x**

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | Channel x is not a synchronous channel. |
| 1     | Channel x is a synchronous channel.     |

42.7.10 PWM DMA Register

**Name:** PWM\_DMAR  
**Offset:** 0x24  
**Reset:** –  
**Property:** Write-only

Only the first 16 bits (channel counter size) are significant.

|        |                |    |    |    |    |    |    |    |
|--------|----------------|----|----|----|----|----|----|----|
| Bit    | 31             | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |                |    |    |    |    |    |    |    |
| Access |                |    |    |    |    |    |    |    |
| Reset  |                |    |    |    |    |    |    |    |
| Bit    | 23             | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | DMADUTY[23:16] |    |    |    |    |    |    |    |
| Access | W              | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0              | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 15             | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | DMADUTY[15:8]  |    |    |    |    |    |    |    |
| Access | W              | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0              | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7              | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | DMADUTY[7:0]   |    |    |    |    |    |    |    |
| Access | W              | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0              | 0  | 0  | 0  | 0  | 0  | 0  | –  |

**Bits 23:0 – DMADUTY[23:0]** Duty-Cycle Holding Register for DMA Access  
 Each write access to PWM\_DMAR sequentially updates PWM\_CDTYUPDx.CDTYUPD with DMADUTY (only for channel configured as synchronous). See [“Method 3: Automatic write of duty-cycle values and automatic trigger of the update”](#) .

42.7.11 PWM Sync Channels Update Control Register

Name: PWM\_SCUC  
Offset: 0x28  
Reset: 0x00000000  
Property: Read/Write

Bit 0 – UPDULOCK Synchronous Channels Update Unlock  
This bit is automatically reset when the update is done.

| Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 1     | If the UPDM field is set to '0' in <a href="#">PWM Sync Channels Mode Register</a> , writing the UPDULOCK bit to '1' triggers the update of the period value, the duty-cycle and the dead-time values of synchronous channels at the beginning of the next PWM period. If the field UPDM is set to '1' or '2', writing the UPDULOCK bit to '1' triggers only the update of the period value and of the dead-time values of synchronous channels. |

### 42.7.12 PWM Sync Channels Update Period Register

**Name:** PWM\_SCUP  
**Offset:** 0x2C  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 7:4 – UPRCNT[3:0]** Update Period Counter  
 Reports the value of the update period counter.

**Bits 3:0 – UPR[3:0]** Update Period  
 Defines the time between each update of the synchronous channels if automatic trigger of the update is activated (UPDM = 1 or UPDM = 2 in [PWM Sync Channels Mode Register](#)). This time is equal to UPR+1 periods of the synchronous channels.

### 42.7.13 PWM Sync Channels Update Period Update Register

**Name:** PWM\_SCUPUPD  
**Offset:** 0x30  
**Reset:** –  
**Property:** Write-only

This register acts as a double buffer for the UPR value. This prevents an unexpected automatic trigger of the update of synchronous channels.

|        |    |    |    |    |             |    |    |    |
|--------|----|----|----|----|-------------|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27          | 26 | 25 | 24 |

|        |    |    |    |    |             |    |    |    |
| Access |    |    |    |    |             |    |    |    |
| Reset  |    |    |    |    |             |    |    |    |
| Bit    | 7  | 6  | 5  | 4  | 3           | 2  | 1  | 0  |
|        |    |    |    |    | UPRUPD[3:0] |    |    |    |
| Access |    |    |    |    | W           | W  | W  | W  |
| Reset  |    |    |    |    | 0           | 0  | 0  | –  |

**Bits 3:0 – UPRUPD[3:0] Update Period Update**  
 Defines the wanted time between each update of the synchronous channels if automatic trigger of the update is activated (UPDM = 1 or UPDM = 2 in [PWM Sync Channels Mode Register](#)). This time is equal to UPR+1 periods of the synchronous channels.

## 42.7.14 PWM Interrupt Enable Register 2

**Name:** PWM\_IER2

**Offset:** 0x34

**Reset:** –

**Property:** Write-only

This register can only be written if bits WPSWS1 and WPHWS1 are cleared in the [PWM Write Protection Status Register](#).

|        |       |       |       |       |       |       |       |       |

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – CMPUx** Comparison x Update Interrupt Enable

**Bits 8, 9, 10, 11, 12, 13, 14, 15 – CMPMx** Comparison x Match Interrupt Enable

**Bit 3 – UNRE** Synchronous Channels Update Underrun Error Interrupt Enable

**Bit 0 – WRDY** Write Ready for Synchronous Channels Update Interrupt Enable

## 42.7.15 PWM Interrupt Disable Register 2

**Name:** PWM\_IDR2  
**Offset:** 0x38  
**Reset:** –  
**Property:** Write-only

This register can only be written if bits WPSWS1 and WPHWS1 are cleared in the [PWM Write Protection Status Register](#).

|        |    |    |    |    |    |    |    |    |

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – CMPUx** Comparison x Update Interrupt Mask

**Bits 8, 9, 10, 11, 12, 13, 14, 15 – CMPMx** Comparison x Match Interrupt Mask

**Bit 3 – UNRE** Synchronous Channels Update Underrun Error Interrupt Mask

**Bit 0 – WRDY** Write Ready for Synchronous Channels Update Interrupt Mask

## 42.7.17 PWM Interrupt Status Register 2

**Name:** PWM\_ISR2  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read-only

Reading PWM\_ISR2 automatically clears flags WRDY, UNRE and CMPSx.

## Bits 16, 17, 18, 19, 20, 21, 22, 23 – CMPUx Comparison x Update

| Value | Description                                                                                       |
|-------|---------------------------------------------------------------------------------------------------|
| 0     | The comparison x has not been updated since the last read of the PWM_ISR2 register.               |
| 1     | The comparison x has been updated at least one time since the last read of the PWM_ISR2 register. |

## Bits 8, 9, 10, 11, 12, 13, 14, 15 – CMPMx Comparison x Match

| Value | Description                                                                                  |
|-------|----------------------------------------------------------------------------------------------|
| 0     | The comparison x has not matched since the last read of the PWM_ISR2 register.               |
| 1     | The comparison x has matched at least one time since the last read of the PWM_ISR2 register. |

## Bit 3 – UNRE Synchronous Channels Update Underrun Error

| Value | Description                                                                                                  |
|-------|--------------------------------------------------------------------------------------------------------------|
| 0     | No Synchronous Channels Update Underrun has occurred since the last read of the PWM_ISR2 register.           |
| 1     | At least one Synchronous Channels Update Underrun has occurred since the last read of the PWM_ISR2 register. |

## Bit 0 – WRDY Write Ready for Synchronous Channels Update

| Value | Description                                                                         |
|-------|-------------------------------------------------------------------------------------|
| 0     | New duty-cycle and dead-time values for the synchronous channels cannot be written. |
| 1     | New duty-cycle and dead-time values for the synchronous channels can be written.    |

42.7.18 PWM Output Override Value Register

Name: PWM\_OOV  
Offset: 0x44

**Bits 16, 17, 18, 19 – OSCUPLx** Output Selection Clear for PWML output of the channel x

| Value | Description                                                                                                              |
|-------|--------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                               |
| 1     | Dead-time generator output DTOLx selected as PWML output of channel x at the beginning of the next channel x PWM period. |

**Bits 0, 1, 2, 3 – OSCUPHx** Output Selection Clear for PWMH output of the channel x

| Value | Description                                                                                                              |
|-------|--------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                               |
| 1     | Dead-time generator output DTOHx selected as PWMH output of channel x at the beginning of the next channel x PWM period. |

## 42.7.24 PWM Fault Mode Register

**Name:** PWM\_FMR  
**Offset:** 0x5C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the [PWM Write Protection Status Register](#).

See [Fault Inputs](#) for details on fault generation.

To prevent an unexpected activation of the status flag FSy in the [PWM Fault Status Register](#), the bit FMODEy can be set to '1' only if the FPOLy bit has been previously configured to its final value.

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

### Bits 23:16 – FFIL[7:0] Fault Filtering

For each bit y of FFIL, where y is the fault input number:

0: The fault input y is not filtered.

1: The fault input y is filtered.

### Bits 15:8 – FMODE[7:0] Fault Activation Mode

For each bit y of FMODE, where y is the fault input number:

0: The fault y is active until the fault condition is removed at the peripheral<sup>(1)</sup> level.

1: The fault y stays active until the fault condition is removed at the peripheral level<sup>(1)</sup> AND until it is cleared in the [PWM Fault Clear Register](#).

#### Note:

1. The peripheral generating the fault.

### Bits 7:0 – FPOL[7:0] Fault Polarity

For each bit y of FPOL, where y is the fault input number:

0: The fault y becomes active when the fault input y is at 0.

1: The fault y becomes active when the fault input y is at 1.

### 42.7.25 PWM Fault Status Register

**Name:** PWM\_FSR  
**Offset:** 0x60  
**Reset:** 0x00000000  
**Property:** Read-only

Refer to [Fault Inputs](#) for details on fault generation.

|        |          |    |    |    |    |    |    |    |
|--------|----------|----|----|----|----|----|----|----|
| Bit    | 31       | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |          |    |    |    |    |    |    |    |
| Access |          |    |    |    |    |    |    |    |

| Bit    | 23       | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |          |    |    |    |    |    |    |    |
| Access |          |    |    |    |    |    |    |    |
| Reset  |          |    |    |    |    |    |    |    |
| Bit    | 15       | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | FS[7:0]  |    |    |    |    |    |    |    |
| Access | R        | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0        | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7        | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | FIV[7:0] |    |    |    |    |    |    |    |
| Access | R        | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0        | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 15:8 – FS[7:0] Fault Status**  
 For each bit y of FS, where y is the fault input number:  
 0: The fault y is not currently active.  
 1: The fault y is currently active.

**Bits 7:0 – FIV[7:0] Fault Input Value**  
 For each bit y of FIV, where y is the fault input number:  
 0: The current sampled value of the fault input y is 0 (after filtering if enabled).  
 1: The current sampled value of the fault input y is 1 (after filtering if enabled).

42.7.26 PWM Fault Clear Register

Name: PWM\_FCR  
Offset: 0x64  
Reset: -  
Property: Write-only

See [Fault Inputs](#) for details on fault generation.

|        |           |    |    |    |    |    |    |    |
|--------|-----------|----|----|----|----|----|----|----|
| Bit    | 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |           |    |    |    |    |    |    |    |
| Access |           |    |    |    |    |    |    |    |
| Reset  |           |    |    |    |    |    |    |    |
| Bit    | 23        | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |           |    |    |    |    |    |    |    |
| Access |           |    |    |    |    |    |    |    |
| Reset  |           |    |    |    |    |    |    |    |
| Bit    | 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        |           |    |    |    |    |    |    |    |
| Access |           |    |    |    |    |    |    |    |
| Reset  |           |    |    |    |    |    |    |    |
| Bit    | 7         | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | FCLR[7:0] |    |    |    |    |    |    |    |
| Access | W         | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0  | -  |

Bits 7:0 – FCLR[7:0] Fault Clear

For each bit y of FCLR, where y is the fault input number:

0: No effect.

1: If bit y of FMODE field is set to '1' and if the fault input y is not at the level defined by the bit y of FPOL field, the fault y is cleared and becomes inactive (FMODE and FPOL fields belong to [PWM Fault Mode Register](#)), else writing this bit to '1' has no effect.

### 42.7.27 PWM Fault Protection Value Register 1

**Name:** PWM\_FPV1  
**Offset:** 0x68  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the [PWM Write Protection Status Register](#).

See [Fault Inputs](#) for details on fault generation.

|        |    |    |    |    |       |       |       |       |
|--------|----|----|----|----|-------|-------|-------|-------|
| Bit    | 31 | 30 | 29 | 28 | 27    | 26    | 25    | 24    |
|        |    |    |    |    |       |       |       |       |
| Access |    |    |    |    |       |       |       |       |
| Reset  |    |    |    |    |       |       |       |       |
| Bit    | 23 | 22 | 21 | 20 | 19    | 18    | 17    | 16    |

| Access |    |    |    |    | R/W   | R/W   | R/W   | R/W   |
| Reset  |    |    |    |    | 0     | 0     | 0     | 0     |
| Bit    | 15 | 14 | 13 | 12 | 11    | 10    | 9     | 8     |
|        |    |    |    |    |       |       |       |       |
| Access |    |    |    |    |       |       |       |       |
| Reset  |    |    |    |    |       |       |       |       |
| Bit    | 7  | 6  | 5  | 4  | 3     | 2     | 1     | 0     |
|        |    |    |    |    | FPVH3 | FPVH2 | FPVH1 | FPVH0 |
| Access |    |    |    |    | R/W   | R/W   | R/W   | R/W   |
| Reset  |    |    |    |    | 0     | 0     | 0     | 0     |

#### Bits 16, 17, 18, 19 – FPVLx Fault Protection Value for PWML output on channel x

This bit is taken into account only if the bit FPZLx is set to '0' in [PWM Fault Protection Value Register 2](#).

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | PWML output of channel x is forced to '0' when fault occurs. |
| 1     | PWML output of channel x is forced to '1' when fault occurs. |

#### Bits 0, 1, 2, 3 – FPHVx Fault Protection Value for PWMH output on channel x

This bit is taken into account only if the bit FPZHx is set to '0' in [PWM Fault Protection Value Register 2](#).

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | PWMH output of channel x is forced to '0' when fault occurs. |
| 1     | PWMH output of channel x is forced to '1' when fault occurs. |

## 42.7.28 PWM Fault Protection Enable Register

**Name:** PWM\_FPE  
**Offset:** 0x6C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the [PWM Write Protection Status Register](#).

Only the first 7 bits (number of fault input pins) of the register fields are significant.

Refer to [Section 6.4 “Fault Inputs”](#) for details on fault generation.

**Bits 0:7, 8:15, 16:23, 24:31 – FPE<sub>x</sub>** Fault Protection Enable for channel x

For each bit y of FPE<sub>x</sub>, where y is the fault input number:

0: Fault y is not used for the fault protection of channel x.

1: Fault y is used for the fault protection of channel x.

To prevent an unexpected activation of the fault protection, the bit y of FPE<sub>x</sub> field can be set to '1' only if the corresponding FPOL field has been previously configured to its final value in [PWM Fault Mode Register](#).

42.7.29 PWM Event Line x Mode Register

**Name:** PWM\_ELMRx  
**Offset:** 0x7C + x\*0x04 [x=0..1]  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |    |    |    |    |    |    |    |

Bits 0, 1, 2, 3, 4, 5, 6, 7 – CSELy Comparison y Selection

| Value | Description                                                                 |
|-------|-----------------------------------------------------------------------------|
| 0     | A pulse is not generated on the event line x when the comparison y matches. |
| 1     | A pulse is generated on the event line x when the comparison y match.       |

### 42.7.30 PWM Spread Spectrum Register

**Name:** PWM\_SSPR  
**Offset:** 0xA0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the [PWM Write Protection Status Register](#).

Only the first 16 bits (channel counter size) are significant.

#### Bit 24 – SPRDM Spread Spectrum Counter Mode

| Value | Description                                                                                                                                                                                                |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Triangular mode. The spread spectrum counter starts to count from -SPRD when the channel 0 is enabled and counts upwards at each PWM period. When it reaches +SPRD, it restarts to count from -SPRD again. |
| 1     | Random mode. The spread spectrum counter is loaded with a new random value at each PWM period. This random value is uniformly distributed and is between -SPRD and +SPRD.                                  |

#### Bits 23:0 – SPRD[23:0] Spread Spectrum Limit Value

The spread spectrum limit value defines the range for the spread spectrum counter. It is introduced in order to achieve constant varying PWM period for the output waveform.

### 42.7.31 PWM Spread Spectrum Update Register

**Name:** PWM\_SSPUP  
**Offset:** 0xA4  
**Reset:** –  
**Property:** Write-only

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the [PWM Write Protection Status Register](#).

This register acts as a double buffer for the SPRD value. This prevents an unexpected waveform when modifying the spread spectrum limit value.

Only the first 16 bits (channel counter size) are significant.

|        |               |    |    |    |    |    |    |    |

| Reset  | 0             | 0  | 0  | 0  | 0  | 0  | 0  | –  |

#### Bits 23:0 – SPRDUP[23:0] Spread Spectrum Limit Value Update

The spread spectrum limit value defines the range for the spread spectrum counter. It is introduced in order to achieve constant varying period for the output waveform.

42.7.32 PWM Stepper Motor Mode Register

Name: PWM\_SMMR  
Offset: 0xB0  
Reset: 0x00000000  
Property: Read/Write

Bits 16, 17 – DOWNx Down Count

| Value | Description   |
|-------|---------------|
| 0     | Up counter.   |
| 1     | Down counter. |

Bits 0, 1 – GCENx Gray Count Enable

| Value | Description                                                                         |
|-------|-------------------------------------------------------------------------------------|
| 0     | Disable Gray count generation on PWML[2*x], PWMH[2*x], PWML[2*x + 1], PWMH[2*x + 1] |
| 1     | Enable Gray count generation on PWML[2*x], PWMH[2*x], PWML[2*x + 1], PWMH[2*x + 1]. |

### 42.7.33 PWM Fault Protection Value Register 2

**Name:** PWM\_FPV2  
**Offset:** 0xC0  
**Reset:** 0x000F000F  
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the [PWM Write Protection Status Register](#).

|        |    |    |    |    |       |       |       |       |

|        |    |    |    |    |       |       |       |       |
| Access |    |    |    |    |       |       |       |       |
| Reset  |    |    |    |    |       |       |       |       |
| Bit    | 7  | 6  | 5  | 4  | 3     | 2     | 1     | 0     |
|        |    |    |    |    | FPZH3 | FPZH2 | FPZH1 | FPZH0 |
| Access |    |    |    |    | R/W   | R/W   | R/W   | R/W   |
| Reset  |    |    |    |    | 1     | 1     | 1     | 1     |

#### Bits 16, 17, 18, 19 – FPZLx Fault Protection to Hi-Z for PWML output on channel x

| Value | Description                                                                                                                                        |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | When fault occurs, PWML output of channel x is forced to value defined by the bit FPVLx in <a href="#">PWM Fault Protection Value Register 1</a> . |
| 1     | When fault occurs, PWML output of channel x is forced to high-impedance state.                                                                     |

#### Bits 0, 1, 2, 3 – FPZHx Fault Protection to Hi-Z for PWMH output on channel x

| Value | Description                                                                                                                                        |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | When fault occurs, PWMH output of channel x is forced to value defined by the bit FPVHx in <a href="#">PWM Fault Protection Value Register 1</a> . |
| 1     | When fault occurs, PWMH output of channel x is forced to high-impedance state.                                                                     |

## 42.7.34 PWM Write Protection Control Register

**Name:** PWM\_WPCR  
**Offset:** 0xE4  
**Reset:** –  
**Property:** Write-only

See [Register Write Protection](#) for the list of registers that can be write-protected.

|        |              |       |       |       |       |       |            |    |
|--------|--------------|-------|-------|-------|-------|-------|------------|----|
| Bit    | 31           | 30    | 29    | 28    | 27    | 26    | 25         | 24 |
|        | WPKEY[23:16] |       |       |       |       |       |            |    |

## Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                                               |
|----------|--------|-----------------------------------------------------------------------------------------------------------|
| 0x50574D | PASSWD | Writing any other value in this field aborts the write operation of the WPCMD field.<br>Always reads as 0 |

## Bits 2, 3, 4, 5, 6, 7 – WPRGx Write Protection Register Group x

| Value | Description                                              |
|-------|----------------------------------------------------------|
| 0     | The WPCMD command has no effect on the register group x. |
| 1     | The WPCMD command is applied to the register group x.    |

## Bits 1:0 – WPCMD[1:0] Write Protection Command

This command is performed only if the WPKEY corresponds to 0x50574D (“PWM” in ASCII).

| Value | Name            | Description                                                                                                                                                                                                                                                                                                           |
|-------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | DISABLE_SW_PROT | Disables the software write protection of the register groups of which the bit WPRGx is at ‘1’.                                                                                                                                                                                                                       |
| 1     | ENABLE_SW_PROT  | Enables the software write protection of the register groups of which the bit WPRGx is at ‘1’.                                                                                                                                                                                                                        |
| 2     | ENABLE_HW_PROT  | Enables the hardware write protection of the register groups of which the bit WPRGx is at ‘1’. Only a hardware reset of the PWM controller can disable the hardware write protection. Moreover, to meet security requirements, the PIO lines associated with the PWM can not be configured through the PIO interface. |

## 42.7.35 PWM Write Protection Status Register

**Name:** PWM\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

|        |             |    |        |        |        |        |        |        |
|--------|-------------|----|--------|--------|--------|--------|--------|--------|
| Bit    | 31          | 30 | 29     | 28     | 27     | 26     | 25     | 24     |
|        | WPVSR[15:8] |    |        |        |        |        |        |        |
| Access | R           | R  | R      | R      | R      | R      | R      | R      |
| Reset  | 0           | 0  | 0      | 0      | 0      | 0      | 0      | 0      |
| Bit    | 23          | 22 | 21     | 20     | 19     | 18     | 17     | 16     |

| Access | R           |    | R      | R      | R      | R      | R      | R      |
| Reset  | 0           |    | 0      | 0      | 0      | 0      | 0      | 0      |

## Bits 31:16 – WPVSR[15:0] Write Protect Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

## Bits 8, 9, 10, 11, 12, 13 – WPHWSx Write Protect HW Status

| Value | Description                                                    |
|-------|----------------------------------------------------------------|
| 0     | The HW write protection x of the register group x is disabled. |
| 1     | The HW write protection x of the register group x is enabled.  |

## Bit 7 – WPVS Write Protect Violation Status

| Value | Description                                                                                                                                                                                                              |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protection violation has occurred since the last read of PWM_WPSR.                                                                                                                                              |
| 1     | At least one write protection violation has occurred since the last read of PWM_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

## Bits 0, 1, 2, 3, 4, 5 – WPSWSx Write Protect SW Status

| Value | Description                                                    |
|-------|----------------------------------------------------------------|
| 0     | The SW write protection x of the register group x is disabled. |
| 1     | The SW write protection x of the register group x is enabled.  |

### 42.7.36 PWM Comparison x Value Register

**Name:** PWM\_CMPVx  
**Offset:** 0x0130 + x\*0x10 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read/Write

Only the first 16 bits (channel counter size) of field CV are significant.

|        |    |    |    |    |    |    |    |     |
|--------|----|----|----|----|----|----|----|-----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24  |
|        |    |    |    |    |    |    |    | CVM |
| Access |    |    |    |    |    |    |    | R/W |
| Reset  |    |    |    |    |    |    |    | 0   |

|        |           |     |     |     |     |     |     |     |
|--------|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 23        | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | CV[23:16] |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

|        |          |     |     |     |     |     |     |     |
|--------|----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 15       | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | CV[15:8] |     |     |     |     |     |     |     |
| Access | R/W      | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0        | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

|        |         |     |     |     |     |     |     |     |
|--------|---------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 7       | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | CV[7:0] |     |     |     |     |     |     |     |
| Access | R/W     | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0       | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bit 24 – CVM Comparison x Value Mode

| Value | Description                                                                                                                                                                                                                                                                     |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is incrementing.                                                                                                                                                |
| 1     | The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is decrementing.<br><br>Note: This bit is not relevant if the counter of the channel 0 is left-aligned (CALG = 0 in <a href="#">PWM Channel Mode Register</a> ) |

#### Bits 23:0 – CV[23:0] Comparison x Value

Define the comparison x value to be compared with the counter of the channel 0.

### 42.7.37 PWM Comparison x Value Update Register

**Name:** PWM\_CMPVUPDx  
**Offset:** 0x0134 + x\*0x10 [x=0..7]  
**Reset:** –  
**Property:** Write-only

This register acts as a double buffer for the CV and CVM values. This prevents an unexpected comparison x match.

Only the first 16 bits (channel counter size) of field CVUPD are significant.

The write of the register PWM\_CMPVUPDx must be followed by a write of the register PWM\_CMPMUPDx.

|        |    |    |    |    |    |    |    |        |
|--------|----|----|----|----|----|----|----|--------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24     |
|        |    |    |    |    |    |    |    | CVMUPD |
| Access |    |    |    |    |    |    |    | W      |
| Reset  |    |    |    |    |    |    |    | –      |

|        |              |    |    |    |    |    |    |    |

| Bit    | 7          | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|        | CVUPD[7:0] |   |   |   |   |   |   |   |
| Access | W          | W | W | W | W | W | W | W |
| Reset  | 0          | 0 | 0 | 0 | 0 | 0 | 0 | – |

#### Bit 24 – CVMUPD Comparison x Value Mode Update

**Note:** This bit is not relevant if the counter of the channel 0 is left-aligned (CALG = 0 in [PWM Channel Mode Register](#))

| Value | Description                                                                                                                      |
|-------|----------------------------------------------------------------------------------------------------------------------------------|
| 0     | The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is incrementing. |
| 1     | The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is decrementing. |

#### Bits 23:0 – CVUPD[23:0] Comparison x Value Update

Define the comparison x value to be compared with the counter of the channel 0.

**42.7.38 PWM Comparison x Mode Register**

**Name:** PWM\_CMPMx  
**Offset:** 0x0138 + x\*0x10 [x=0..7]  
**Reset:** 0x00000000  
**Property:** R/W

|        |              |     |     |     |           |     |     |     |

| Reset  | R/W          | R/W | R/W | R/W | R/W       | R/W | R/W | R/W |
| Reset  | 0            | 0   | 0   | 0   | 0         | 0   | 0   | 0   |
| Bit    | 7            | 6   | 5   | 4   | 3         | 2   | 1   | 0   |
| Access | CTR[3:0]     |     |     |     |           |     |     | CEN |
| Reset  | R/W          | R/W | R/W | R/W |           |     |     | R/W |
| Reset  | 0            | 0   | 0   | 0   |           |     |     | 0   |

**Bits 23:20 – CUPRCNT[3:0] Comparison x Update Period Counter**

Reports the value of the comparison x update period counter.

Note: The field CUPRCNT is read-only

**Bits 19:16 – CUPR[3:0] Comparison x Update Period**

Defines the time between each update of the comparison x mode and the comparison x value. This time is equal to CUPR+1 periods of the channel 0 counter.

**Bits 15:12 – CPRCNT[3:0] Comparison x Period Counter**

Reports the value of the comparison x period counter.

Note: The field CPRCNT is read-only

**Bits 11:8 – CPR[3:0] Comparison x Period**

CPR defines the maximum value of the comparison x period counter (CPRCNT). The comparison x value is performed periodically once every CPR+1 periods of the channel 0 counter.

**Bits 7:4 – CTR[3:0] Comparison x Trigger**

The comparison x is performed when the value of the comparison x period counter (CPRCNT) reaches the value defined by CTR.

**Bit 0 – CEN Comparison x Enable**

| Value | Description                                     |
|-------|-------------------------------------------------|
| 0     | The comparison x is disabled and can not match. |
| 1     | The comparison x is enabled and can match.      |

### 42.7.39 PWM Comparison x Mode Update Register

**Name:** PWM\_CMPMUPDx  
**Offset:** 0x013C + x\*0x10 [x=0..7]  
**Reset:** –  
**Property:** W

This register acts as a double buffer for the CEN, CTR, CPR and CUPR values. This prevents an unexpected comparison x match.

|        |             |    |    |    |              |    |    |        |
|--------|-------------|----|----|----|--------------|----|----|--------|

#### Bits 19:16 – CUPRUPD[3:0] Comparison x Update Period Update

Defines the time between each update of the comparison x mode and the comparison x value. This time is equal to CUPR+1 periods of the channel 0 counter.

#### Bits 11:8 – CPRUPD[3:0] Comparison x Period Update

CPR defines the maximum value of the comparison x period counter (CPRCNT). The comparison x value is performed periodically once every CPR+1 periods of the channel 0 counter.

#### Bits 7:4 – CTRUPD[3:0] Comparison x Trigger Update

The comparison x is performed when the value of the comparison x period counter (CPRCNT) reaches the value defined by CTR.

#### Bit 0 – CENUPD Comparison x Enable Update

| Value | Description                                     |
|-------|-------------------------------------------------|
| 0     | The comparison x is disabled and can not match. |
| 1     | The comparison x is enabled and can match.      |

## 42.7.40 PWM Channel Mode Register

**Name:** PWM\_CMRx  
**Offset:** 0x0200 + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the [PWM Write Protection Status Register](#).

|        |    |    |      |       |           |      |      |      |
|--------|----|----|------|-------|-----------|------|------|------|
| Bit    | 31 | 30 | 29   | 28    | 27        | 26   | 25   | 24   |
| Access |    |    |      |       |           |      |      |      |
| Reset  |    |    |      |       |           |      |      |      |
| Bit    | 23 | 22 | 21   | 20    | 19        | 18   | 17   | 16   |
| Access |    |    |      |       | PPM       | DTLI | DTHI | DTE  |
| Reset  |    |    |      |       | R/W       | R/W  | R/W  | R/W  |
|        |    |    |      |       | 0         | 0    | 0    | 0    |
| Bit    | 15 | 14 | 13   | 12    | 11        | 10   | 9    | 8    |
| Access |    |    | TCTS | DPOLI | UPDS      | CES  | CPOL | CALG |
| Reset  |    |    | R/W  | R/W   | R/W       | R/W  | R/W  | R/W  |
|        |    |    | 0    | 0     | 0         | 0    | 0    | 0    |
| Bit    | 7  | 6  | 5    | 4     | 3         | 2    | 1    | 0    |
| Access |    |    |      |       | CPRE[3:0] |      |      |      |
| Reset  |    |    |      |       | R/W       | R/W  | R/W  | R/W  |
|        |    |    |      |       | 0         | 0    | 0    | 0    |

### Bit 19 – PPM Push-Pull Mode

The Push-Pull mode is enabled for channel x.

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | The Push-Pull mode is disabled for channel x. |
| 1     | The Push-Pull mode is enabled for channel x.  |

### Bit 18 – DTLI Dead-Time PWMLx Output Inverted

| Value | Description                                 |
|-------|---------------------------------------------|
| 0     | The dead-time PWMLx output is not inverted. |
| 1     | The dead-time PWMLx output is inverted.     |

### Bit 17 – DTHI Dead-Time PWMHx Output Inverted

| Value | Description                                 |
|-------|---------------------------------------------|
| 0     | The dead-time PWMHx output is not inverted. |
| 1     | The dead-time PWMHx output is inverted.     |

### Bit 16 – DTE Dead-Time Generator Enable

| Value | Description                          |
|-------|--------------------------------------|
| 0     | The dead-time generator is disabled. |
| 1     | The dead-time generator is enabled.  |

### Bit 13 – TCTS Timer Counter Trigger Selection

| Value | Description                                                                                     |
|-------|-------------------------------------------------------------------------------------------------|
| 0     | The comparator of the channel x (OCx) is used as the trigger source for the Timer Counter (TC). |
| 1     | The counter events of the channel x is used as the trigger source for the Timer Counter (TC).   |

**Bit 12 – DPOLI** Disabled Polarity Inverted

| Value | Description                                                                                                                                   |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | When the PWM channel x is disabled ( $CHIDx(PWM\_SR) = 0$ ), the OCx output waveform is the same as the one defined by the CPOL bit.          |
| 1     | When the PWM channel x is disabled ( $CHIDx(PWM\_SR) = 0$ ), the OCx output waveform is inverted compared to the one defined by the CPOL bit. |

**Bit 11 – UPDS** Update Selection

If the PWM period is center-aligned ( $CALG=1$ ):

0: The update occurs at the next end of the PWM period after writing the update register(s).

1: The update occurs at the next end of the PWM half period after writing the update register(s).

If the PWM period is left-aligned ( $CALG=0$ ), the update always occurs at the end of the PWM period after writing the update register(s).

**Bit 10 – CES** Counter Event Selection

If the PWM period is center-aligned ( $CALG=1$ ):

0: The channel counter event occurs at the end of the PWM period.

1: The channel counter event occurs at the end of the PWM period and at half the PWM period.

If the PWM period is left-aligned ( $CALG=0$ ), the channel counter event occurs at the end of the period and the CES bit has no effect.

**Bit 9 – CPOL** Channel Polarity

| Value | Description                                                                  |
|-------|------------------------------------------------------------------------------|
| 0     | The OCx output waveform (output from the comparator) starts at a low level.  |
| 1     | The OCx output waveform (output from the comparator) starts at a high level. |

**Bit 8 – CALG** Channel Alignment

| Value | Description                   |
|-------|-------------------------------|
| 0     | The period is left-aligned.   |
| 1     | The period is center-aligned. |

**Bits 3:0 – CPRE[3:0]** Channel Prescaler

| Value | Name         | Description           |
|-------|--------------|-----------------------|
|       | MCK          | Peripheral clock      |
| 1     | MCK_DIV_2    | Peripheral clock/2    |
| 2     | MCK_DIV_4    | Peripheral clock/4    |
| 3     | MCK_DIV_8    | Peripheral clock/8    |
| 4     | MCK_DIV_16   | Peripheral clock/16   |
| 5     | MCK_DIV_32   | Peripheral clock/32   |
| 6     | MCK_DIV_64   | Peripheral clock/64   |
| 7     | MCK_DIV_128  | Peripheral clock/128  |
| 8     | MCK_DIV_256  | Peripheral clock/256  |
| 9     | MCK_DIV_512  | Peripheral clock/512  |
| 10    | MCK_DIV_1024 | Peripheral clock/1024 |
| 11    | CLKA         | Clock A               |
| 12    | CLKB         | Clock B               |

### 42.7.41 PWM Channel Duty Cycle Register

**Name:** PWM\_CDTYx  
**Offset:** 0x0204 + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

Only the first 16 bits (channel counter size) are significant.

|        |             |     |     |     |     |     |     |     |
|--------|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31          | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |             |     |     |     |     |     |     |     |
| Access |             |     |     |     |     |     |     |     |
| Reset  |             |     |     |     |     |     |     |     |
| Bit    | 23          | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | CDTY[23:16] |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15          | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | CDTY[15:8]  |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7           | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | CDTY[7:0]   |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 23:0 – CDTY[23:0] Channel Duty-Cycle**  
 Defines the waveform duty-cycle. This value must be defined between 0 and CPRD (PWM\_CPRDx).

42.7.42 PWM Channel Duty Cycle Update Register

**Name:** PWM\_CDTYUPDx  
**Offset:** 0x0208 + x\*0x20 [x=0..3]  
**Reset:** –  
**Property:** Write-only

This register acts as a double buffer for the CDTY value. This prevents an unexpected waveform when modifying the waveform duty-cycle.  
 Only the first 16 bits (channel counter size) are significant.

|        |                |    |    |    |    |    |    |    |
|--------|----------------|----|----|----|----|----|----|----|
| Bit    | 31             | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |                |    |    |    |    |    |    |    |
| Access |                |    |    |    |    |    |    |    |
| Reset  |                |    |    |    |    |    |    |    |
| Bit    | 23             | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | CDTYUPD[23:16] |    |    |    |    |    |    |    |
| Access | W              | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0              | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 15             | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | CDTYUPD[15:8]  |    |    |    |    |    |    |    |
| Access | W              | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0              | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7              | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | CDTYUPD[7:0]   |    |    |    |    |    |    |    |
| Access | W              | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0              | 0  | 0  | 0  | 0  | 0  | 0  | –  |

**Bits 23:0 – CDTYUPD[23:0]** Channel Duty-Cycle Update  
 Defines the waveform duty-cycle. This value must be defined between 0 and CPRD (PWM\_CPRDx).

### 42.7.43 PWM Channel Period Register

**Name:** PWM\_CPRDx  
**Offset:** 0x020C + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the [PWM Write Protection Status Register](#).

Only the first 16 bits (channel counter size) are significant.

|        |             |     |     |     |     |     |     |     |
|--------|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31          | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
| Access |             |     |     |     |     |     |     |     |
| Reset  |             |     |     |     |     |     |     |     |

| Access | CPRD[23:16] |     |     |     |     |     |     |     |
| Reset  | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15          | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| Access | CPRD[15:8]  |     |     |     |     |     |     |     |
| Reset  | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7           | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| Access | CPRD[7:0]   |     |     |     |     |     |     |     |
| Reset  | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 23:0 – CPRD[23:0] Channel Period

If the waveform is left-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:

- By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(X \times \text{CPRD})}{f_{\text{peripheral clock}}}$$

- By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(X \times \text{CPRD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(X \times \text{CPRD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

If the waveform is center-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:

- By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(2 \times X \times \text{CPRD})}{f_{\text{peripheral clock}}}$$

- By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(2 \times X \times \text{CPRD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(2 \times X \times \text{CPRD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

## 42.7.44 PWM Channel Period Update Register

**Name:** PWM\_CPRDUPDx  
**Offset:** 0x0210 + x\*0x20 [x=0..3]  
**Reset:** –  
**Property:** Write-only

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the [PWM Write Protection Status Register](#).

This register acts as a double buffer for the CPRD value. This prevents an unexpected waveform when modifying the waveform period.

Only the first 16 bits (channel counter size) are significant.

### Bits 23:0 – CPRDUPD[23:0] Channel Period Update

If the waveform is left-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:

– By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(X \times \text{CPRDUPD})}{f_{\text{peripheral clock}}}$$

– By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(X \times \text{CPRDUPD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(X \times \text{CPRDUPD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

If the waveform is center-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:

– By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(2 \times X \times \text{CPRDUPD})}{f_{\text{peripheral clock}}}$$

– By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(2 \times X \times \text{CPRDUPD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(2 \times X \times \text{CPRDUPD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

### 42.7.45 PWM Channel Counter Register

**Name:** PWM\_CCNTx  
**Offset:** 0x0214 + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read-only

Only the first 16 bits (channel counter size) are significant.

#### Bits 23:0 – CNT[23:0] Channel Counter Register

Channel counter value. This register is reset when:

- the channel is enabled (writing CHIDx in the PWM\_ENA register).
- the channel counter reaches CPRD value defined in the PWM\_CPRDx register if the waveform is left-aligned.

**42.7.46 PWM Channel Dead Time Register**

**Name:** PWM\_DT<sub>x</sub>  
**Offset:** 0x0218 + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS4 and WPHWS4 are cleared in the [PWM Write Protection Status Register](#).

Only the first 12 bits (dead-time counter size) of fields DTH and DTL are significant.

|        |           |     |     |     |     |     |     |     |

**Bits 31:16 – DTL[15:0] Dead-Time Value for PWML<sub>x</sub> Output**

Defines the dead-time value for PWML<sub>x</sub> output. This value must be defined between 0 and CDTY (PWM\_CDTY<sub>x</sub>).

**Bits 15:0 – DTH[15:0] Dead-Time Value for PWMH<sub>x</sub> Output**

Defines the dead-time value for PWMH<sub>x</sub> output. This value must be defined between 0 and the value (CPRD – CDTY) (PWM\_CPRD<sub>x</sub> and PWM\_CDTY<sub>x</sub>).

## 42.7.47 PWM Channel Dead Time Update Register

**Name:** PWM\_DTUPDx  
**Offset:** 0x021C + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Write-only

This register can only be written if bits WPSWS4 and WPHWS4 are cleared in the [PWM Write Protection Status Register](#).

This register acts as a double buffer for the DTH and DTL values. This prevents an unexpected waveform when modifying the dead-time values.

Only the first 12 bits (dead-time counter size) of fields DTHUPD and DTLUPD are significant.

|        |              |    |    |    |    |    |    |    |
|--------|--------------|----|----|----|----|----|----|----|

|        | DTLUPD[7:0]  |    |    |    |    |    |    |    |
| Access | W            | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | –  |
| Bit    | 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | DTHUPD[15:8] |    |    |    |    |    |    |    |
| Access | W            | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | DTHUPD[7:0]  |    |    |    |    |    |    |    |
| Access | W            | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | –  |

### Bits 31:16 – DTLUPD[15:0] Dead-Time Value Update for PWMLx Output

Defines the dead-time value for PWMLx output. This value must be defined between 0 and CDTY (PWM\_CDTYx). This value is applied only at the beginning of the next channel x PWM period.

### Bits 15:0 – DTHUPD[15:0] Dead-Time Value Update for PWMHx Output

Defines the dead-time value for PWMHx output. This value must be defined between 0 and the value (CPRD – CDTY) (PWM\_CPRDx and PWM\_CDTYx). This value is applied only at the beginning of the next channel x PWM period.

### 42.7.48 PWM Channel Mode Update Register

**Name:** PWM\_CMUPDx  
**Offset:** 0x0400 + x\*0x20 [x=0..3]  
**Reset:** –  
**Property:** Write-only

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the [PWM Write Protection Status Register](#).

This register acts as a double buffer for the CPOL value. This prevents an unexpected waveform when modifying the polarity value.

**Bit 13 – CPOLINVUP** Channel Polarity Inversion Update  
 If this bit is written at '1', the write of the bit CPOLUP is not taken into account.

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | No effect.                                                        |
| 1     | The OCx output waveform (output from the comparator) is inverted. |

**Bit 9 – CPOLUP** Channel Polarity Update  
 The write of this bit is taken into account only if the bit CPOLINVUP is written at '0' at the same time.

| Value | Description                                                                  |
|-------|------------------------------------------------------------------------------|
| 0     | The OCx output waveform (output from the comparator) starts at a low level.  |
| 1     | The OCx output waveform (output from the comparator) starts at a high level. |

## 42.7.49 PWM External Trigger Register

**Name:** PWM\_ETRGx  
**Offset:** 0x042C + (x-1)\*0x20 [x=1..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |      |        |         |         |    |    |              |     |
|--------|------|--------|---------|---------|----|----|--------------|-----|
| Bit    | 31   | 30     | 29      | 28      | 27 | 26 | 25           | 24  |

| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

|        |              |     |     |     |     |     |     |     |
|--------|--------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 15           | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | MAXCNT[15:8] |     |     |     |     |     |     |     |
| Access | R/W          | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0            | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

|        |             |     |     |     |     |     |     |     |
|--------|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 7           | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | MAXCNT[7:0] |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

## Bit 31 – RFEN Recoverable Fault Enable

| Value | Description                                                                   |
|-------|-------------------------------------------------------------------------------|
| 0     | The TRGINx signal does not generate a recoverable fault.                      |
| 1     | The TRGINx signal generate a recoverable fault in place of the fault x input. |

## Bit 30 – TRGSRC Trigger Source

| Value | Description                                        |
|-------|----------------------------------------------------|
| 0     | The TRGINx signal is driven by the PWMETRGr input. |
| 1     | Reserved                                           |

## Bit 29 – TRGFILT Filtered input

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | The external trigger input x is not filtered. |
| 1     | The external trigger input x is filtered.     |

## Bit 28 – TRGEDGE Edge Selection

| Value | Name         | Description                                                                                      |
|-------|--------------|--------------------------------------------------------------------------------------------------|
| 0     | FALLING_ZERO | TRGMODE = 1: TRGINx event detection on falling edge.<br>TRGMODE = 2, 3: TRGINx active level is 0 |
| 1     | RISING_ONE   | TRGMODE = 1: TRGINx event detection on rising edge.<br>TRGMODE = 2, 3: TRGINx active level is 1  |

## Bits 25:24 – TRGMODE[1:0] External Trigger Mode

| Value | Name  | Description                      |
|-------|-------|----------------------------------|
| 0     | OFF   | External trigger is not enabled. |
| 1     | MODE1 | External PWM Reset Mode          |
| 2     | MODE2 | External PWM Start Mode          |

| Value | Name  | Description              |
|-------|-------|--------------------------|
| 3     | MODE3 | Cycle-by-cycle Duty Mode |

**Bits 23:0 – MAXCNT[23:0]** Maximum Counter value

Maximum channel x counter value measured at the TRGINx event since the last read of the register. At the TRGINx event, if the channel x counter value is greater than the stored MAXCNT value, then MAXCNT is updated by the channel x counter value.

### 42.7.50 PWM Leading-Edge Blanking Register

**Name:** PWM\_LEBRx  
**Offset:** 0x0430 + (x-1)\*0x20 [x=1..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |               |     |     |         |         |         |         |
|--------|----|---------------|-----|-----|---------|---------|---------|---------|
| Bit    | 31 | 30            | 29  | 28  | 27      | 26      | 25      | 24      |
| Access |    |               |     |     |         |         |         |         |
| Reset  |    |               |     |     |         |         |         |         |
| Bit    | 23 | 22            | 21  | 20  | 19      | 18      | 17      | 16      |
| Access |    |               |     |     | PWMHREN | PWMHFEN | PWMLREN | PWMLFEN |
| Reset  |    |               |     |     | R/W     | R/W     | R/W     | R/W     |
|        |    |               |     |     | 0       | 0       | 0       | 0       |
| Bit    | 15 | 14            | 13  | 12  | 11      | 10      | 9       | 8       |
| Access |    |               |     |     |         |         |         |         |
| Reset  |    |               |     |     |         |         |         |         |
| Bit    | 7  | 6             | 5   | 4   | 3       | 2       | 1       | 0       |
| Access |    | LEBDELAY[6:0] |     |     |         |         |         |         |
| Reset  |    | R/W           | R/W | R/W | R/W     | R/W     | R/W     | R/W     |
|        |    | 0             | 0   | 0   | 0       | 0       | 0       | 0       |

**Bit 19 – PWMHREN** PWMH Rising Edge Enable  
 Leading-edge blanking is enabled on PWMHx output rising edge.

| Value | Description                                                    |
|-------|----------------------------------------------------------------|
| 0     | Leading-edge blanking is disabled on PWMHx output rising edge. |
| 1     | Leading-edge blanking is enabled on PWMHx output rising edge.  |

**Bit 18 – PWMHFEN** PWMH Falling Edge Enable

| Value | Description                                                     |
|-------|-----------------------------------------------------------------|
| 0     | Leading-edge blanking is disabled on PWMHx output falling edge. |
| 1     | Leading-edge blanking is enabled on PWMHx output falling edge.  |

**Bit 17 – PWMLREN** PWML Rising Edge Enable

| Value | Description                                                    |
|-------|----------------------------------------------------------------|
| 0     | Leading-edge blanking is disabled on PWMLx output rising edge. |
| 1     | Leading-edge blanking is enabled on PWMLx output rising edge.  |

**Bit 16 – PWMLFEN** PWML Falling Edge Enable

| Value | Description                                                     |
|-------|-----------------------------------------------------------------|
| 0     | Leading-edge blanking is disabled on PWMLx output falling edge. |
| 1     | Leading-edge blanking is enabled on PWMLx output falling edge.  |

**Bits 6:0 – LEBDELAY[6:0]** Leading-Edge Blanking Delay for TRGINx  
 Leading-edge blanking duration for external trigger x input. The delay is calculated according to the following formula:  
 $LEBDELAY = (f_{\text{peripheral clock}} \times \text{Delay}) + 1$

## 43. Integrity Check Monitor (ICM)

### 43.1 Description

The Integrity Check Monitor (ICM) is a DMA controller that performs hash calculation over multiple memory regions through the use of transfer descriptors located in memory (ICM Descriptor Area). The Hash function is based on the Secure Hash Algorithm (SHA). The ICM integrates two modes of operation. The first one is used to hash a list of memory regions and save the digests to memory (ICM Hash Area). The second mode is an active monitoring of the memory. In that mode, the hash function is evaluated and compared to the digest located at a predefined memory address (ICM Hash Area). If a mismatch occurs, an interrupt is raised. See the figure below for an example of four-region monitoring. Hash and Descriptor areas are located in Memory instance i2, and the four regions are split in memory instances i0 and i1.

**Figure 43-1.** Four-region Monitoring Example

The ICM SHA engine is compliant with the American FIPS (Federal Information Processing Standard) Publication 180-2 specification.

The following terms are concise definitions of the ICM concepts used throughout this document:

- **Region** — A partition of instruction or data memory space.
- **Region Descriptor** — A data structure stored in memory, defining region attributes.
- **Region Attributes** — Region start address, region size, region SHA engine processing mode, Write Back or Compare function mode.
- **Context Registers** — A set of ICM non-memory-mapped, internal registers which are automatically loaded, containing the attributes of the region being processed.
- **Main List** — A list of region descriptors. Each element associates the start address of a region with a set of attributes.
- **Secondary List** — A linked list defined on a per region basis that describes the memory layout of the region (when the region is non-contiguous).
- **Hash Area** — predefined memory space where the region hash results (digest) are stored.

## 43.2 Embedded Characteristics

- DMA AHB Master Interface
- Supports Monitoring of up to 4 Non-Contiguous Memory Regions
- Supports Block Gathering Using Linked Lists
- Supports Secure Hash Algorithm (SHA1, SHA224, SHA256)
- Compliant with FIPS Publication 180-2
- Configurable Processing Period:
  - When SHA1 algorithm is processed, the runtime period is either 85 or 209 clock cycles.
  - When SHA256 or SHA224 algorithm is processed, the runtime period is either 72 or 194 clock cycles.
- Programmable Bus Burden
- Register Write Protection

## 43.3 Block Diagram

Figure 43-2. ICM Block Diagram

## 43.4 Product Dependencies

### 43.4.1 Power Management

The peripheral clock is not continuously provided to the ICM. The programmer must first enable the ICM clock in the Power Management Controller (PMC) before using the ICM.

### 43.4.2 Interrupt Sources

The ICM interface has an interrupt line connected to the Interrupt Controller.

Handling the ICM interrupt requires programming the interrupt controller before configuring the ICM.

## 43.5 Functional Description

### 43.5.1 Overview

The Integrity Check Monitor (ICM) is a DMA controller that performs SHA-based memory hashing over memory regions. As shown in figure [Integrity Check Monitor Block Diagram](#), it integrates a DMA interface, a Monitoring Finite State Machine (FSM), an integrity scheduler, a set of context registers, a SHA engine, an interface for configuration and status registers.

The ICM integrates a Secure Hash Algorithm engine (SHA). This engine requires a message padded according to FIPS180-2 specification when used as a SHA calculation unit only. Otherwise, if the ICM is used as integrated check for memory content, the padding is not mandatory. The SHA module produces an N-bit message digest each time a block is read and a processing period ends. N is 160 for SHA1, 224 for SHA224, 256 for SHA256.

When the ICM module is enabled, it sequentially retrieves a circular list of region descriptors from the memory (Main List described in figure [ICM Region Descriptor and Hash Areas](#)). Up to four regions may be monitored. Each region descriptor is composed of four words indicating the layout of the memory region (see figure [Region Descriptor](#)). It also contains the hashing engine configuration on a per-region basis. As soon as the descriptor is loaded from the memory and context registers are updated with the data structure, the hashing operation starts. A programmable number of blocks (see TRSIZE field of the ICM\_RCTRL structure member) is transferred from the memory to the SHA engine. When the desired number of blocks have been transferred, the digest is either moved to memory (Write Back function) or compared with a digest reference located in the system memory (Compare function). If a digest mismatch occurs, an interrupt is triggered if unmasked. The ICM module passes through the region descriptor list until the end of the list marked by an end of list marker (WRAP or EOM bit in ICM\_RCFCG structure member set to one). To continuously monitor the list of regions, the WRAP bit must be set to one in the last data structure and EOM must be cleared.

**Figure 43-3.** ICM Region Descriptor and Hash Areas

Each region descriptor supports gathering of data through the use of the Secondary List. Unlike the Main List, the Secondary List cannot modify the configuration attributes of the region. When the end of the Secondary List has been encountered, the ICM returns to the Main List. Memory integrity monitoring can be considered as a background service and the mandatory bandwidth shall be very limited. In order to limit the ICM memory bandwidth, use ICM\_CFG.BBC to control the ICM memory load.

Figure 43-4. Region Descriptor

The figure below shows an example of the mandatory ICM settings required to monitor three memory data blocks of the system memory (defined as two regions) with one region being not contiguous (two separate areas) and one contiguous memory area. For each region, the SHA algorithm may be independently selected (different for each region). The wrap allows continuous monitoring.

**Figure 43-5.** Example: Monitoring of 3 Memory Data Blocks (Defined as 2 Regions)

### 43.5.2 ICM Region Descriptor Structure

The ICM Region Descriptor Area is a contiguous area of system memory that the controller and the processor can access. When the ICM is activated, the controller performs a descriptor fetch operation at  $*(ICM\_DSCR)$  address. If the Main List contains more than one descriptor (i.e., more than one region is to be monitored), the fetch address is  $*(ICM\_DSCR) + (RID \ll 4)$  where RID is the region identifier.

**Table 43-1.** Region Descriptor Structure (Main List)

| Offset                             | Structure Member         | Name      |
|------------------------------------|--------------------------|-----------|
| $ICM\_DSCR + 0x000 + RID * (0x10)$ | ICM Region Start Address | ICM_RADDR |
| $ICM\_DSCR + 0x004 + RID * (0x10)$ | ICM Region Configuration | ICM_RCFG  |
| $ICM\_DSCR + 0x008 + RID * (0x10)$ | ICM Region Control       | ICM_RCTRL |
| $ICM\_DSCR + 0x00C + RID * (0x10)$ | ICM Region Next Address  | ICM_RNEXT |

43.5.2.1 ICM Region Start Address Structure Member

Name: ICM\_RADDR  
Property: Read/Write

Register offset is calculated as ICM\_DSCR+0x000+RID\*(0x10).

|        |              |     |     |     |     |     |     |     |

#### Bits 14:12 – ALGO[2:0] SHA Algorithm

Values which are not listed in the table must be considered as “reserved”.

| Value | Name   | Description                |
|-------|--------|----------------------------|
| 0     | SHA1   | SHA1 algorithm processed   |
| 1     | SHA256 | SHA256 algorithm processed |
| 4     | SHA224 | SHA224 algorithm processed |

#### Bit 10 – PROCDLY Processing Delay

When SHA1 algorithm is processed, the runtime period is either 85 or 209 clock cycles.

When SHA256 or SHA224 algorithm is processed, the runtime period is either 72 or 194 clock cycles.

| Value | Name     | Description                                 |
|-------|----------|---------------------------------------------|
| 0     | SHORTEST | SHA processing runtime is the shortest one. |
| 1     | LONGEST  | SHA processing runtime is the longest one.  |

#### Bit 9 – SUIEN Monitoring Status Updated Condition Interrupt (Default Enabled)

| Value | Name | Description                                                                                    |
|-------|------|------------------------------------------------------------------------------------------------|
| 0     |      | The ICM_ISR.RSU[i] flag is set when the corresponding descriptor is loaded from memory to ICM. |
| 1     |      | The ICM_ISR.RSU[i] flag remains cleared even if the setting condition is met.                  |

#### Bit 8 – ECIEN End Bit Condition Interrupt (Default Enabled)

| Value | Name | Description                                                                           |
|-------|------|---------------------------------------------------------------------------------------|
| 0     |      | The ICM_ISR.REC[i] flag is set when the descriptor with the EOM bit set is processed. |
| 1     |      | The ICM_ISR.REC[i] flag remains cleared even if the setting condition is met.         |

#### Bit 7 – WCIEEN Wrap Condition Interrupt Disable (Default Enabled)

| Value | Name | Description                                                                               |
|-------|------|-------------------------------------------------------------------------------------------|
| 0     |      | The ICM_ISR.RWC[i] flag is set when the WRAP bit is set in a descriptor of the main list. |
| 1     |      | ICM_ISR.RWC[i] flag remains cleared even if the setting condition is met.                 |

**Bit 6 – BEIEN** Bus Error Interrupt Disable (Default Enabled)

| Value | Name | Description                                                                    |
|-------|------|--------------------------------------------------------------------------------|
| 0     |      | The flag is set when an error is reported on the system bus by the bus matrix. |
| 1     |      | The flag remains cleared even if the setting condition is met.                 |

**Bit 5 – DMIEN** Digest Mismatch Interrupt Disable (Default Enabled)

| Value | Name | Description                                                                                                                    |
|-------|------|--------------------------------------------------------------------------------------------------------------------------------|
| 0     |      | The ICM_ISR.RBE[i] flag is set when the hash value just calculated from the processed region differs from expected hash value. |
| 1     |      | The ICM_ISR.RBE[i] flag remains cleared even if the setting condition is met.                                                  |

**Bit 4 – RHIEEN** Region Hash Completed Interrupt Disable (Default Enabled)

| Value | Name | Description                                                                                        |
|-------|------|----------------------------------------------------------------------------------------------------|
| 0     |      | The ICM_ISR.RHC[i] flag is set when the field NEXT = 0 in a descriptor of the main or second list. |
| 1     |      | The ICM_ISR.RHC[i] flag remains cleared even if the setting condition is met.                      |

**Bit 2 – EOM** End Of Monitoring

| Value | Name | Description                                                                |
|-------|------|----------------------------------------------------------------------------|
| 0     |      | The current descriptor does not terminate the monitoring.                  |
| 1     |      | The current descriptor terminates the Main List. WRAP value has no effect. |

**Bit 1 – WRAP** Wrap Command

| Value | Name | Description                                                                                                        |
|-------|------|--------------------------------------------------------------------------------------------------------------------|
| 0     |      | The next region descriptor address loaded is the current region identifier descriptor address incremented by 0x10. |
| 1     |      | The next region descriptor address loaded is ICM_DSCR.                                                             |

**Bit 0 – CDWBN** Compare Digest or Write Back Digest

| Value | Name | Description                                                         |
|-------|------|---------------------------------------------------------------------|
| 0     |      | The digest is written to the Hash area.                             |
| 1     |      | The digest value is compared to the digest stored in the Hash area. |

43.5.2.3 ICM Region Control Structure Member

Name: ICM\_RCTRL  
Property: Read/Write

Register offset is calculated as ICM\_DSCR+0x008+RID\*(0x10).

**Bits 15:0 – TRSIZE[15:0]** Transfer Size for the Current Chunk of Data  
ICM performs a transfer of (TRSIZE + 1) blocks of 512 bits.

**Table 43-3. LE Resulting SHA-160 Message Digest Memory Mapping****Table 43-4.** Resulting SHA-224 Message Digest Memory Mapping**Table 43-5. Resulting SHA-256 Message Digest Memory Mapping**

Considering the following 1024-bit message (example given in FIPS 180-2):

[illegible]

The message is written to memory in a Little Endian (LE) system architecture.

**Table 43-6. 1024 bits Message Memory Mapping**

| Memory Address | Address Offset / Byte Lane |             |            |           |
|----------------|----------------------------|-------------|------------|-----------|
|                | 0x3 / 31:24                | 0x2 / 23:16 | 0x1 / 15:8 | 0x0 / 7:0 |
| 0x000          | 80                         | 63          | 62         | 61        |
| 0x004–0x078    | 00                         | 00          | 00         | 00        |
| 0x07C          | 18                         | 00          | 00         | 00        |

#### 43.5.4 Using ICM as SHA Engine

The ICM can be configured to only calculate a SHA1, SHA224, SHA256 digest value.

##### 43.5.4.1 Settings for Simple SHA Calculation

The start address of the system memory containing the data to hash must be configured in the transfer descriptor of the DMA embedded in the ICM.

The transfer descriptor is a system memory area integer multiple of 4 x 32-bit words and the start address of the descriptor must be configured in ICM\_DSCR (the start address must be aligned on 64-bytes; six LSB must be cleared). If the data to hash is already padded according to SHA standards, only a single descriptor is required, and ICM\_RCFG.EOM must be written to 1. If the data to hash does not contain a padding area, it is possible to define the padding area in another system memory location, the ICM can be configured to automatically jump from a memory area to another one by configuring the descriptor register ICM\_RNEXT with a value that differs from 0. Configuring ICM\_RNEXT.NEXT with the start address of the padding area forces the ICM to concatenate both areas, thus providing the SHA result from the start address of the hash area configured in ICM\_HASH.

Whether the system memory is configured as a single or multiple data block area, ICM\_RCFG.CDWBK and ICM\_RCFG.WRAP must be cleared. The bits WBDIS, EOMDIS, SLBDIS must be cleared in ICM\_CFG.

ICM\_RCTRL.RHIEN and ICM\_RCTRL.ECIEN must be written to 1. The flag RHC[i], i being the region index, is set (if RHIEN is set) when the hash result is available at address defined in ICM\_HASH. The flag REC[i], i being the region index, is set (if ECIEN is set) when the hash result is available at the address defined in ICM\_HASH.

An interrupt is generated if the bit RHC[i] is written to 1 in the ICM\_IER (if RHC[i] is set in ICM\_RCTRL of region i) or if the bit REC[i] is written to 1 in the ICM\_IER (if REC[i] is set in ICM\_RCTRL of region i).

##### 43.5.4.2 Processing Period

The ICM engine has a core (SHA) inherent processing period that may result, depending on the application, in a significant bandwidth usage at system bus level. In some applications, it may be important to keep as much bandwidth as possible for the other peripherals (e.g. CPU, DMA). The ICM SHA engine processing period can be configured to reduce the bandwidth required by writing ICM\_RCFG.PROCDLY=1.

In SHA1 mode, the shortest processing period is 85 clock cycles + 2 clock cycles for start command synchronization (ICM\_RCFG.PROCDLY=0). The longest period is 209 clock cycles + 2 clock cycles when ICM\_RCFG.PROCDLY=1 (see the figure below).

In SHA256 or SHA224 mode, the shortest processing period is 72 clock cycles + 2 clock cycles for start command synchronization. The longest period is 194 clock cycles + 2 clock cycles.

**Figure 43-6. Bandwidth Usage in SHA1 Mode**

### 43.5.5 ICM Automatic Monitoring Mode

ICM\_CFG.ASCD is used to activate the ICM Automatic Monitoring mode. When ICM\_CFG.ASCD is set and bits CDWBN and EOM in ICM.RCFG equal 0, the ICM performs the following actions:

1. The ICM passes through the Main List once to calculate the message digest of the monitored area.
2. When WRAP = 1 in ICM\_RCFG, the ICM begins monitoring. CDWBN in ICM\_RCFG is now automatically set and EOM is cleared. These bits have no effect during the monitoring period that ends when EOM is set.

### 43.5.6 Programming the ICM

**Table 43-7. Region Attributes**

| Transfer Type |                                                                                  | Main List | ICM_RCFG |      |     | ICM_RNEXT                                               | Comments                                                                                                                                 |
|---------------|----------------------------------------------------------------------------------|-----------|----------|------|-----|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                  |           | CDWBN    | WRAP | EOM | NEXT                                                    |                                                                                                                                          |
| Single Region | Contiguous list of blocks<br>Digest written to memory<br>Monitoring disabled     | 1 item    | 0        | 0    | 1   | 0                                                       | The Main List contains only one descriptor. The Secondary List is empty for that descriptor. The digest is computed and saved to memory. |
|               | Non-contiguous list of blocks<br>Digest written to memory<br>Monitoring disabled | 1 item    | 0        | 0    | 1   | Secondary List address of the current region identifier | The Main List contains only one descriptor. The Secondary List describes the layout of the non-contiguous region.                        |
|               | Contiguous list of blocks<br>Digest comparison enabled<br>Monitoring enabled     | 1 item    | 1        | 1    | 0   | 0                                                       | When the hash computation is terminated, the digest is compared with the one saved in memory.                                            |

.....continued

| Transfer Type    |                                                                                  | Main List          | ICM_RCFG |                             |                             | ICM_RNEXT              | Comments                                                                                     |
|------------------|----------------------------------------------------------------------------------|--------------------|----------|-----------------------------|-----------------------------|------------------------|----------------------------------------------------------------------------------------------|
|                  |                                                                                  |                    | CDWBN    | WRAP                        | EOM                         | NEXT                   |                                                                                              |
| Multiple Regions | Contiguous list of blocks Digest written to memory Monitoring disabled           | More than one item | 0        | 0                           | 1 for the last, 0 otherwise | 0                      | ICM passes through the list once.                                                            |
|                  | Contiguous list of blocks Digest comparison is enabled Monitoring is enabled     | More than one item | 1        | 1 for the last, 0 otherwise | 0                           | 0                      | ICM performs active monitoring of the regions. If a mismatch occurs, an interrupt is raised. |
|                  | Non-contiguous list of blocks Digest is written to memory Monitoring is disabled | More than one item | 0        | 0                           | 1                           | Secondary List address | ICM performs hashing and saves digests to the Hash area.                                     |
|                  | Non-contiguous list of blocks Digest comparison is enabled Monitoring is enabled | More than one item | 1        | 1                           | 0                           | Secondary List address | ICM performs data gathering on a per region basis.                                           |

### 43.5.7 Security Features

When an undefined register access occurs, the URAD bit in the Interrupt Status Register (ICM\_ISR) is set if unmasked. Its source is then reported in the Undefined Access Status Register (ICM\_UASR). Only the first undefined register access is available through the ICM\_UASR.URAT field.

Several kinds of unspecified register accesses can occur:

- Unspecified structure member set to one detected when the descriptor is loaded
- Configuration register (ICM\_CFG) modified during active monitoring
- Descriptor register (ICM\_DSCR) modified during active monitoring
- Hash register (ICM\_HASH) modified during active monitoring
- Write-only register read access

The URAD bit and the URAT field can only be reset by writing a 1 to the ICM\_CTRL.SWRST bit.

### 43.5.8 ICM Register Write Protection

To prevent any single software error from corrupting ICM behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the ICM Write Protection Mode Register (ICM\_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the ICM Write Protection Status Register (ICM\_WPSR) is set and the Write Protection Violation Source (WPVSR) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading ICM\_WPSR.

The following register(s) can be write-protected when WPEN is set:

- [ICM Configuration Register](#)
- [ICM Descriptor Area Start Address Register](#)
- [ICM Hash Area Start Address Register](#)
- [ICM User Initial Hash Value Register](#)

The following registers can be write-protected when WPITEN is set:

- [ICM Interrupt Enable Register](#)

- [ICM Interrupt Disable Register](#)

The following register can be write-protected when WPCREN is set:

- [ICM Control Register](#)

## 43.6 Register Summary

| Offset              | Name        | Bit Pos. | 7           | 6 | 5 | 4      | 3 | 2             | 1        | 0      |
|---------------------|-------------|----------|-------------|---|---|--------|---|---------------|----------|--------|
| 0x00                | ICM_CFG     | 7:0      | BBC[3:0]    |   |   |        |   | SLBDIS        | EOMDIS   | WBDIS  |
|                     |             | 15:8     | UALGO[2:0]  |   |   | UIHASH |   |               | DUALBUFF | ASCD   |
|                     |             | 23:16    |             |   |   |        |   |               |          |        |

### 43.6.1 ICM Configuration Register

**Name:** ICM\_CFG  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ICM Write Protection Mode Register](#).

|        |            |     |     |        |    |        |          |       |

|        | UALGO[2:0] |     |     | UIHASH |    |        | DUALBUFF | ASCD  |
| Access | R/W        | R/W | R/W | R/W    |    |        | R/W      | R/W   |
| Reset  | 0          | 0   | 0   | 0      |    |        | 0        | 0     |
| Bit    | 7          | 6   | 5   | 4      | 3  | 2      | 1        | 0     |
|        | BBC[3:0]   |     |     |        |    | SLBDIS | EOMDIS   | WBDIS |
| Access | R/W        | R/W | R/W | R/W    |    | R/W    | R/W      | R/W   |
| Reset  | 0          | 0   | 0   | 0      |    | 0      | 0        | 0     |

#### Bits 15:13 – UALGO[2:0] User SHA Algorithm

| Value | Name   | Description                |
|-------|--------|----------------------------|
| 0     | SHA1   | SHA1 algorithm processed   |
| 1     | SHA256 | SHA256 algorithm processed |
| 4     | SHA224 | SHA224 algorithm processed |

#### Bit 12 – UIHASH User Initial Hash Value

| Value | Description                                                                                                                                    |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The secure hash standard provides the initial hash value.                                                                                      |
| 1     | The initial hash value is programmable. Field UALGO provides the SHA algorithm. The ALGO field of the ICM_RCFG structure member has no effect. |

#### Bit 9 – DUALBUFF Dual Input Buffer

| Value | Description                                                                                       |
|-------|---------------------------------------------------------------------------------------------------|
| 0     | Dual Input Buffer mode is disabled.                                                               |
| 1     | Dual Input Buffer mode is enabled (better performances, higher bandwidth required on system bus). |

#### Bit 8 – ASCD Automatic Switch To Compare Digest

| Value | Description                                                                                                                                            |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Automatic monitoring mode is disabled.                                                                                                                 |
| 1     | The ICM passes through the Main List once to calculate the message digest of the monitored area. When WRAP = 1 in ICM_RCFG, the ICM begins monitoring. |

**Bits 7:4 – BBC[3:0] Bus Burden Control**

This field is used to control the burden of the ICM system bus. The number of system clock cycles between the end of the current processing and the next block transfer is set to  $2^{BBC}$ . Up to 32,768 cycles can be inserted.

**Bit 2 – SLBDIS Secondary List Branching Disable**

| Value | Description                                                                                                                                    |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Branching to the Secondary List is permitted.                                                                                                  |
| 1     | Branching to the Secondary List is forbidden. The NEXT field of the ICM_RNEXT structure member has no effect and is always considered as zero. |

**Bit 1 – EOMDIS End of Monitoring Disable**

| Value | Description                                                                                 |
|-------|---------------------------------------------------------------------------------------------|
| 0     | End of Monitoring is permitted.                                                             |
| 1     | End of Monitoring is forbidden. The EOM bit of the ICM_RCFG structure member has no effect. |

**Bit 0 – WBDIS Write Back Disable**

When ASCD is set, WBDIS has no effect.

| Value | Description                                                                                                                                                             |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Write Back operations are permitted.                                                                                                                                    |
| 1     | Write Back operations are forbidden. Context register CDWBN bit is internally set to one and cannot be modified by a linked list element. ICM_RCFG.CDWBN has no effect. |

### 43.6.2 ICM Control Register

**Name:** ICM\_CTRL  
**Offset:** 0x04  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the [ICM Write Protection Mode Register](#).

|        |             |    |    |    |            |       |         |        |
|--------|-------------|----|----|----|------------|-------|---------|--------|
| Bit    | 31          | 30 | 29 | 28 | 27         | 26    | 25      | 24     |
|        |             |    |    |    |            |       |         |        |
| Access |             |    |    |    |            |       |         |        |
| Reset  |             |    |    |    |            |       |         |        |
| Bit    | 23          | 22 | 21 | 20 | 19         | 18    | 17      | 16     |
|        |             |    |    |    |            |       |         |        |
| Access |             |    |    |    |            |       |         |        |
| Reset  |             |    |    |    |            |       |         |        |
| Bit    | 15          | 14 | 13 | 12 | 11         | 10    | 9       | 8      |

| Reset  | –           | –  | –  | –  |            | –     | –       | –      |

#### Bits 15:12 – RMEN[3:0] Region Monitoring Enable

Monitoring is activated by default.

| Value | Description                                                                              |
|-------|------------------------------------------------------------------------------------------|
| 0     | No effect                                                                                |
| 1     | When bit RMEN[i] is set to one, the monitoring of region with identifier i is activated. |

#### Bits 11:8 – RMDIS[3:0] Region Monitoring Disable

| Value | Description                                                                              |
|-------|------------------------------------------------------------------------------------------|
| 0     | No effect                                                                                |
| 1     | When bit RMDIS[i] is set to one, the monitoring of region with identifier i is disabled. |

#### Bits 7:4 – REHASH[3:0] Recompute Internal Hash

| Value | Description                                                                                                                  |
|-------|------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect                                                                                                                    |
| 1     | When REHASH[i] is set to one, Region i digest is re-computed. This bit is only available when region monitoring is disabled. |

#### Bit 2 – SWRST Software Reset

| Value | Description     |
|-------|-----------------|
| 0     | No effect       |
| 1     | Resets the ICM. |

#### Bit 1 – DISABLE ICM Disable Register

| Value | Description |
|-------|-------------|
| 0     | No effect   |

| Value | Description                                                            |
|-------|------------------------------------------------------------------------|
| 1     | The ICM is disabled. If a region is active, this region is terminated. |

**Bit 0 – ENABLE ICM Enable**

| Value | Description                            |
|-------|----------------------------------------|
| 0     | No effect                              |
| 1     | When set to one, the ICM is activated. |

43.6.3 ICM Status Register

Name: ICM\_SR  
Offset: 0x08  
Reset: 0x00000000  
Property: Read-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |            |    |    |    |               |    |   |   |
|--------|------------|----|----|----|---------------|----|---|---|
| Bit    | 15         | 14 | 13 | 12 | 11            | 10 | 9 | 8 |
|        | RMDIS[3:0] |    |    |    | RAWRMDIS[3:0] |    |   |   |
| Access | R          | R  | R  | R  | R             | R  | R | R |
| Reset  | 0          | 0  | 0  | 0  | 0             | 0  | 0 | 0 |

|        |   |   |   |   |   |   |   |        |
|--------|---|---|---|---|---|---|---|--------|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0      |
|        |   |   |   |   |   |   |   | ENABLE |
| Access |   |   |   |   |   |   |   | R      |
| Reset  |   |   |   |   |   |   |   | 0      |

Bits 15:12 – RMDIS[3:0] Region Monitoring Disabled Status

| Value | Description                                                                                                    |
|-------|----------------------------------------------------------------------------------------------------------------|
| 0     | Region i is being monitored (occurs after integrity check value has been calculated and written to Hash area). |
| 1     | Region i monitoring is not being monitored.                                                                    |

Bits 11:8 – RAWRMDIS[3:0] Region Monitoring Disabled Raw Status

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | Region i monitoring has been activated by writing a 1 in RMEN[i] of ICM_CTRL.    |
| 1     | Region i monitoring has been deactivated by writing a 1 in RMDIS[i] of ICM_CTRL. |

Bit 0 – ENABLE ICM Enable Register

| Value | Description       |
|-------|-------------------|
| 0     | ICM is disabled.  |
| 1     | ICM is activated. |

### 43.6.4 ICM Interrupt Enable Register

**Name:** ICM\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [ICM Write Protection Mode Register](#).

|        |    |    |    |    |    |    |    |      |
|--------|----|----|----|----|----|----|----|------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        |    |    |    |    |    |    |    | URAD |
| Access |    |    |    |    |    |    |    | W    |

| Reset  | –        | – | – | – | –        | – | – | – |

#### Bit 24 – URAD Undefined Register Access Detection Interrupt Enable

| Value | Description                                         |
|-------|-----------------------------------------------------|
| 0     | No effect.                                          |
| 1     | The Undefined Register Access interrupt is enabled. |

#### Bits 23:20 – RSU[3:0] Region Status Updated Interrupt Disable

| Value | Description                                                                  |
|-------|------------------------------------------------------------------------------|
| 0     | No effect.                                                                   |
| 1     | When RSU[i] is set to one, the region i Status Updated interrupt is enabled. |

#### Bits 19:16 – REC[3:0] Region End bit Condition Detected Interrupt Enable

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 0     | No effect.                                                                      |
| 1     | When REC[i] is set to one, the region i End bit Condition interrupt is enabled. |

#### Bits 15:12 – RWC[3:0] Region Wrap Condition detected Interrupt Enable

| Value | Description                                                                  |
|-------|------------------------------------------------------------------------------|
| 0     | No effect.                                                                   |
| 1     | When RWC[i] is set to one, the Region i Wrap Condition interrupt is enabled. |

#### Bits 11:8 – RBE[3:0] Region Bus Error Interrupt Enable

| Value | Description                                                             |
|-------|-------------------------------------------------------------------------|
| 0     | No effect.                                                              |
| 1     | When RBE[i] is set to one, the Region i Bus Error interrupt is enabled. |

**Bits 7:4 – RDM[3:0] Region Digest Mismatch Interrupt Enable**

| Value | Description                                                                   |
|-------|-------------------------------------------------------------------------------|
| 0     | No effect.                                                                    |
| 1     | When RDM[i] is set to one, the Region i Digest Mismatch interrupt is enabled. |

**Bits 3:0 – RHC[3:0] Region Hash Completed Interrupt Enable**

| Value | Description                                                                  |
|-------|------------------------------------------------------------------------------|
| 0     | No effect.                                                                   |
| 1     | When RHC[i] is set to one, the Region i Hash Completed interrupt is enabled. |

### 43.6.5 ICM Interrupt Disable Register

**Name:** ICM\_IDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [ICM Write Protection Mode Register](#).

|        |          |    |    |    |          |    |    |      |
|--------|----------|----|----|----|----------|----|----|------|
| Bit    | 31       | 30 | 29 | 28 | 27       | 26 | 25 | 24   |
|        |          |    |    |    |          |    |    | URAD |
| Access |          |    |    |    |          |    |    | W    |
| Reset  |          |    |    |    |          |    |    | –    |
| Bit    | 23       | 22 | 21 | 20 | 19       | 18 | 17 | 16   |
|        | RSU[3:0] |    |    |    | REC[3:0] |    |    |      |
| Access | W        | W  | W  | W  | W        | W  | W  | W    |
| Reset  | –        | –  | –  | –  | –        | –  | –  | –    |
| Bit    | 15       | 14 | 13 | 12 | 11       | 10 | 9  | 8    |
|        | RWC[3:0] |    |    |    | RBE[3:0] |    |    |      |
| Access | W        | W  | W  | W  | W        | W  | W  | W    |
| Reset  | –        | –  | –  | –  | –        | –  | –  | –    |
| Bit    | 7        | 6  | 5  | 4  | 3        | 2  | 1  | 0    |
|        | RDM[3:0] |    |    |    | RHC[3:0] |    |    |      |
| Access | W        | W  | W  | W  | W        | W  | W  | W    |
| Reset  | –        | –  | –  | –  | –        | –  | –  | –    |

#### Bit 24 – URAD Undefined Register Access Detection Interrupt Disable

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 0     | No effect.                                                 |
| 1     | Undefined Register Access Detection interrupt is disabled. |

#### Bits 23:20 – RSU[3:0] Region Status Updated Interrupt Disable

| Value | Description                                                                   |
|-------|-------------------------------------------------------------------------------|
| 0     | No effect.                                                                    |
| 1     | When RSU[i] is set to one, the region i Status Updated interrupt is disabled. |

#### Bits 19:16 – REC[3:0] Region End bit Condition detected Interrupt Disable

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | No effect.                                                                       |
| 1     | When REC[i] is set to one, the region i End bit Condition interrupt is disabled. |

#### Bits 15:12 – RWC[3:0] Region Wrap Condition Detected Interrupt Disable

| Value | Description                                                                   |
|-------|-------------------------------------------------------------------------------|
| 0     | No effect.                                                                    |
| 1     | When RWC[i] is set to one, the Region i Wrap Condition interrupt is disabled. |

#### Bits 11:8 – RBE[3:0] Region Bus Error Interrupt Disable

| Value | Description                                                              |
|-------|--------------------------------------------------------------------------|
| 0     | No effect.                                                               |
| 1     | When RBE[i] is set to one, the Region i Bus Error interrupt is disabled. |

**Bits 7:4 – RDM[3:0] Region Digest Mismatch Interrupt Disable**

| Value | Description                                                                    |
|-------|--------------------------------------------------------------------------------|
| 0     | No effect.                                                                     |
| 1     | When RDM[i] is set to one, the Region i Digest Mismatch interrupt is disabled. |

**Bits 3:0 – RHC[3:0] Region Hash Completed Interrupt Disable**

| Value | Description                                                                   |
|-------|-------------------------------------------------------------------------------|
| 0     | No effect.                                                                    |
| 1     | When RHC[i] is set to one, the Region i Hash Completed interrupt is disabled. |

### 43.6.6 ICM Interrupt Mask Register

**Name:** ICM\_IMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

|        |    |    |    |    |    |    |    |      |

|--------|----------|---|---|---|----------|---|---|---|
| Bit    | 7        | 6 | 5 | 4 | 3        | 2 | 1 | 0 |
|        | RDM[3:0] |   |   |   | RHC[3:0] |   |   |   |
| Access | R        | R | R | R | R        | R | R | R |
| Reset  | 0        | 0 | 0 | 0 | 0        | 0 | 0 | 0 |

#### Bit 24 – URAD Undefined Register Access Detection Interrupt Mask

| Value | Description           |
|-------|-----------------------|
| 0     | Interrupt is disabled |
| 1     | Interrupt is enabled. |

#### Bits 23:20 – RSU[3:0] Region Status Updated Interrupt Mask

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | When RSU[i] is set to zero, the interrupt is disabled for region i. |
| 1     | When RSU[i] is set to one, the interrupt is enabled for region i.   |

#### Bits 19:16 – REC[3:0] Region End Bit Condition Detected Interrupt Mask

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | When REC[i] is set to zero, the interrupt is disabled for region i. |
| 1     | When REC[i] is set to one, the interrupt is enabled for region i.   |

#### Bits 15:12 – RWC[3:0] Region Wrap Condition Detected Interrupt Mask

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | When RWC[i] is set to zero, the interrupt is disabled for region i. |
| 1     | When RWC[i] is set to one, the interrupt is enabled for region i.   |

#### Bits 11:8 – RBE[3:0] Region Bus Error Interrupt Mask

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | When RBE[i] is set to zero, the interrupt is disabled for region i. |
| 1     | When RBE[i] is set to one, the interrupt is enabled for region i.   |

#### Bits 7:4 – RDM[3:0] Region Digest Mismatch Interrupt Mask

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | When RDM[i] is set to zero, the interrupt is disabled for region i. |
| 1     | When RDM[i] is set to one, the interrupt is enabled for region i.   |

**Bits 3:0 – RHC[3:0] Region Hash Completed Interrupt Mask**

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | When RHC[i] is set to zero, the interrupt is disabled for region i. |
| 1     | When RHC[i] is set to one, the interrupt is enabled for region i.   |

### 43.6.7 ICM Interrupt Status Register

**Name:** ICM\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

|        |    |    |    |    |    |    |    |      |
|--------|----|----|----|----|----|----|----|------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        |    |    |    |    |    |    |    | URAD |
| Access |    |    |    |    |    |    |    | R    |
| Reset  |    |    |    |    |    |    |    | 0    |

|        |          |    |    |    |          |    |    |    |
|--------|----------|----|----|----|----------|----|----|----|
| Bit    | 23       | 22 | 21 | 20 | 19       | 18 | 17 | 16 |
|        | RSU[3:0] |    |    |    | REC[3:0] |    |    |    |
| Access | R        | R  | R  | R  | R        | R  | R  | R  |
| Reset  | 0        | 0  | 0  | 0  | 0        | 0  | 0  | 0  |

|        |          |    |    |    |          |    |   |   |
|--------|----------|----|----|----|----------|----|---|---|
| Bit    | 15       | 14 | 13 | 12 | 11       | 10 | 9 | 8 |
|        | RWC[3:0] |    |    |    | RBE[3:0] |    |   |   |
| Access | R        | R  | R  | R  | R        | R  | R | R |
| Reset  | 0        | 0  | 0  | 0  | 0        | 0  | 0 | 0 |

|        |          |   |   |   |          |   |   |   |
|--------|----------|---|---|---|----------|---|---|---|
| Bit    | 7        | 6 | 5 | 4 | 3        | 2 | 1 | 0 |
|        | RDM[3:0] |   |   |   | RHC[3:0] |   |   |   |
| Access | R        | R | R | R | R        | R | R | R |
| Reset  | 0        | 0 | 0 | 0 | 0        | 0 | 0 | 0 |

#### Bit 24 – URAD Undefined Register Access Detection Status

The URAD bit is only reset by the SWRST bit in ICM\_CTRL.

The URAT field in ICM\_UASR indicates the unspecified access type.

| Value | Description                                                                    |
|-------|--------------------------------------------------------------------------------|
| 0     | No undefined register access has been detected since the last SWRST.           |
| 1     | At least one undefined register access has been detected since the last SWRST. |

#### Bits 23:20 – RSU[3:0] Region Status Updated Detected

When RSU[i] is set, it indicates that a region status updated condition has been detected.

#### Bits 19:16 – REC[3:0] Region End Bit Condition Detected

When REC[i] is set, it indicates that an end bit condition has been detected.

#### Bits 15:12 – RWC[3:0] Region Wrap Condition Detected

When RWC[i] is set, it indicates that a wrap condition has been detected.

#### Bits 11:8 – RBE[3:0] Region Bus Error

When RBE[i] is set, it indicates that a bus error has been detected while hashing memory region i.

#### Bits 7:4 – RDM[3:0] Region Digest Mismatch

When RDM[i] is set, it indicates that there is a digest comparison mismatch between the hash value of the region with identifier i and the reference value located in the Hash Area.

#### Bits 3:0 – RHC[3:0] Region Hash Completed

When RHC[i] is set, it indicates that the ICM has completed the region with identifier i.

43.6.8 ICM Undefined Access Status Register

Name: ICM\_UASR  
Offset: 0x20  
Reset: 0x00000000  
Property: Read-only

**Bits 2:0 – URAT[2:0] Undefined Register Access Trace**  
Only the first Undefined Register Access Trace is available through the URAT field.  
The URAT field is only reset by the SWRST bit in the ICM\_CTRL register.

| Value | Name                 | Description                                                                     |
|-------|----------------------|---------------------------------------------------------------------------------|
| 0     | UNSPEC_STRUCT_MEMBER | Unspecified structure member set to one detected when the descriptor is loaded. |
| 1     | ICM_CFG_MODIFIED     | ICM_CFG modified during active monitoring.                                      |
| 2     | ICM_DSCR_MODIFIED    | ICM_DSCR modified during active monitoring.                                     |
| 3     | ICM_HASH_MODIFIED    | ICM_HASH modified during active monitoring.                                     |
| 4     | READ_ACCESS          | Write-only register read access                                                 |

### 43.6.9 ICM Descriptor Area Start Address Register

**Name:** ICM\_DSCR  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ICM Write Protection Mode Register](#).

|        |             |     |     |     |     |     |     |     |
|--------|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31          | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | DASA[25:18] |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 23          | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | DASA[17:10] |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15          | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | DASA[9:2]   |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7           | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | DASA[1:0]   |     |     |     |     |     |     |     |
| Access | R/W         | R/W |     |     |     |     |     |     |
| Reset  | 0           | 0   |     |     |     |     |     |     |

**Bits 31:6 – DASA[25:0] Descriptor Area Start Address**  
 The start address is a multiple of the total size of the data structure (64 bytes).

### 43.6.10 ICM Hash Area Start Address Register

**Name:** ICM\_HASH  
**Offset:** 0x34  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ICM Write Protection Mode Register](#).

|        |             |     |     |     |     |     |     |     |
|--------|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31          | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | HASA[24:17] |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 23          | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | HASA[16:9]  |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit    | 15          | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | HASA[8:1]   |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7           | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | HASA[0]     |     |     |     |     |     |     |     |
| Access | R/W         |     |     |     |     |     |     |     |
| Reset  | 0           |     |     |     |     |     |     |     |

#### Bits 31:7 – HASA[24:0] Hash Area Start Address

This field points at the Hash memory location. The address must be a multiple of 128 bytes.

### 43.6.11 ICM User Initial Hash Value Register

**Name:** ICM\_UIHVALx  
**Offset:** 0x38 + x\*0x04 [x=0..7]  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [ICM Write Protection Mode Register](#).

|        |            |    |    |    |    |    |    |    |
|--------|------------|----|----|----|----|----|----|----|
| Bit    | 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        | VAL[31:24] |    |    |    |    |    |    |    |
| Access | W          | W  | W  | W  | W  | W  | W  | W  |
| Reset  | –          | –  | –  | –  | –  | –  | –  | –  |
| Bit    | 23         | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | VAL[23:16] |    |    |    |    |    |    |    |

|        | VAL[7:0]   |    |    |    |    |    |    |    |
| Access | W          | W  | W  | W  | W  | W  | W  | W  |
| Reset  | –          | –  | –  | –  | –  | –  | –  | –  |

#### Bits 31:0 – VAL[31:0] Initial Hash Value

When ICM\_CFG.UIHASH is set, the Initial Hash Value is user-programmable.

To meet the desired standard, use the following example values.

For ICM\_UIHVAL0 field:

| Example    | Comment          |
|------------|------------------|
| 0x67452301 | SHA1 algorithm   |
| 0xC1059ED8 | SHA224 algorithm |
| 0x6A09E667 | SHA256 algorithm |

For ICM\_UIHVAL1 field:

| Example    | Comment          |
|------------|------------------|
| 0xEFCDAB89 | SHA1 algorithm   |
| 0x367CD507 | SHA224 algorithm |
| 0xBB67AE85 | SHA256 algorithm |

For ICM\_UIHVAL2 field:

| Example    | Comment          |
|------------|------------------|
| 0x98BADCFE | SHA1 algorithm   |
| 0x3070DD17 | SHA224 algorithm |
| 0x3C6EF372 | SHA256 algorithm |

For ICM\_UIHVAL3 field:

| Example    | Comment          |
|------------|------------------|
| 0x10325476 | SHA1 algorithm   |
| 0xF70E5939 | SHA224 algorithm |
| 0xA54FF53A | SHA256 algorithm |

For ICM\_UIHVAL4 field:

| Example    | Comment          |
|------------|------------------|
| 0xC3D2E1F0 | SHA1 algorithm   |
| 0xFFC00B31 | SHA224 algorithm |
| 0x510E527F | SHA256 algorithm |

For ICM\_UIHVAL5 field:

| Example    | Comment          |
|------------|------------------|
| 0x68581511 | SHA224 algorithm |
| 0x9B05688C | SHA256 algorithm |

For ICM\_UIHVAL6 field:

| Example    | Comment          |
|------------|------------------|
| 0x64F98FA7 | SHA224 algorithm |
| 0x1F83D9AB | SHA256 algorithm |

For ICM\_UIHVAL7 field:

| Example    | Comment          |
|------------|------------------|
| 0xBEFA4FA4 | SHA224 algorithm |
| 0x5BE0CD19 | SHA256 algorithm |

Example of Initial Value for SHA-1 Algorithm

| Register Address  | Address Offset / Byte Lane |             |            |           |
|-------------------|----------------------------|-------------|------------|-----------|
|                   | 0x3 / 31:24                | 0x2 / 23:16 | 0x1 / 15:8 | 0x0 / 7:0 |
| 0x000 ICM_UIHVAL0 | 01                         | 23          | 45         | 67        |
| 0x004 ICM_UIHVAL1 | 89                         | ab          | cd         | ef        |
| 0x008 ICM_UIHVAL2 | fe                         | dc          | ba         | 98        |
| 0x00C ICM_UIHVAL3 | 76                         | 54          | 32         | 10        |
| 0x010 ICM_UIHVAL4 | f0                         | e1          | d2         | c3        |

### 43.6.12 ICM Write Protection Mode Register

**Name:** ICM\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |              |    |    |    |    |        |        |      |

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                                                                |
|----------|--------|----------------------------------------------------------------------------------------------------------------------------|
| 0x49434D | PASSWD | Writing any other value in this field aborts the write operation of the WPEN, WPITEN and WPCREN bits.<br>Always reads as 0 |

#### Bit 2 – WPCREN Write Protection Control Enable

| Value | Description                                                                                          |
|-------|------------------------------------------------------------------------------------------------------|
| 0     | Disables the write protection on control register if WPKEY corresponds to 0x49434D ("ICM" in ASCII). |
| 1     | Enables the write protection on control register if WPKEY corresponds to 0x49434D ("ICM" in ASCII).  |

#### Bit 1 – WPITEN Write Protection Interrupt Enable

| Value | Description                                                                                             |
|-------|---------------------------------------------------------------------------------------------------------|
| 0     | Disables the write protection on interrupt registers if WPKEY corresponds to 0x49434D ("ICM" in ASCII). |
| 1     | Enables the write protection on interrupt registers if WPKEY corresponds to 0x49434D ("ICM" in ASCII).  |

#### Bit 0 – WPEN Write Protection Enable

See [ICM Register Write Protection](#) for the list of registers that can be write-protected.

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 0     | Disables the write protection if WPKEY corresponds to 0x49434D ("ICM" in ASCII) |
| 1     | Enables the write protection if WPKEY corresponds to 0x49434D ("ICM" in ASCII)  |

43.6.13 ICM Write Protection Status Register

Name: ICM\_WPSR  
Offset: 0xE8  
Reset: 0x00000000  
Property: Read-only

|        |            |    |    |    |    |    |    |      |
|--------|------------|----|----|----|----|----|----|------|
| Bit    | 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        |            |    |    |    |    |    |    |      |
| Access |            |    |    |    |    |    |    |      |
| Reset  |            |    |    |    |    |    |    |      |
| Bit    | 23         | 22 | 21 | 20 | 19 | 18 | 17 | 16   |
|        |            |    |    |    |    |    |    |      |
| Access |            |    |    |    |    |    |    |      |
| Reset  |            |    |    |    |    |    |    |      |
| Bit    | 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8    |
|        | WPVSR[7:0] |    |    |    |    |    |    |      |
| Access | R          | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7          | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        |            |    |    |    |    |    |    | WPVS |
| Access |            |    |    |    |    |    |    | R    |
| Reset  |            |    |    |    |    |    |    | 0    |

**Bits 15:8 – WPVSR[7:0]** Write Protection Violation Source  
When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status (Cleared on read)

| Value | Description                                                                                                                                                                                                |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protect violation has occurred since the last read of ICM_WPSR.                                                                                                                                   |
| 1     | A write protect violation has occurred since the last read of ICM_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

## 44. True Random Number Generator (TRNG)

### 44.1 Description

The True Random Number Generator (TRNG) passes the American *NIST Special Publication 800-22 (A Statistical Test Suite for Random and Pseudorandom Number Generators for Cryptographic Applications)* and the *Diehard Suite of Tests*.

The TRNG may be used as an entropy source for seeding an NIST approved DRNG (Deterministic RNG) as required by FIPS PUB 140-2 and 140-3.

The TRNG is fully designed with digital cells, and under the specified operating conditions, external factors such as temperature, humidity, etc. affect TRNG ageing in the same manner as all other digital peripherals (CPU core, bus matrix, etc.) of the product.

### 44.2 Embedded Characteristics

- Passes *NIST Special Publication 800-22 Test Suite*
- Passes *Diehard Suite of Tests*
- May be Used as Entropy Source for seeding a NIST-approved DRNG (Deterministic RNG) as required by FIPS PUB 140-2 and 140-3
- Provides a 32-bit Random Number Every 84 Clock Cycles

### 44.3 Block Diagram

Figure 44-1. TRNG Block Diagram

### 44.4 Product Dependencies

#### 44.4.1 Power Management

The TRNG interface may be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the TRNG user interface clock. The user interface clock is independent from any clock that may be used in the entropy source logic circuitry. The source of entropy can be enabled before enabling the user interface clock.

#### 44.4.2 Interrupt Sources

The TRNG interface has an interrupt line connected to the Interrupt Controller. In order to handle interrupts, the Interrupt Controller must be programmed before configuring the TRNG.

### 44.5 Functional Description

As soon as the TRNG is enabled in the Control register (TRNG\_CR), the generator provides one 32-bit random value every 84 clock cycles.

The TRNG interrupt line can be enabled in the Interrupt Enable register (TRNG\_IER), and disabled in the Interrupt Disable register (TRNG\_IDR). This interrupt is set when a new random value is available and is cleared when the Status register (TRNG\_ISR) is read. The flag TRNG\_ISR.DATRDY is set when the random data is ready to be read out on the 32-bit Output Data register (TRNG\_ODATA).

The normal mode of operation checks that the flag in TRNG\_ISR equals '1' before reading TRNG\_ODATA when a 32-bit random value is required by the software application.

**Figure 44-2.** TRNG Data Generation Sequence

## 44.6 Register Summary

| Offset              | Name       | Bit Pos. | 7            | 6 | 5 | 4 | 3 | 2 | 1 | 0      |
|---------------------|------------|----------|--------------|---|---|---|---|---|---|--------|
| 0x00                | TRNG_CR    | 7:0      |              |   |   |   |   |   |   | ENABLE |
|                     |            | 15:8     | WAKEY[7:0]   |   |   |   |   |   |   |        |

### 44.6.1 TRNG Control Register

**Name:** TRNG\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

|        |              |    |    |    |    |    |    |        |
|--------|--------------|----|----|----|----|----|----|--------|
| Bit    | 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24     |
|        | WAKEY[23:16] |    |    |    |    |    |    |        |
| Access | W            | W  | W  | W  | W  | W  | W  | W      |
| Reset  | –            | –  | –  | –  | –  | –  | –  | –      |
| Bit    | 23           | 22 | 21 | 20 | 19 | 18 | 17 | 16     |
|        | WAKEY[15:8]  |    |    |    |    |    |    |        |
| Access | W            | W  | W  | W  | W  | W  | W  | W      |
| Reset  | –            | –  | –  | –  | –  | –  | –  | –      |
| Bit    | 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8      |
|        | WAKEY[7:0]   |    |    |    |    |    |    |        |
| Access | W            | W  | W  | W  | W  | W  | W  | W      |
| Reset  | –            | –  | –  | –  | –  | –  | –  | –      |
| Bit    | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0      |
|        |              |    |    |    |    |    |    | ENABLE |
| Access |              |    |    |    |    |    |    | W      |
| Reset  |              |    |    |    |    |    |    | –      |

#### Bits 31:8 – WAKEY[23:0] Register Write Access Key

| Value    | Name   | Description                                                       |
|----------|--------|-------------------------------------------------------------------|
| 0x524E47 | PASSWD | Writing any other value in this field aborts the write operation. |

#### Bit 0 – ENABLE Enable TRNG to Provide Random Values

| Value | Description                                                                                |
|-------|--------------------------------------------------------------------------------------------|
| 0     | Disables the TRNG if 0x524E47 (“RNG” in ASCII) is written in WAKEY field at the same time. |
| 1     | Enables the TRNG if 0x524E47 (“RNG” in ASCII) is written in WAKEY field at the same time.  |

44.6.2 TRNG Interrupt Enable Register

Name: TRNG\_IER  
Offset: 0x10  
Reset: -  
Property: Write-only

Bit 0 – DATRDY Data Ready Interrupt Enable

| Value | Description                          |
|-------|--------------------------------------|
| 0     | No effect.                           |
| 1     | Enables the corresponding interrupt. |

44.6.3 TRNG Interrupt Disable Register

Name: TRNG\_IDR  
Offset: 0x14  
Reset: -  
Property: Write-only

Bit 0 – DATRDY Data Ready Interrupt Disable

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Disables the corresponding interrupt. |

44.6.4 TRNG Interrupt Mask Register

Name: TRNG\_IMR  
Offset: 0x18  
Reset: 0x00000000  
Property: Read-only

Bit 0 – DATRDY Data Ready Interrupt Mask

| Value | Description                                 |
|-------|---------------------------------------------|
| 0     | The corresponding interrupt is not enabled. |
| 1     | The corresponding interrupt is enabled.     |

44.6.5 TRNG Interrupt Status Register

Name: TRNG\_ISR  
Offset: 0x1C  
Reset: 0x00000000  
Property: Read-only

Bit 0 – DATRDY Data Ready (cleared on read)

| Value | Description                                                      |
|-------|------------------------------------------------------------------|
| 0     | Output data is not valid or TRNG is disabled.                    |
| 1     | New random value is completed since the last read of TRNG_ODATA. |

#### 44.6.6 TRNG Output Data Register

**Name:** TRNG\_ODATA  
**Offset:** 0x50  
**Reset:** 0x00000000  
**Property:** Read-only

|        |              |    |    |    |    |    |    |    |
|--------|--------------|----|----|----|----|----|----|----|
| Bit    | 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        | ODATA[31:24] |    |    |    |    |    |    |    |
| Access | R            | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 23           | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | ODATA[23:16] |    |    |    |    |    |    |    |
| Access | R            | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

##### Bits 31:0 – ODATA[31:0] Output Data

The 32-bit Output Data register contains the 32-bit random data.

## 45. Secure Hash Algorithm (SHA)

### 45.1 Description

The Secure Hash Algorithm (SHA) is compliant with the American *FIPS (Federal Information Processing Standard) Publication 180-2* specification.

The 512/1024-bit block of message is respectively stored in 16/32 x 32-bit registers, (SHA\_IDATARx/ SHA\_IODATARx) which are write-only.

As soon as the input data is written, hash processing can be started. The registers comprising the block of a message must be entered consecutively. Then, after the processing period, the message digest is ready to be read out on the 5 up to 8/16 x 32-bit output data registers (SHA\_IODATARx) or through the DMA channels.

### 45.2 Embedded Characteristics

- Supports Hash-based Message Authentication Code (HMAC) Algorithm (HMAC-SHA1, HMAC-SHA224, HMAC-SHA256, HMAC-SHA384, HMAC-SHA512, )
- Compliant with FIPS Publication 180-2
- Supports Automatic Padding of Messages
- Supports Up to 2 Sets of Initial Hash Values Registers (HMAC Acceleration or other)
- Supports Automatic Check of the Hash (HMAC Acceleration or other)
- Configurable Processing Period:
  - 85 clock cycles to obtain a fast SHA1 runtime, 88 clock cycles for SHA384, SHA512 or 209 Clock Cycles for Maximizing Bandwidth of Other Applications
  - 72 clock cycles to obtain a fast SHA224, SHA256 runtime or 194 clock cycles for maximizing bandwidth of other applications
- Connection to DMA Channel Capabilities Optimizes Data Transfers
- Double Input Buffer Optimizes Runtime
- Register Write Protection

### 45.3 Product Dependencies

#### 45.3.1 Power Management

The SHA may be clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the SHA clock.

#### 45.3.2 Interrupt Sources

The SHA interface has an interrupt line connected to the Interrupt Controller.

Handling the SHA interrupt requires programming the Interrupt Controller before configuring the SHA.

### 45.4 Functional Description

The Secure Hash Algorithm (SHA) module requires a padded message according to FIPS180-2 specification. This message can be provided with the padding to the SHA module, or the padding can be automatically computed by the SHA module if the size of the message is provided. The first block of the message must be indicated to the module by a specific command. The SHA module produces an N-bit message digest each time a block is written and processing period ends, where N is 160 for SHA1, 224 for SHA224, 256 for SHA256, 384 for SHA384, 512 for SHA512. The SHA module is also capable of computing Hash-based Message Authentication Code (HMAC) algorithm.

#### 45.4.1 SHA Algorithm

The SHA can process SHA1, SHA224, SHA256, SHA384, SHA512 by configuring the ALGO field in the SHA Mode register (SHA\_MR).

#### 45.4.2 HMAC Algorithm

The HMAC algorithm is as follows:

$$\text{HMAC}_K(m) = h((K_0 \oplus \text{opad}) || h((K_0 \oplus \text{ipad}) || m))$$

where:

- $h$  = SHA function
- $K_0$  = the key  $K$  after any necessary pre-processing to form a block size key
- $m$  = message to authenticate
- $||$  = concatenation operator
- $\oplus$  = XOR operator
- $\text{ipad}$  = predefined constant (0x3636...3636)
- $\text{opad}$  = predefined constant (0x5C5C...5C5C)

The SHA provides a fully optimized processing of the HMAC algorithm by executing the following operations:

- starting the SHA algorithm from any user predefined hash value, thus ' $h(K_0 \oplus \text{ipad})$ ' for first HMAC hash and ' $h(K_0 \oplus \text{opad})$ ' for second HMAC hash
- performing automatic padding
- routing automatically the first hash result ' $h((K_0 \oplus \text{ipad}) || m)$ ' to the source of the second hash processing ' $h((K_0 \oplus \text{opad}) || (\text{first hash result}))$ ' including the concatenation of the first hash result to ' $K_0 \oplus \text{opad}$ '.

To perform the HMAC operation, the ALGO field value must be greater than 7, the automatic padding feature must be enabled (MSGSIZE and BYTCNT fields differ from 0) and the SHA internal initial hash value registers 0 and 1 must be configured, respectively, with the hash results of input blocks " $K_0 \oplus \text{ipad}$ " and " $K_0 \oplus \text{opad}$ " (see [Internal Registers for Initial Hash Value or Expected Hash Result](#)).

The size of the message (' $m$ ') must be written in the MSGSIZE and BYTCNT fields.

The FIRST bit in the SHA Control register (SHA\_CR) should be set before writing the first block of the message.

The SHA can process HMAC-SHA1, HMAC-SHA224, HMAC-SHA256, HMAC-SHA384, HMAC-SHA512 by configuring the ALGO field in the SHA\_MR.

#### 45.4.3 Processing Period

When SHA is enabled and DMA is used to write the messages, the inherent processing period may result, depending on the application, in a significant bandwidth usage at system bus level. In some applications, it may be important to keep as much bandwidth as possible for the other peripherals (e.g. CPU, other DMA channels). The SHA engine inherent processing period can be configured to reduce the bandwidth required by writing SHA\_MR.PROCDLY=1.

In SHA1 mode, the shortest processing period is 85 clock cycles + 2 clock cycles for start command synchronization (SHA\_MR.PROCDLY=0). The longest period is 209 clock cycles + 2 clock cycles when SHA\_MR.PROCDLY=1 (see the figure below).

In SHA256 mode, the shortest processing period is 72 clock cycles + 2 clock cycles for start command synchronization (SHA\_MR.PROCDLY=0). The longest period is 194 clock cycles + 2 clock cycles when SHA\_MR.PROCDLY=1.

In SHA384 or SHA512 mode, the shortest processing period is 88 clock cycles + 2 clock cycles for start command synchronization. The longest period is 209 clock cycles + 2 clock cycles.

**Figure 45-1. Bandwidth Usage in SHA-1 Mode**

#### 45.4.4 Double Input Buffer

The SHA Input Data registers (SHA\_IDATARx) can be double-buffered to reduce the runtime of large messages.

Double-buffering allows a new message block to be written while the previous message block is being processed. This is only possible when DMA accesses are performed (SMOD = 2).

The DUALBUFF bit in the SHA\_MR must be set to have double input buffer access.

#### 45.4.5 Internal Registers for Initial Hash Value or Expected Hash Result

The SHA module embeds two sets of internal registers (IR0, IR1) to store different data used by the SHA or HMAC algorithms (See the figure below). These internal registers are accessed through SHA Input Data registers (SHA\_IDATARx).

When the ALGO field selects SHA algorithms, IR0 can be configured with a user initial hash value. This initial hash value can be used to compute a custom hash algorithm with two sets of different initial constants, or to continue a hash computation by providing the intermediate hash value previously returned by the SHA module.

When the ALGO field selects SHA algorithms, IR1 can be configured with either a user initial hash value or an expected hash result. The expected hash result must be configured in the IR1 if the field CHECK = 1 (refer to [Automatic Check](#)). If the field CHECK = 0 or 2, IR1 can be configured with a user initial hash value that differs from IR0 value.

When the ALGO field selects HMAC algorithms, IR0 must be configured with the hash result of  $K_0 \oplus \text{ipad}$  and IR1 must be configured with the hash result of  $K_0 \oplus \text{opad}$ . These pre-computed first blocks speed up the HMAC computation by saving the time to compute the intermediate hash values of the first block which is constant while the secret key is constant (See [HMAC Algorithm](#)).

**Table 45-1. Configuration Values of Internal Registers**

| Register | SHA Modes (ALGO < 8) |                      |                   | HMAC Modes (ALGO > 7)            |
|----------|----------------------|----------------------|-------------------|----------------------------------|
|          | CHECK = 0            | CHECK = 1            | CHECK = 2         |                                  |
| IR0      | User Initial Hash    | User Initial Hash    | User Initial Hash | hash( $K_0 \oplus \text{ipad}$ ) |
| IR1      | User Initial Hash    | Expected Hash Result | User Initial Hash | hash( $K_0 \oplus \text{opad}$ ) |

To calculate the initial HMAC values, follow this sequence:

1. Calculate  $K_0$ .
2. Calculate  $K_0 \oplus \text{ipad}$  and  $K_0 \oplus \text{opad}$ .
3. Perform a hash of the result of  $K_0 \oplus \text{ipad}$  and  $K_0 \oplus \text{opad}$  (auto-padding must be disabled for that type of hash).
4. Write  $h(K_0 \oplus \text{ipad})$  and  $h(K_0 \oplus \text{opad})$  in IR0 and IR1 respectively.

To write IR0 or IR1, follow this sequence:

1. Set SHA\_CR.WUIHV (IR0) or SHA\_CR.WUIEHV (IR1).
2. Write the data in SHA\_IDATARx. The number of registers to write depends on the type of data (user initial hash values or expected hash result) and on the type of algorithm selected:
  - SHA\_IDATAR0 to SHA\_IDATAR4 for data used in algorithms based on SHA1
  - SHA\_IDATAR0 to SHA\_IDATAR7 for data used in algorithms based on SHA256
  - SHA\_IDATAR0 to SHA\_IDATAR15 for data used in algorithms based on SHA512
  - SHA\_IDATAR0 to SHA\_IDATAR6 for expected hash result of algorithms based on SHA224
  - SHA\_IDATAR0 to SHA\_IDATAR11 for expected hash result of algorithms based on SHA384
3. Clear SHA\_CR.WUIHV or SHA\_CR.WUIEHV.

IR0 and IR1 are automatically selected for HMAC processing if the field ALGO selects HMAC algorithms. If SHA algorithms are selected, the internal registers are selected if the corresponding UIHV or UIEHV bits are set.

**Figure 45-2.** User Initial Hash Value and Expected Hash Internal Register Access

#### 45.4.6 Automatic Padding

The SHA module features an automatic padding computation to speed up the execution of the algorithm.

The automatic padding function requires the following information:

- Complete message size in bytes to be written in the MSGSIZE field of the SHA Message Size register (SHA\_MSR).  
The size of the message is written at the end of the last block, as required by the FIPS180-2 specification (the size is automatically converted into a bit-size).
- Number of remaining bytes (to write in the SHA\_IDATARx) to be written in the BYTCNT field of the SHA Bytes Count register (SHA\_BCR).  
Automatic padding occurs when the BYTCNT field reaches 0. At each write in the SHA Input registers, the BYTCNT field value is decreased by the number of bytes written.

The BYTCNT field value must be written with the same value as the MSGSIZE field value if the full message is processed. If the message is partially preprocessed and an initial hash value is used, BYTCNT must be written with the remaining bytes to hash while MSGSIZE holds the message size.

To disable the automatic padding feature, the MSGSIZE and BYTCNT fields must be configured with 0.

#### 45.4.7 Automatic Check

The SHA module features an automatic check of the hash result with the expected hash. A check failure can generate an interrupt if configured in the SHA Interrupt Enable register (SHA\_IER).

Automatic check requires the automatic padding feature to be enabled (MSGSIZE and BYTCNT fields must be greater than 0).

There are two methods to configure the expected hash result:

- if SHA\_MR.CHECK = 1, the expected hash result is read from the internal register (IR1). This method cannot be used when HMAC algorithms is selected because this register is already used to store user initial hash values for the second hash processing. IR1 cannot be read by software.
- If SHA\_MR.CHECK = 2, the expected hash result is written in the SHA\_IDATARx after the message.

When SHA\_MR.CHECK = 2, the method can provide more flexibility of use if a message is stored in system memory together with its expected hash result. A DMA with linked list can be used to ease the transfer of the message and its expected hash result.

**Figure 45-3. Message and Expected Hash Result Memory Mapping**

The number of 32-bit words of the hash result to check with the expected hash can be selected with SHA\_MR.CHCNT. The status of the check is available in the CHKST field in the SHA Interrupt Status register (SHA\_ISR).

An interrupt can be generated (if enabled) when the check is completed. The check occurs several clock cycles after the computation of the requested hash, so the interrupt and the CHECKF bit are set several clock cycles after the DATRDY flag of the SHA\_ISR.

#### 45.4.8 Start Modes

SHA\_MR.SMOD is used to select the Hash Processing Start mode.

##### 45.4.8.1 Manual Mode

In Manual mode, the sequence is as follows:

1. Set SHA\_IER.DATRDY (Data Ready), depending on whether an interrupt is required at the end of processing.
2. If the initial hash values differ from the FIPS standard, set SHA\_MR.UIHV and/or SHA\_MR.UIEHV. If the initial hash values comply with the FIPS180-2 specification, clear SHA\_MR.UIHV and/or SHA\_MR.UIEHV.
3. If automatic padding is required, configure SHA\_MSR.MSGSIZE with the number of bytes of the message, and configure SHA\_BCR.BYTCNT with the remaining number of bytes to write. The BYTCNT field must be written with a value different from MSGSIZE field value if the message is preprocessed and completed by using user initial hash values. If automatic padding is not required, configure SHA\_MSR.MSGSIZE and SHA\_BCR.BYTCNT to 0.
4. For the first block of a message, the FIRST command must be set by writing a 1 into the corresponding bit of the Control register (SHA\_CR). For the other blocks, there is nothing to write.
5. Write the block to be processed in the SHA\_IDATARx.

6. To begin processing, set SHA\_CR.START.
7. When processing is completed, the bit DATRDY in the Interrupt Status register (SHA\_ISR) rises. If an interrupt has been enabled by setting SHA\_IER.DATRDY, the interrupt line of the SHA is activated.
8. Repeat the write procedure for each block, start procedure and wait for the interrupt procedure up to the last block of the entire message. Each time the start procedure is complete, the DATRDY flag is cleared.
9. After the last block is processed (DATRDY flag is set, if an interrupt has been enabled by setting SHA\_IER.DATRDY, the interrupt line of the SHA is activated), read the message digest in the Output Data registers. The DATRDY flag is automatically cleared when reading the SHA\_IODATARx registers.

#### 45.4.8.2 Auto Mode

In Auto mode, processing starts as soon as the correct number of SHA\_IDATARx is written. No action in the SHA\_CR is necessary.

#### 45.4.8.3 DMA Mode

The DMA can be used in association with the SHA to perform the algorithm on a complete message without any action by the software during processing.

SHA\_MR.SMOD must be configured to 2.

The DMA must be configured with non-incremental addresses.

The start address of any transfer descriptor must be set to point to the SHA\_IDATAR0.

The DMA chunk size must be set to transfer, for each trigger request, 16 words of 32 bits.

The FIRST bit of the SHA\_CR must be set before starting the DMA when the first block is transferred.

The DMA generates an interrupt when the end of buffer transfer is completed but the SHA processing is still in progress. The end of SHA processing is indicated by the flag DATRDY in the SHA\_ISR.

If automatic padding is disabled, the end of SHA processing requires two interrupts to be verified. The DMA end of transfer interrupt must be verified first, then the SHA DATRDY interrupt must be enabled and verified.

If automatic padding is enabled, the end of SHA processing requires only one interrupt to be verified. The DMA end of transfer is not required, so the SHA DATRDY interrupt must be enabled prior to start the DMA and DATRDY interrupt is the only one to be verified. Refer to the figures below.

**Figure 45-4.** Interrupts Processing with DMA

**Figure 45-5.** Interrupts Processing with DMA and Automatic Padding

#### 45.4.8.4 SHA Register Endianness

In Arm processor-based products, the system bus and processors manipulate data in little-endian form. The SHA interface requires little-endian format words. However, in accordance with the protocol of FIPS 180-2 specification, data is collected, processed and stored by the SHA algorithm in big-endian form.

The following example illustrates how to configure the SHA:

If the first 64 bits of a message (according to FIPS 180-2, i.e., big-endian format) to be processed is 0xcafedeca\_01234567, then the SHA\_IDATAR0 and SHA\_IDATAR1 registers must be written with the following pattern:

- SHA\_IDATAR0 = 0xcadefeca
- SHA\_IDATAR1 = 0x67452301

In a little-endian system, the message (according to FIPS 180-2) starting with pattern 0xcafedeca 01234567 is stored into memory as follows:

- 0xca stored at initial offset (for example 0x00),
- then 0xfe stored at initial offset + 1 (i.e., 0x01),
- 0xde stored at initial offset + 2 (i.e., 0x02),
- 0xca stored at initial offset + 3 (i.e., 0x03).

If the message is received through a serial-to-parallel communication channel, the first received character is 0xca and it is stored at the first memory location (initial offset). The second byte, 0xfe, is stored at initial offset + 1.

When reading on a 32-bit little-endian system bus, the first word read back from system memory is 0xcadefeca.

When the SHA\_IODATARx registers are read, the hash result is organized in little-endian format, allowing system memory storage in the same format as the message.

Taking an example from the FIPS 180-2 specification Appendix B.1, the endian conversion can be observed.

For this example, the 512-bit message is:

[illegible]

and the expected SHA-256 result is:

0xba7816bf 8f01cfea 414140de 5dae2223 b00361a3 96177a9c b410ff61 f20015ad

If the message has not already been stored in the system memory, the first step is to convert the input message to little-endian before writing to the SHA\_IDATARx registers. This would result in a write of:

SHA\_IDATAR0 = 0x80636261..... SHA\_IDATAR15 = 0x18000000

The data in the output message digest registers, SHA\_IODATARx, contain SHA\_IODATAR0 = 0xbf1678ba... SHA\_IODATAR7 = 0xad1500f2 which is the little-endian format of 0xba7816bf,..., 0xf20015ad.

Reading SHA\_IODATAR0 to SHA\_IODATAR1 and storing into a little-endian memory system forces hash results to be stored in the same format as the message.

When the output message is read, the user can convert back to big-endian for a resulting message value of:

0xba7816bf\_8f01cfea\_414140de\_5dae2223\_b00361a3\_96177a9c\_b410ff61\_f20015ad

## 45.4.9 Security Features

### 45.4.9.1 Unspecified Register Access Detection

When an unspecified register access occurs, the URAD bit in the SHA\_ISR is set. Its source is then reported in the Unspecified Register Access Type field (URAT). Only the last unspecified register access is available through the URAT field.

Several kinds of unspecified register accesses can occur:

- SHA\_IDATARx written during data processing in DMA mode
- SHA\_IODATARx read during data processing
- SHA\_MR written during data processing
- Write-only register read access

The URAD bit and the URAT field can only be reset by the SWRST bit in the SHA\_CR.

### 45.4.9.2 Register Write Protection

To prevent any single software error from corrupting SHA behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the SHA Write Protection Mode register (SHA\_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the SHA Write Protection Status register (SHA\_WPSR) is set and the Write Protection Violation Source (WPVSRC) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading SHA\_WPSR.

The following register(s) can be write-protected when SHA\_WPMR.WPEN is set:

- [SHA Mode Register](#)
- [SHA Message Size Register](#)
- [SHA Bytes Count Register](#)

The following register(s) can be write-protected when WPITEN is set:

- [SHA Interrupt Enable Register](#)
- [SHA Interrupt Disable Register](#)

The following register(s) can be write-protected when WPCREN is set:

- [SHA Control Register](#)

## 45.5 Register Summary

| Offset              | Name          | Bit Pos. | 7              | 6         | 5      | 4     | 3         | 2 | 1         | 0          |
|---------------------|---------------|----------|----------------|-----------|--------|-------|-----------|---|-----------|------------|
| 0x00                | SHA_CR        | 7:0      |                |           |        | FIRST |           |   |           | START      |
|                     |               | 15:8     |                |           | WUIEHV | WUIHV |           |   |           | SWRST      |
|                     |               | 23:16    |                |           |        |       |           |   |           |            |
|                     |               | 31:24    |                |           |        |       |           |   |           |            |
| 0x04                | SHA_MR        | 7:0      |                | UIEHV     | UIHV   |       |           |   | SMOD[1:0] |            |
|                     |               | 15:8     |                |           |        |       | ALGO[3:0] |   |           |            |
|                     |               | 23:16    |                |           |        |       |           |   |           | DUALBUFF   |
|                     |               | 31:24    | CHKCNT[3:0]    |           |        |       |           |   |           | CHECK[1:0] |
| 0x08<br>...<br>0x0F | Reserved      |          |                |           |        |       |           |   |           |            |
| 0x10                | SHA_IER       | 7:0      |                |           |        |       |           |   |           | DATRDY     |
|                     |               | 15:8     |                |           |        |       |           |   |           | URAD       |
|                     |               | 23:16    |                |           |        |       |           |   |           | CHECKF     |
|                     |               | 31:24    |                |           |        |       |           |   |           | SECE       |
| 0x14                | SHA_IDR       | 7:0      |                |           |        |       |           |   |           | DATRDY     |
|                     |               | 15:8     |                |           |        |       |           |   |           | URAD       |

### 45.5.1 SHA Control Register

**Name:** SHA\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |        |       |    |    |   |       |
|--------|----|----|--------|-------|----|----|---|-------|
| Bit    | 15 | 14 | 13     | 12    | 11 | 10 | 9 | 8     |
|        |    |    | WUIEHV | WUIHV |    |    |   | SWRST |
| Access |    |    | W      | W     |    |    |   | W     |
| Reset  |    |    | –      | –     |    |    |   | –     |

|        |   |   |   |       |   |   |   |       |
|--------|---|---|---|-------|---|---|---|-------|
| Bit    | 7 | 6 | 5 | 4     | 3 | 2 | 1 | 0     |
|        |   |   |   | FIRST |   |   |   | START |
| Access |   |   |   | W     |   |   |   | W     |
| Reset  |   |   |   | –     |   |   |   | –     |

#### Bit 13 – WUIEHV Write User Initial or Expected Hash Values

| Value | Description                                                      |
|-------|------------------------------------------------------------------|
| 0     | SHA_IDATARx accesses are routed to the data registers.           |
| 1     | SHA_IDATARx accesses are routed to the internal registers (IR1). |

#### Bit 12 – WUIHV Write User Initial Hash Values

| Value | Description                                                      |
|-------|------------------------------------------------------------------|
| 0     | SHA_IDATARx accesses are routed to the data registers.           |
| 1     | SHA_IDATARx accesses are routed to the internal registers (IR0). |

#### Bit 8 – SWRST Software Reset

| Value | Description                                                                            |
|-------|----------------------------------------------------------------------------------------|
| 0     | No effect.                                                                             |
| 1     | Resets the SHA. A software-triggered hardware reset of the SHA interface is performed. |

#### Bit 4 – FIRST First Block of a Message

| Value | Description                                                             |
|-------|-------------------------------------------------------------------------|
| 0     | No effect.                                                              |
| 1     | Indicates that the next block to process is the first one of a message. |

#### Bit 0 – START Start Processing

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Starts manual hash algorithm process. |

## 45.5.2 SHA Mode Register

**Name:** SHA\_MR  
**Offset:** 0x04  
**Reset:** 0x0000100  
**Property:** Read/Write

| Access |             | R/W   | R/W  |     |           |     | R/W        | R/W      |
| Reset  |             | 0     | 0    |     |           |     | 0          | 0        |

### Bits 31:28 – CHKCNT[3:0] Check Counter

Number of 32-bit words to check. The value 0 indicates that the number of words to compare will be based on the algorithm selected (5 words for SHA1, 7 words for SHA224, 8 words for SHA256, 12 words for SHA384, 16 words for SHA512).

### Bits 25:24 – CHECK[1:0] Hash Check

Values not listed in table must be considered as “reserved”.

| Value | Name          | Description                                                                             |
|-------|---------------|-----------------------------------------------------------------------------------------|
| 0     | NO_CHECK      | No check is performed                                                                   |
| 1     | CHECK_EHV     | Check is performed with expected hash stored in internal expected hash value registers. |
| 2     | CHECK_MESSAGE | Check is performed with expected hash provided after the message.                       |

### Bit 16 – DUALBUFF Dual Input Buffer

| Value | Name     | Description                                                                                                                                           |
|-------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | INACTIVE | SHA_IDATARx and SHA_IODATARx cannot be written during processing of previous block.                                                                   |
| 1     | ACTIVE   | SHA_IDATARx and SHA_IODATARx can be written during processing of previous block when SMOD value = 2. It speeds up the overall runtime of large files. |

### Bits 11:8 – ALGO[3:0] SHA Algorithm

Values not listed in the table must be considered as “reserved”.

| Value | Name      | Description                             |
|-------|-----------|-----------------------------------------|
| 0     | SHA1      | SHA1 algorithm processed                |
| 1     | SHA256    | SHA256 algorithm processed              |
| 2     | SHA384    | SHA384 algorithm processed              |
| 3     | SHA512    | SHA512 algorithm processed              |
| 4     | SHA224    | SHA224 algorithm processed              |
| 8     | HMAC_SHA1 | HMAC algorithm with SHA1 Hash processed |

| Value | Name        | Description                               |
|-------|-------------|-------------------------------------------|
| 9     | HMAC_SHA256 | HMAC algorithm with SHA256 Hash processed |
| 10    | HMAC_SHA384 | HMAC algorithm with SHA384 Hash processed |
| 11    | HMAC_SHA512 | HMAC algorithm with SHA512 Hash processed |
| 12    | HMAC_SHA224 | HMAC algorithm with SHA224 Hash processed |

#### Bit 6 – UIEHV User Initial or Expected Hash Value Registers

| Value | Description                                                                                                                                                                       |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The SHA algorithm is started with the standard initial values as defined in the FIPS180-2 specification.                                                                          |
| 1     | The SHA algorithm is started with the user initial hash values stored in the internal register 1 (IR1). If HMAC is configured, UIEHV has no effect (i.e. IR1 is always selected). |

#### Bit 5 – UIHV User Initial Hash Values

| Value | Description                                                                                                                                                               |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The SHA algorithm is started with the standard initial values as defined in the FIPS180-2 specification.                                                                  |
| 1     | The SHA algorithm is started with the user initial hash values stored in the internal register 0 (IR0). If HMAC is configured, UIHV has no effect (i.e. IR0 is selected). |

#### Bits 1:0 – SMOD[1:0] Start Mode

Values not listed in the table must be considered as “reserved”.

If a DMA transfer is used, configure the SMOD value to 2. See [DMA Mode](#) for details.

| Value | Name          | Description                                               |
|-------|---------------|-----------------------------------------------------------|
| 0     | MANUAL_START  | Manual mode                                               |
| 1     | AUTO_START    | Auto mode                                                 |
| 2     | IDATAR0_START | SHA_IDATAR0 access only mode (mandatory when DMA is used) |

### 45.5.3 SHA Interrupt Enable Register

**Name:** SHA\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |    |    |    |    |    |    |    |        |
|--------|----|----|----|----|----|----|----|--------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24     |
|        |    |    |    |    |    |    |    | SECE   |
| Access |    |    |    |    |    |    |    | W      |
| Reset  |    |    |    |    |    |    |    | –      |
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16     |
|        |    |    |    |    |    |    |    | CHECKF |
| Access |    |    |    |    |    |    |    | W      |
| Reset  |    |    |    |    |    |    |    | –      |
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8      |
|        |    |    |    |    |    |    |    | URAD   |
| Access |    |    |    |    |    |    |    | W      |
| Reset  |    |    |    |    |    |    |    | –      |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0      |
|        |    |    |    |    |    |    |    | DATRDY |
| Access |    |    |    |    |    |    |    | W      |
| Reset  |    |    |    |    |    |    |    | –      |

**Bit 24 – SECE** Safety Event Interrupt Enable

**Bit 16 – CHECKF** Check Done Interrupt Enable

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Enable

**Bit 0 – DATRDY** Data Ready Interrupt Enable

#### 45.5.4 SHA Interrupt Disable Register

**Name:** SHA\_IDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|        |    |    |    |    |    |    |    |      |
|--------|----|----|----|----|----|----|----|------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        |    |    |    |    |    |    |    | SECE |
| Access |    |    |    |    |    |    |    | W    |
| Reset  |    |    |    |    |    |    |    | –    |

|        |    |    |    |    |    |    |    |        |
|--------|----|----|----|----|----|----|----|--------|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16     |
|        |    |    |    |    |    |    |    | CHECKF |
| Access |    |    |    |    |    |    |    | W      |
| Reset  |    |    |    |    |    |    |    | –      |

|        |    |    |    |    |    |    |   |      |
|--------|----|----|----|----|----|----|---|------|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8    |
|        |    |    |    |    |    |    |   | URAD |
| Access |    |    |    |    |    |    |   | W    |
| Reset  |    |    |    |    |    |    |   | –    |

|        |   |   |   |   |   |   |   |        |
|--------|---|---|---|---|---|---|---|--------|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0      |
|        |   |   |   |   |   |   |   | DATRDY |
| Access |   |   |   |   |   |   |   | W      |
| Reset  |   |   |   |   |   |   |   | –      |

**Bit 24 – SECE** Safety Event Interrupt Disable

**Bit 16 – CHECKF** Check Done Interrupt Disable

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Disable

**Bit 0 – DATRDY** Data Ready Interrupt Disable

### 45.5.5 SHA Interrupt Mask Register

**Name:** SHA\_IMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

|        |    |    |    |    |    |    |    |        |
|--------|----|----|----|----|----|----|----|--------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24     |
|        |    |    |    |    |    |    |    | SECE   |
| Access |    |    |    |    |    |    |    | R      |
| Reset  |    |    |    |    |    |    |    | 0      |
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16     |
|        |    |    |    |    |    |    |    | CHECKF |
| Access |    |    |    |    |    |    |    | R      |
| Reset  |    |    |    |    |    |    |    | 0      |
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8      |
|        |    |    |    |    |    |    |    | URAD   |
| Access |    |    |    |    |    |    |    | R      |
| Reset  |    |    |    |    |    |    |    | 0      |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0      |
|        |    |    |    |    |    |    |    | DATRDY |
| Access |    |    |    |    |    |    |    | R      |
| Reset  |    |    |    |    |    |    |    | 0      |

**Bit 24 – SECE** Safety Event Interrupt Mask

**Bit 16 – CHECKF** Check Done Interrupt Mask

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Mask

**Bit 0 – DATRDY** Data Ready Interrupt Mask

## 45.5.6 SHA Interrupt Status Register

**Name:** SHA\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

|        |    |    |    |    |    |    |    |      |
|--------|----|----|----|----|----|----|----|------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        |    |    |    |    |    |    |    | SECE |
| Access |    |    |    |    |    |    |    | R    |
| Reset  |    |    |    |    |    |    |    | 0    |

|        |    |    |    |    |    |    |    |        |
|--------|----|----|----|----|----|----|----|--------|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16     |
|        |    |    |    |    |    |    |    | CHECKF |
| Access | R  | R  | R  | R  |    |    |    | R      |
| Reset  | 0  | 0  | 0  | 0  |    |    |    | 0      |

|        |    |    |    |    |    |    |   |      |
|--------|----|----|----|----|----|----|---|------|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8    |
|        |    |    |    |    |    |    |   | URAD |
| Access |    | R  | R  | R  |    |    |   | R    |
| Reset  |    | 0  | 0  | 0  |    |    |   | 0    |

|        |   |   |   |      |   |   |   |        |
|--------|---|---|---|------|---|---|---|--------|
| Bit    | 7 | 6 | 5 | 4    | 3 | 2 | 1 | 0      |
|        |   |   |   | WRDY |   |   |   | DATRDY |
| Access |   |   |   | R    |   |   |   | R      |
| Reset  |   |   |   | 0    |   |   |   | 0      |

## Bit 24 – SECE Safety Event

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | There is no report in SHA_WPSR.               |
| 1     | There is a Safety Event reported in SHA_WPSR. |

**Bits 23:20 – CHKST[3:0]** Check Status (cleared by writing START or SWRST bits in SHA\_CR or by reading SHA\_IODATARx)

Value 5 indicates identical hash values (expected hash = hash result). Any other value indicates different hash values.

**Bit 16 – CHECKF** Check Done Status (cleared by writing START or SWRST bits in SHA\_CR or by reading SHA\_IODATARx)

| Value | Description                                                          |
|-------|----------------------------------------------------------------------|
| 0     | Hash check has not been computed.                                    |
| 1     | Hash check has been computed, status is available in the CHKST bits. |

**Bits 14:12 – URAT[2:0]** Unspecified Register Access Type (cleared by writing a 1 to SWRST bit in SHA\_CR)  
Only the last Unspecified Register Access Type is available through the URAT field.

| Value | Name                                                                                                                                           |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | SHA_IDATAR0 to SHA_IDATAR15 written during data processing in DMA mode (URAD = 1 and URAT = 0 can occur only if DUALBUFF is cleared in SHA_MR) |
| 1     | Output Data Register read during data processing                                                                                               |
| 2     | SHA_MR written during data processing                                                                                                          |
| 3     | Write-only register read access                                                                                                                |

**Bit 8 – URAD** Unspecified Register Access Detection Status (cleared by writing a 1 to SWRST bit in SHA\_CR)

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | No unspecified register access has been detected since the last SWRST.           |
| 1     | At least one unspecified register access has been detected since the last SWRST. |

#### Bit 4 – WRDY Input Data Register Write Ready

| Value | Description                   |
|-------|-------------------------------|
| 0     | SHA_IDATAR0 cannot be written |
| 1     | SHA_IDATAR0 can be written    |

#### Bit 0 – DATRDY Data Ready (cleared by writing a 1 to bit SWRST or START in SHA\_CR, or by reading SHA\_IDATARx)

| Value | Description                                                                                                                                                                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Output data is not valid.                                                                                                                                                                                                                                          |
| 1     | 512/1024-bit block process is completed. DATRDY is cleared when one of the following conditions is met: <ul style="list-style-type: none"> <li>• Bit START in SHA_CR is set.</li> <li>• Bit SWRST in SHA_CR is set.</li> <li>• The hash result is read.</li> </ul> |

### 45.5.7 SHA Message Size Register

**Name:** SHA\_MSR  
**Offset:** 0x20  
**Reset:** 0x0  
**Property:** Read/Write

|        |                |     |     |     |     |     |     |     |

|        | MSGSIZE[7:0]   |     |     |     |     |     |     |     |
| Access | R/W            | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0              | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 31:0 – MSGSIZE[31:0] Message Size

The size in bytes of the message. When MSGSIZE differs from 0, the SHA appends the corresponding value converted in bits after the padding section, as described in the FIPS180-2 specification. To disable automatic padding, MSGSIZE field must be written to 0.

### 45.5.8 SHA Bytes Count Register

**Name:** SHA\_BCR  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |               |     |     |     |     |     |     |     |
|--------|---------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31            | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | BYTCNT[31:24] |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 23            | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | BYTCNT[23:16] |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15            | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | BYTCNT[15:8]  |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7             | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | BYTCNT[7:0]   |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 31:0 – BYTCNT[31:0] Remaining Byte Count Before Auto Padding

When the hash processing starts from the beginning of a message (without preprocessed hash part), BYTCNT must be written with the same value as the MSGSIZE. If a part of the message has been already hashed and the hash does not start from the beginning, BYTCNT must be configured with the number of bytes remaining to process before padding section.

When read, provides the size in bytes of message remaining to be written before the automatic padding starts.

BYTCNT field is automatically updated each time a write occurs in the SHA\_IDATARx and SHA\_IODATARx.

When BYTCNT reaches 0, the MSGSIZE is converted into bit count and appended at the end of the message after the padding as described in the FIPS180-2 specification.

To disable automatic padding, MSGSIZE and BYTCNT fields must be written to 0.

### 45.5.9 SHA Input Data Register x

**Name:** SHA\_IDATARx  
**Offset:** 0x40 + x\*0x04 [x=0..15]  
**Reset:** –  
**Property:** Write-only

|        |              |    |    |    |    |    |    |    |
|--------|--------------|----|----|----|----|----|----|----|
| Bit    | 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        | IDATA[31:24] |    |    |    |    |    |    |    |

#### Bits 31:0 – IDATA[31:0] Input Data

32-bit Input Data registers load the data block used for hash processing. These registers are write-only to prevent reading of input data by another application. SHA\_IDATAR0 corresponds to the first word of the block, SHA\_IDATAR15 to the last word of the last block in case SHA algorithm is set to SHA1, SHA224, SHA256, or SHA\_IDATAR15 to the last word of the block if SHA algorithm is SHA384 or SHA512 (see [SHA Input/Output Data Register x](#)).

#### 45.5.10 SHA Input/Output Data Register x

**Name:** SHA\_IODATARx  
**Offset:** 0x80 + x\*0x04 [x=0..15]  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |               |     |     |     |     |     |     |     |
|--------|---------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31            | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | IODATA[31:24] |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 23            | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | IODATA[23:16] |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15            | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | IODATA[15:8]  |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7             | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | IODATA[7:0]   |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 31:0 – IODATA[31:0] Input/Output Data

These registers can be used to read the resulting message digest and to write the second part of the message block when the SHA algorithm is SHA-384 or SHA-512.

SHA\_IODATAR0 to SHA\_IODATAR15 can be written or read but reading these offsets does not return the content of corresponding parts (words) of the message block. Only results from SHA calculation can be read through these registers.

When SHA processing is in progress, these registers return 0x0000.

SHA\_IODATAR0 corresponds to the first word of the message digest; SHA\_IODATAR4 to the last one in SHA1 mode, SHA\_IODATAR6 in SHA224, SHA\_IODATAR7 in SHA256, SHA\_IODATAR11 in SHA384 or SHA\_IODATAR15 in SHA512.

When SHA224 is selected, the content of SHA\_IODATAR7 must be ignored.

When SHA384 is selected, the content of SHA\_IODATAR12 to SHA\_IODATAR15 must be ignored.

## 45.5.11 SHA Write Protection Mode Register

**Name:** SHA\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |              |    |    |    |    |        |        |      |
|--------|--------------|----|----|----|----|--------|--------|------|
| Bit    | 31           | 30 | 29 | 28 | 27 | 26     | 25     | 24   |
|        | WPKEY[23:16] |    |    |    |    |        |        |      |
| Access | W            | W  | W  | W  | W  | W      | W      | W    |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0      | 0      | 0    |
| Bit    | 23           | 22 | 21 | 20 | 19 | 18     | 17     | 16   |
|        | WPKEY[15:8]  |    |    |    |    |        |        |      |

| Bit    | 15           | 14 | 13 | 12 | 11 | 10     | 9      | 8    |
|        | WPKEY[7:0]   |    |    |    |    |        |        |      |
| Access | W            | W  | W  | W  | W  | W      | W      | W    |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0      | 0      | 0    |
| Bit    | 7            | 6  | 5  | 4  | 3  | 2      | 1      | 0    |
|        |              |    |    |    |    | WPCREN | WPITEN | WPEN |
| Access |              |    |    |    |    | R/W    | R/W    | R/W  |
| Reset  |              |    |    |    |    | 0      | 0      | 0    |

## Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                                                         |
|----------|--------|---------------------------------------------------------------------------------------------------------------------|
| 0x534841 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN,WPITEN,WPCREN bits. Always reads as 0. |

## Bit 2 – WPCREN Write Protection Control Enable

| Value | Description                                                                                          |
|-------|------------------------------------------------------------------------------------------------------|
| 0     | Disables the write protection on control register if WPKEY corresponds to 0x534841 ("SHA" in ASCII). |
| 1     | Enables the write protection on control register if WPKEY corresponds to 0x534841 ("SHA" in ASCII).  |

## Bit 1 – WPITEN Write Protection Interruption Enable

| Value | Description                                                                                             |
|-------|---------------------------------------------------------------------------------------------------------|
| 0     | Disables the write protection on interrupt registers if WPKEY corresponds to 0x534841 ("SHA" in ASCII). |
| 1     | Enables the write protection on interrupt registers if WPKEY corresponds to 0x534841 ("SHA" in ASCII).  |

## Bit 0 – WPEN Write Protection Configuration Enable

See [Register Write Protection](#) for the list of registers that can be write-protected.

| Value | Description                                                                                                 |
|-------|-------------------------------------------------------------------------------------------------------------|
| 0     | Disables the write protection on configuration registers if WPKEY corresponds to 0x534841 ("SHA" in ASCII). |
| 1     | Enables the write protection on configuration registers if WPKEY corresponds to 0x534841 ("SHA" in ASCII).  |

45.5.12 SHA Write Protection Status Register

Name: SHA\_WPSR  
Offset: 0xE8  
Reset: 0x00000000  
Property: Read-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |            |    |    |    |    |    |   |   |
|--------|------------|----|----|----|----|----|---|---|
| Bit    | 15         | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        | WPVSR[7:0] |    |    |    |    |    |   |   |
| Access | R          | R  | R  | R  | R  | R  | R | R |
| Reset  | 0          | 0  | 0  | 0  | 0  | 0  | 0 | 0 |

|        |   |   |   |   |   |   |   |      |
|--------|---|---|---|---|---|---|---|------|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0    |
|        |   |   |   |   |   |   |   | WPVS |
| Access |   |   |   |   |   |   |   | R    |
| Reset  |   |   |   |   |   |   |   | 0    |

**Bits 15:8 – WPVSR[7:0]** Write Protection Violation Source  
When WPVS=1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status (cleared on read)

| Value | Description                                                                                                                                       |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protect violation has occurred since the last read of SHA_WPSR.                                                                          |
| 1     | A write protect violation has occurred since the last read of SHA_WPSR. The address offset of the violated register is reported into field WPVSR. |

## 46. Non-Maskable Interrupt Controller (NMIC)

### 46.1 Description

The Non-Maskable Interrupt Controller (NMIC) forwards critical interrupts from the Supply Controller (SUPC) and Power Management Controller (PMC) internal interrupt sources, or from the PIO Controller external interrupt sources to the NMI input of the processor in a programmable way.

### 46.2 Embedded Characteristics

- Glitch Filter
- Programmable Source Polarity
- Edge or Level Detection
- Freeze Capability for Each Interrupt Line Configuration
- Global Configuration Write Protection Register with Key

### 46.3 Block Diagram

Figure 46-1. Block Diagram

### 46.4 I/O Line Description

Table 46-1. I/O Line Description

| Pin Name | Pin Description        | Type  |
|----------|------------------------|-------|
| NMIC_NMI | Non-maskable Interrupt | Input |

### 46.5 Product Dependencies

#### 46.5.1 Power Management

The NMIC generic clock (gclk) must be enabled before using NMIC.

Prior to using the glitch filter, the NMIC peripheral clock (MCK) shall also be enabled.

## 46.5.2 Interrupt Sources

The following table describes the interrupt sources available in the product.

**Table 46-2.** Interrupt Sources

| Source No. | Source Name   | Source Description                       |
|------------|---------------|------------------------------------------|
| NMI0       | NMIC_NMI      | External Pin NMI                         |
| NMI1       | CPU_FAIL      | Wrong CPU Frequency Monitor Detection    |
| NMI2       | XTAL_12M_FAIL | Fast XTAL Clock Failure Detection        |
| NMI3       | XTAL_32K_FAIL | Slow XTAL 32 KHz Clock Failure Detection |
| NMI4       | VDDCORE_FAIL  | VDDCORE Failure Detection                |
| NMI5       | NOFIX_TCM     | TCM Non-Fixable Error Detection          |
| NMI6       | NOFIX_HEMC    | HEMC Non-Fixable Error Detection         |
| NMI7       | NOFIX_HEFC    | HEFC Non-Fixable Error Detection         |
| NMI8       | NOFIX_FlexRAM | FlexRAM Non-Fixable Error Detection      |
| NMI9       | —             | —                                        |
| NMI10      | —             | —                                        |
| NMI11      | —             | —                                        |
| NMI12      | —             | —                                        |
| NMI13      | —             | —                                        |
| NMI14      | —             | —                                        |
| NMI15      | —             | —                                        |

## 46.6 Functional Description

### 46.6.1 Interrupt Line Characteristics

For each event source, the NMIC features a dedicated interrupt line as shown in the block diagram above.

If the Glitch Filter Enable (GFEN) bit is cleared in the Source Configuration Register (NMIC\_SCFGxR), pulses of any width can be forwarded and detected as valid source events on the interrupt line x regardless of the respective frequencies of the source clock, the generic clock, the NMIC peripheral clock and the CPU clock.

If the NMIC\_SCFGxR.GFEN bit is set, the source events are filtered to remove unwanted glitches. The glitch filter is guaranteed to forward its input level when it is maintained for more than  $2^{GFSEL}$  gclk cycles and to reject pulses narrower than  $2^{GFSEL}-1$  gclk cycles.

The source event polarity can be changed by the NMIC\_SCFGxR.POL bit.

Either edge or level event detection can be performed by the NMIC\_SCFGxR.LVL bit.

If the NMIC\_SCFGxR.EN bit is set, the detection result is flagged into the interrupt pending bit of the Interrupt Status Register (NMIC\_ISR).

If the Active Interrupt x (NMIx) bit for the interrupt line is set in the Interrupt Active Register (NMIC\_IAR), the pending status is forwarded to the CPU non-maskable interrupt input.

When set, the NMIC\_SCFGxR.FRZ bit freezes all interrupt line settings until hardware reset. This includes the settings in the NMIC\_SCFGxR and in the interrupt active x bit of the NMIC\_IAR. This feature can be used to prevent any corruption of the critical interrupt lines configuration.

The propagation delay of the NMIC affects the activation of the interrupt.

When the NMIC is configured in level-triggered mode, the propagation delay of the NMIC also affects the de-activation of the interrupt.

If the Glitch Filter is enabled in the NMIC\_SCFGxR.GFEN bit, the maximum propagation delay through the NMIC (shown in the figure below) is calculated as:

$$\text{nmic\_delay\_max} = (2 + 2^{\text{GFSEL}}) * \text{gclk\_period} + 2.5 * \text{clock\_period}$$

and the minimum propagation delay through the NMIC is:

$$\text{nmic\_delay\_min} = (1 + 2^{\text{GFSEL}}) * \text{gclk\_period} + 1 * \text{clock\_period}$$

If the Glitch Filter is disabled, the maximum propagation delay through the NMIC is calculated as:

$$\text{nmic\_delay\_max} = 2.5 * \text{clock\_period}$$

and the minimum propagation delay through the NMIC is:

$$\text{nmic\_delay\_min} = 1 * \text{clock\_period}$$

**Figure 46-2.** NMIC Propagation Delay

The gclk\_period is the NMIC generic clock period as programmed in the Power Management Controller.

The clock\_period is the peripheral clock period of the NMIC as programmed in the Power Management Controller.

## 46.6.2 Interrupt Line Programming

The steps to set up or change the interrupt line x configuration are the following:

1. If the source might glitch due to setup changes required at the source peripheral, clear the SCFGxR.EN bit to disable the NMIC interrupt source.
2. Perform any external setup that might be required at the source peripheral and wait until the peripheral source output is stabilized.
3. If the interrupt line is featured with a glitch filter, wait until the Ready flag RDYx is set in the Glitch Filter Configuration Status Register (NMIC\_GFCS).
4. Write the required interrupt line configuration fields among GFSEL, GFEN, POL, LVL into the NMIC\_SCFGxR.
5. Set the NMI bit in the Interrupt Enable Register (NMIC\_IER) to activate the interrupt line if required and if it was disabled.
6. If the interrupt line is featured with a glitch filter, wait until the RDYx flag is set in the NMIC\_GFCS register.
7. Set the NMIC\_SCFGxR.EN bit if the source is not yet enabled and, if required for safety, freeze the interrupt line x configuration by setting the NMIC\_SCFGxR.FRZ bit.

Note that if the source peripheral is glitch free or stable enough compared to the current glitch filter settings, the interrupt source does not need to be disabled with the NMIC\_SCFGxR.EN bit prior to its reprogramming.

As an example, if the user desires to stop or minimize the circuit activity after a voltage or frequency failure detection on a rising edge of an NMIC interrupt source, the polarity can be changed with a single write to the NMIC\_SCFGxR.POL bit to detect a falling edge of the same source. Detection of

the falling edge source indicates the recovery of a normal condition. In this case, the sequence steps described previously can be ignored.

### 46.6.3 Interrupt Handling

When the interrupt source  $x$  is triggered, the corresponding interrupt pending flag  $NMIx$  is set by hardware in the `NMIC_ISR`.

If the interrupt source ( $NMIx$ ) is enabled in the `NMIC_IAR`, the CPU non-maskable interrupt input is set and the interrupt handler routine is entered.

The interrupt handler software reads the `NMIC_ISR` to identify the source of the NMI. This read normally has the effect of clearing the `NMIC_ISR` so that the software can immediately proceed to the critical task and also immediately detect a new incoming source assertion.

However, if the interrupt was configured as level-triggered in the `NMIC_SCFGxR` and the source is still keeping the active level at the time of reading the `NMIC_ISR`, the  $NMIx$  bit stays active so that the interrupt can be immediately re-entered upon return from the interrupt handler. To avoid a re-entry to the interrupt handler, the `NMIC_ISR` can be polled until the  $NMIx$  is read at 0 prior ending the interrupt handler.

Alternatively, the interrupt might have been configured as edge-triggered in the `NMIC_SCFGxR`. In this case, the `NMIC_ISR` is cleared when read by the software handler routine. The `NMIC_ISR.NMIx` bit remains at value 0 until the interrupt source is reasserted from the inactive level.

### 46.6.4 Register Write Protection

To prevent any single software error from corrupting NMIC behavior, certain registers in the address space can be write-protected.

The following registers can be write-protected by setting the `WPCFEN` bit in the [NMIC Write Protection Mode Register](#) (`NMIC_WPMR`):

- NMIC Source Configuration Register  $x$  (`NMIC_SCFGxR`)

The following registers can be write-protected by setting the `WPITEN` bit in the [NMIC Write Protection Mode Register](#) (`NMIC_WPMR`):

- NMIC Interrupt Enable Register (`NMIC_IER`)
- NMIC Interrupt Disable Register (`NMIC_IDR`)

If a write access to a write-protected register is detected, the `WPVS` flag in the [NMIC Write Protection Status Register](#) (`NMIC_WPSR`) is set and the field `WVSRC` indicates the register in which the write access has been attempted.

The `WPVS` bit is automatically cleared after reading the `NMIC_WPSR`.

If a write attempts to modify the settings of an interrupt line  $x$  that has been previously frozen by setting the `NMIC_SCFGxR.FRZ` bit, the `FZWVS` flag in the `NMIC_WPSR` is set and the field `WVSRC` indicates the register in which the write access has been attempted.

The `FZWVS` bit is automatically cleared after reading the `NMIC_WPSR`.

If a write attempts to modify the settings of the glitch filter of interrupt line  $x$  but the NMIC Source Configuration Register  $x$  (`NMIC_SCFGxR`) access is discarded due to an already ongoing glitch filter configuration, the `FZWVS` flag in the `NMIC_WPSR` is set and the field `WVSRC` indicates the register in which the write access has been attempted.

The `FZWVS` bit is automatically cleared after reading the `NMIC_WPSR`.

## 46.7 Register Summary

| Offset | Name        | Bit Pos. | 7    | 6    | 5    | 4    | 3    | 2    | 1          | 0    |
|--------|-------------|----------|------|------|------|------|------|------|------------|------|
| 0x00   | NMIC_IER    | 7:0      | NMI7 | NMI6 | NMI5 | NMI4 | NMI3 | NMI2 | NMI1       | NMI0 |
|        |             | 15:8     |      |      |      |      |      |      |            | NMI8 |
|        |             | 23:16    |      |      |      |      |      |      |            |      |

| Bit    | 7   | 6  | 5  | 4    | 3  | 2  | 1          | 0   |
|        |     |    |    | GFEN |    |    | GFSEL[1:0] |     |
| Access |     |    |    | R/W  |    |    | R/W        | R/W |
| Reset  |     |    |    | 1    |    |    | 1          | 1   |

### Bit 31 – FRZ Interrupt Line Freeze

| Value | Description                                                                       |
|-------|-----------------------------------------------------------------------------------|
| 0     | No effect.                                                                        |
| 1     | The NMIC_SCFGxR value and the NMIC_IAR.NMIx bits are frozen until hardware reset. |

### Bit 16 – EN Source Enable

| Value | Description                                                                                                               |
|-------|---------------------------------------------------------------------------------------------------------------------------|
| 0     | The NMI source x is disabled. Any source edge or level detection is discarded.                                            |
| 1     | The NMI source x is enabled. Any valid source edge or level of polarity (POL) sets the NMIC_ISR.NMIx pending status flag. |

### Bit 9 – LVL Level Detection

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | The NMI source x interrupt status is set on a valid source edge.  |
| 1     | The NMI source x interrupt status is set on a valid source level. |

### Bit 8 – POL Polarity

| Value | Description                                                                                |
|-------|--------------------------------------------------------------------------------------------|
| 0     | The NMI source x is active low if LVL is set, or active on falling edge if LVL is cleared. |
| 1     | The NMI source x is active high if LVL is set, or active on rising edge if LVL is cleared. |

### Bit 4 – GFEN Glitch Filter Enable

| Value | Description                                                                                                                                                     |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The Glitch Filter is disabled or not implemented for NMI source x. Any source x change is forwarded as is to the source detection logic.                        |
| 1     | The Glitch Filter is enabled for NMI source x. The NMI source x glitches are filtered according to the section <a href="#">Interrupt Line Characteristics</a> . |

**Bits 1:0 – GFSEL[1:0]** Glitch Filter Selector  
If GFEN is set, NMI source x glitches are filtered according to the section [Interrupt Line Characteristics](#).

### 46.7.7 NMIC Source Configuration Register x

**Name:** NMIC\_SCFGxR  
**Offset:**  $0x18 + (x-1)*0x04$  [ $x=1..8$ ]  
**Reset:** 0x00000300  
**Property:** Read/Write

**Note:** The reset value is product-dependent.

This register can only be written if the WPCFEN bit is cleared in the [NMIC Write Protection Mode Register](#).

|        |     |    |    |      |    |    |            |     |
|--------|-----|----|----|------|----|----|------------|-----|
| Bit    | 31  | 30 | 29 | 28   | 27 | 26 | 25         | 24  |
|        | FRZ |    |    |      |    |    |            |     |
| Access | R/W |    |    |      |    |    |            |     |
| Reset  | 0   |    |    |      |    |    |            |     |
| Bit    | 23  | 22 | 21 | 20   | 19 | 18 | 17         | 16  |
|        |     |    |    |      |    |    |            | EN  |
| Access |     |    |    |      |    |    |            | R/W |
| Reset  |     |    |    |      |    |    |            | 0   |
| Bit    | 15  | 14 | 13 | 12   | 11 | 10 | 9          | 8   |
|        |     |    |    |      |    |    | LVL        | POL |
| Access |     |    |    |      |    |    | R/W        | R/W |
| Reset  |     |    |    |      |    |    | 1          | 1   |
| Bit    | 7   | 6  | 5  | 4    | 3  | 2  | 1          | 0   |
|        |     |    |    | GFEN |    |    | GFSEL[1:0] |     |
| Access |     |    |    | R/W  |    |    | R/W        | R/W |
| Reset  |     |    |    | 0    |    |    | 0          | 0   |

#### Bit 31 – FRZ Interrupt Line Freeze

| Value | Description                                                                       |
|-------|-----------------------------------------------------------------------------------|
| 0     | No effect.                                                                        |
| 1     | The NMIC_SCFGxR value and the NMIC_IAR.NMIx bits are frozen until hardware reset. |

#### Bit 16 – EN Source Enable

| Value | Description                                                                                                               |
|-------|---------------------------------------------------------------------------------------------------------------------------|
| 0     | The NMI source x is disabled. Any source edge or level detection is discarded.                                            |
| 1     | The NMI source x is enabled. Any valid source edge or level of polarity (POL) sets the NMIC_ISR.NMIx pending status flag. |

#### Bit 9 – LVL Level Detection

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | The NMI source x interrupt status is set on a valid source edge.  |
| 1     | The NMI source x interrupt status is set on a valid source level. |

#### Bit 8 – POL Polarity

| Value | Description                                                                                |
|-------|--------------------------------------------------------------------------------------------|
| 0     | The NMI source x is active low if LVL is set, or active on falling edge if LVL is cleared. |
| 1     | The NMI source x is active high if LVL is set, or active on rising edge if LVL is cleared. |

#### Bit 4 – GFEN Glitch Filter Enable

| Value | Description                                                                                                                                                     |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The Glitch Filter is disabled or not implemented for NMI source x. Any source x change is forwarded as is to the source detection logic.                        |
| 1     | The Glitch Filter is enabled for NMI source x. The NMI source x glitches are filtered according to the section <a href="#">Interrupt Line Characteristics</a> . |

**Bits 1:0 – GFSEL[1:0]** Glitch Filter Selector

If GFEN is set, NMI source x glitches are filtered according to the section [Interrupt Line Characteristics](#).

### 46.7.8 NMIC Write Protection Mode Register

**Name:** NMIC\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |              |    |    |    |    |    |        |        |
|--------|--------------|----|----|----|----|----|--------|--------|
| Bit    | 31           | 30 | 29 | 28 | 27 | 26 | 25     | 24     |
|        | WPKEY[23:16] |    |    |    |    |    |        |        |
| Access | W            | W  | W  | W  | W  | W  | W      | W      |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0      | 0      |
| Bit    | 23           | 22 | 21 | 20 | 19 | 18 | 17     | 16     |
|        | WPKEY[15:8]  |    |    |    |    |    |        |        |
| Access | W            | W  | W  | W  | W  | W  | W      | W      |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0      | 0      |
| Bit    | 15           | 14 | 13 | 12 | 11 | 10 | 9      | 8      |
|        | WPKEY[7:0]   |    |    |    |    |    |        |        |
| Access | W            | W  | W  | W  | W  | W  | W      | W      |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0      | 0      |
| Bit    | 7            | 6  | 5  | 4  | 3  | 2  | 1      | 0      |
|        |              |    |    |    |    |    | WPITEN | WPCFEN |
| Access |              |    |    |    |    |    | R/W    | R/W    |
| Reset  |              |    |    |    |    |    | 0      | 0      |

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                                                       |
|----------|--------|-------------------------------------------------------------------------------------------------------------------|
| 0x4E4D49 | PASSWD | Writing any other value in this field aborts the write operation of the WPCFEN and WPITEN bit. Always reads as 0. |

#### Bit 1 – WPITEN Write Protection Interrupt Enable

See [Register Write Protection](#) for the list of registers that can be protected.

| Value | Description                                                                                               |
|-------|-----------------------------------------------------------------------------------------------------------|
| 0     | Disables the write protection of NMIC_IER and NMIC_IDR if WPKEY corresponds to 0x4E4D49 ("NMI" in ASCII). |
| 1     | Enables the write protection of NMIC_IER and NMIC_IDR if WPKEY corresponds to 0x4E4D49 ("NMI" in ASCII).  |

#### Bit 0 – WPCFEN Write Protection Configuration Enable

| Value | Description                                                                                                     |
|-------|-----------------------------------------------------------------------------------------------------------------|
| 0     | Disables the write protection of the configuration registers if WPKEY corresponds to 0x4E4D49 ("NMI" in ASCII). |
| 1     | Enables the write protection of the configuration registers if WPKEY corresponds to 0x4E4D49 ("NMI" in ASCII).  |

### 46.7.9 NMIC Write Protection Status Register

**Name:** NMIC\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

|        |            |    |    |    |    |       |       |      |
|--------|------------|----|----|----|----|-------|-------|------|
| Bit    | 31         | 30 | 29 | 28 | 27 | 26    | 25    | 24   |
|        |            |    |    |    |    |       |       |      |
| Access |            |    |    |    |    |       |       |      |
| Reset  |            |    |    |    |    |       |       |      |
| Bit    | 23         | 22 | 21 | 20 | 19 | 18    | 17    | 16   |
|        |            |    |    |    |    |       |       |      |
| Access |            |    |    |    |    |       |       |      |
| Reset  |            |    |    |    |    |       |       |      |
| Bit    | 15         | 14 | 13 | 12 | 11 | 10    | 9     | 8    |
|        | WVSRC[7:0] |    |    |    |    |       |       |      |
| Access | R          | R  | R  | R  | R  | R     | R     | R    |
| Reset  | 0          | 0  | 0  | 0  | 0  | 0     | 0     | 0    |
| Bit    | 7          | 6  | 5  | 4  | 3  | 2     | 1     | 0    |
|        |            |    |    |    |    | BSWVS | FZWVS | WPVS |
| Access |            |    |    |    |    | R     | R     | R    |
| Reset  |            |    |    |    |    | 0     | 0     | 0    |

**Bits 15:8 – WVSRC[7:0]** Write Violation Source  
 When one of the WPVS, FZWVS, BSWVS is equal to 1, WVSRC indicates the register address offset at which a write access has been attempted.

**Bit 2 – BSWVS** Busy Register Write Violation Status

| Value | Description                                                                                                                                           |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write access violation of a busy register has occurred since the last read of the NMIC_WPSR.                                                       |
| 1     | A write access violation of a busy register has occurred since the last read of the NMIC_WPSR. The associated violation is reported into field WVSRC. |

**Bit 1 – FZWVS** Frozen Register Write Violation Status

| Value | Description                                                                                                                                             |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write access violation of a frozen register has occurred since the last read of the NMIC_WPSR.                                                       |
| 1     | A write access violation of a frozen register has occurred since the last read of the NMIC_WPSR. The associated violation is reported into field WVSRC. |

**Bit 0 – WPVS** Write Protection Register Violation Status

| Value | Description                                                                                                                            |
|-------|----------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protection violation has occurred since the last read of the NMIC_WPSR.                                                       |
| 1     | A write protection violation has occurred since the last read of the NMIC_WPSR. The associated violation is reported into field WVSRC. |

## 47. Electrical Characteristics

### 47.1 Absolute Maximum Ratings

**Table 47-1.** Absolute Maximum Ratings\*

|                                                                 |                  |                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Storage Temperature                                             | -65°C to + 150°C | *Notice: Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. |
| Voltage on input pins with respect to Ground                    | -0.3V to + 4.0V  |                                                                                                                                                                                                                                                                                                                                                                                                               |
| Voltage on VDDPLLA, VDDPLL B and VDDCORE with respect to Ground | -0.3V to + 2.0V  |                                                                                                                                                                                                                                                                                                                                                                                                               |
| Voltage on VDDIO with respect to Ground                         | -0.3V to + 4.0V  |                                                                                                                                                                                                                                                                                                                                                                                                               |
| Total DC Output Current on all I/O lines (256-lead CQFP)        | 1.4A             |                                                                                                                                                                                                                                                                                                                                                                                                               |
| DC current per I/O pins                                         | Up to 48 mA      |                                                                                                                                                                                                                                                                                                                                                                                                               |

## 47.4 Power Consumption

### 47.4.1 Core Power Consumption

#### 47.4.1.1 Methodology

The values in this section are measured values of power consumption under the following conditions, except where noted.

**Operating Conditions**

- $V_{DDIO} = 3.3V$
- $V_{DDCORE} = 1.8V$
- $V_{DDPLLA} = 1.8V$
- $V_{DDPLLB} = 1.8V$
- $SPWREF = 1.25V$

All the power consumption is performed on the VDD1V8 power supply considering the following scheme at 25°C.

**Figure 47-1.** Power Consumption Scheme at 25°C**Clocks**

- MainCK is connected to an external 10 MHz quartz
- SCLK\_TD is connected to an external 32 KHz crystal
- SCLK\_MD is connected to the internal RC oscillator at 10 MHz
- When enabled, the PLLA is configured at
  - 200 MHz for 50 MHz -100 MHz or 50 MHz - 50 MHz
  - 140 MHz for 35 MHz - 70 MHz or 35 MHz 35 MHz
- PLLB is not enabled

Following are the internal clock connections:

- HCLK is connected to
  - MainCK for 10 MHz -10 MHz or 5 MHz - 10 MHz
  - PLLA/2 in others cases
- MCK is connected to:
  - HCLK divided by 2, for 5 MHz - 10 MHz, 35 MHz - 70 MHz, 50 MHz - 100 MHz
  - HCLK divided by 1, for 10 MHz - 10 MHz, 35 MHz - 25MHz, 50 MHz - 50 MHz

The following AHB module clocks and peripheral clocks are running:

- All system clocks (Cortex M7 processor, internal SRAM memories (FlexRAM and TCM), internal AMBA buses—Hmatrix, AHB and APB, SUPC, RSTC, PMC, WDT, RTT and RTC)
- All other AHB clocks and APB clocks stopped.

**PIO**

- PIOs are configured in PIO with internal pull-up, except the one dedicated to HEMC and 16 IO (PA[0:7] and PB[19:27])

**CPU**

- CPU is active, code is fetched from internal FlexRAM or TCM memories
- Cache disable

In this default condition, the power consumption VDD1V8 is measured.

**47.4.1.1.1 Specific conditions for While(1)**

Peripheral enabled: PIOA.

#### 47.4.1.1.2 Specific Conditions for Coremark

Peripherals enabled: PIOA, TC3 and FlexCOM1.

TC3 PIO are configured on the peripheral function.

#### 47.4.1.1.3 Specific Conditions for Dhrystone

Peripherals enabled: PIOA, TC3 and FlexCOM1

TC3 PIO are configured on the peripheral function.

### 47.4.1.2 Results

**Table 47-6.** While(1) Algorithm – VDD1V8 Power Measurements

| HCLK/MCK [MHz] | FlexRAM | TCM  | Unit |
|----------------|---------|------|------|
| 10/5           | 105     | 109  | mA   |
| 10/10          | 120     | 124  |      |
| 35/35          | 419     | 413  |      |
| 70/35          | 700     | 723  |      |
| 50/50          | 589     | 605  |      |
| 100/50         | 975     | 1005 |      |

**Table 47-7.** Coremark Algorithm – VDD1V8 Power Measurements

| HCLK/MCK [MHz] | FlexRAM | TCM  | Unit |
|----------------|---------|------|------|
| 10/5           | 101     | 110  | mA   |
| 10/10          | 121     | 129  |      |
| 35/35          | 422     | 447  |      |
| 70/35          | 671     | 730  |      |
| 50/50          | 590     | 622  |      |
| 100/50         | 935     | 1015 |      |

**Table 47-8.** Dhrystone Algorithm – VDD1V8 Power Measurements

| HCLK/MCK [MHz] | FlexRAM | TCM  | Unit |
|----------------|---------|------|------|
| 10/5           | 114     | 114  | mA   |
| 10/10          | 134     | 133  |      |
| 35/35          | 426     | 444  |      |
| 70/35          | 675     | 734  |      |

| 100/50         | 932     | 1020 |      |

## 47.4.2 Peripherals Power Consumption

### 47.4.2.1 Methodology

The values in this section are measured values of power consumption under the following conditions, except where indicated.

#### Operating Conditions

- VDDIO = 3.3V
- VDDCORE = 1.8V
- VDDPLLA = 1.8V
- VDDPLLB = 1.8V
- SPWREF = 1.25V

All the power consumption are performed on the VDD1V8 power supply considering the following scheme at 25°C.

**Figure 47-2.** Power Consumption Scheme at 25°C

### Clocks

- MainCK is connected to an external 10 MHz quartz
- SCLK\_TD is connected to an external 32 KHz crystal
- SCLK\_MD is connected to the internal RC oscillator at 10 MHz
- When enabled, the PLLA is configured at 200 MHz
- When enabled, the PLLB is configured at 100 MHz except for 1553 peripheral, where it is configured at 120 MHz

Following are the internal clock connections:

- HCLK is connected to PLLA divided by 2
- MCK is connected to HCLK divided by 2
- The following AHB module clocks and peripheral clocks are running:
  - All system clocks (Cortex M7 processor, internal SRAM memories (FlexRAM and TCM), internal AMBA buses—Hmatrix, AHB and APB, SUPC, RSTC, PMC, WDT, RTT and RTC).
  - All other AHB clocks and APB clocks are stopped.

### PIO

I/Os are configured in PIO with internal pull-up, except the one dedicated to HEMC, PIOA[0:7], PB[19:26].

### CPU

- CPU is active, code is fetched from internal FlexRAM memories.
- Cache disable

In this default conditions, the power consumption I<sub>default</sub> is measured.

Operating mode for each peripheral in turn:

- Configure and enable the peripheral GCLK (When relevant, see conditions in [Table 47-9](#))
- Unmask the peripheral clock(n)
- Enable the peripheral (when relevant)
- Measurement I<sub>totalperiph(n)</sub>
- Go to the next peripheral (n+1)

Then, difference is made between  $I_{totalperiph}(n+1)$  and  $I_{totalperiph}(n)$ , to obtain the  $I_{periph}(n)$  value measurement.

Each peripheral power consumption provided in Table 47-10 is the value ( $I_{periph}(n) - I_{default}$ ), using the same measurement method as for global power consumption measurement.

**Table 47-9. GCLK Test Conditions**

| Peripheral                                          | GCLK                           |
|-----------------------------------------------------|--------------------------------|
| HEFC                                                | MainCK/5                       |
| MCAN (See <b>Note 3</b> )                           | PLLBACK/5                      |
| FLEXCOM(See <b>Note 1</b> ), TC(See <b>Note 4</b> ) | MCK                            |
| SPW, HEMC_HSDRAMC, NMIC                             | PLLBACK                        |
| SPW_INT1 (TimeTick)                                 | MainCK                         |
| 1553                                                | PLLBACK(See <b>Note 2</b> )/10 |
| Others peripherals                                  | No GCLK                        |

**Notes:**

1. FlexCOM[0-9] has the same value. The result is provided for one instance.
2. When enabled, the PLLB is configured at 100 MHz except for 1553 peripheral, where it is configured at 120 MHz
3. CAN[0-1] has the same value. The result is provided for one instance.
4. TC[0-11] has the same value. The result is provided for one instance.

#### 47.4.2.2 Peripheral Results

**Table 47-10. Typical VDD1V8 Measurements**

| Features                         | VDD1V8 [mA/MCK_MHZ] |
|----------------------------------|---------------------|
| HEFC                             | 0.48                |
| NMIC                             | 0.26                |
| PIOA                             | 0.39                |
| FLEXCOM (See <b>Note 1</b> )     | 0.26                |
| TC (See <b>Note 2</b> )          | 0.09                |
| CAN (See <b>Note 3</b> )         | 0.80                |
| PWM (See <b>Note 4</b> )         | 0.33                |
| ICM                              | 0.55                |
| SHA                              | 0.96                |
| QSPI                             | 0.11                |
| HEMC                             | 0.24                |
| HEMC_SDRAMC (See <b>Note 5</b> ) | 0.12                |
| SPW                              | 2.16                |
| GMAC                             | 2.59                |
| IP1553                           | 0.77                |
| XDMAC                            | 0.53                |
| TRNG                             | 0.02                |

**Notes:**

1. FlexCOM[0-9] has the same value. The result is provided for one instance.
2. TC[0-11] has the same value. The result is provided for one instance.
3. CAN[0-1] has the same value. The result is provided for one instance.
4. PWM[0-1] has the same value. The result is provided for one instance.
5. When using the HEMC\_SDRAMC, consider also the power consumption of the HEMC.

## 47.5 Oscillator Characteristics

### 47.5.1 32 kHz RC Oscillator Characteristics

**Table 47-11.** 32 kHz RC Oscillator Characteristics

| Symbol      | Parameter           | Conditions         | Min | Typ | Max | Unit    |
|-------------|---------------------|--------------------|-----|-----|-----|---------|
| $f_{OSC}$   | Operating Frequency | -                  | 24  | 32  | 40  | kHz     |
| $t_{START}$ | Startup Time        | -                  | -   | -   | 100 | $\mu s$ |
| $I_{DDON}$  | Current Consumption | After startup time | -   | 70  | 110 | $\mu A$ |

### 47.5.2 4/8/10/12 MHz RC Oscillators Characteristics

**Table 47-12.** 4/8/10/12 MHz RC Oscillators Characteristics

| Symbol      | Parameter             | Conditions                     | Min  | Typ | Max   | Unit    |
|-------------|-----------------------|--------------------------------|------|-----|-------|---------|
| $ACC_4$     | 4 MHz total accuracy  | 4 MHz output selected at 25°C  | 3.6  | 4   | 4.4   | MHz     |
| $ACC_8$     | 8 MHz total accuracy  | 8 MHz output selected at 25°C  | 7.2  | 8   | 8.8   | MHz     |
| $ACC_{10}$  | 10 MHz total accuracy | 10 MHz output selected at 25°C | 9    | 10  | 11    | MHz     |
| $ACC_{12}$  | 12 MHz total accuracy | 12 MHz output selected at 25°C | 10.8 | 12  | 13.2  | MHz     |
|             | Temp dependency       | -                              | -    | -   | 0.005 | %/°C    |
| $t_{START}$ | Startup Time          | -                              | -    | -   | 6     | $\mu s$ |

### 47.5.3 32 kHz Crystal Oscillator Characteristics

**Table 47-13.** 32 kHz Crystal Oscillator Characteristics

| Parameter   | Conditions           | Min                                        | Typ    | Max | Unit      |
|-------------|----------------------|--------------------------------------------|--------|-----|-----------|
| Freq        | Nominal Frequency    | -                                          | 32.768 |     | kHz       |
| Duty        | Duty cycle           | 40                                         | 50     | 60  | %         |
| $R_f$       | Internal resistance  | Equivalent resistance between xin and xout | 18     |     | $M\Omega$ |
| $C_{IN}$    | Internal capacitance | On-chip internal capacitance               | 0.9    |     | pF        |
| $t_{start}$ | Startup time         | $V_{DDIO}$ stabilized                      | 1      |     | s         |

### 47.5.4 3 to 20 MHz Crystal Oscillator Characteristics

**Table 47-14.** 3 to 20 MHz Crystal Oscillator Characteristics

| Parameter | Conditions           | Min                                        | Typ | Max | Unit      |
|-----------|----------------------|--------------------------------------------|-----|-----|-----------|
| Freq      | Nominal Frequency    | -                                          | 3   | 20  | MHz       |
| Duty      | Duty cycle           | 40                                         | 50  | 60  | %         |
| $R_f$     | Internal resistance  | Equivalent resistance between xin and xout | 6   |     | $M\Omega$ |
| $C_{IN}$  | Internal capacitance | On-chip internal capacitance               | 0.9 |     | pF        |
| $T_{on}$  | Startup time         | $V_{DDIO}$ stabilized                      | 1   | 15  | ms        |

## 47.6 PLLA Characteristics

**Table 47-15.** PLLA Characteristics

| Symbol      | Parameter                          | Conditions                     | Min | Typ | Max | Unit                   |
|-------------|------------------------------------|--------------------------------|-----|-----|-----|------------------------|
| $f_{IN}$    | Input Frequency                    | –                              | 8   | –   | 20  | MHz                    |
| $f_{OUT}$   | Output Frequency                   | –                              | 40  | –   | 200 | MHz                    |
| Nf          | Frequency ratio $F_{out} / F_{in}$ |                                | –   | –   | 25  | –                      |
| $I_{PLL}$   | Current Consumption                | Active mode at 160 MHz at 1.8V | –   | –   | 9   | mA                     |
| $t_{START}$ | Startup time                       | –                              | –   | –   | 8   | μs                     |
| $J_{per}$   | Output period jitter               | –                              | –   | –   | 1.3 | % (input clock period) |

## 47.7 PLLB Characteristics

**Table 47-16.** PLLB Characteristics

| Symbol      | Parameter                          | Conditions                     | Min | Typ | Max | Unit                   |
|-------------|------------------------------------|--------------------------------|-----|-----|-----|------------------------|
| $f_{IN}$    | Input Frequency                    | –                              | 8   | –   | 20  | MHz                    |
| $f_{OUT}$   | Output Frequency                   | –                              | 40  | –   | 200 | MHz                    |
| Nf          | Frequency ratio $F_{out} / F_{in}$ | –                              | –   | –   | 25  | –                      |
| $I_{PLL}$   | Current Consumption                | Active mode at 160 MHz at 1.8V | –   | –   | 9   | mA                     |
| $t_{START}$ | Startup time                       | –                              | –   | –   | 8   | μs                     |
| $J_{per}$   | Output period jitter               | –                              | –   | –   | 1.3 | % (input clock period) |

## 47.8 Embedded Flash Characteristics

**Table 47-17.** Flash Characteristics

| Parameter          | Conditions                                                           | Min | Typ  | Max | Unit   |
|--------------------|----------------------------------------------------------------------|-----|------|-----|--------|
| Program Cycle Time | Write Page mode                                                      | 3.8 | 4    | 4.2 | ms     |
|                    | Erase Page mode                                                      | 3.8 | 4    | 4.2 | ms     |
| Full Chip Erase    | 128 Kbytes                                                           | –   | 2.08 | –   | s      |
| Data Retention     | At $T_A=110^{\circ}\text{C}$                                         | 20  | –    | –   | years  |
|                    | Write/Erase cycles per page, block or sector at $25^{\circ}\text{C}$ | 10K | –    | –   | cycles |

**Note:** Cycling done over 0 to  $85^{\circ}\text{C}$  temperature range.

## 47.9 AC Characteristics

Unless it is explicitly specified in the table, the timing of the AC characteristics are performed by STA in the worst case conditions (slow process, high temperature and low voltage).

In the following sections, the following parameters refers to:

- Drive: PIO drive value of the signal referenced in the parameter description ([PIO\\_CFGRx register](#)).
- Cdata or Csdram: Capacitance of the signal referenced in the parameter description.
- Cclk: Capacitance of the clock signal of the peripheral referenced.
- Csdck: Capacitance of the clock signal of the HSDRAMC peripheral.

**Note:** Drive is in mA and capacitances are in pF.

## 47.9.1 Processor Clock Characteristics

**Table 47-18.** Processor Clock Waveform Parameters

| Symbol                 | Parameter                 | Conditions                                           | Min | Max | Unit |
|------------------------|---------------------------|------------------------------------------------------|-----|-----|------|
| 1/(t <sub>CPCK</sub> ) | Processor Clock Frequency | Typical conditions (process,voltage and temperature) | -   | 110 | MHz  |
|                        |                           | Worst case                                           | -   | 90  | MHz  |

## 47.9.2 Master Clock Characteristics

**Table 47-19.** Master Clock Waveform Parameters

| Symbol                  | Parameter              | Conditions                                            | Min | Max | Unit |
|-------------------------|------------------------|-------------------------------------------------------|-----|-----|------|
| 1/(t <sub>CPMCK</sub> ) | Master Clock Frequency | Typical conditions (process, voltage and temperature) | -   | 55  | MHz  |
|                         |                        | Worst case                                            | -   | 45  | MHz  |

## 47.9.3 NRST Characteristics

**Figure 47-3.** NRST Characteristics

**Table 47-20.** NRST Timings

| Symbol | Parameter             | Conditions | Min | Typ | Max | Unit |
|--------|-----------------------|------------|-----|-----|-----|------|
| NRST1  | Reset low pulse width | —          | 50  | —   | —   | μs   |

**Note:** After 100 μs startup time of slow clock RC oscillator.

## 47.9.4 NMIC NMI Characteristics

**Figure 47-4.** NMIC NMI Characteristics Active Level Low

**Figure 47-5.** NMIC NMI Characteristics Active Level High

**Table 47-21.** NMIC NMI Characteristics

| Symbol    | Parameter                         | Conditions | Min                | Typ | Max | Unit |
|-----------|-----------------------------------|------------|--------------------|-----|-----|------|
| NMIC_NMI1 | NMI min pulse width (active low)  | GFEN=1     | 2 <sup>GFSEL</sup> | -   | -   | GCK  |
| NMIC_NMI2 | NMI min pulse width (active high) | GFEN=1     | 2 <sup>GFSEL</sup> | -   | -   | GCK  |
| NMIC_NMI1 | NMI min pulse width (active low)  | GFEN=0     | 10                 | -   | -   | ns   |
| NMIC_NMI2 | NMI min pulse width (active high) | GFEN=0     | 10                 | -   | -   | ns   |

### 47.9.5 Trace Characteristics

Figure 47-6. Trace Characteristics

Table 47-22. Trace Timings

| Symbol | Parameter                                                        | Conditions | Min                                                  | Typ     | Max                                                 | Unit            |
|--------|------------------------------------------------------------------|------------|------------------------------------------------------|---------|-----------------------------------------------------|-----------------|
| TRACE1 | Output delay for TRACE_Dx from TRACE_CLK rising or falling (DDR) | —          | $-3.0+0.48 \times (C_{data}-C_{clk}) / \text{Drive}$ | —       | $1.7+0.48 \times (C_{data}-C_{clk}) / \text{Drive}$ | ns              |
| TRACE2 | TRACE_CLK HIGH level                                             | —          | 1                                                    | tPCK3/2 | —                                                   | HCLK HIGH level |
| TRACE3 | TRACE_CLK LOW level                                              | —          | 1                                                    | tPCK3/2 | —                                                   | HCLK LOW level  |
| TRACE4 | TRACE_CLK Period                                                 | —          | 2                                                    | tPCK3/2 | —                                                   | HCLK period     |

1. PCK3 is the internal clock dedicated to TRACE.
2. Cdata, Cclk capacitances are in pF, Drive is in mA

### 47.9.6 1553 Characteristics

Figure 47-7. 1553 Characteristics

Table 47-23. 1553 Timings

| Symbol   | Parameter                                        | Conditions | Min | Typ  | Max | Unit |
|----------|--------------------------------------------------|------------|-----|------|-----|------|
| IP1553_1 | 1553 period data for A/BTXOUTP                   | -          | -   | 1000 | -   | ns   |
| IP1553_2 | 1553 period data for A/BTXOUTN                   | -          | -   | 1000 | -   | ns   |
| IP1553_3 | 1553 period data for A/BRXINP                    | -          | -   | 1000 | -   | ns   |
| IP1553_4 | 1553 period data for A/BRXINN                    | -          | -   | 1000 | -   | ns   |
| IP1553_5 | ATXOUTP / ATXOUTN delay (BTXOUTP/ BTXOUTN delay) | -          | -   | -    | 6   | ns   |

## 47.9.7 SPW Characteristics

Figure 47-8. SPW RX Characteristics

Figure 47-9. SPW TX Characteristics

Table 47-24. Space Wire Timings

| Symbol | Parameter                                    | Conditions                       | Min  | Typ | Max  | Unit |
|--------|----------------------------------------------|----------------------------------|------|-----|------|------|
| SPW_1  | Data Strobe output max skew (absolute value) | Cdiff < 1pF (See <b>Note 1</b> ) | -    | -   | 1.17 | ns   |
| SPW_2  | Data Strobe input min edge separation        | -                                | 2.15 | -   | -    | ns   |

**Note:**

1. Cdiff is the difference of capacitance between SPWDOUTx and SPWSOUTx.

## 47.9.8 GMAC Characteristics

Figure 47-10. GMAC MDIO/MDC Characteristics

**Table 47-25.** GMAC MDIO/MDC Timings

| Symbol | Parameter                           | Conditions | Min                                     | Typ | Max                                    | Unit |
|--------|-------------------------------------|------------|-----------------------------------------|-----|----------------------------------------|------|
| GMAC1  | Setup GMDIO from GMDC rising        | —          | $24.8+0.48*(5.6+C_{gmdc})/Drive$        | —   | —                                      | ns   |
| GMAC2  | Hold GMDIO from GMDC rising         | —          | 0                                       | —   | —                                      | ns   |
| GMAC3  | Output delay GMDIO from GMDC rising | —          | $-1.0+0.48*(C_{mdio} - C_{gmdc})/Drive$ | —   | $7.8+0.48*(C_{mdio} - C_{gmdc})/Drive$ | ns   |

**Note:** Cgmdc, Cmdio capacitances are in pF, Drive is in mA

**Figure 47-11.** GMAC MII Mode

**Table 47-26.** GMAC MII Mode Timings

| Symbol | Parameter                                   | Conditions                    | Min | Typ | Max                                | Unit |
|--------|---------------------------------------------|-------------------------------|-----|-----|------------------------------------|------|
| GMAC15 | Output delay for GTXER from GTXCK rising    | Value should not exceed 25 ns | 0   | —   | $21.4+0.48*(0.56+C_{gtxer})/Drive$ | ns   |
| GMAC16 | Output delay for GTXEN from GTXCK rising    | Value should not exceed 25 ns | 0   | —   | $21.4+0.48*(0.56+C_{gtxen})/Drive$ | ns   |
| GMAC17 | Output delay for GTX[3:0] from GTXCK rising | Value should not exceed 25 ns | 0   | —   | $21.4+0.48*(0.56+C_{gtx})/Drive$   | ns   |
| GMAC18 | Setup for GRX[3:0] from GRXCK rising        | —                             | 1.8 | —   | —                                  | ns   |
| GMAC19 | Hold for GRX[3:0] from GRXCK rising         | —                             | 9.6 | —   | —                                  | ns   |
| GMAC20 | Setup for GRXER from GRXCK rising           | —                             | 1.8 | —   | —                                  | ns   |
| GMAC21 | Hold for GRXER from GRXCK rising            | —                             | 9.6 | —   | —                                  | ns   |
| GMAC22 | Setup for GRXDV from GRXCK rising           | —                             | 1.8 | —   | —                                  | ns   |
| GMAC23 | Hold for GRXDV from GRXCK rising            | —                             | 9.6 | —   | —                                  | ns   |

**Note:** Cgtxer, Cgtxen, Cgtx capacitances are in pF, Drive is in mA.

Figure 47-12. GMAC RMII

Table 47-27. GMAC RMII Mode Timings

| Symbol | Parameter                                    | Conditions                    | Min | Typ | Max                                                   | Unit |
|--------|----------------------------------------------|-------------------------------|-----|-----|-------------------------------------------------------|------|
| GMAC46 | Output delay for GTXEN from GREFCK rising    | Value should not exceed 16 ns | 2   | —   | $15.1 + 0.48 \times (0.56 + C_{gtxn}) / \text{Drive}$ | ns   |
| GMAC47 | Output delay for GTX[1:0] from GREFCK rising | Value should not exceed 16 ns | 2   | —   | $15.1 + 0.48 \times (0.56 + C_{gtx}) / \text{Drive}$  | ns   |
| GMAC48 | Hold for GRX[1:0] from GREFCK rising         | —                             | 2   | —   | —                                                     | ns   |
| GMAC49 | Setup for GRX[1:0] from GREFCK rising        | —                             | 4   | —   | —                                                     | ns   |
| GMAC50 | Hold for GRXER from GREFCK rising            | —                             | 2   | —   | —                                                     | ns   |
| GMAC51 | Setup for GRXER from GREFCK rising           | —                             | 4   | —   | —                                                     | ns   |
| GMAC52 | Setup for GCRSDV from GREFCK rising          | —                             | 4   | —   | —                                                     | ns   |
| GMAC53 | Hold for GCRSDV from GREFCK rising           | —                             | 2   | —   | —                                                     | ns   |

**Note:** Cgtxn, Cgtx capacitances are in pF, Drive is in mA.

#### 47.9.9 QSPI Characteristics

Figure 47-13. QSPI Master Mode with (CPOL= 0 and NCPHA = 0) or (CPOL= 1 and NCPHA= 1)

Table 47-28. QSPI Timings (CPOL=0 and NCPHA=0 OR CPOL=1 and NCPHA=1)

| Symbol | Parameter                                     | Conditions | Min                                                      | Typ | Max                                                     | Unit |
|--------|-----------------------------------------------|------------|----------------------------------------------------------|-----|---------------------------------------------------------|------|
| QSPI1  | Output delay for QSPI_D[3:0] from QSKC rising | -          | $-0.2 + 0.48 \times (C_{data} - C_{clk}) / \text{Drive}$ |     | $6.5 + 0.48 \times (C_{data} - C_{clk}) / \text{Drive}$ | ns   |
| QSPI2  | QSKC high level                               | -          | 0.5                                                      |     |                                                         | MCK  |
| QSPI3  | QSKC low level                                | -          | 0.5                                                      |     |                                                         | MCK  |
| QSPI4  | QSKC period                                   | -          | 1                                                        |     |                                                         | MCK  |
| QSPI5  | Hold for QSPI_D[3:0] from QSKC rising         | -          | 0.2                                                      |     |                                                         | ns   |
| QSPI6  | Setup for QSPI_D[3:0] from QSKC rising        | -          | 5.9                                                      |     |                                                         | ns   |

**Note:** Cdata, Cclk capacitances are in pF, Drive is in mA.

**Figure 47-14.** QSPI Master Mode with (CPOL = 0 and NCPHA=1) or (CPOL=0 and NCPHA= 1)**Table 47-29.** QSPI Timings (CPOL=0 and NCPHA=1 OR CPOL=0 and NCPHA=1)

| Symbol | Parameter                                       | Conditions | Min                                                  | Typ | Max                                                 | Unit |
|--------|-------------------------------------------------|------------|------------------------------------------------------|-----|-----------------------------------------------------|------|
| QSPI11 | Output delay for QSPI_D[3:0] from QSCCK falling | —          | $-0.8+0.46 \times (C_{data}-C_{clk}) / \text{Drive}$ | —   | $5.8+0.46 \times (C_{data}-C_{clk}) / \text{Drive}$ | ns   |

## 48. Schematic Checklist

### 48.1 General Hardware Recommendations

#### 48.1.1 Inactive SpaceWire Interface

When the SpaceWire interface is not used and remains inactive, Microchip recommends to apply the configuration schematic provided in the following figure to put the ports into a defined Stable Inoperant state.

**Note:** This configuration should not remain connected if you wish to have a functional SpaceWire link.

**Figure 48-1.** Inactive SpaceWire configuration

#### 48.1.2 Inactive 1553 Interface

When the 1553 interface is not used and remains inactive, it is recommended to apply the configuration schematic provided in the following figure to put the ports into a defined stable inoperant state.

**Note:** This configuration should not remain connected if you wish to have a functional 1553 link.

**Figure 48-2.** Inactive 1553 Configuration

#### 48.1.3 Check the BOOT\_MODE Pin

For more information, see [10.2.4. Boot Strategies](#).

## 50. Package Marking Information

All devices are marked with a company logo and the ordering code.

Additional marking is as follows:

where,

- "YY": Manufactory year
- "WW": Manufactory week
- "Ordering Code": Ordering code
- "CCCC": Assembly country code (optional)
- "XXXXXXXXXX": Lot number

## 51. Ordering Information

This section provides ordering information for SAMRH71.

### 51.1 Product Identification System

### 51.2 Valid Combinations

**Table 51-1.** SAMRH71 Ordering Information

| Ordering Code      | Package  | SEL Level                    | Operating Temperature Range |
|--------------------|----------|------------------------------|-----------------------------|
| SAMRH71F20E-HFB-HP | TFBGA625 | 62.5 MeV.cm <sup>2</sup> /mg | -55 °C to +105 °C           |
| SAMRH71F20E-7GB-E  | CQFP256  | 78 MeV.cm <sup>2</sup> /mg   | +25 °C                      |
| SAMRH71F20E-7GB-MQ | CQFP256  | 78 MeV.cm <sup>2</sup> /mg   | -55 °C to +125 °C           |
| SAMRH71F20E-7GB-SV | CQFP256  | 78 MeV.cm <sup>2</sup> /mg   | -55 °C to +125 °C           |
| SAMRH71F20E-7GB-SR | CQFP256  | 78 MeV.cm <sup>2</sup> /mg   | -55 °C to +125 °C           |

**Note:**

1. Not recommended for new designs.

## 52. Revision History

The revision history describes the changes that were implemented in the document. The changes are listed by revision, starting with the most current publication.

| Revision | Date    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Microchip Information

### The Microchip Website

Microchip provides online support via our website at [www.microchip.com/](http://www.microchip.com/). This website is used to make files and information easily available to customers. Some of the content available includes:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip design partner program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

### Product Change Notification Service

Microchip's product change notification service helps keep customers current on Microchip products. Subscribers will receive email notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, go to [www.microchip.com/pcn](http://www.microchip.com/pcn) and follow the registration instructions.

### Customer Support

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Embedded Solutions Engineer (ESE)
- Technical Support

Customers should contact their distributor, representative or ESE for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in this document.

Technical support is available through the website at: [www.microchip.com/support](http://www.microchip.com/support)

### Microchip Devices Code Protection Feature

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable". Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.

### Legal Notice

This publication and the information herein may be used only with Microchip products, including to design, test, and integrate Microchip products with your application. Use of this information in any other manner violates these terms. Information regarding device applications is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure

that your application meets with your specifications. Contact your local Microchip sales office for additional support or, obtain additional support at [www.microchip.com/en-us/support/design-help/client-support-services](http://www.microchip.com/en-us/support/design-help/client-support-services).

THIS INFORMATION IS PROVIDED BY MICROCHIP "AS IS". MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE, OR WARRANTIES RELATED TO ITS CONDITION, QUALITY, OR PERFORMANCE.

IN NO EVENT WILL MICROCHIP BE LIABLE FOR ANY INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL, OR CONSEQUENTIAL LOSS, DAMAGE, COST, OR EXPENSE OF ANY KIND WHATSOEVER RELATED TO THE INFORMATION OR ITS USE, HOWEVER CAUSED, EVEN IF MICROCHIP HAS BEEN ADVISED OF THE POSSIBILITY OR THE DAMAGES ARE FORESEEABLE. TO THE FULLEST EXTENT ALLOWED BY LAW, MICROCHIP'S TOTAL LIABILITY ON ALL CLAIMS IN ANY WAY RELATED TO THE INFORMATION OR ITS USE WILL NOT EXCEED THE AMOUNT OF FEES, IF ANY, THAT YOU HAVE PAID DIRECTLY TO MICROCHIP FOR THE INFORMATION.

Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

## Trademarks

The Microchip name and logo, the Microchip logo, Adaptec, AVR, AVR logo, AVR Freaks, BesTime, BitCloud, CryptoMemory, CryptoRF, dsPIC, flexPWR, HELDO, IGLOO, JukeBlox, KeeLoq, Kleer, LANCheck, LinkMD, maXStylus, maXTouch, MediaLB, megaAVR, Microsemi, Microsemi logo, MOST, MOST logo, MPLAB, OptoLyzer, PIC, picoPower, PICSTART, PIC32 logo, PolarFire, Prochip Designer, QTouch, SAM-BA, SenGenuity, SpyNIC, SST, SST Logo, SuperFlash, Symmetricom, SyncServer, Tachyon, TimeSource, tinyAVR, UNI/O, Vectron, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

AgileSwitch, APT, ClockWorks, The Embedded Control Solutions Company, EtherSynch, Flashtec, Hyper Speed Control, HyperLight Load, Libero, motorBench, mTouch, Powermite 3, Precision Edge, ProASIC, ProASIC Plus, ProASIC Plus logo, Quiet-Wire, SmartFusion, SyncWorld, Temux, TimeCesium, TimeHub, TimePictra, TimeProvider, TrueTime, and ZL are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Adjacent Key Suppression, AKS, Analog-for-the-Digital Age, Any Capacitor, AnyIn, AnyOut, Augmented Switching, BlueSky, BodyCom, Clockstudio, CodeGuard, CryptoAuthentication, CryptoAutomotive, CryptoCompanion, CryptoController, dsPICDEM, dsPICDEM.net, Dynamic Average Matching, DAM, ECAN, Espresso T1S, EtherGREEN, GridTime, IdealBridge, In-Circuit Serial Programming, ICSP, INICnet, Intelligent Paralleling, IntelliMOS, Inter-Chip Connectivity, JitterBlocker, Knob-on-Display, KoD, maxCrypto, maxView, memBrain, Mindi, MiWi, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICKit, PICtail, PowerSmart, PureSilicon, QMatrix, REAL ICE, Ripple Blocker, RTAX, RTG4, SAM-ICE, Serial Quad I/O, simpleMAP, SimpliPHY, SmartBuffer, SmartHLS, SMART-I.S., storClad, SQL, SuperSwitcher, SuperSwitcher II, Switchtec, SynchroPHY, Total Endurance, Trusted Time, TSHARC, USBCheck, VariSense, VectorBlox, VeriPHY, ViewSpan, WiperLock, XpressConnect, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

The Adaptec logo, Frequency on Demand, Silicon Storage Technology, and Symmcom are registered trademarks of Microchip Technology Inc. in other countries.

GestIC is a registered trademark of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.
