

## Features

- IPM 20 A, 600 V 3-phase IGBT inverter bridge including 2 control ICs for gate driving and freewheeling diodes
- 3.3 V, 5 V TTL/CMOS inputs with hysteresis
- Internal bootstrap diode
- Undervoltage lockout of gate drivers
- Smart shutdown function
- Short-circuit protection
- Shutdown input/fault output
- Separate open emitter outputs
- Built-in temperature sensor
- Comparator for fault protection
- Short-circuit rugged TFS IGBTs
- Very fast, soft recovery diodes
- 85 kΩ NTC UL 1434 CA 4 recognized
- Fully isolated package
- Isolation rating of 1500 Vrms/min

## Applications

- 3-phase inverters for motor drives
- Home appliances such as washing machines, refrigerators, air conditioners and sewing machines

## Description

This second series of SLLIMM (small low-loss intelligent molded module) provides a compact, high performance AC motor drive in a simple, rugged design. It combines new ST proprietary control ICs (one LS and one HS driver) with an improved short-circuit rugged trench gate field-stop (TFS) IGBT, making it ideal for 3-phase inverter systems such as home appliances and air conditioners. SLLIMM™ is a trademark of STMicroelectronics.

| 11  | LINv                      | Low-side logic input for V phase                                   |
| 12  | LINw                      | Low-side logic input for W phase                                   |
| 13  | VCCL                      | Low-side low voltage power supply                                  |
| 14  | $\overline{\text{SD/OD}}$ | Shutdown logic input (active low) / open-drain (comparator output) |
| 15  | CIN                       | Comparator input                                                   |
| 16  | GND                       | Ground                                                             |
| 17  | TSO                       | Temperature sensor output                                          |
| 18  | NW                        | Negative DC input for W phase                                      |
| 19  | NV                        | Negative DC input for V phase                                      |
| 20  | NU                        | Negative DC input for U phase                                      |
| 21  | W                         | W phase output                                                     |
| 22  | V                         | V phase output                                                     |
| 23  | U                         | U phase output                                                     |
| 24  | P                         | Positive DC input                                                  |
| 25  | T2                        | NTC thermistor terminal 2                                          |
| 26  | T1                        | NTC thermistor terminal 1                                          |

## 2 Absolute maximum ratings

(T<sub>J</sub> = 25°C unless otherwise noted).

**Table 3. Inverter parts**

| Symbol                 | Parameter                                                                                                                                             | Value | Unit |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|-------|------|
| V <sub>PN</sub>        | Supply voltage between P -N <sub>U</sub> , -N <sub>V</sub> , -N <sub>W</sub>                                                                          | 450   | V    |
| V <sub>PN(surge)</sub> | Supply voltage surge between P -N <sub>U</sub> , -N <sub>V</sub> , -N <sub>W</sub>                                                                    | 500   | V    |
| V <sub>CES</sub>       | Collector-emitter voltage each IGBT                                                                                                                   | 600   | V    |
| ±I <sub>C</sub>        | Continuous collector current each IGBT (T <sub>C</sub> = 25 °C)                                                                                       | 20    | A    |
|                        | Continuous collector current each IGBT (T <sub>C</sub> = 80 °C)                                                                                       | 15    |      |
| ±I <sub>CP</sub>       | Peak collector current each IGBT (less than 1ms)                                                                                                      | 40    | A    |
| P <sub>TOT</sub>       | Total dissipation at T <sub>C</sub> =25°C each IGBT                                                                                                   | 81    | W    |
| t <sub>scw</sub>       | Short circuit withstand time, V <sub>CE</sub> = 300V, T <sub>J</sub> = 125 °C, V <sub>CC</sub> = V <sub>boot</sub> = 15 V, V <sub>IN</sub> = 0 to 5 V | 5     | µs   |

**Table 4. Control parts**

| Symbol              | Parameter                                                           | Min                    | Max                     | Unit |
|---------------------|---------------------------------------------------------------------|------------------------|-------------------------|------|
| V <sub>CC</sub>     | Supply voltage between V <sub>CCH</sub> -GND, V <sub>CCL</sub> -GND | -0.3                   | 20                      | V    |
| V <sub>BOOT</sub>   | Bootstrap voltage                                                   | -0.3                   | 619                     | V    |
| V <sub>OUT</sub>    | Output voltage between U, V, W and GND                              | V <sub>BOOT</sub> - 21 | V <sub>BOOT</sub> + 0.3 | V    |
| V <sub>CIN</sub>    | Comparator input voltage                                            | -0.3                   | 20                      | V    |
| V <sub>IN</sub>     | Logic input voltage applied between HINx, LINx and GND              | -0.3                   | 15                      | V    |
| V <sub>SD</sub> /OD | Open drain voltage                                                  | -0.3                   | 7                       | V    |
| I <sub>SD</sub> /OD | Open drain sink current                                             | -                      | 10                      | mA   |
| V <sub>TSO</sub>    | Temperature sensor output voltage                                   | -0.3                   | 5.5                     | V    |
| I <sub>TSO</sub>    | Temperature sensor output current                                   |                        | 7                       | A    |

**Table 5. Total system**

| Symbol           | Parameter                                                                                         | Value      | Unit |
|------------------|---------------------------------------------------------------------------------------------------|------------|------|
| V <sub>ISO</sub> | Isolation withstand voltage applied between each pin and heat sink plate (AC voltage, t = 60sec.) | 1500       | Vrms |
| T <sub>J</sub>   | Power chips operating junction temperature                                                        | -40 to 175 | °C   |
| T <sub>C</sub>   | Module case operation temperature                                                                 | -40 to 125 | °C   |

Table 6. Thermal data

| Symbol        | Parameter                                     | Value | Unit |
|---------------|-----------------------------------------------|-------|------|
| $R_{th(j-c)}$ | Thermal resistance junction-case single IGBT  | 1.85  | °C/W |
|               | Thermal resistance junction-case single diode | 2.8   |      |

1. Applied between  $HIN_x$ ,  $LIN_x$  and GND for  $x = U, V, W$

2.  $t_{on}$  and  $t_{off}$  include the propagation delay time of the internal drive.  $t_{c(on)}$  and  $t_{c(off)}$  are the switching time of IGBT itself under the internally given gate driving condition.

| $SR_{SD}$     | $\overline{SD}$ fall slew rate               | $\overline{SD}$ pulled to 5V through $R_{SD}=10\text{ k}\Omega$ ; $C_L=1\text{ nF}$ through $\overline{SD}$ and ground;<br>90% $\overline{SD}$ to 10% $\overline{SD}$ |      | 25  |     | V/ $\mu\text{s}$ |

Note: Comparator remains enabled even if  $V_{CC}$  is in UVLO condition but higher than 4 V.

## 4 Fault management

The device integrates an open-drain output connected to  $\overline{\text{SD}}$  Pin. As soon as a fault occurs, the open-drain is activated and LVGx outputs are forced low. Two types of fault can be detected:

- Overcurrent (OC) sensed by the internal comparator (see more detail in [Section 4.2: Smart shutdown function](#));
- Undervoltage on supply voltage ( $V_{\text{CC}}$ );

Each fault enables the SD open drain for a different time; refer to the following [Table 10: Fault timing](#).

**Table 10. Fault timing**

| Symbol | Parameter                   | Event time                                                                                                 | SD open-drain enable time result |
|--------|-----------------------------|------------------------------------------------------------------------------------------------------------|----------------------------------|
| OC     | Overcurrent event           | $\leq 20 \mu\text{s}$                                                                                      | 20 $\mu\text{s}$                 |
|        |                             | $\geq 20 \mu\text{s}$                                                                                      | OC time                          |
| UVLO   | Undervoltage lock out event | $\leq 50 \mu\text{s}$                                                                                      | 50 $\mu\text{s}$                 |
|        |                             | $\geq 50 \mu\text{s}$<br>until the $V_{\text{CC\_LS}}$ exceed the $V_{\text{CC\_LS}}$ UV turn ON threshold | UVLO time                        |

The device actually remains in a fault condition ( $\overline{\text{SD}}$  at low logic level and LVGx outputs disabled) for a time that also depends on the RC network connected to the  $\overline{\text{SD}}$  pin. The network generates a time interval that is added to the internal value.

**Figure 4. Overcurrent timing (without contribution of RC network on  $\overline{\text{SD}}$ )**

Figure 5. UVLO timing (without contribution of RC network on  $\overline{SD}$ )

#### 4.1 TSO output

The device integrates a temperature sensor. A voltage proportional to die temperature is available on the TSO pin. When this function is not used, the pin can be left floating.

#### 4.2 Smart shutdown function

The device integrates a comparator committed to the fault sensing function. The comparator input can be connected to an external shunt resistor in order to implement a simple overcurrent detection function.

The output signal of the comparator is fed to an integrated MOSFET with the open drain output available on  $\overline{SD}$  input. When the comparator triggers, the device is set in the shutdown state and its outputs are all set to low level.

Figure 6. Smart shutdown timing waveforms in case of overcurrent event

Note:  $R_{ON\_OD} = V_{OD}/5 \text{ mA}$  see Table 9;  $R_{PD\_SD} (\text{typ}) = 5 \text{ V}/I_{SDh}$

In common over-current protection architectures, the comparator output is usually connected to the SD input and an RC network is connected to this SD line in order to provide a mono-stable circuit, which implements a protection time that follows the fault condition.

Differently from the common fault detection systems, the device Smart shutdown architecture allows to immediately turn-off the outputs gate driver in case of fault, by minimizing the propagation delay between the fault detection event and the actual outputs switch-off. In fact the time delay between the fault and the outputs turn off is no more dependent on the RC value of the external network connected to the pin.

In the smart shutdown circuitry, the fault signal has a preferential path which directly switches off the outputs after the comparator triggering.

At the same time the internal logic turns on the open drain output and holds it on until the  $\overline{\text{SD}}$  voltage goes below the  $V_{\text{SSD}}$  threshold and  $t_{\text{oc}}$  time is elapsed.

The driver outputs restart following the input pins as soon as the voltage at the  $\overline{\text{SD}}$  pin reaches the higher threshold of the SD logic input.

The Smart shutdown system provides the possibility to increase the time constant of the external RC network (that is the disable time after the fault event) up to very large values without increasing the delay time of the protection.

## 5 Typical application circuit

**Figure 7. Typical application circuit**

## 6 Recommendations

1. Input signals HIN, LIN are active-high logic. A 500 k $\Omega$  (typ.) pull-down resistor is built-in for each high side input. To prevent input signal oscillation, the wiring of each input should be as short as possible and the use of RC filters (R1, C1) on each input signal is suggested. The filters should be done with a time constant of about 100 ns and must be placed as close as possible to the IPM input pins.
2. The bypass capacitor C<sub>vcc</sub> (aluminum or tantalum) is recommended to reduce the transient circuit demand on the power supply. In addition, a decoupling capacitor C<sub>2</sub> (100 to 220 nF, with low ESR and low ESL) is suggested, to reduce high frequency switching noise distributed on the power supply lines. It must be placed as close as possible to each V<sub>cc</sub> pin and in parallel to the bypass capacitor.
3. The use of RC filter (RSF, CSF) for preventing protection circuit malfunction is recommended. The time constant (RSF x CSF) should be set to 1 $\mu$ s and the filter must be placed as close as possible to the CIN pin.
4. The  $\overline{\text{SD}}$  is an input/output pin (open drain type if used as output). It should be pulled up to MCU power supply (3.3/5 V) by a resistor higher than 1.0 k $\Omega$  in order to keep I<sub>od</sub> lower than 5 mA. The filter on SD has to be sized to get a desired re-starting time after a fault event and placed as close as possible to the SD pin.
5. To increase the noise immunity of the TSO thermal sensor, it is recommended to parallel a decoupling capacitor C<sub>TSO</sub> between 1 nF and 10 nF. Similarly, if the NTC thermistor is available and used, it is recommended to parallel a decoupling capacitor C<sub>OT</sub> between 10 nF and 100 nF. In both cases, the capacitors must be placed close to the MCU.
6. The decoupling capacitor C<sub>3</sub> (100 to 220 nF, with low ESR and low ESL) in parallel with each C<sub>boot</sub> is recommended to filter high frequency disturbances. Both C<sub>boot</sub> and C<sub>3</sub> must be placed as close as possible to the U,V,W and V<sub>boot</sub> pins. Bootstrap negative electrodes should be connected to U,V,W terminals directly and separated from the main output wires.
7. A Zener diode (Dz1) between each V<sub>cc</sub> pin and GND, and in parallel (Dz2) with each C<sub>boot</sub> is suggested in order to prevent overvoltage.
8. The decoupling capacitor C<sub>4</sub> (100 to 220 nF, with low ESR and low ESL) in parallel with the electrolytic capacitor C<sub>vdc</sub> is recommended, in order to prevent surge destruction. Both capacitors C<sub>4</sub> and C<sub>vdc</sub> should be placed as close as possible to the IPM (C<sub>4</sub> has priority over C<sub>vdc</sub>).
9. By integrating an application-specific type HVIC inside the module, direct coupling to the MCU terminals without an opto-coupler is possible.
10. Low inductance shunt resistors should be used for phase leg current sensing
11. In order to avoid malfunctions, the wiring between N pins, the shunt resistor and PWR\_GND should be as short as possible.
12. It is recommended to connect SGN\_GND to PWR\_GND at only one point (near the terminal of shunt resistor), in order to avoid any malfunction due to power ground fluctuation.

Table 11. Recommended operating conditions

| Symbol         | Parameter                          | Test condition                                                          | Min  | Typ | Max | Unit |
