

## 'Turbo' CAN Transceivers for CAN with Flexible Data Rate (FD) and Redundancy

Check for Samples: [SN65HVD265](#), [SN65HVD266](#), [SN65HVD267](#)

### FEATURES

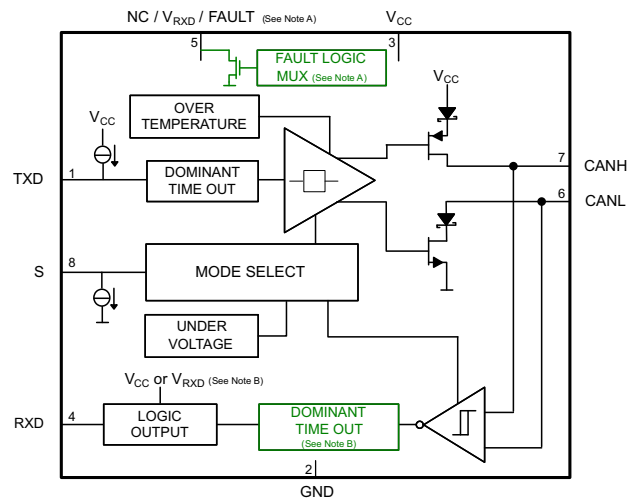

- Meets the Requirements of ISO11898-2
- 'Turbo' CAN:
  - Specified for 2Mbps CAN with Flexible Data Rate
  - Short and Symmetrical Propagation Delay Times and Fast Loop Times for Enhanced Timing Margin
  - Higher Data Rates in CAN Networks
- I/O Voltage Range Supports 3.3V and 5V MCUs
- Ideal Passive Behavior When Unpowered
  - Bus and Logic Pins are High Impedance (no load)
  - Power Up/Down With Glitch Free Operation On Bus
- Protection Features
  - HBM ESD Protection Exceeds  $\pm 12\text{kV}$
  - Bus Fault Protection  $-27\text{V}$  to  $40\text{V}$
  - Undervoltage Protection on Supply Pins
  - Driver Dominant Time Out (TXD DTO)
  - SN65HVD267: Receiver Dominant Time Out (RXD DTO)
  - SN65HVD267: FAULT Output Pin
  - Thermal Shutdown Protection
- Characterized for  $-40^\circ\text{C}$  to  $125^\circ\text{C}$  Operation

### APPLICATIONS

- 2Mbps Operation in CAN with Flexible Data Rate Networks
- 1Mbps Operation in Highly Loaded CAN Networks Down to 10kbps Networks Using TXD DTO
- Industrial Automation, Control, Sensors and Drive Systems
- Building, Security and Climate Control Automation
- Telecom Base Station Status and Control
- SN65HVD267: Functional Safety With Redundant and Multi-topology CAN networks
- CAN Bus Standards Such as CANopen, DeviceNet, NMEA2000, ARNIC825, ISO11783, CANaerospace

### DESCRIPTION

This CAN transceiver meets the ISO1189-2 High Speed CAN (Controller Area Network) Physical Layer standard. It is designed for data rates in excess of 2 megabit per second (Mbps) for CAN with flexible data rates, greater than 1 Mbps for CAN in short networks, and enhanced timing margin and higher data rates in long and highly-loaded networks. The device provides many protection features to enhance device and CAN-network robustness. The SN65HVD267 adds additional features, allowing easy design of redundant and multi-topology networks with fault indication for higher levels of functional safety in the CAN system.

- A. Pin 5 function is device dependent; NC on SN65HVD265,  $V_{RXD}$  for RXD output level-shifting device on SN65HVD266, and FAULT Output on SN65HVD267
- B. RXD logic output is driven to  $5\text{V } V_{CC}$  on 5V-only supply devices (SN65HVD265, SN65HVD267) and driven to  $V_{RXD}$  on output level-shifting device (SN65HVD266).
- C. RXD (Receiver) Dominant State Time Out is a device dependent option available only on SN65HVD267.

**Figure 1. Functional Block Diagram**

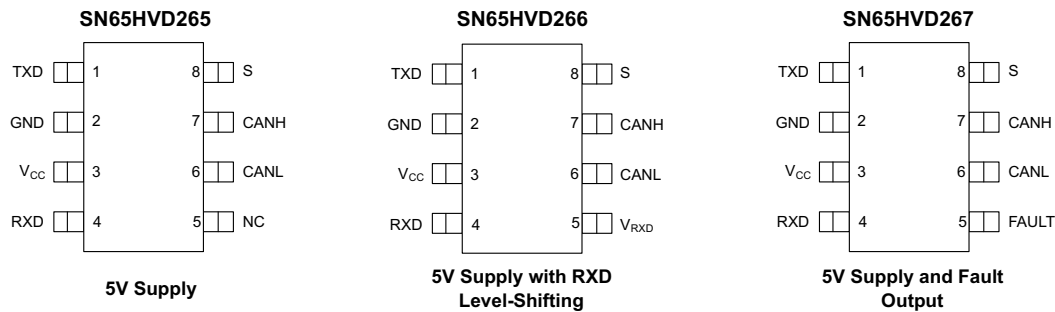

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

DEVICE OPTIONS

PART NUMBER	I/O SUPPLY for RXD	TXD DTO	RXD DTO	FAULT Output	COMMENT
SN65HVD265	No	Yes	No	No	'251 and '1050 functional upgrade with 'Turbo CAN' fast loop times and TXD DTO protection allowing data rates down to 10kbps
SN65HVD266	Yes	Yes	No	No	'251 and '1050 functional upgrade with 'Turbo CAN' fast loop times and TXD DTO protection allowing data rates down to 10kbps. RXD output level shifting via RXD supply input.
SN65HVD267	No	Yes	Yes	Yes	'251 and '1050 functional upgrade with 'Turbo CAN' fast loop times, TXD and RXD DTO protection allowing data rates down to 10kbps and fault output pin

PIN FUNCTIONS

PIN		TYPE	DESCRIPTION
NAME	NO.		
TXD	1	I	CAN transmit data input (LOW for dominant and HIGH for recessive bus states)
GND	2	GND	Ground connection
V <sub>CC</sub>	3	Supply	Transceiver 5V supply voltage
RXD	4	O	CAN receive data output (LOW for dominant and HIGH for recessive bus states)
NC	5	NC	SN65HVD265: No Connect
V <sub>RXD</sub>		Supply	SN65HVD266: RXD output supply voltage
FAULT		O	SN65HVD267: open drain FAULT output pin
CANL	6	I/O	Low level CAN bus line
CANH	7	I/O	High level CAN bus line
S	8	I	Mode select: S (silent mode) select pin (active high)

For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at [www.ti.com](http://www.ti.com).

## FUNCTIONAL DESCRIPTION

### OPERATING MODES

The device has two main operating modes: normal mode and silent mode. Operating mode selection is made via the S input pin.

Table 1. Operating Modes

S Pin	MODE	DRIVER	RECEIVER	RXD Pin
LOW	Normal Mode	Enabled (ON)	Enabled (ON)	Mirrors Bus State <sup>(1)</sup>
HIGH	Silent Mode	Disabled (OFF)	Enabled (ON)	Mirrors Bus State

(1) Mirrors bus state: low if CAN bus is dominant, high if CAN bus is recessive.

### CAN BUS STATES

The CAN bus has two states during powered operation of the device; *dominant* and *recessive*. A dominant bus state is when the bus is driven differentially, corresponding to a logic low on the TXD and RXD pin. A recessive bus state is when the bus is biased to  $V_{CC} / 2$  via the high-resistance internal input resistors  $R_{IN}$  of the receiver, corresponding to a logic high on the TXD and RXD pins. See Figure 3 and Figure 4.

Figure 3. Bus States (Physical Bit Representation)

Figure 4. Simplified Recessive Common Mode Bias and Receiver

### NORMAL MODE

Select the *normal mode* of device operation by setting S low. The CAN driver and receiver are fully operational and CAN communication is bi-directional. The driver is translating a digital input on TXD to a differential output on CANH and CANL. The receiver is translating the differential signal from CANH and CANL to a digital output on RXD.

## SILENT MODE

Activate *silent mode* (receive only) by setting S high. The CAN driver is turned off while the receiver remains active and RXD outputs the received bus state.

**APPLICATION NOTE:** Silent mode may be used to implement *babbling idiot* protection, to ensure that the driver does not disrupt the network during a local fault. Silent mode may also be used in redundant systems to select or de-select the redundant transceiver (driver) when needed.

## DRIVER AND RECEIVER FUNCTION TABLES

**Table 2. Driver Function Table**

DEVICE	INPUTS		OUTPUTS		DRIVEN BUS STATE
	S <sup>(1) (2)</sup>	TXD <sup>(1) (3)</sup>	CANH <sup>(1)</sup>	CANL <sup>(1)</sup>	
All Devices	L or Open	L	H	L	Dominant
		H or Open	Z	Z	Recessive
	H	X	Z	Z	Recessive

- (1) H = high level, L = low level, X = irrelevant, Z = common mode (recessive) bias to  $V_{CC} / 2$ . See [Figure 3](#) and [Figure 4](#) for bus state and common mode bias information.
- (2) Devices have an internal pull down to GND on S pin. If S pin is open the pin will be pulled low and the device will be in normal mode.
- (3) Devices have an internal pull up to  $V_{CC}$  on TXD pin. If the TXD pin is open the pin will be pulled high and the transmitter will remain in recessive (non-driven) state.

**Table 3. Receiver Function Table**

DEVICE MODE	CAN DIFFERENTIAL INPUTS $V_{ID} = V_{CANH} - V_{CANL}$	BUS STATE	RXD PIN <sup>(1)</sup>
Normal or Silent	$V_{ID} \geq 0.9 V$	Dominant	L <sup>(2)</sup>
	$0.5 V < V_{ID} < 0.9 V$	?	?
	$V_{ID} \leq 0.5 V$	Recessive	H
	Open ( $V_{ID} \approx 0 V$ )	Open	H

- (1) H = high level, L = low level, ? = indeterminate.
- (2) RXD output remains dominant (low) as long as the bus is dominant. On SN65HVD267 device with RXD dominant timeout, once the bus has been dominant longer than the dominant timeout,  $t_{RXD\_DTO}$ , the RXD pin will return recessive (high). See [RXD Dominant Timeout \(SN65HVD267\)](#) for a description of behavior during receiving a bus stuck dominant condition.

## DIGITAL INPUTS AND OUTPUTS

### 5 V $V_{CC}$ Only Devices (SN65HVD265 and SN65HVD267):

The 5V  $V_{CC}$  device is supplied by a single 5 V rail. The digital inputs are 5 V and 3.3 V compatible. This device has a 5 V ( $V_{CC}$ ) level RXD output. TXD is internally pulled up to  $V_{CC}$  and S is internally pulled down to GND.

**APPLICATION NOTE:** TXD is internally pulled up to  $V_{CC}$  and the S pin is internally pulled down to GND. However, the internal bias may only put the device into a known state if the pins float. The internal bias may be inadequate for system-level biasing. TXD pullup strength and CAN bit timing require special consideration when the SN65HVD25x devices are used with an open-drain TXD output on the CAN controller. An adequate external pullup resistor must be used to ensure that the CAN controller output of the  $\mu P$  maintains adequate bit timing input to the SN65HVD25x.

### 5 V $V_{CC}$ with $V_{RXD}$ RXD output Supply Devices (SN65HVD266):

This device is a 5V  $V_{CC}$  CAN transceiver with a separate supply for the RXD output,  $V_{RXD}$ . The digital inputs are 5 V and 3.3 V compatible. These devices have a  $V_{RXD}$ -level RXD output. TXD remains weakly pulled up to  $V_{CC}$ .

**APPLICATION NOTE:** On device versions with a  $V_{RXD}$  supply that shifts the RXD output level, the input pins of the device remain the same. TXD remains weakly pulled up to  $V_{CC}$  internally. Thus, a small  $I_{IH}$  current flows if the TXD input is used below  $V_{CC}$  levels.

### 5 V $V_{CC}$ with FAULT Open-Drain Output Device (SN65HVD267):

This device has a FAULT output pin (open-drain). FAULT must be pulled up to  $V_{CC}$  or I/O supply level via an external resistor.

**APPLICATION NOTE:** Because the FAULT output pin is open-drain, it actively pulls down when there is no fault, and becomes high-impedance when a fault condition is detected. An external pullup resistor to the  $V_{CC}$  or I/O supply of the system must be used to pull the pin high to indicate a fault to the host microprocessor. The open-drain architecture makes the fault pin compatible with 3.3 V and 5 V I/O-level systems. The pullup current, selected by the pullup resistance value, should be as low as possible while achieving the desired voltage level output in the system with margin against noise.

## PROTECTION FEATURES

### TXD Dominant Timeout (DTO)

During normal mode (the only mode where the CAN driver is active), the TXD DTO circuit prevents the transceiver from blocking network communication in the event of a hardware or software failure where TXD is held dominant longer than the timeout period  $t_{TXD\_DTO}$ . The DTO circuit timer starts on a falling edge on TXD. The DTO circuit disables the CAN bus driver if no rising edge is seen before the timeout period expires. This frees the bus for communication between other nodes on the network. The CAN driver is re-activated when a recessive signal is seen on TXD pin, thus clearing the TXD DTO condition. The receiver and RXD pin still reflect the CAN bus, and the bus pins are biased to recessive level during a TXD dominant timeout.

**APPLICATION NOTE:** The minimum dominant TXD time allowed by the TXD DTO circuit limits the minimum possible transmitted data rate of the device. The CAN protocol allows a maximum of eleven successive dominant bits (on TXD) for the worst case, where five successive dominant bits are followed immediately by an error frame. This, along with the  $t_{TXD\_DTO}$  minimum, limits the minimum data rate. Calculate the minimum transmitted data rate by: Minimum Data Rate =  $11 / t_{TXD\_DTO}$ .

### RXD Dominant Timeout (SN65HVD267)

The SN65HVD267 device has a RXD dominant timeout (RXD DTO) circuit that prevents a bus stuck dominant fault from permanently driving the RXD output dominant (low) when the bus is held dominant longer than the timeout period  $t_{RXD\_DTO}$ . The RXD DTO timer starts on a falling edge on RXD (bus going dominant). If no rising edge (bus returning recessive) is seen before the timeout constant of the circuit expires ( $t_{RXD\_DTO}$ ), the RXD pin returns high (recessive). The RXD output is re-activated to mirror the bus receiver output when a recessive signal is seen on the bus, clearing the RXD dominant timeout. The CAN bus pins are biased to the recessive level during a RXD DTO.

**APPLICATION NOTE:** The minimum dominant RXD time allowed by the RXD DTO limits the minimum possible received data rate of the device. The CAN protocol allows a maximum of eleven successive dominant bits for the worst case transmission, where five successive dominant bits are followed immediately by an error frame. This, along with the  $t_{RXD\_DTO}$  minimum, limits the minimum data rate. The minimum received data rate may be calculated by: Minimum Data Rate =  $11 / t_{RXD\_DTO}$ .

### Thermal Shutdown

If the junction temperature of the device exceeds the thermal shut down threshold the device turns off the CAN driver circuits thus blocking the TXD to bus transmission path. The shutdown condition is cleared when the junction temperature drops below the thermal shutdown temperature of the device.

**APPLICATION NOTE:** During thermal shutdown the CAN bus drivers turn off; thus no transmission is possible from TXD to the bus. The CAN bus pins are biased to recessive level during a thermal shutdown, and the receiver to RXD path remains operational.

## Undervoltage Lockout

The supply pins have undervoltage detection that places the device in protected mode. This protects the bus during an undervoltage event on either the  $V_{CC}$  or  $V_{RXD}$  supply pins.

**Table 4. Undervoltage Lockout 5V Only Devices (SN65HVD265 and SN65HVD267)**

$V_{CC}$	DEVICE STATE	BUS OUTPUT	RXD
GOOD	Normal	Per Device State and TXD	Mirrors Bus
BAD	Protected	High Impedance	High Impedance (3-state)

**Table 5. Undervoltage Lockout 5V and  $V_{RXD}$  Device (SN65HVD266)**

$V_{CC}$	$V_{RXD}$	DEVICE STATE	BUS OUTPUT	RXD
GOOD	GOOD	Normal	Per Device State and TXD	Mirrors Bus
BAD	GOOD	Protected	High Impedance	High (Recessive)
GOOD	BAD	Protected	Recessive	High Impedance (3-state)
BAD	BAD	Protected	High Impedance	High Impedance (3-state)

**APPLICATION NOTE:** After an undervoltage condition is cleared and the supplies have returned to valid levels, the device typically resumes normal operation in 300  $\mu$ s.

## FAULT Pin (SN65HVD267)

If one or more of the faults (TXD-Dominant Timeout, RXD dominant Timeout, Thermal Shutdown or Undervoltage Lockout) occurs, the FAULT pin (open-drain) turns off, resulting in a high level when externally pulled up to  $V_{CC}$  or IO supply.

**Figure 5. FAULT Pin Function Diagram and Application**

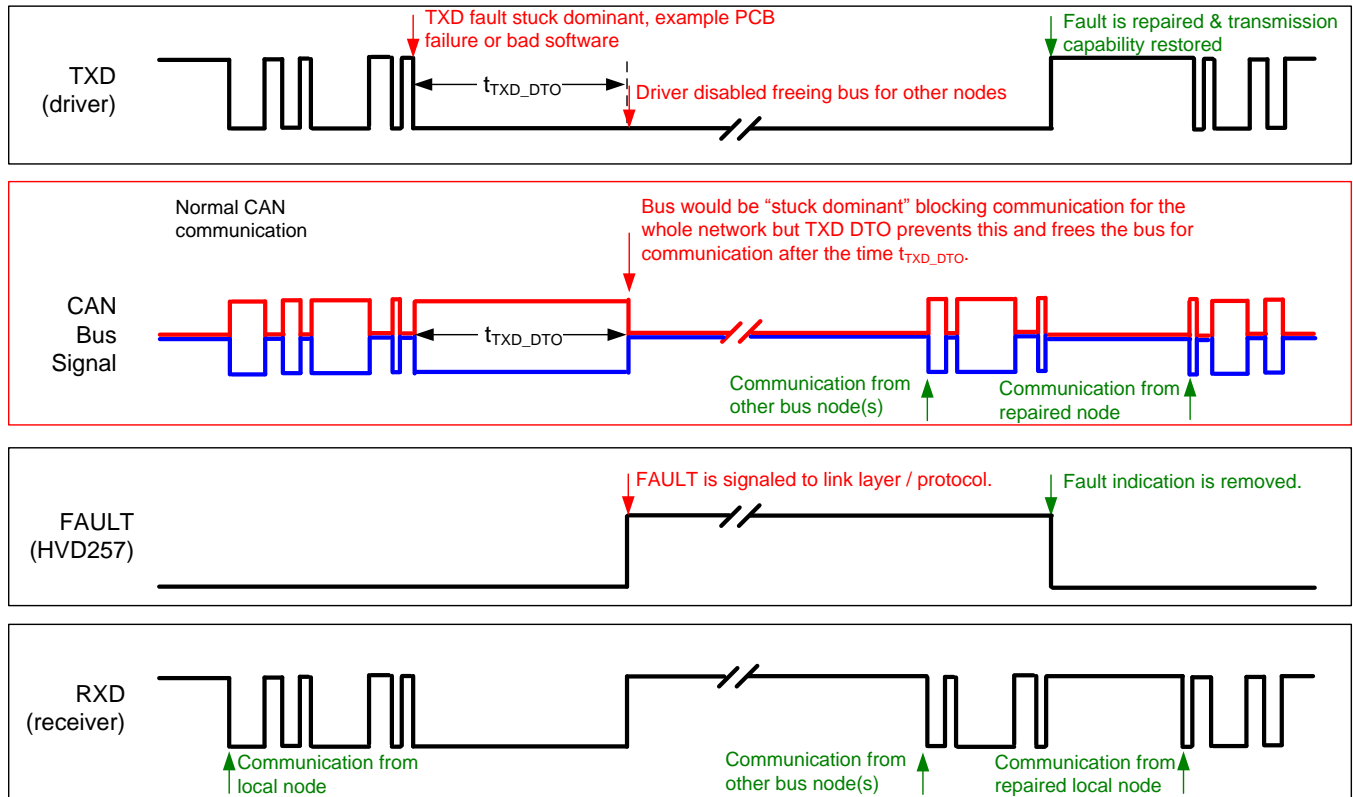

Figure 6. Example Timing Diagram for TXD DTO and FAULT Pin

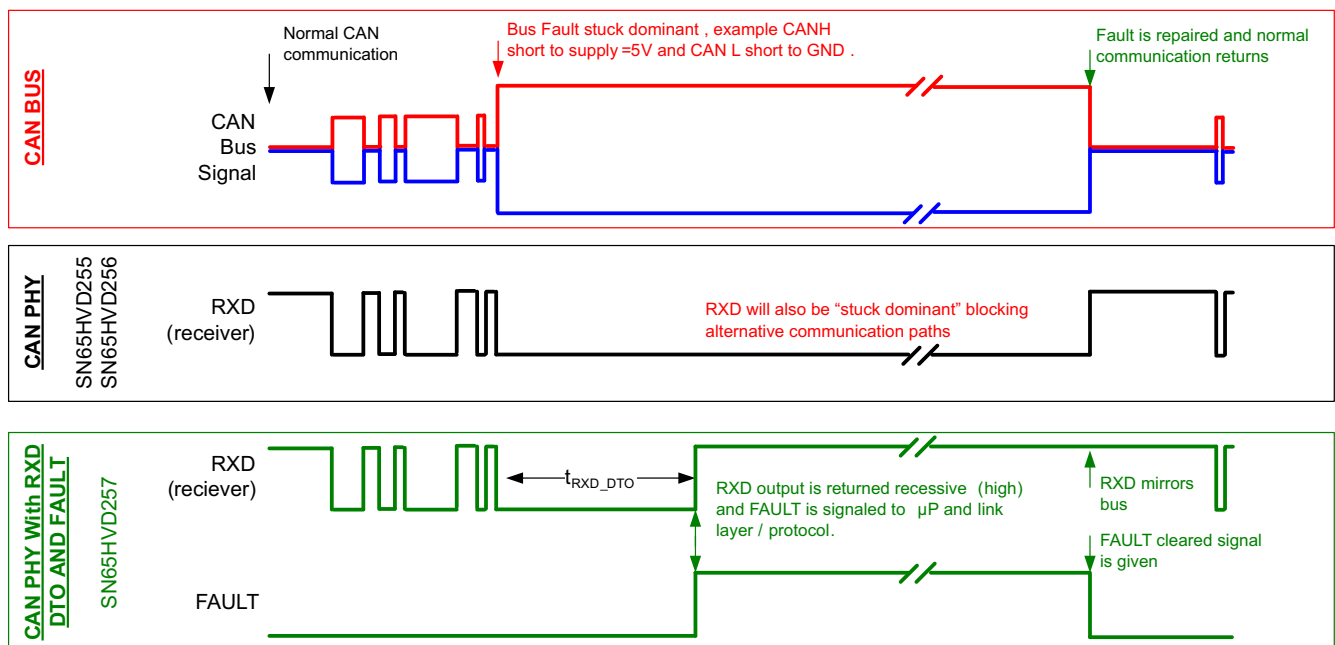

Figure 7. Example Timing Diagram for Devices With and Without RXD DTO and FAULT Pin

## Unpowered Device

The device is designed to be an 'ideal passive' or 'no load' to the CAN bus if it is unpowered. The bus pins (CANH, CANL) have extremely low leakage currents when the device is unpowered so they will not load down the bus. This is critical if some nodes of the network will be unpowered while the rest of the of network remains in operation. The logic pins also have extremely low leakage currents when the device is unpowered to avoid loading down other circuits that may remain powered.

## Floating Pins

The device has internal pull ups and pull downs on critical pins to place the device into known states if the pins float. The TXD pin is pulled up to  $V_{CC}$  to force a recessive input level if the pin floats. The S pin is pulled down to GND to force the device into normal mode if the pin floats.

## CAN Bus Short Circuit Current Limiting

The device has several protection features that limit the short circuit current when a CAN bus line is shorted. These include driver current limiting (dominant and recessive). The device has TXD dominant state time out to prevent permanent higher short circuit current of the dominant state during a system fault. During CAN communication the bus switches between dominant and recessive states with the data and control fields bits, thus the short circuit current may be viewed either as the instantaneous current during each bus state, or as a DC average current. For system current (power supply) and power considerations in the termination resistors and common-mode choke ratings, use the average short circuit current. Determine the ratio of dominant and recessive bits by the data in the CAN frame plus the following factors of the protocol and PHY that force either recessive or dominant at certain times:

- Control fields with set bits
- Bit stuffing
- Interframe space
- TXD dominant time out (fault case limiting)

These ensure a minimum recessive amount of time on the bus even if the data field contains a high percentage of dominant bits.

**APPLICATION NOTE:** The short circuit current of the bus depends on the ratio of recessive to dominant bits and their respective short circuit currents. The average short circuit current may be calculated with the following formula:

$$I_{OS(AVG)} = \%Transmit \times [(\%REC\_Bits \times I_{OS(SS)\_REC}) + (\%DOM\_Bits \times I_{OS(SS)\_DOM})] + [\%Receive \times I_{OS(SS)\_REC}]$$

Where

- $I_{OS(AVG)}$  is the average short circuit current
- %Transmit is the percentage the node is transmitting CAN messages
- %Receive is the percentage the node is receiving CAN messages
- %REC\_Bits is the percentage of recessive bits in the transmitted CAN messages
- %DOM\_Bits is the percentage of dominant bits in the transmitted CAN messages
- $I_{OS(SS)\_REC}$  is the recessive steady state short circuit current
- $I_{OS(SS)\_DOM}$  is the dominant steady state short circuit current

**APPLICATION NOTE:** Consider the short circuit current and possible fault cases of the network when sizing the power ratings of the termination resistance and other network components.

12.5	$t_{\text{RXD\_DTO}}$ <sup>(5)</sup>	Receiver dominant time out (SN65HVD267 only) See Figure 8, $C_{\text{L\_RXD}} = 15\text{ pF}$	1380		4200	$\mu\text{s}$

(4) The TXD dominant timeout ( $t_{\text{TXD\_DTO}}$ ) disables the driver of the transceiver once the TXD has been dominant longer than  $t_{\text{TXD\_DTO}}$ , which releases the bus lines to recessive, preventing a local failure from locking the bus dominant. The driver may only transmit dominant again after TXD has been returned HIGH (recessive). While this protects the bus from local faults, locking the bus dominant, it limits the minimum data rate possible. The CAN protocol allows a maximum of eleven successive dominant bits (on TXD) for the worst case, where five successive dominant bits are followed immediately by an error frame. This, along with the  $t_{\text{TXD\_DTO}}$  minimum, limits the minimum bit rate. The minimum bit rate may be calculated by: Minimum Bit Rate =  $11 / t_{\text{TXD\_DTO}} = 11\text{ bits} / 1175\text{ }\mu\text{s} = 9.4\text{ kbps}$ .

(5) The RXD timeout ( $t_{\text{RXD\_DTO}}$ ) disables the driver of the transceiver once the RXD has been dominant longer than  $t_{\text{RXD\_DTO}}$ , which releases the bus lines to recessive, preventing a local failure from locking the bus dominant. The driver may only transmit dominant again after RXD has been returned HIGH (recessive). While this protects the bus from local faults, locking the bus dominant, it limits the minimum data rate possible. The CAN protocol allows a maximum of eleven successive dominant bits (on RXD) for the worst case, where five successive dominant bits are followed immediately by an error frame. This, along with the  $t_{\text{RXD\_DTO}}$  minimum, limits the minimum bit rate. The minimum bit rate may be calculated by: Minimum Bit Rate =  $11 / t_{\text{RXD\_DTO}} = 11\text{ bits} / 1380\text{ }\mu\text{s} = 8\text{ kbps}$ .

## BUS LOADING, LENGTH AND NUMBER OF NODES

The ISO11898 Standard specifies a maximum bus length of 40m and maximum stub length of 0.3m with a maximum of 30 nodes. However, with careful design, users can have longer cables, longer stub lengths, and many more nodes to a bus. A large number of nodes requires a transceiver with high input impedance such as the SN65HVD25x family.

Many CAN organizations and standards have scaled the use of CAN for applications outside the original ISO11898. They have made system level trade offs for data rate, cable length, and parasitic loading of the bus. Examples of some of these specifications are ARINC825, CANopen, DeviceNet and NMEA200.

A CAN network design is a series of tradeoffs, but these devices operate over wide common-mode range. In ISO11898-2 the driver differential output is specified with a 60Ω load (the two 120Ω termination resistors in parallel) and the differential output must be greater than 1.5V. The SN65HVD25x family is specified to meet the 1.5V requirement with a 45Ω load incorporating the worst case including parallel transceivers. The differential input resistance of the SN65HVD25x is a minimum of 30KΩ. If 167 SN65HVD25x family transceivers are in parallel on a bus, this is equivalent to a 180Ω differential load worst case. That transceiver load of 180Ω in parallel with the 60Ω gives a total 45Ω. Therefore, the SN65HVD25x family theoretically supports over 167 transceivers on a single bus segment with margin to the 1.2V minimum differential input at each node. However for CAN network design margin must be given for signal loss across the system and cabling, parasitic loadings, network imbalances, ground offsets and signal integrity thus a practical maximum number of nodes is typically much lower. Bus length may also be extended beyond the original ISO11898 standard of 40m by careful system design and data rate tradeoffs. For example CANopen network design guidelines allow the network to be up to 1km with changes in the termination resistance, cabling, less than 64 nodes and significantly lowered data rate.

This flexibility in CAN network design is one of the key strengths of the various extensions and additional standards that have been built on the original ISO11898 CAN standard. In using this flexibility comes the responsibility of good network design and balancing these tradeoffs.

## CAN TERMINATION

The ISO11898 standard specifies the interconnect to be a twisted pair cable (shielded or unshielded) with 120  $\Omega$  characteristic impedance ( $Z_0$ ). Resistors equal to the characteristic impedance of the line should be used to terminate both ends of the cable to prevent signal reflections. Underterminated drop lines (stubs) connecting nodes to the cable or in a node, but if nodes may be removed from the bus the termination must be carefully placed so that it is not removed from the bus.

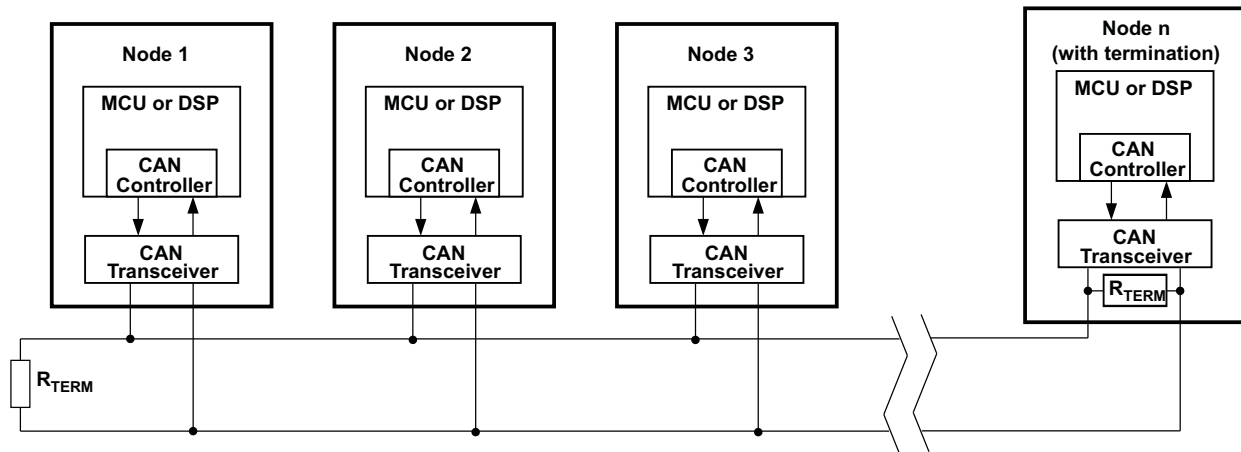

Figure 19. Typical CAN Bus

Termination may be a single 120  $\Omega$  resistor at the end of the bus, either on the cable or in a terminating node. If filtering and stabilization of the common mode voltage of the bus is desired, then split termination may be used. (See Figure 20). Split termination improves the electromagnetic emissions behavior of the network by eliminating fluctuations in the bus common-mode voltages at the start and end of message transmissions.

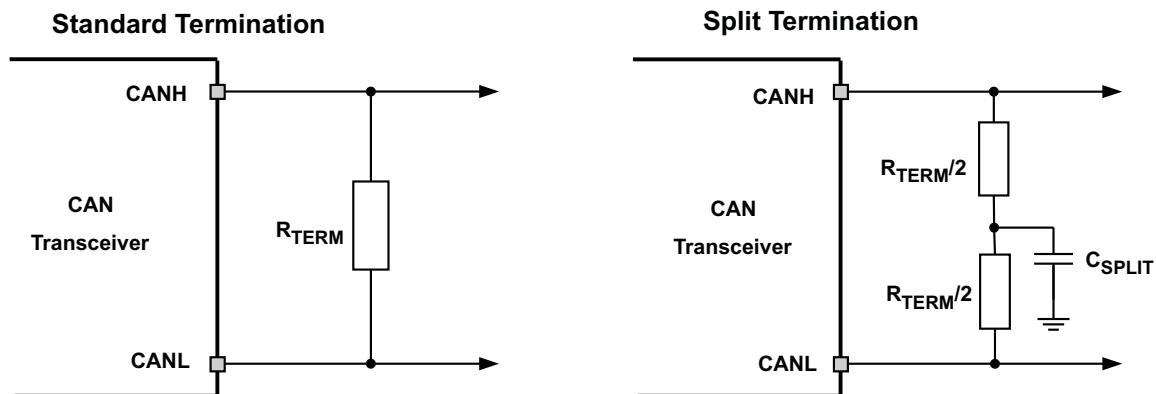

Figure 20. CAN Bus Termination Concepts

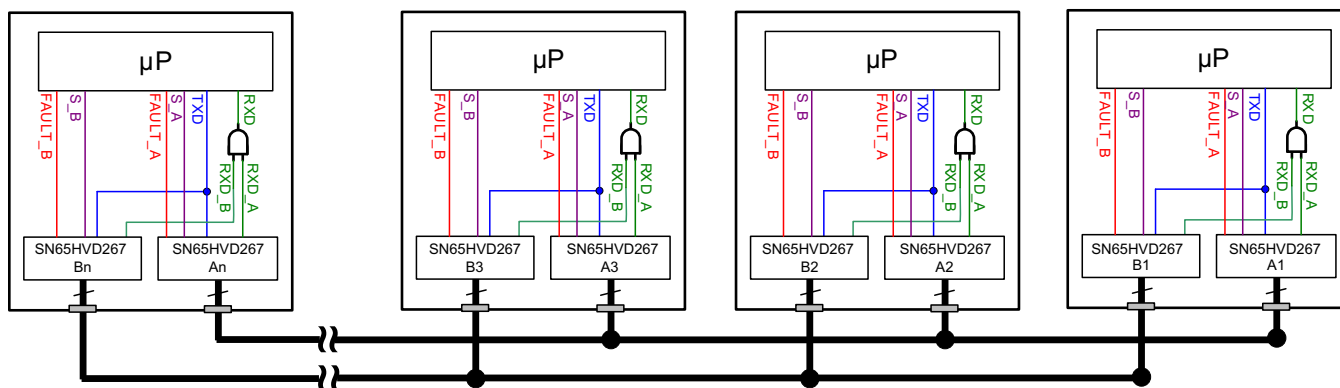

## Example: Functional Safety Using the SN65HVD267 in a Redundant Physical Layer CAN Network Topology

CAN is a standard linear bus topology using 120 Ω twisted pair cabling. The SN65HVD267 CAN device includes several features to use the CAN physical layer in nonstandard topologies with only one CAN link layer controller (μP) interface. This allows much greater flexibility in the physical topology of the bus while reducing the digital controller and software costs. The combination of RXD DTO and the FAULT output allows great flexibility, control and monitoring of these applications.

A simple example of this flexibility is to use two SN65HVD267 devices in parallel with an AND gate to achieve redundancy (parallel) of the physical layer (cabling and PHYs) in a CAN network.

For the CAN bit-wise arbitration to work, the RXD outputs of the transceivers must connect via AND gate logic so that a dominant bit (low) from any of the branches is received by the link layer logic (μP), and appears to the link layer and above as a single physical network. The RXD DTO feature prevents a bus stuck dominant fault in a single branch from taking down the entire network by forcing the RXD pin for the transceivers on the branch with the fault back to the recessive after the  $t_{RXD\_DTO}$  time. The remaining branch of the network continues to function. The FAULT pin of the transceivers on the branch with the fault indicates this via the FAULT output to their host processors, which diagnose the failure condition. The S pin (silent mode pin) may be used to put a branch in silent mode to check each branch for other faults. Thus it is possible to implement a robust and redundant CAN network topology in a simple and low cost manner.

These concepts can be expanded into more complicated and flexible CAN network topologies to solve various system level challenges with a networked infrastructure.

- CAN nodes with termination are PHY A, PHY B, PHY An and PHY Bn.
- RXD DTO prevents a single branch-stuck-dominant condition from blocking the redundant branch via the AND logic on RXD. The transceivers signal a received bus stuck dominant fault via the FAULT pin. The system detects which branch is stuck dominant, and issues a system warning. Other network faults on a single branch that appear as recessive (not blocking the redundant network) may be detected through diagnostic routines, and using the Silent Mode of the PHYs to use only one branch at a time for transmission during diagnostic mode. This combination allows robust fault detection and recovery within single branches so that they may be repaired and again provide redundancy of the physical layer.

Figure 21. Typical Redundant Physical Layer Topology Using the SN65HVD267

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**TAPE AND REEL BOX DIMENSIONS**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
SN65HVD265DR	SOIC	D	8	2500	340.5	338.1	20.6
SN65HVD266DR	SOIC	D	8	2500	340.5	338.1	20.6
SN65HVD267DR	SOIC	D	8	2500	340.5	338.1	20.6

D (R-PDSO-G8)

PLASTIC SMALL OUTLINE

NOTES: A. All linear dimensions are in inches (millimeters).  
 B. This drawing is subject to change without notice.  
 C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.006 (0,15) each side.  
 D. Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.  
 E. Reference JEDEC MS-012 variation AA.

D (R-PDSO-G8)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
  - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
