## Register 82: Ethernet PHY Configuration 2 - MR10 (EPHYCFG2), address 0x00A

Fields in this register are used to configure the Ethernet PHY. These configuration values are programmed by the system processor after a POR. The DONE bit in the **EPHYCFG1** register is set when configuration is complete. This register is used when the user requires a configuration different from what is provided in the **EMACPC** register.

### Ethernet PHY Configuration 2 - MR10 (EPHYCFG2)

Base n/a

Address 0x00A

Type RW, reset 0x0004

## Register 83: Ethernet PHY Configuration 3 - MR11 (EPHYCFG3), address 0x00B

Fields in this register are used to configure the Ethernet PHY. These configuration values are programmed by the system processor after a POR. The DONE bit in the **EPHYCFG1** register is set when configuration is complete. This register is used when the user requires a configuration different from what is provided in the **EMACPC** register.

| 4:0       | FLDWNM | RW   | 0x0   | <p>Fast Link Down Modes</p> <p>The Fast Link Down function is an OR of the following five options. The application can enable combinations of these conditions.</p> <p>Bit 4: Drop the link due to descrambler sync loss. If this bit is enabled, the link is dropped when the receiver loses synchronization of the transmitter.</p> <p>Bit 3: Drop the link based on RX Error count of the MII interface. When a predefined number of 32 RX Error occurrences in a 10µs interval is reached, the link is dropped.</p> <p>Bit 2: Drop the link based on MLT3 Errors count (Violation of the MLT3 coding in the DSP output). When a predefined number of 20 MLT3 Error occurrences in a 10µs interval is reached, the link is dropped.</p> <p>Bit 1: Drop the link based on Low SNR Threshold. When a predefined number of 20 Threshold crossing occurrences in a 10µs interval is reached, the link is dropped.</p> <p>Bit 0: Drop the link based on Signal/Energy loss indication – When the Energy detector indicates Energy Loss, the link is dropped. Typical reaction time is 10µs.</p> |

## Register 84: Ethernet PHY Register Control - MR13 (EPHYREGCTL), address 0x00D

**EPHYREGCTL** (0x00D) and **EPHYADDAR** (0x00E) registers allow read/write access to the extended register set using indirect addressing. The modes for the FUNC field are as follows:

- **EPHYREGCTL[15:14] = 0x0**: A write to **EPHYADDAR** modifies the extended register set address register. This address register must be initialized in order to access any of the registers within the extended register set.
- **EPHYREGCTL[15:14] = 0x1**: A read/write to **EPHYADDAR** operates on the register within the extended register set selected (pointed to) by the value in the address register. The address register contents (pointer) remain unchanged.
- **EPHYREGCTL[15:14] = 0x2**: A read/write to **EPHYADDAR** operates on the register within the extended register set selected (pointed to) by the value in the address register. After that access is complete, for both reads and writes, the value in the address register is incremented.
- **EPHYREGCTL[15:14] = 0x3**: A read/write to **EPHYADDAR** operates on the register within the extended register set selected (pointed to) by the value in the address register. After that access is complete, for write accesses only, the value in the address register is incremented. For read accesses, the value of the address register remains unchanged.

This register is the MDIO Manageable Device (MMD) access control. In general, register **EPHYREGCTL [4:0]** is the device address, DEVAD, that directs any accesses of **EPHYADDAR** (0x00E) register to the appropriate MMD. It also contains selection bits for auto-increment of the data register. This register contains the device address to be written to access the extended registers. Write 0x1F into bits [4:0] of this register. It also contains selection bits [15:14] for the address auto-increment mode of **EPHYADDAR**.

| 4:0       | DEVAD | WO   | 0x0   | <p>Device Address</p> <p>In general, these bits [4:0] are the device address DEVAD that directs any accesses of <b>EPHYADDR</b> register (0x00E) to the appropriate MMD. The PHY uses the vendor specific DEVAD [4 : 0] = 0x1F for accesses. All accesses through registers <b>EPHYREGCR</b> and <b>EPHYADDR</b> should use this DEVAD. Transactions with other DEVAD are ignored.</p> |

**Register 85: Ethernet PHY Address or Data - MR14 (EPHYADDR), address 0x00E**

This register is the address/data MMD register. It is used in conjunction with **EPHYREGCTL** register (PHY offset 0x00D) to provide the access by an indirect read/write mechanism to the extended register set.

Ethernet PHY Address or Data - MR14 (EPHYADDR)

Base n/a  
Address 0x00E  
Type WO, reset 0x0000

**Register 87: Ethernet PHY Specific Control- MR17 (EPHYSCR), address 0x011**

This register implements the PHY Specific Control register. This register allows access to general functionality inside the PHY to enable operation in reduced power modes and control the interrupt mechanism.

**Ethernet PHY Specific Control- MR17 (EPHYSCR)**

Base n/a

Address 0x011

Type RW, reset 0x0103

## Register 88: Ethernet PHY MII Interrupt Status 1 - MR18 (EPHYMISR1), address 0x012

This register contains events status and enables for the interrupt function. If an event has occurred since the last read of this register, the corresponding status bit is set. If the corresponding enable bit in the register is set, an interrupt is generated if the event occurs. The INTEN bit (Bit 1) in the **EPHYSCR** register (0x011) must also be set to allow interrupts. The status indications in this register are set even if the interrupt is not enabled.

### Ethernet PHY MII Interrupt Status 1 - MR18 (EPHYMISR1)

Base n/a

Address 0x012

Type RW, reset 0x0000

## Register 89: Ethernet PHY MII Interrupt Status 2 - MR19 (EPHYMISR2), address 0x013

This register contains additional event status and enables for the interrupt function. If an event has occurred since the last read of this register, the corresponding status bit is set. If the corresponding enable bit in the register is set, an interrupt is generated if the event occurs. The INTEN bit (bit 1) in the **EPHYSCR** register (PHY offset 0x011) must also be set to allow interrupts. The status indications in this register are set even if the interrupt is not enabled.

| 15:0      | RXERRCNT | RO   | 0x0   | Receive Error Count<br><br>When a valid carrier is present (while EN0RXDV is active), and there is at least one occurrence of an invalid data symbol, this 16-bit counter increments for each receive error detected. The <b>EPHYRXERCNT</b> counter does not count in MII loopback mode. The counter stops when it reaches its maximum count of 0xFFFF. When the counter exceeds half-full (0x7FFF), an interrupt is generated. This register is cleared on read. |

**Register 92: Ethernet PHY BIST Control - MR22 (EPHYBISTCR), address 0x016**

This register is used for Build-In Self Test (BIST) configuration. The BIST functionality provides Pseudo Random Bit Stream (PRBS) mechanism including packet generation generator and checker. Selection of the exact loopback point in the signal chain is also done in this register.

**Register 93: Ethernet PHY LED Control - MR24 (EPHYLED CR), address 0x018**

This register provides the ability to control the blink rate on the LED outputs.

## Ethernet PHY LED Control - MR24 (EPHYLED CR)

Base n/a

Address 0x018

Type RW, reset 0x0400

## Register 95: Ethernet PHY 10Base-T Status/Control - MR26 (EPHY10BTSC), address 0x01A

This register provides the ability to control and read status of the PHY's internal 10Base-T functionality.

### Ethernet PHY 10Base-T Status/Control - MR26 (EPHY10BTSC)

Base n/a

Address 0x01A

Type RW, reset 0x0000

## Register 96: Ethernet PHY BIST Control and Status 1 - MR27 (EPHYBICSR1), address 0x01B

This register provides the total number of error bytes that are received by the PRBS checker and defines the Inter-Packet Gap (IPG) for the packet generator.

### Ethernet PHY BIST Control and Status 1 - MR27 (EPHYBICSR1)

Base n/a

Address 0x01B

Type RW, reset 0x007D

| 15:8      | ERRCNT    | RO   | 0x00  | <p>BIST Error Count</p> <p>This field holds the number of erroneous bytes that were received by the PRBS checker. The value in this register is locked when a write is done to bit 15.</p> <p>When the PRBSM field in the <b>EPHYBISCR</b> register (0x0016) is set to zero, the count stops at 0xFF. See the <b>EPHYBISCR</b> register for further details.</p> |
| 7:0       | IPGLENGTH | RW   | 0x7D  | <p>BIST IPG Length</p> <p>Inter Packet Gap (IPG) Length defines the size of the gap (in bytes) between any 2 successive packets generated by the BIST. Default value is 0x7D, which is equal to 125 bytes.</p>                                                                                                                                                   |

**Register 97: Ethernet PHY BIST Control and Status 2 - MR28 (EPHYBICSR2), address 0x01C**

This register allows programming the length of the generated packets in bytes for the BIST mechanism

Ethernet PHY BIST Control and Status 2 - MR28 (EPHYBICSR2)

**Register 99: Ethernet PHY Reset Control - MR31 (EPHYRCR), address 0x01F**

This register allows the system to reset or restart the PHY by register access.

## Ethernet PHY Reset Control - MR31 (EPHYRCR)

Base n/a

Address 0x01F

Type RW, reset 0x0000

## 24 Universal Serial Bus (USB) Controller

**Important:** The full USB chapter is under NDA. This chapter describes the module features at a high level. For a copy of the full NDA data sheet, follow the instructions in the *Non-Disclosure Agreement for the Tiva C Series TM4C129LNCZAD Microcontroller Data Sheet* (literature number [SPMS420](#)).

The TM4C129LNCZAD USB controller operates as a full-speed or low-speed function controller during point-to-point communications with USB Host, Device, or OTG functions. If the integrated ULPI interface is utilized, the USB can operate at high-speed. The controller complies with the USB 2.0 standard, which includes SUSPEND and RESUME signaling. 16 endpoints including two hard-wired for control transfers (one endpoint for IN and one endpoint for OUT) plus 14 endpoints defined by firmware along with a dynamic sizable FIFO support multiple packet queueing. USB DMA access to the FIFO allows minimal interference from system software. Software-controlled connect and disconnect allows flexibility during USB device start-up. The controller complies with OTG Standard's Session Request Protocol (SRP) and Host Negotiation Protocol (HNP).

The TM4C129LNCZAD USB module has the following features:

- Complies with USB-IF (Implementer's Forum) certification standards
- USB 2.0 high-speed (480 Mbps) operation with the integrated ULPI interface communicating with an external PHY
- Link Power Management support which uses link-state awareness to reduce power usage
- 4 transfer types: Control, Interrupt, Bulk, and Isochronous
- 16 endpoints
  - 1 dedicated control IN endpoint and 1 dedicated control OUT endpoint
  - 7 configurable IN endpoints and 7 configurable OUT endpoints
- 4 KB dedicated endpoint memory: one endpoint may be defined for double-buffered 1023-byte isochronous packet size
- VBUS droop detection and interrupt
- Integrated USB DMA with bus master capability
  - Up to eight RX Endpoint channels and up to eight TX Endpoint channels are available.
  - Each channel can be separately programmed to operate in different modes
  - Incremental burst transfers of 4-, 8-, 16- or unspecified length supported

## 24.1 Block Diagram

Figure 24-1. USB Module Block Diagram

## 24.2 Signal Description

The following table lists the external signals of the USB controller and describes the function of each. Some USB controller signals are alternate functions for some GPIO signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for these USB signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 796) should be set to choose the USB function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOCTL)** register (page 813) to assign the USB signal to the specified GPIO port pin. The USB0VBUS and USB0ID signals are configured by clearing the appropriate DEN bit in the **GPIO Digital Enable (GPIODEN)** register. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 765. The remaining signals (with the word "fixed" in the Pin Mux/Pin Assignment column) have a fixed pin assignment and function.

**Note:** When used in OTG mode, USB0VBUS and USB0ID do not require any configuration as they are dedicated pins for the USB controller and directly connect to the USB connector's VBUS and ID signals. If the USB controller is used as either a dedicated Host or Device, the DEVMOD field in the **USB General-Purpose Control and Status (USBGPCS)** register can be used to connect the USB0VBUS and/or USB0ID inputs to fixed levels internally, freeing the PB0 and PB1 pins for GPIO use. Note that PB1 (USB0VBUS) is a 5-V tolerant signal as required. For proper self-powered Device operation, the VBUS value must still be monitored to assure that if the Host removes VBUS, the self-powered Device disables the D+/D- pull-up resistors. This function can be accomplished by connecting a standard GPIO to VBUS.

The termination resistors for the USB PHY have been added internally, and thus there is no need for external resistors. For a device, there is a 1.5 KOhm pull-up on the D+ and for a host there are 15 KOhm pull-downs on both D+ and D-.

**Note:** Port pins PL6 and PL7 operate as Fast GPIO pads, but have 4-mA drive capability only. GPIO register controls for drive strength, slew rate and open drain have no effect on these pins. The registers which have no effect are as follows: **GPIODR2R**, **GPIODR4R**, **GPIODR8R**, **GPIODR12R**, **GPIOSLR**, and **GPIOODR**. Refer to “General-Purpose Input/Outputs (GPIOs)” on page 765 and “Recommended GPIO Operating Characteristics” on page 2053 for more information.

**Table 24-1. USB Signals (212BGA)**

| Pin Name | Pin Number     | Pin Mux / Pin Assignment       | Pin Type | Buffer Type | Description                                                                                                                                                                                                                                                   |
|----------|----------------|--------------------------------|----------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USB0CLK  | B17            | PB3 (14)                       | O        | TTL         | 60-MHz clock to the external PHY.                                                                                                                                                                                                                             |
| USB0D0   | G16            | PL0 (14)                       | I/O      | TTL         | USB data 0.                                                                                                                                                                                                                                                   |
| USB0D1   | H19            | PL1 (14)                       | I/O      | TTL         | USB data 1.                                                                                                                                                                                                                                                   |
| USB0D2   | G18            | PL2 (14)                       | I/O      | TTL         | USB data 2.                                                                                                                                                                                                                                                   |
| USB0D3   | J18            | PL3 (14)                       | I/O      | TTL         | USB data 3.                                                                                                                                                                                                                                                   |
| USB0D4   | H18            | PL4 (14)                       | I/O      | TTL         | USB data 4.                                                                                                                                                                                                                                                   |
| USB0D5   | G19            | PL5 (14)                       | I/O      | TTL         | USB data 5.                                                                                                                                                                                                                                                   |
| USB0D6   | B12            | PP5 (14)                       | I/O      | TTL         | USB data 6.                                                                                                                                                                                                                                                   |
| USB0D7   | D8             | PP4 (14)                       | I/O      | TTL         | USB data 7.                                                                                                                                                                                                                                                   |
| USB0DIR  | C12            | PP3 (14)                       | O        | TTL         | Indicates that the external PHY is able to accept data from the USB controller.                                                                                                                                                                               |
| USB0DM   | B18            | PL7                            | I/O      | Analog      | Bidirectional differential data pin (D- per USB specification) for USB0.                                                                                                                                                                                      |
| USB0DP   | C18            | PL6                            | I/O      | Analog      | Bidirectional differential data pin (D+ per USB specification) for USB0.                                                                                                                                                                                      |
| USB0EPEN | V5<br>R7<br>B3 | PA6 (5)<br>PA7 (11)<br>PD6 (5) | O        | TTL         | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                                                                                              |
| USB0ID   | A16            | PB0                            | I        | Analog      | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
| USB0NXT  | B13            | PP2 (14)                       | O        | TTL         | Asserted by the external PHY to throttle all data types.                                                                                                                                                                                                      |
| USB0PFLT | R7<br>B2       | PA7 (5)<br>PD7 (5)             | I        | TTL         | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |
| USB0STP  | A17            | PB2 (14)                       | O        | TTL         | Asserted by the USB controller to signal the end of a USB transmit packet or register write operation.                                                                                                                                                        |
| USB0VBUS | B16            | PB1                            | I/O      | Analog      | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                            |

## 24.3 Register Map

Table 24-2 on page 1792 lists the registers. All addresses given are relative to the USB base address of 0x4005.0000. Note that the USB controller clock must be enabled before the registers can be programmed (see page 407). There must be a delay of 3 system clocks after the USB module clock is enabled before any USB module registers are accessed.

**Note:** Descriptions for all these registers can be found in the NDA version of the data sheet.

**Table 24-2. List of Registers**

| Offset | Name           | Description                                            |
|--------|----------------|--------------------------------------------------------|
| 0x000  | USBFADDR       | USB Device Functional Address                          |
| 0x001  | USBPOWER       | USB Power                                              |
| 0x002  | USBTXIS        | USB Transmit Interrupt Status                          |
| 0x004  | USBRXIS        | USB Receive Interrupt Status                           |
| 0x006  | USBTXIE        | USB Transmit Interrupt Enable                          |
| 0x008  | USBRXIE        | USB Receive Interrupt Enable                           |

## 25 LCD Controller

The Liquid Crystal Display (LCD) Controller provides support for a variety of LCD and OLED panels. The TM4C129LNCZAD controller includes an LCD Controller with the following features:

- Character-based panels
  - Support for two character panels (CS0 and CS1) with independent and programmable bus timing parameters when in asynchronous Hitachi, Motorola, and Intel modes
  - Support for one character panel (CS0) with programmable bus timing parameters when in synchronous Motorola and Intel modes
  - Can be used as a generic 16-bit address/data interleaved MPU bus master with no external stall
- Passive matrix LCD panels
  - Panel types including STN, DSTN, and C-DSTN
  - AC Bias Control
- Active matrix LCD panels
  - Panel types including TN TFT
  - 1, 2, 4, or 8 bits per pixel with palette RAM and 16 or 24 bits per pixel without palette RAM
- OLED Panels
  - Passive Matrix (PM OLED) with frame buffer and controller IC inside the panel
  - Active Matrix (AM OLED)
- Bus mastering capability from either system SRAM or EPI memory.

### 25.1 Block Diagram

The LCD controller consists of two independent controllers, the Raster Controller and the LCD Interface Display Driver (LIDD) controller. Each controller operates independently from the other and only one of them is active at any given time.

- The Raster Controller provides a synchronous LCD interface. It provides timing and data for constant graphics refresh to a passive display. It supports a wide variety of monochrome and full-color display types and sizes by use of programmable timing controls, a built-in palette, and a gray-scale/serializer. Graphics data is processed and stored in frame buffers. A frame buffer is a contiguous memory block in the system. A built-in DMA engine supplies the graphics data to the Raster engine which, in turn, outputs to the external LCD device.
- The LIDD controller provides an asynchronous and/or synchronous interface depending on the mode the LIDD controller is operating in. It provides full-timing programmability of control signals (chip selects, read/write strobes, enable, direction) and output data.

Figure 25-1 on page 1799 shows the LCD controller details. The raster and LIDD Controllers are responsible for generating the correct external timing. The LCD DMA engine provides a constant flow of data from the frame buffer(s) to the external LCD panel via the Raster and LIDD Controllers. In addition, CPU access is provided to read and write registers.

The solid, thick lines in Figure 13-1 indicate the data path. For more information on the Raster Controller data path, see Figure 25-3 on page 1808 .

**Figure 25-1. LCD Block Diagram**

## 25.2 Signal Description

The following table lists the external signals of the LCD controller and describes the function of each.

**Table 25-1. LCD Signals (212BGA)**

| Pin Name  | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type | Description                                                                                                        |
|-----------|------------|--------------------------|----------|-------------|--------------------------------------------------------------------------------------------------------------------|
| LCDAC     | N1         | PJ6 (15)                 | O        | TTL         | LCD AC bias or latch enable in Raster mode; Primary chip select (CS0)/Primary Enable (E0) in LIDD MPU/Hitachi mode |
| LCDCP     | N5         | PR0 (15)                 | O        | TTL         | LCD Pixel Clock in Raster mode; read strobe or read/write strobe in LIDD mode                                      |
| LCDDATA00 | P3         | PR4 (15)                 | I/O      | TTL         | LCD Data Pin 0 input/output.                                                                                       |
| LCDDATA01 | P2         | PR5 (15)                 | I/O      | TTL         | LCD Data Pin 1 input/output.                                                                                       |
| LCDDATA02 | U8         | PF7 (15)                 | I/O      | TTL         | LCD Data Pin 2 input/output.                                                                                       |
| LCDDATA03 | V8         | PR3 (15)                 | I/O      | TTL         | LCD Data Pin 3 input/output.                                                                                       |
| LCDDATA04 | W9         | PR6 (15)                 | I/O      | TTL         | LCD Data Pin 4 input/output.                                                                                       |
| LCDDATA05 | R10        | PR7 (15)                 | I/O      | TTL         | LCD Data Pin 5 input/output.                                                                                       |

**Table 25-1. LCD Signals (212BGA) (continued)**

| Pin Name  | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type | Description                                                                                                         |

The following table gives a more detailed summary of how the signals are used in each mode. These features are also discussed in the functional description section.

**Table 25-2. LCD External Signal Details**

| Signal           | Type   | Mode        | Function                                                                                                                                                                           |
|------------------|--------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LCDFP<br>(VSYNC) | Output | Raster Mode | This signal functions as a frame clock the LCD uses to signal the start of a new frame of pixels. This signal is also used by TFT displays as the vertical synchronization signal. |
|                  |        | LIDD Mode   | This signal functions as an Address Latch Enable (ALE)                                                                                                                             |
| LCDLP<br>(HSYNC) | Output | Raster Mode | This signal functions as a line clock the LCD uses to signal the end of a line of pixels. This signal is also used by TFT displays as the horizontal synchronization signal.       |
|                  |        | LIDD Mode   | This signal functions as a write strobe or direction bit depending on the interface mode.                                                                                          |

**Table 25-2. LCD External Signal Details (continued)**

| Signal                 | Type         | Mode        | Function                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------|--------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LCDCP<br>(Pixel clock) | Output       | Raster Mode | This signal functions as the pixel clock the LCD uses to clock the pixel data into the line shift register. In passive mode, the pixel clock transitions only when valid data is available on the data lines. In active mode, the pixel clock transitions continuously, and the LCDAC pin is used as an output enable to signal when data is available on the LCD pin.                                                               |
|                        |              | LIDD Mode   | This signal functions as a read strobe (RS) or read/write strobe (RS/WS) depending on the interface mode.                                                                                                                                                                                                                                                                                                                            |
| LCDAC                  | Output       | Raster Mode | This signal functions as the AC-bias used to trigger the LCD to switch the polarity of the power supplies to the row and column axis of the screen to counteract DC offset. The signal is used in TFT mode as the output enable to signal when data is latched from the data pins using the pixel clock.<br>LIDD Character: Primary Enable Strobe (E0)<br>LIDD Graphics: Chip Select 0 (CS0)                                         |
|                        |              | LIDD Mode   | This signal functions as the primary enable (E0) or Hitachi mode and the primary chip select (CS0) depending on the interface mode.                                                                                                                                                                                                                                                                                                  |
| LCDMCLK                | OUT          | LIDD Mode   | This signal is not used in Raster mode, but is used as a secondary Enable Strobe (E1) or Chip Select (CS1) depending on the interface mode.                                                                                                                                                                                                                                                                                          |
| LCDDATA                | Output       | Raster Mode | These signals function as the LCD data bus providing 4-, 8-, 16-, or 24-bit data path. For monochrome displays, each signal represents a pixel; for passive color displays, groupings of three signals represent one pixel (red, green, and blue). LCDDATA[3:0] are used for monochrome displays of 2, 4, and 8 BPP; LCDDATA[7:0] are used for color STN displays and LCDDATA[15:0] or LCDDATA[23:0] are used for active (TFT) mode. |
|                        | Output/Input | LIDD Mode   | These signals function as the read and write path for the command and data registers.                                                                                                                                                                                                                                                                                                                                                |

Table 25-3 on page 1801 details MODESEL programming for the alternate pin functions in LIDD mode. For further programming information refer to the **LCDLIDDCTL** register.

**Table 25-3. LCD Alternate Signal Functions in LIDD Mode**

| PIN     | MODE = 0x0 | MODE = 0x1 | MODE = 0x2 | MODE = 0x3 | MODE = 0x4 |
|---------|------------|------------|------------|------------|------------|
| LDCP    | RS/WS      | RS/WS      | RS         | RS         | N/A        |
| LCDLP   | DIR        | DIR        | WS         | WS         | DIR        |

## 25.3 Functional Description

The following sections describe the functional capability of the LCD Controller

### 25.3.1 Clocking

This section details the various clocks and signals. Figure 25-2 on page 1802 shows the input and output LCD controller clocks.

Figure 25-2. Input and Output Clocks

#### 25.3.1.1 Pixel Clock (LCDCP signal)

The pixel clock (LCDCP) frequency is derived from the system clock, which is the internal reference clock (MCLK) to the LCD module. The pixel clock is used by the LCD display to clock the pixel data into the line shift register. The formula used for the pixel clock is:

$$\text{LCDCP} = \text{System Clock} / \text{CLKDIV}$$

where CLKDIV is a field in the **LCD Control (LCDCTL)** register. The value of CLKDIV should not be 0 or 1 in Raster Mode. The pixel clock operates differently depending on the mode of the LCD controller:

- Passive (STN) mode: LCDCP only transitions when valid data is available for output. It does not transition when the horizontal clock (HSYNC) is asserted or during wait state insertion.
- Active (TFT) mode: LCDCP continuously toggles as long as the Raster Controller is enabled.

#### 25.3.1.2 HSYNC Horizontal Clock (LCDLP signal)

HSYNC (LCDLP signal) toggles after all pixels in a horizontal line have been transmitted to the LCD and a programmable number of pixel clock wait states have elapsed both at the beginning and end of each line. The **LCD Raster Timing 0 (LCDRASTRIM0)** register, offset 0x02C, fully defines the behavior of this signal.

HSYNC can be programmed to be synchronized with the rising or falling edge of the pixel clock (LCDCP). The PXLCLKCTL and PSYNCRF bits in the **LCD Raster Timing 2 (LCDRASTRIM2)** register, offset 0x034, are used to configure the synchronization.

- Active (TFT) mode: The horizontal clock or the line clock is also used by TFT displays as the horizontal synchronization signal (HSYNC).

The timings of the horizontal clock (line clock) pins are programmable to support:

- Delay insertion both at the beginning and end of each line

- Line clock polarity
- Line clock pulse width, driven on rising or falling edge of pixel clock

### 25.3.1.3 VSYNC Vertical Clock (LCDFP signal)

VSYNC (LCDFP signal) toggles after all lines in a frame have been transmitted to the LCD and a programmable number of line clock cycles has elapsed both at the beginning and end of each frame. The **LCD Raster Timing 1 (LCDRASTRIM1)** register, offset 0x030, fully defines the behavior of this signal.

VSYNC can be programmed to be synchronized with the rising or falling edge of LCDCP pixel clock. The PXLCLKCTL and PSYNCRF bits in the **LCD Raster Timing 2 (LCDRASTRIM2)** register, offset 0x034, are used to configure the synchronization.

- Passive (STN) mode: The vertical, or frame, clock toggles during the first line of the screen.
- Active (TFT) mode: The vertical, or frame, clock is also used by TFT displays as the vertical synchronization signal (VSYNC). The timings of the vertical clock pins are programmable to support:
  - Delay insertion both at the beginning and end of each frame
  - Frame clock polarity

### 25.3.1.4 LCD AC Bias Enable (LCDAC)

- Passive (STN) mode: To prevent a DC charge within the screen pixels, the power and ground supplies of the display are periodically switched. The Raster Controller signals the LCD to switch the polarity by toggling this pin.
- Active (TFT) mode: This signal acts as an output enable (OE) signal. It is used to signal the external LCD that the data is valid on the data bus.

## 25.3.2 LCD DMA Engine

The LCD DMA engine provides the capability to output graphics data to constantly refresh the external LCD display, without burdening the CPU, via interrupts or a firmware timer. It operates on one or two frame buffers, which are set up during initialization. Using two frame buffers (ping-pong buffers) enables the simultaneous operation of outputting the current video frame to the external display and updating the next video frame. The ping-pong buffering approach is preferred in most applications.

When the Raster Controller is used, the LCD DMA engine reads data from a frame buffer and writes it to the input FIFO. The Raster Controller requests data from the FIFO for frame refresh, so the DMA is used to keep the FIFO filled.

When the LIDD controller is used, the LCD DMA engine accesses the LIDD controller's address and/or data registers. The following steps are needed to configure the DMA engine:

1. Configure the data format in the **LCD DMA Control (LCDDMACTL)** register, offset 0x040.
2. Configure frame buffer 0 by programming the **LCD DMA Frame Buffer 0 Base Address (LCDDMABAFB0)** register, offset 0x044, and the **LCD DMA Frame Buffer 0 Ceiling Address (LCDDMACAFB0)** register, offset 0x048

3. Configure frame buffer 1 by programming the **LCD DMA Frame Buffer 1 Base Address (LCDDMABAFB1)** register, offset 0x04C, and the **LCD DMA Frame Buffer 1 Ceiling Address (LCDDMACAFB1)** register, offset 0x050.

In addition, depending on whether the application is operating in LIDD mode or Raster Mode, the **LCDLIDDCTL** or the **LCDRASTRCTL** register should be configured appropriately, along with all of the timing registers. To enable DMA transfers, the DMAEN bit in the **LCDLIDDCTL** or the LCDEN bit in the **LCDRASTRCTL** register should be written with a 1.

### 25.3.2.1 Interrupts

Interrupts in this LCD module are related to DMA engine operation. Five registers are used to control and monitor the interrupts:

- **LCDLIDDCTL** and **LCDRASTRCTL** registers enable and disable individual features that can generate interrupts.
- The **LCD Interrupt Raw Status and Set Register (LCDRISSET)** register, offset 0x058, collects all of the interrupt status information.
- The **LCD Interrupt Status and Clear (LCDMISCLR)** register, offset 0x05C, is used to read and clear the status of the masked interrupt triggers.
- The **LCD Interrupt Mask (LCDIM)** register, offset 0x060, is used to control whether an interrupt source is masked or not.

#### **LIDD Mode**

When operating in LIDD mode, the DMA engine generates one interrupt signal every time the specified frame buffer has been transferred completely. The EOF1, EOF0 and DONE bits of the **LCDRISSET** register reflect the interrupt signal, regardless of whether or not the interrupt is enabled.

#### **Raster Mode**

When operating in Raster mode, the DMA engine can generate the interrupts in the following scenarios:

- **Output FIFO under-run:** This interrupt occurs when the DMA engine cannot keep up with the data rate consumed by the LCD (which is determined by the LCDCP.) This is likely due to a system memory throughput issue or an incorrect LCDCP setting. The FIFOU bit in **LCD Interrupt Raw Status and Set Register (LCDRISSET)** register is set when this error occurs. This bit is cleared by disabling the Raster Controller, that is clearing the LCDEN bit in **LCD Raster Control (LCDRASTRCTL)** register.
- **Frame Synchronization lost:** This error happens when the DMA engine attempts to read what it believes to be the first word of the video buffer but the data cannot be recognized as such. This situation can be caused by an invalid frame buffer address or an invalid BPP value. The SYNC bit in the IRQSTATUS\_RAW register is set when such an error is detected. This field is cleared by disabling the Raster Controller (clearing the LCDEN bit in **LCD Raster Control (LCDRASTRCTL)** register).
- **Palette loaded:** This interrupt can be generated when the palette is loaded into the memory by the DMA engine. At the same time, the PALLOAD bit in the **LCD Interrupt Raw Status and Set Register (LCDRISSET)** register is set. In data-only (PALMODE = 0x2) and palette-plus-data (PALMODE = 0x0) modes, writing 0 to this bit clears the interrupt. In the palette-only (PALMODE

= 0x1) mode, this bit is cleared by disabling the Raster Controller (clearing the LCDEN bit in the **LCD Raster Control (LCDRASTRCTL)** register).

- **AC Bias transition:** If the ACBI field in the **LCD Raster Timing 2 (LCDRASTRTIM2)** register is programmed with a nonzero value, an internal counter is loaded with this value and starts to decrement each time LCDAC (AC-bias signal) switches its state. When the counter reaches zero, the ACBS bit in the **LCD Interrupt Raw Status and Set Register (LCDRISSET)** register is set, which delivers an interrupt signal to the system interrupt controller (if the interrupt is enabled.) The counter reloads the value in ACBI field, but does not start to decrement until the ABC bit is cleared by writing 0 to this bit.
- **Frame transfer completed:** When one frame of data is transferred completely, the DONE bit in the **LCD Interrupt Raw Status and Set Register (LCDRISSET)** register is set. This bit is cleared by disabling the Raster Controller (clearing the LCDEN bit in **LCD Raster Control (LCDRASTRCTL)** register). The E0F0 and E0F1 bits in **LCD Interrupt Raw Status and Set Register (LCDRISSET)** register are set accordingly.

Note that the function enable bits are in the in **LCD Raster Control (LCDRASTRCTL)** register and must be set in order to generate an interrupt to the CPU.

### 25.3.3 LIDD Bus Operation

The integrated LCD Interface Display Drive (LIDD) Controller has programmable timing parameters that support a wide variety of character-based LCD panels. Alternatively, the DMA module can be used to mimic the CPU and perform a sequence of write-only data bus transactions to the character-based LCD panel.

LIDD mode is enabled by clearing the LCDMODE bit in the **LCD Control (LCDCTL)** register.

LIDD Controller operation is summarized as follows:

- During initialization, the **LCD LIDD CS0 Configuration (LIDDCS0CFG)** and **LCD LIDD CS1 Configuration (LIDDCS1CFG)** registers are configured to match the requirements of the LCD panel being used.
- During normal operation, the CPU writes display data to the **LIDD CS0 Data Read/Write Initiation (LIDDCS0DATA)** and **LIDD CS1 Data Read/Write Initiation (LIDDCS1DATA)** registers. The LIDD interface converts the CPU write into the proper signal transition sequence for the display, as programmed earlier. Note that the first CPU write should send the beginning address of the update to the LCD panel and the subsequent writes update data at display locations starting from the first address and continuing sequentially. Note that DMA may be used instead of CPU.
- The LIDD Controller is also capable of reading back status or data from the LCD panel, if the latter has this capability. This is set up and activated in a similar manner to the write function described above.

Table 25-4 on page 1806 describes how the signals are used to interface to external LCD modules, which are configured by the **LCDLIDDCTL** register.

Table 25-4. LIDD I/O Name Map

| Display Type                    | Interface Type | Data Bits | LCDLIDDCTL[2:0] | Signal Name   | LCD Display I/O Name | LCD Display I/O Description                  |
|---------------------------------|----------------|-----------|-----------------|---------------|----------------------|----------------------------------------------|
| Character Display               | HD44780 Type   | 4         | 0x4             | LCDDATA[7:4]  | DATA[7:4]            | LCD Data Bus (length defined by instruction) |
|                                 |                |           |                 | LCDAC         | E (or E0)            | Enable Strobe (first display)                |
|                                 |                |           |                 | LCDLP         | R/W                  | Read/Write                                   |
|                                 |                |           |                 | LCDFP         | RS                   | Register Select (Data/not Instruction)       |
|                                 |                |           |                 | LCDMCLK       | E1                   | Enable Strobe (second display optional)      |
| Character Display               | HD44780 Type   | 8         | 0x4             | LCDDATA[7:0]  | DATA[7:0]            | LCD Data Bus (length defined by instruction) |
|                                 |                |           |                 | LCDAC         | E (or E0)            | Enable Strobe (first display)                |
|                                 |                |           |                 | LCDLP         | R/W                  | Read/Write                                   |
|                                 |                |           |                 | LCDFP         | RS                   | Register Select (Data/not Instruction)       |
|                                 |                |           |                 | LCDMCLK       | E1                   | Enable Strobe (second display optional)      |
| Micro Interface Graphic Display | 6800 Family    | Up to 16  | 0x1             | LCDDATA[15:0] | DATA[15:0]           | LCD Data Bus (16 bits always available)      |
|                                 |                |           |                 | LCDCP         | E                    | Enable Clock                                 |
|                                 |                |           |                 | LCDLP         | R/W                  | Read/Write                                   |
|                                 |                |           |                 | LCDFP         | A0                   | Address/Data Select                          |
|                                 |                |           |                 | LCDAC         | CS (or CS0)          | Chip Select (first display)                  |
|                                 |                |           |                 | LCDMCLK       | CS1                  | Chip Select (second display optional)        |
|                                 |                |           | 0x0             | LCDMCLK       | None                 | Synchronous Clock (optional)                 |
| Micro Interface Graphic Display | 8080 Family    | Up to 16  | 0x3             | LCDDATA[15:0] | DATA[15:0]           | LCD Data Bus (16 bits always available)      |
|                                 |                |           |                 | LCDCP         | RD                   | Read Strobe                                  |
|                                 |                |           |                 | LCDLP         | WR                   | Write Strobe                                 |
|                                 |                |           |                 | LCDFP         | A0                   | Address/Data Select                          |
|                                 |                |           |                 | LCDAC         | CS (or CS0)          | Chip Select (first display)                  |
|                                 |                |           |                 | LCDMCLK       | CS1                  | Chip Select (second display optional)        |
|                                 |                |           | 0x2             | LCDMCLK       | None                 | Synchronous Clock (optional)                 |

### 25.3.4 Raster Control

The Raster mode is enabled by setting the MODESEL bit in the **LCD Control (LCDCTL)** register. The following table shows the active external signals when this mode is active:

**Table 25-5. Operation Modes Supported by Raster Controller**

| Interface                | Data Bus Width | RASTERCTRL [9, 7, 1] | Signal Name   | Description                   |
|--------------------------|----------------|----------------------|---------------|-------------------------------|
| Passive (STN) Mono 4-bit | 4              | 001                  | LCDDATA[3:0]  | Data Bus                      |
|                          |                |                      | LCDCP         | Pixel Clock                   |
|                          |                |                      | LCDLP         | Horizontal clock (line clock) |
|                          |                |                      | LCDFP         | Vertical clock (frame clock)  |
|                          |                |                      | LCDAC         | AC Bias                       |
|                          |                |                      | LCDMCLK       | Not used                      |
| Passive (STN) Mono 8-bit | 8              | 101                  | LCDDATA[7:0]  | Data Bus                      |
|                          |                |                      | LCDCP         | Pixel Clock                   |
|                          |                |                      | LCDLP         | Horizontal clock (line clock) |
|                          |                |                      | LCDFP         | Vertical clock (frame clock)  |
|                          |                |                      | LCDAC         | AC Bias                       |
|                          |                |                      | LCDMCLK       | Not used                      |
| Passive (STN) Color      | 8              | 100                  | LCDDATA[7:0]  | Data Bus                      |
|                          |                |                      | LCDCP         | Pixel Clock                   |
|                          |                |                      | LCDLP         | Horizontal clock (line clock) |
|                          |                |                      | LCDFP         | Vertical clock (frame clock)  |
|                          |                |                      | LCDAC         | AC Bias                       |
|                          |                |                      | LCDMCLK       | Not used                      |
| Active (TFT) Color       | 16             | x10                  | LCDDATA[15:0] | Data Bus                      |
|                          |                |                      | LCDCP         | Pixel Clock                   |
|                          |                |                      | LCDLP         | Horizontal clock (line clock) |
|                          |                |                      | LCDFP         | Vertical clock (frame clock)  |

#### 25.3.4.1 Logical Data Path

The block diagram of the Raster controller is shown in Figure 25-1 on page 1799. Figure 25-3 on page 1808 illustrates its logical data path for various operation modes (passive (STN) versus active (TFT) and various BPP size). Figure 25-3 on page 1808 shows that:

- The gray-scaler/serializer and output FIFO blocks are bypassed in active (TFT) modes.
- The palette is bypassed in both 12- and 16-BPP modes.

Figure 25-3. LCD Raster Data Path

In summary:

- The display image is stored in frame buffers.
- The built-in DMA engine constantly transfers the data stored in the frame buffers to the input FIFO.
- The Raster Controller relays data to the external pins according to the specified format.

### 25.3.5 LCD Frame Buffer

The LCD controller has the option to use the internal SRAM memory or external memory through the EPI interface to hold the frame buffer. The frame buffer is a contiguous memory block, storing enough data to fill a full LCD screen. The frame buffer contains the palette look-up table (palette RAM) and the frame data for a given source image. When moving data into the LCD, the PALMODE bit in the **LCD Raster Control (LCDRASTRCTL)** register can be configured for palette and data loading, palette loading only or data loading only.

**Note:** When using the LCD with EPI to interface to external memory, the external code address space 0x1000.0000 must be selected by programing the ECADR field to 0x1 in the **EPI Address Map (EPIADDRMAP)** register at EPI offset 0x01C.

### 25.3.6 Palette RAM

The palette RAM is a programmable cross reference table that maps a small set of input codes into a larger set of output codes. For active matrix displays, the palette RAM programmed in the LCD is used only for color source images. For passive matrix displays, the palette RAM is used for both grayscale and color source images. For color components, the passive matrix mode only supports, 4 bits per color component. 1, 2, 4, and 8 bit per pixel (bpp) source images always use the palette. 12, 16, and 24 bits per pixel do not use the palette RAM, since raw data transfers occur.

The LCD palette RAM uses a 12-bit output code such that there is a possibility of 4096 color options to choose from. Depending on the bpp frame storage of palette RAM, two, four, 16, or 256 palette colors can be stored in the palette RAM.

#### 25.3.6.1 Palette RAM Structure for 1, 2, and 4 Bits Per Pixel

When palette RAM is enabled for 1, 2, and 4 bpp frame storage, the palette buffer is 16 word entries, where the upper half of the word is unused. The first entry of the palette RAM contains the encoding for the palette type (1, 2, 3, 6, or 12/16/24) of the stored picture on bits [14:12], as well as the first input code for one palette entry (bits [11:0]). Subsequent entries only contain the input codes for next palette entries. Figure 25-4 on page 1810 shows the frame buffer structure.

**Figure 25-4. Palette RAM Structure for 1, 2, and 4 Bits Per Pixel**

Note that for 1 bpp source pictures, the first two palette entries are valid; for 2 bpp sources, the first four palette entry sources are valid; for 4 bpp, all 16 palette entries are valid. Even if the palette entries are not valid for a particular type, there is a fixed number of 8 words reserved for the palette RAM.

The first palette entry represents the RGB value for the source pixel encoded as 0x0. The second palette entry represents the RGB value for the source pixel encoded as 0x1, and so on, such that the sixteenth palette entry is used to represent the RGB value for a pixel encoded as 0xF.

Source data encoded as 12, 16, or 24 bpp do not use the palette RAM since the encoded data already represents the actual RGB values. However, 16 palette RAM entries still precede the picture data in this case and the first palette entry must still define the bpp in bits [14:12]. The type field encoding is defined below in Table 25-6 on page 1810

**Table 25-6. Type Encoding in Palette Entry 0 Buffer**

| First Palette RAM Entry [14:12] | Source Image Type |
|---------------------------------|-------------------|
| 0x0                             | 1 bpp             |
| 0x1                             | 2 bpp             |
| 0x2                             | 4 bpp             |
| 0x3                             | 8 bpp             |
| 0x4                             | 12, 16, or 24 bpp |

### 25.3.6.2 Palette RAM Structure for 8 Bits Per Pixel

For image sources that are 8 bpp, 256 palette entries ( $2^8$ ) are required. This structure of the palette RAM is similar to the one described for 1, 2, 4, or 4 bpp except that the palette requires 256 entries (128 words), instead of 16. The first palette entry again contains the "type" definition of the picture along with the RGB values in bits [11:0].

#### **LCD RAM Configuration**

The LCD RAM can be configured to hold palette only, picture data only or both palette and picture data. Depending on the mode, the RAM is used differently:

- **Palette Only:** The PALMODE field in the **LCD Raster Control (LCDRASTRCTL)** register is programmed to 0x01. If the type field in the first palette entry is for 1, 2, 4, or 12/16/24 bpp, an 8 word palette buffer will be read from DDR by the DMA. If the bpp field in the first entry is 8 bpp, a 128 word palette will be loaded by the DMA. Note that the **DMA Frame Buffer n Base Address (LCDDMABAn)** and **LCD DMA Frame Buffer n Ceiling Address (LCDMACAn)** registers must encompass the palette information size. Note that although an 8 word buffer is created for 12/16/24 bpp, it is ignored during data transfers.
- **Data Only:** When PALMODE is programmed to 0x10, the bpp field from the last palette read is used. Thus, a single palette in DDR can be associated with multiple stored pictures in DDR, enabling the palette loading to occur once (PALMODE = 0x01) and subsequent data-only frame buffers to be transferred by the DMA into the RAM (PALMODE = 0x10). For 12/16/24 bpp frames the bpp field in the previously read palette RAM buffer is irrelevant.
- **Palette and Data:** When the PALMODE encoding is 0x00, the frame buffer is comprised of palette data followed immediately by pixel information. For 12, 14, and 24 bit (packed or unpacked) raw formats, an 8 word palette is prepended to the pixel data. Thus, palette information will be read from DDR even though it is not applicable data and the configuration will look similar to Figure 25-4 on page 1810.

#### **Raw Data and Color Component Formats**

Depending on the value programmed in the raster control register you can have different color formats. Raw data formats are used for active matrix panels. The LCD controller supports, 24 bpp, 16 bpp and 12 bpp raw formats.

**Note:** The TYPE code in the first palette entry must be set to "1XX" for 12/16/24 bpp raw data formats.

#### **Data Format for 24 bpp**

For raw formats used in active matrix panels, the palette RAM provides a 12 bpp output, or a color depth of 12 bits (4096 colors per pixel). Data formats of 24 bpp can be stored in packed or unpacked format. In packed format, four 24 bit pixels are stored in 3 contiguous 32-bit words (also called a quad-pixel triplet) in DDR, as show in Figure 25-5 on page 1812.

**Figure 25-5. 24 bpp Packed Data Format**

When using a 24 bit packed format, four consecutive pixels provide three word-aligned accesses for the DMA. If the MSBPPL and PPL bits in the **LCDRASTRTIM0** register are programmed to a multiple of 16, then the MSBLPP and LPP bits of the **LCDRASTRTIM1** and **LCDRASTRTIM2** register must follow a multiple of 16 so that the DMA can access the data using word-aligned accesses.

When LCDTFT = 0x1, TFT24UPCK = 0x1 and TFT24 = 0x1 in the **LCDRASTRCTL** register, 24 bit unpacked format is used. In this mode, each 24 bpp data is stored in a 32 bit word, with the upper 8 bits unused. Figure 25-6 on page 1812 shows the unpacked implementation.

**Figure 25-6. 24 bpp Unpacked Data Format**

For 24 bpp color components, data is stored in the DDR in B-G-R order with each color representing 8 bits. When the data is transferred to the LCD pixel data bus (LCDDATA[23:0]), the output is transposed such that a portion of the color components are now displayed on LCDDATA [15:0] in RGB565 format. The three least significant bits of the RGB 24-bit data are prepended to RGB565 data on LCDDATA[23:15]. The transposition of data is shown in Figure 25-7 on page 1813.

**Figure 25-7. 24 bpp Color RGB Remapping on LCDDATA[23:0]****Data format for 16 bpp**

The LCD controller is configured to support 16 bpp raw data format when TFT24 = 0x0, LCDTFT = 0x1, TFTMAP = 0x0 in the **LCDRASTRCTL** register. Two 16 bpp raw data pixels can be stored in one word in DDR. The configuration is shown in Figure 25-8 on page 1813. For color component ordering, pixel data is in a RGB565 configuration and is output on the LCD pixel data bus LCDDATA [15:0] in the same order. LCDDATA bits [23:16] are undefined in 16 bpp mode. Figure 25-9 on page 1813 shows the configuration of the pixel data retrieved from memory and LCD bus output.

**Figure 25-8. 16 bpp Data Format****Figure 25-9. 16 bpp Color Component Ordering**

### Data Format for 12 bpp

Two pixel data are stored in each 32-bit word in memory. The upper four bits in each 16-bit halfword are unused. Figure 25-10 on page 1814 shows the 12bpp data format.

**Figure 25-10. 12 bpp Data Format**

12 bpp color format has 4 pixels per Red, Green and Blue color component. The BGR configuration is output on LCDDATA [11:0] as shown in Figure 25-11 on page 1814. LCDDATA [23:12] are unused.

**Figure 25-11. 12 bpp Color Component Ordering**

### 1/2/4/8 bpp Data Format

The Palette frame buffer for 1/2/4/8 bpp data supports passive and active matrix displays. Active matrix is enabled by setting the TFT bit in the **LCD Raster Control (LCDRASTRCTL)** register. When the TFTMAP is set to 0, the output from the palette look-up is a 12 bpp BGR pixel as shown in Figure 25-4 on page 1810, where each color is a 4 bit value. This output is sent to LCDDATA [11:0]. By setting TFTMAP to 1, the pixel data output is converted to a 16-bit BGR565 format. The extra least significant are dithered by replication of the component values' most significant bits. This conversion is shown in Figure 25-12 on page 1815.

**Figure 25-12. 1/2/4/8 bpp Dither Output**

### 25.3.7 Palette

As explained in the previous section, the pixel data is an index of palette entry (when palette is used). The number of colors supported is given by 2<sup>number of BPP</sup>. However, due to a limitation of the grayscale/ serializer block, fewer grayscales or colors may be supported.

The PALMODE field in the **LCD Raster Control (LCDRASTRCTL)** register affects the palette loading:

- If PALMODE is 0x0 (palette-plus-data mode) or 0x1 (palette-only mode), the palette is loaded by the DMA engine at the very beginning, which is followed by the loading of pixel data.
- If PALMODE is 0x2 (data-only mode), the palette is not loaded. Instead, the DMA engine loads the pixel data immediately.

### 25.3.8 Gray-Scaler/Serializer - Passive (STN) Mode

Once a palette entry is selected from the look-up palette by the pixel data, its content is sent to the grayscale/ serializer. If it is monochrome data, it is encoded as 4 bits. If it is color data, it is encoded as 4 bits (Red), 4 bits (Green), and 4 bits (Blue). These 4-bit values are used to select one of the 16 intensity levels, as shown in Table 13-10. A patented algorithm is used during this processing to provide an optimized intensity value that matches the eye's visual perception of color/gray gradations.

### 25.3.9 Gray-Scaler/Serializer - Active (TFT) Mode

The gray-scaler/serializer is bypassed in this mode.

### 25.3.10 Color/Grayscale Intensities and Modulation Rates

The following table details the intensities and modulation rates for varying dither values.

**Table 25-7. Intensities and Modulation Rates**

| Dither Value (4-Bit Value from Palette) | Intensity (0% is White) | Modulation Rate (Ratio of ON to ON+OFF Pixels) |
|-----------------------------------------|-------------------------|------------------------------------------------|
| 0x0                                     | 0.0%                    | 0                                              |
| 0x1                                     | 14.3%                   | 1/7                                            |
| 0x2                                     | 20.0%                   | 1/5                                            |
| 0x3                                     | 25%                     | 1/4                                            |
| 0x4                                     | 33.3%                   | 3/9                                            |
| 0x5                                     | 40.0%                   | 2/5                                            |
| 0x6                                     | 44.4%                   | 4/9                                            |

**Table 25-7. Intensities and Modulation Rates (continued)**

| Dither Value (4-Bit Value from Palette) | Intensity (0% is White) | Modulation Rate (Ratio of ON to ON+OFF Pixels) |
|-----------------------------------------|-------------------------|------------------------------------------------|
| 0x7                                     | 50.0%                   | 1/2                                            |
| 0x8                                     | 55.6%                   | 5/9                                            |
| 0x9                                     | 60.0%                   | 3/5                                            |
| 0xA                                     | 66.6%                   | 6/9                                            |
| 0xB                                     | 75%                     | 3/4                                            |
| 0xC                                     | 80.0%                   | 4/5                                            |
| 0xD                                     | 85.7%                   | 6/7                                            |
| 0xE                                     | 93.3%                   | 14/15                                          |
| 0xF                                     | 100.0%                  | 1                                              |

### 25.3.11 Summary of Color Depth

summarizes the color depths depending on the number of BPP.

**Table 25-8. Number of Colors/Shades of Gray Available on Screen**

| Number of BPP | Passive Mode (LCDTFT = 0)                                                                                       |                                                           | Active Mode (LCDTFT = 1)                                  |
|---------------|-----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|-----------------------------------------------------------|
|               | Monochrome (LCDBW = 1)                                                                                          | Color (LCDBW = 0)                                         | Color Only (LCDBW = 0)                                    |
| 1             | 2 palette entries to select within 15 grayscales                                                                | 2 palette entries to select within 3375 possible colors   | 2 palette entries to select within 4096 possible colors   |
| 2             | 4 palette entries to select within 15 grayscales                                                                | 4 palette entries to select within 3375 possible colors   | 4 palette entries to select within 4096 possible colors   |
| 4             | 16 palette entries to select within 15 grayscales                                                               | 16 palette entries to select within 3375 possible colors  | 16 palette entries to select within 4096 possible colors  |
| 8             | Not relevant because it would consist in 256 palette entries to select within 15 grayscales, but exists anyways | 256 palette entries to select within 3375 possible colors | 256 palette entries to select within 4096 possible colors |
| 12            | X                                                                                                               | 3375 possible colors                                      | 4096 possible colors                                      |
| 16            | X                                                                                                               | 3375 possible colors (STN_565 = 1)                        | Up to 65536 possible colors                               |

### 25.3.12 Output Format

The following section describes the output format for both passive and active LCD modes.

#### 25.3.12.1 Passive (STN) Mode

As shown in Figure 25-13 on page 1817, the pixel data stored in frame buffers go through palette (if applicable) and grayscale/serializer before reaching the Output FIFO. As a result, it is likely that the data fed to the output FIFO is numerically different from the data in the frame buffers. (However, they represent the same color or grayscale.)

The output FIFO formats the received data according to display modes (see Table 13-7). Figure 25-13 on page 1817, shows the actual data output on the external pins.

### 25.3.12.2 Active (TFT) Mode

As shown in Figure 25-13 on page 1817, the gray-scaler/serializer and output FIFO are bypassed in active (TFT) mode. Namely, at each pixel clock, one pixel data (16 bits) is output to the external LCD.

**Figure 25-13. Monochrome and Color Output**

### 25.3.13 Subpicture Feature

A feature exists in the LCD to cover either the top or lower portion of the display with a default color. This feature is called a subpicture and is illustrated in Figure 25-14 on page 1818. Subpictures are only allowed for Active Matrix Mode (when LCDTFT = 0x1 in the **LCD Raster Control (LCDRASTRCTL)** register).

Subpicture reduce the bandwidth since lines containing default pixel data are not read from memory. For example, suppose the panel has 100 lines of which 50 are default pixel data lines. Then, only 50 lines of data are DMAed from DDR for this subpicture setup. That is, the **LCD DMA Frame Buffer**

n Base Address (LCDDMABAFBn) and LCD DMA Frame Buffer n Base Address (LCDDMABAFBn) registers only encompass 50 lines of data instead of 100.

**Figure 25-14. Example of Subpicture**

The subpicture feature is enabled when the SPEN control bit in the **LCD Raster Subpanel Display n (LCDRASTRSUBPn)** register is set to 1. The HOLS bit, when programmed to 0, puts the Default Pixel Data lines at the top of the screen and the active video lines at the bottom of the screen. When the HOLS bit is set to 1, Active video lines are at the top of the screen and Default Pixel Data lines are at the bottom of the screen. The HOLS bit behavior is shown in Figure 25-15 on page 1818.

**Figure 25-15. Subpicture Output with HOLS Bit Variations**

The LPPT (lines per panel threshold) bitfield defines the number of lines at the bottom of the picture for both HOLS = 1 or 0. LPPT is an encoded value in the range {0:2047} used to represent the number of lines in the range {1:2048}.

## 25.4 Interrupts

The application can program the LCD controller to trigger an interrupt for the following events:

- **DMA end-of-frame 1:** The DMA end-of-frame 1 (E0F1) interrupt is triggered when the DMA module has completed transferring the contents of a bounded frame buffer 1.
- **DMA end-of-frame 0:** The DMA end-of-frame 0 (E0F0) interrupt is triggered when the DMA module has completed transferring the contents of a bounded frame buffer 0.

- **DMA palette loaded:** When PALMODE is set to Palette-only or Palette+data, the palette loaded interrupt is triggered when the palette portion of the DMA transfer has been stored in the Palette RAM.
- **DMA FIFO Underflow:** The FIFO Underflow (FIFOU) interrupt is triggered when the real-time output needs to send a value for pixel data but one cannot be found in the FIFO.
- **AC Bias Count Decrement to Zero:** For Passive Matrix displays, a count can be kept of the number of times the AC Bias line toggles. Once the specified number of transitions has been seen, the AC Bias Count (ACBS) interrupt is triggered. The module does not post any further interrupts or keep counting AC Bias transitions until the interrupt has been cleared.
- **Frame synchronization lost:** When the DMA module reads a frame buffer and stores it in the FIFO, it sets a start frame and an end frame indicator embedded with the data. On retrieving the data from the FIFO, the Sync Lost (SYNCS) interrupt is triggered if the start indicator is not found at the first pixel of a new frame.
- **Recurrent Raster mode frame done:** In raster mode, the Recurrent Frame Done (RRASTRDONE) interrupt is triggered each time a complete frame has been sent to the interface pins.
- **Raster or LIDD frame done (shared interrupt):** In LIDD DMA mode, a frame buffer of data is sent. When the frame buffer has completed, the LIDD Frame Done (DONE) interrupt is triggered. In order to do another LIDD DMA, the DMA engine must be disabled and then re-enabled.

In Raster mode, the interrupt is triggered after LCDEN bit is programmed to 0 in the **LCD Raster Control (LCDRASTRCTL)** register and after the last frame is sent to the pins. After the Raster mode DMA is running, the interrupt occurs only once after the module is disabled.

The interrupts are enabled in the **LCD Interrupt Mask register (LCDIM)** register. All pending interrupts in the LCD module must be serviced by the Host's Interrupt Service Routine before it exits.

## 25.5 Bus Transaction Modes

The LCD Controller supports character-based LCD panels by ensuring the bus cycles for reading/writing commands and data are met. The LIDD (LCD Interface Display Driver) provides this support. The LIDD interfaces with an ARM CPU in the SOC using a VBUS slave port. Abundant programmable timing parameters can be configured such that the off-chip interface can support a wide variety of character based LCD panels. Alternatively, the DMA module can be used to mimic the CPU and perform a sequence of write-only data bus transactions to the character based LCD panel. The Motorola and Intel interfaces support asynchronous and synchronous modes. The only difference between the two is that, for synchronous mode, the internal bus clock is output on a pin that replaces CS1. In other words, only one character panel can be supported under synchronous mode while two panels can be supported for asynchronous mode.

## 25.6 Initialization and Configuration

Basic configuration of the LCD controller is as follows:

1. Enable the LCD Controller in the System Control module using the **RCGCLCD** register. See page 416.
2. Enable the DMA, core and LIDD controller (if required) in the **LCDCLKEN** register.

3. Select the LCD mode (LIDD or Raster) by programming the LCDMODE bit in the **LCDCTL** register. In addition, configure the LCDCP or LCDMCLK frequency through the CLKDIV field.
4. When operating in LIDD mode:
  - a. Program the **LCDLIDDCTL** register along with the chip select configuration register, **LIDDCSnCFG**.
  - b. Select the DMA parameters in the **LCDDMACTL** register. Program the frame buffer boundaries in the **LCDDMABAFB0** and **LCDDMACAFB0** registers.
  - c. Enable any required interrupts in the **LCDIM** register.
  - d. Initiate LIDD mode transactions by setting the DMAEN bit in the **LCDLIDDCTL** register.
5. When operating in Raster Mode:
  - a. Program the **LCDRASTRCTL** register along with the raster timings in the **LCDRASTRTIMn** registers.
  - b. Configure the subpanel display in the **LCDRASTRSUBPn** registers.
  - c. Select the DMA parameters such as burst size, and memory layout in the **LCDDMACTL** register. Program the frame buffer boundaries in the **LCDDMABAFBn** and **LCDDMACAFBn** registers.
  - d. Enable any required interrupts in the **LCDIM** register.
  - e. Initiate Raster mode transactions by setting the LCDEN bit in the **LCDRASTRCTL** register.

The LCD DMA may interface to internal SRAM or the external memory through EPI for transfer of data. To configure the EPI for use with LCD, refer to “External Peripheral Interface (EPI)” on page 841.

**Note:** When using the LCD with EPI to interface to external memory, the external code address space 0x1000.0000 must be selected by programing the ECADR field to 0x1 in the **EPI Address Map (EPIADDRMAP)** register at EPI offset 0x01C.

## 25.7 Register Map

Table 25-9 on page 1820 lists the LCD registers. The offset listed is a hexadecimal increment to the register's address, relative to the LCD module's base address of 0x4405.0000.

**Table 25-9. LCD Register Map**

| Offset | Name        | Type | Reset       | Description                         | See page |
|--------|-------------|------|-------------|-------------------------------------|----------|
| 0x000  | LCDPID      | RO   | 0x4F20.1000 | LCD PID Register Format             | 1822     |
| 0x004  | LCDCTL      | RW   | 0x0000.0000 | LCD Control                         | 1823     |
| 0x00C  | LCDLIDDCTL  | RW   | 0x0000.0000 | LCD LIDD Control                    | 1825     |

## 25.8 Register Descriptions

Following is a description of the individual registers of the LCD controller.

## Register 1: LCD PID Register Format (LCDPID), offset 0x000

This register contains information regarding the Peripheral ID (PID) of the LCD module.

### LCD PID Register Format (LCDPID)

Base 0x4405.0000

Offset 0x000

Type RO, reset 0x4F20.1000

|       |          |    |    |    |       |    |    |    |          |    |       |    |    |    |    |    |

The minimum value is 0x1.                   |
| 16:12     | RDSU   | RW   | 0x0   | Read Strobe (RD) Set-Up cycles.<br>When performing a read access, this field defines the number of LCDMCLK cycles that Data Bus/Pad Output Enable, ALE, the DIR, and CS1 signals have to be ready before RD (LCDCP) is asserted.                                           |
| 11:6      | RDDUR  | RW   | 0x1   | Read Strobe (RD) Duration cycles.<br>Field value defines the number of LCDMCLK cycles for which RD (LCDCP) is held active when performing a read access. The minimum value is 0x1.                                                                                         |
| 5:2       | RDHOLD | RW   | 0x1   | Read Strobe (RD) Hold cycles.<br>Field value defines the number of LCDMCLK cycles for which Data Bus/Pad Output Enable, ALE, DIR, and CS1 signals are held after RD (LCDCP) is deasserted when performing a read access. The minimum value is 0x1.                         |
| 1:0       | GAP    | RW   | 0x0   | Field value defines the number of LCDMCLK cycles (GAP + 1) between the end of one CS1 (LCDAC) device access and the start of another CS0 (LCDAC) device access unless the two accesses are both reads. In this case, this delay is not incurred. The minimum value is 0x0. |

## Register 8: LIDD CS1 Address Read/Write Initiation (LIDDCS1ADDR), offset 0x020

This register contains the read and write address of the current access enabled by CS1 (LCDAC).

### LIDD CS1 Address Read/Write Initiation (LIDDCS1ADDR)

| 19:12     | REQDLY                                                                                                         | RW   | 0x00  | <p>Palette Loading Delay</p> <p>This 8-bit parameter pauses reading of the Palette data from the asynchronous FIFO between each burst of 16 words. The delay is in terms of system clock (SYSCLK) cycles. The value (0-255) used to specify the number of system clock cycles that should be paused between bursts of 16 word reads from the asynchronous FIFO while loading the Palette SRAM. Programming REQDLY=0x00 disables this pause when loading the Palette table.</p> <p>When loading the Palette from system memory, palette data is burst into the internal Palette SRAM from the Asynchronous FIFO. 1, 2, and 4-bit per pixel frame buffer encodings use a fixed 16-word entry palette residing above the video data.</p> <p>The 8-bit per pixel frame buffer encoding uses a 256-word entry palette residing above the video data. Likewise, 12, 16, and 24-bit per pixel frame buffer encodings also define a 256-word entry palette even though these encodings will not do a full bit-depth palette lookup. However, the 256-word palette entry must still be read from DDR as a frame buffer is fetched.</p> <p>Bursting in 256 words in sequential SYSCLK cycles may cause the asynchronous FIFO to underflow depending on the DDR burst bandwidth.</p> |       |             |   |                                                                                                                |   |                                                                                                                |

## Register 22: LCD Interrupt Raw Status and Set Register (LCDRISSET), offset 0x058

This register contains the raw interrupt status. In addition to providing the Raw Interrupt Status on a read, a 1 to a bit will set the associated interrupt.

### LCD Interrupt Raw Status and Set Register (LCDRISSET)

Base 0x4405.0000

Offset 0x058

Type RW, reset 0x0000.0000

**Register 23: LCD Interrupt Status and Clear (LCDMISCLR), offset 0x05C**

This register contains the Interrupt Enable Status. This register returns Masked (Enabled) status interrupts on a Read. Writing a 1 to a bit will clear the associated interrupt.

**LCD Interrupt Status and Clear (LCDMISCLR)**

**Register 24: LCD Interrupt Mask (LCDIM), offset 0x060**

This register provides for the setting of interrupt enables (Mask bits).

**LCD Interrupt Mask (LCDIM)**

Base 0x4405.0000

Offset 0x060

Type RW, reset 0x0000.0000

## Register 25: LCD Interrupt Enable Clear (LCDIENC), offset 0x064

This register provides for the clearing of interrupt enables (Mask bits).

### LCD Interrupt Enable Clear (LCDIENC)

Base 0x4405.0000

Offset 0x064

Type RW, reset 0x0000.0000

**Register 26: LCD Clock Enable (LCDCLKEN), offset 0x06C**

This register contains the Clock enables for each major domain within the LCD.

**LCD Clock Enable (LCDCLKEN)**

Base 0x4405.0000

Offset 0x06C

Type RW, reset 0x0000.0000

## 26 Analog Comparators

An analog comparator is a peripheral that compares two analog voltages and provides a logical output that signals the comparison result.

**Note:** Not all comparators have the option to drive an output pin. See “Signal Description” on page 1868 for more information.

The comparator can provide its output to a device pin, acting as a replacement for an analog comparator on the board. In addition, the comparator can signal the application via interrupts or trigger the start of a sample sequence in the ADC. The interrupt generation and ADC triggering logic is separate and independent. This flexibility means, for example, that an interrupt can be generated on a rising edge and the ADC triggered on a falling edge.

The TM4C129LNCZAD microcontroller provides three independent integrated analog comparators with the following functions:

- Compare external pin input to external pin input or to internal programmable voltage reference
- Compare a test voltage against any one of the following voltages:
  - An individual external reference voltage
  - A shared single external reference voltage
  - A shared internal reference voltage

## 26.1 Block Diagram

Figure 26-1. Analog Comparator Module Block Diagram

**Note:** This block diagram depicts the maximum number of analog comparators and comparator outputs for the family of microcontrollers; the number for this specific device may vary. See page 1881 for what is included on this device.

## 26.2 Signal Description

The following table lists the external signals of the Analog Comparators and describes the function of each. The Analog Comparator output signals are alternate functions for some GPIO signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for the Analog Comparator signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 796) should be set to choose the Analog Comparator function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOPCTL)** register (page 813) to assign the Analog Comparator signal to the specified GPIO port pin. The positive and negative input signals are configured by clearing the DEN bit in the **GPIO Digital Enable (GPIODEN)** register. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 765.

Table 26-1. Analog Comparators Signals (212BGA)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type | Description                         |

## 26.3 Functional Description

The comparator compares the VIN- and VIN+ inputs to produce an output, VOUT.

$VIN- < VIN+, VOUT = 1$

$VIN- > VIN+, VOUT = 0$

As shown in Figure 26-2 on page 1869, the input source for VIN- is an external input, Cn-, where n is the analog comparator number. In addition to an external input, Cn+, input sources for VIN+ can be the C0+ or an internal reference, V<sub>IREF</sub>.

Figure 26-2. Structure of Comparator Unit

A comparator is configured through two status/control registers, **Analog Comparator Control (ACCTL)** and **Analog Comparator Status (ACSTAT)**. The internal reference is configured through one control register, **Analog Comparator Reference Voltage Control (ACREFCTL)**. Interrupt status and control are configured through three registers, **Analog Comparator Masked Interrupt Status (ACMIS)**, **Analog Comparator Raw Interrupt Status (ACRIS)**, and **Analog Comparator Interrupt Enable (ACINTEN)**.

Typically, the comparator output is used internally to generate an interrupt as controlled by the ISEN bit in the **ACCTL** register. The output may also be used to drive one of the external pins (Cno), or generate an analog-to-digital converter (ADC) trigger.

**Important:** The ASRCP bits in the **ACCTL** register must be set before using the analog comparators.

### 26.3.1 Internal Reference Programming

The structure of the internal reference is shown in Figure 26-3 on page 1870. The internal reference is controlled by a single configuration register (**ACREFCTL**).

**Figure 26-3. Comparator Internal Reference Structure**

**Note:** In the figure above,  $N \cdot R$  represents a multiple of the  $R$  value that produces the results specified in Table 26-2 on page 1870.

The internal reference can be programmed in one of two modes (low range or high range) depending on the RNG bit in the **ACREFCTL** register. When RNG is clear, the internal reference is in high-range mode, and when RNG is set the internal reference is in low-range mode.

In each range, the internal reference,  $V_{IREF}$ , has 16 preprogrammed thresholds or step values. The threshold to be used to compare the external input voltage against is selected using the VREF field in the **ACREFCTL** register.

In the high-range mode, the  $V_{IREF}$  threshold voltages start at the ideal high-range starting voltage of  $V_{DDA}/4.2$  and increase in ideal constant voltage steps of  $V_{DDA}/29.4$ .

In the low-range mode, the  $V_{IREF}$  threshold voltages start at 0 V and increase in ideal constant voltage steps of  $V_{DDA}/22.12$ . The ideal  $V_{IREF}$  step voltages for each mode and their dependence on the RNG and VREF fields are summarized in Table 26-2.

**Table 26-2. Internal Reference Voltage and ACREFCTL Field Values**

| ACREFCTL Register |               | Output Reference Voltage Based on VREF Field Value                                                                  |
|-------------------|---------------|---------------------------------------------------------------------------------------------------------------------|
| EN Bit Value      | RNG Bit Value |                                                                                                                     |
| EN=0              | RNG=X         | 0 V (GND) for any value of VREF. It is recommended that RNG=1 and VREF=0 to minimize noise on the reference ground. |

**Table 26-2. Internal Reference Voltage and ACREFTL Field Values (continued)**

| ACREFTL Register |               | Output Reference Voltage Based on VREF Field Value                                                                                                                                                                                                                                                                                                                                                   |
|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EN Bit Value     | RNG Bit Value |                                                                                                                                                                                                                                                                                                                                                                                                      |
| EN=1             | RNG=0         | $V_{IREF}$ High Range: 16 voltage threshold values indexed by $VREF = 0x0 \dots 0xF$<br>Ideal starting voltage ( $VREF=0$ ): $V_{DDA} / 4.2$<br>Ideal step size: $V_{DDA} / 29.4$<br>Ideal $V_{IREF}$ threshold values: $V_{IREF}(VREF) = V_{DDA} / 4.2 + VREF * (V_{DDA} / 29.4)$ , for $VREF = 0x0 \dots 0xF$<br>For minimum and maximum $V_{IREF}$ threshold values, see Table 26-3 on page 1871. |
|                  | RNG=1         | $V_{IREF}$ Low Range: 16 voltage threshold values indexed by $VREF = 0x0 \dots 0xF$<br>Ideal starting voltage ( $VREF=0$ ): 0 V<br>Ideal step size: $V_{DDA} / 22.12$<br>Ideal $V_{IREF}$ threshold values: $V_{IREF}(VREF) = VREF * (V_{DDA} / 22.12)$ , for $VREF = 0x0 \dots 0xF$<br>For minimum and maximum $V_{IREF}$ threshold values, see Table 26-4 on page 1872.                            |

Note that the values shown in Table 26-2 are the ideal values of the  $V_{IREF}$  thresholds. These values actually vary between minimum and maximum values for each threshold step, depending on process and temperature. The minimum and maximum values for each step are given by:

- $V_{IREF}(VREF) [Min] = \text{Ideal } V_{IREF}(VREF) - (\text{Ideal Step size} - 2 \text{ mV}) / 2$
- $V_{IREF}(VREF) [Max] = \text{Ideal } V_{IREF}(VREF) + (\text{Ideal Step size} - 2 \text{ mV}) / 2$

Examples of minimum and maximum  $V_{IREF}$  values for  $V_{DDA} = 3.3V$  for high and low ranges, are shown in Table 26-3 and Table 26-4. Note that these examples are only valid for  $V_{DDA} = 3.3V$ ; values scale up and down with  $V_{DDA}$ .

**Table 26-3. Analog Comparator Voltage Reference Characteristics,  $V_{DDA} = 3.3V$ , EN= 1, and RNG = 0**

| VREF Value | $V_{IREF}$ Min | Ideal $V_{IREF}$ | $V_{IREF}$ Max | Unit |

| 0xF        | 2.164          | 2.238            | 2.311          | V    |

## 26.4 Initialization and Configuration

The following example shows how to configure an analog comparator to read back its output value from an internal register.

1. Enable the analog comparator clock by writing a value of 0x0000.0001 to the **RCGCACMP** register in the System Control module (see page 411).
2. Enable the clock to the appropriate GPIO modules via the **RCGCGPIO** register (see page 396). To find out which GPIO ports to enable, refer to Table 30-5 on page 2037.
3. In the GPIO module, enable the GPIO port/pin associated with the input signals as GPIO inputs. To determine which GPIO to configure, see Table 30-4 on page 2022.
4. Configure the  $PMCn$  fields in the **GPIOPCTL** register to assign the analog comparator output signals to the appropriate pins (see page 813 and Table 30-5 on page 2037).
5. Configure the internal voltage reference to 1.65 V by writing the **ACREFCTL** register with the value 0x0000.030C.
6. Configure the comparator to use the internal voltage reference and to *not* invert the output by writing the **ACCTLn** register with the value of 0x0000.040C.
7. Delay for 10  $\mu s$ .
8. Read the comparator output value by reading the **ACSTATn** register's OVAL value.

Change the level of the comparator negative input signal C- to see the OVAL value change.

## 26.5 Register Map

Table 26-5 on page 1873 lists the comparator registers. The offset listed is a hexadecimal increment to the register's address, relative to the Analog Comparator base address of 0x4003.C000. Note that the analog comparator clock must be enabled before the registers can be programmed (see page 411). There must be a delay of 3 system clocks after the analog comparator module clock is enabled before any analog comparator module registers are accessed.

**Table 26-5. Analog Comparators Register Map**

| Offset | Name     | Type | Reset       | Description                                 | See page |

## 26.6 Register Descriptions

The remainder of this section lists and describes the Analog Comparator registers, in numerical order by address offset.

## Register 1: Analog Comparator Masked Interrupt Status (ACMIS), offset 0x000

This register provides a summary of the interrupt status (masked) of the comparators.

### Analog Comparator Masked Interrupt Status (ACMIS)

Base 0x4003.C000

Offset 0x000

Type RW1C, reset 0x0000.0000

|       |          |    |    |    |    |    |    |    |    |    |    |    |    |      |      |      |

## Register 4: Analog Comparator Reference Voltage Control (ACREFCTL), offset 0x010

This register specifies whether the resistor ladder is powered on as well as the range and tap.

### Analog Comparator Reference Voltage Control (ACREFCTL)

Base 0x4003.C000

Offset 0x010

Type RW, reset 0x0000.0000

**Register 11: Analog Comparator Peripheral Properties (ACMPPP), offset 0xFC0**

The **ACMPPP** register provides information regarding the properties of the analog comparator module.

**Analog Comparator Peripheral Properties (ACMPPP)**

Base 0x4003.C000

Offset 0xFC0

Type RO, reset 0x0007.0007

## 27 Pulse Width Modulator (PWM)

Pulse width modulation (PWM) is a powerful technique for digitally encoding analog signal levels. High-resolution counters are used to generate a square wave, and the duty cycle of the square wave is modulated to encode an analog signal. Typical applications include switching power supplies and motor control.

The TM4C129LNCZAD microcontroller contains one PWM module, with four PWM generator blocks and a control block, for a total of 8 PWM outputs. The control block determines the polarity of the PWM signals, and which signals are passed through to the pins.

Each PWM generator block produces two PWM signals that share the same timer and frequency and can either be programmed with independent actions or as a single pair of complementary signals with dead-band delays inserted. The output signals, `pwmA'` and `pwmB'`, of the PWM generation blocks are managed by the output control block before being passed to the device pins as `MnPWM0` and `MnPWM1` or `MnPWM2` and `MnPWM3`, and so on.

The TM4C129LNCZAD PWM module provides a great deal of flexibility and can generate simple PWM signals, such as those required by a simple charge pump as well as paired PWM signals with dead-band delays, such as those required by a half-H bridge driver. Three generator blocks can also generate the full six channels of gate controls required by a 3-phase inverter bridge.

Each PWM generator block has the following features:

- Four fault-condition handling inputs to quickly provide low-latency shutdown and prevent damage to the motor being controlled
- One 16-bit counter
  - Runs in Down or Up/Down mode
  - Output frequency controlled by a 16-bit load value
  - Load value updates can be synchronized
  - Produces output signals at zero and load value
- Two PWM comparators
  - Comparator value updates can be synchronized
  - Produces output signals on match
- PWM signal generator
  - Output PWM signal is constructed based on actions taken as a result of the counter and PWM comparator output signals
  - Produces two independent PWM signals
- Dead-band generator
  - Produces two PWM signals with programmable dead-band delays suitable for driving a half-H bridge
  - Can be bypassed, leaving input PWM signals unmodified

- Can initiate an ADC sample sequence

The control block determines the polarity of the PWM signals and which signals are passed through to the pins. The output of the PWM generation blocks are managed by the output control block before being passed to the device pins. The PWM control block has the following options:

- PWM output enable of each PWM signal
- Optional output inversion of each PWM signal (polarity control)
- Optional fault handling for each PWM signal
- Synchronization of timers in the PWM generator blocks
- Synchronization of timer/comparator updates across the PWM generator blocks
- Extended PWM synchronization of timer/comparator updates across the PWM generator blocks
- Interrupt status summary of the PWM generator blocks
- Extended PWM fault handling, with multiple fault signals, programmable polarities, and filtering
- PWM generators can be operated independently or synchronized with other generators

## **27.1 Block Diagram**

Figure 27-1 on page 1885 provides the TM4C129LNCZAD PWM module diagram and Figure 27-2 on page 1885 provides a more detailed diagram of a TM4C129LNCZAD PWM generator. The TM4C129LNCZAD controller contains four generator blocks that generate eight independent PWM signals or four paired PWM signals with dead-band delays inserted.

Figure 27-2. PWM Generator Block Diagram

## 27.2 Signal Description

The following table lists the external signals of the PWM module and describes the function of each. The PWM controller signals are alternate functions for some GPIO signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for these PWM signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 796) should be set to choose the PWM function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOCTL)** register (page 813) to assign the PWM signal to the specified GPIO port pin. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 765.

## 27.3 Functional Description

### 27.3.1 Clock Configuration

The PWM has two clock source options:

- The System Clock
- A predivided System Clock

The clock source is selected by programming the USEPWM bit in the **PWM Clock Configuration (PWMCC)** register. The PWMDIV bitfield specifies the divisor of the System Clock that is used to create the PWM Clock.

### 27.3.2 PWM Timer

The timer in each PWM generator runs in one of two modes: Count-Down mode or Count-Up/Down mode. In Count-Down mode, the timer counts from the load value to zero, goes back to the load value, and continues counting down. In Count-Up/Down mode, the timer counts from zero up to the load value, back down to zero, back up to the load value, and so on. Generally, Count-Down mode is used for generating left- or right-aligned PWM signals, while the Count-Up/Down mode is used for generating center-aligned PWM signals.

The timers output three signals that are used in the PWM generation process: the direction signal (this is always Low in Count-Down mode, but alternates between Low and High in Count-Up/Down mode), a single-clock-cycle-width High pulse when the counter is zero, and a single-clock-cycle-width High pulse when the counter is equal to the load value. Note that in Count-Down mode, the zero pulse is immediately followed by the load pulse. In the figures in this chapter, these signals are labelled "dir," "zero," and "load."

### 27.3.3 PWM Comparators

Each PWM generator has two comparators that monitor the value of the counter; when either comparator matches the counter, they output a single-clock-cycle-width High pulse, labeled "cmpA" and "cmpB" in the figures in this chapter. When in Count-Up/Down mode, these comparators match both when counting up and when counting down, and thus are qualified by the counter direction signal. These qualified pulses are used in the PWM generation process. If either comparator match value is greater than the counter load value, then that comparator never outputs a High pulse.

Figure 27-3 on page 1888 shows the behavior of the counter and the relationship of these pulses when the counter is in Count-Down mode. Figure 27-4 on page 1888 shows the behavior of the counter and the relationship of these pulses when the counter is in Count-Up/Down mode. In these figures, the following definitions apply:

- LOAD is the value in the **PWMnLOAD** register
- COMPA is the value in the **PWMnCMPA** register
- COMPB is the value in the **PWMnCMPB** register
- 0 is the value zero
- load is the internal signal that has a single-clock-cycle-width High pulse when the counter is equal to the load value
- zero is the internal signal that has a single-clock-cycle-width High pulse when the counter is zero
- cmpA is the internal signal that has a single-clock-cycle-width High pulse when the counter is equal to COMPA
- cmpB is the internal signal that has a single-clock-cycle-width High pulse when the counter is equal to COMPB
- dir is the internal signal that indicates the count direction

**Figure 27-3. PWM Count-Down Mode****Figure 27-4. PWM Count-Up/Down Mode**

### 27.3.4 PWM Signal Generator

Each PWM generator takes the load, zero, cmpA, and cmpB pulses (qualified by the dir signal) and generates two internal PWM signals, pwmA and pwmB. In Count-Down mode, there are four events that can affect these signals: zero, load, match A down, and match B down. In Count-Up/Down mode, there are six events that can affect these signals: zero, load, match A down, match A up, match B down, and match B up. The match A or match B events are ignored when they coincide with the zero or load events. If the match A and match B events coincide, the first signal, pwmA, is generated based only on the match A event, and the second signal, pwmB, is generated based only on the match B event.

For each event, the effect on each output PWM signal is programmable: it can be left alone (ignoring the event), it can be toggled, it can be driven Low, or it can be driven High. These actions can be used to generate a pair of PWM signals of various positions and duty cycles, which do or do not overlap. Figure 27-5 on page 1889 shows the use of Count-Up/Down mode to generate a pair of center-aligned, overlapped PWM signals that have different duty cycles. This figure shows the pwmA and pwmB signals before they have passed through the dead-band generator.

**Figure 27-5. PWM Generation Example In Count-Up/Down Mode**

In this example, the first generator is set to drive High on match A up, drive Low on match A down, and ignore the other four events. The second generator is set to drive High on match B up, drive Low on match B down, and ignore the other four events. Changing the value of comparator A changes the duty cycle of the pwmA signal, and changing the value of comparator B changes the duty cycle of the pwmB signal.

### 27.3.5 Dead-Band Generator

The pwmA and pwmB signals produced by each PWM generator are passed to the dead-band generator. If the dead-band generator is disabled, the PWM signals simply pass through to the pwmA' and pwmB' signals unmodified. If the dead-band generator is enabled, the pwmB signal is lost and two PWM signals are generated based on the pwmA signal. The first output PWM signal, pwmA', is the pwmA signal with the rising edge delayed by a programmable amount. The second output PWM signal, pwmB', is the inversion of the pwmA signal with a programmable delay added between the falling edge of the pwmA signal and the rising edge of the pwmB' signal.

The resulting signals are a pair of active High signals where one is always High, except for a programmable amount of time at transitions where both are Low. These signals are therefore suitable for driving a half-H bridge, with the dead-band delays preventing shoot-through current from damaging the power electronics. Figure 27-6 on page 1889 shows the effect of the dead-band generator on the pwmA signal and the resulting pwmA' and pwmB' signals that are transmitted to the output control block.

**Figure 27-6. PWM Dead-Band Generator**

### 27.3.6 Interrupt/ADC-Trigger Selector

Each PWM generator also takes the same four (or six) counter events and uses them to generate an interrupt or an ADC trigger. Any of these events or a set of these events can be selected as a source for an interrupt; when any of the selected events occur, an interrupt is generated. Additionally, the same event, a different event, the same set of events, or a different set of events can be selected as a source for an ADC trigger; when any of these selected events occur, an ADC trigger pulse is generated. The selection of events allows the interrupt or ADC trigger to occur at a specific position

within the pwmA or pwmB signal. Note that interrupts and ADC triggers are based on the raw events; delays in the PWM signal edges caused by the dead-band generator are not taken into account.

### 27.3.7 Synchronization Methods

The PWM module provides four PWM generators, each providing two PWM outputs that may be used in a wide variety of applications. Generally speaking, the PWM is used in one of two categories of operation:

- **Unsynchronized.** The PWM generator and its two output signals are used alone, independent of other PWM generators.
- **Synchronized.** The PWM generator and its two outputs signals are used in conjunction with other PWM generators using a common, unified time base. If multiple PWM generators are configured with the same counter load value, synchronization can be used to guarantee that they also have the same count value (the PWM generators must be configured before they are synchronized). With this feature, more than two MnPWMn signals can be produced with a known relationship between the edges of those signals because the counters always have the same values. Other states in the module provide mechanisms to maintain the common time base and mutual synchronization.

The counter in a PWM generator can be reset to zero by writing the **PWM Time Base Sync (PWMSYNC)** register and setting the SYNCn bit associated with the generator. Multiple PWM generators can be synchronized together by setting all necessary SYNCn bits in one access. For example, setting the SYNC0 and SYNC1 bits in the **PWMSYNC** register causes the counters in PWM generators 0 and 1 to reset together.

Additional synchronization can occur between multiple PWM generators by updating register contents in one of the following three ways:

- **Immediately.** The write value has immediate effect, and the hardware reacts immediately.
- **Locally Synchronized.** The write value does not affect the logic until the counter reaches the value zero at the end of the PWM cycle. In this case, the effect of the write is deferred, providing a guaranteed defined behavior and preventing overly short or overly long output PWM pulses.
- **Globally Synchronized.** The write value does not affect the logic until two sequential events have occurred: (1) the Update mode for the generator function is programmed for global synchronization in the **PWMnCTL** register, and (2) the counter reaches zero at the end of the PWM cycle. In this case, the effect of the write is deferred until the end of the PWM cycle following the end of all updates. This mode allows multiple items in multiple PWM generators to be updated simultaneously without odd effects during the update; everything runs from the old values until a point at which they all run from the new values. The Update mode of the load and comparator match values can be individually configured in each PWM generator block. It typically makes sense to use the synchronous update mechanism across PWM generator blocks when the timers in those blocks are synchronized, although this is not required in order for this mechanism to function properly.

The following registers provide either local or global synchronization based on the state of various Update mode bits and fields in the **PWMnCTL** register (LOADUPD; CMPAUPD; CMPBUPD):

- Generator Registers: **PWMnLOAD**, **PWMnCMPA**, and **PWMnCMPB**

The following registers default to immediate update, but are provided with the optional functionality of synchronously updating rather than having all updates take immediate effect:

- Module-Level Register: **PWMENABLE** (based on the state of the ENUPDn bits in the PWMENUPD register).
- Generator Register: **PWMnGENA**, **PWMnGENB**, **PWMnDBCTL**, **PWMnDBRISE**, and **PWMnDBFALL** (based on the state of various Update mode bits and fields in the **PWMnCTL** register (GENAUPD; GENBUPD; DBCTLUPD; DBRISEUPD; DBFALLUPD)).

All other registers are considered statically provisioned for the execution of an application or are used dynamically for purposes unrelated to maintaining synchronization and therefore do not need synchronous update functionality.

### 27.3.8 Fault Conditions

A fault condition is one in which the controller must be signaled to stop normal PWM function and then set the MnPWMn signals to a safe state. Two basic situations cause fault conditions:

- The microcontroller is stalled and cannot perform the necessary computation in the time required for motion control
- An external error or event is detected

The PWM generator can use the following inputs to generate a fault condition, including:

- MnFAULTn pin assertion
- A stall of the controller generated by the debugger
- The trigger of an ADC digital comparator

Fault conditions are calculated on a per-PWM generator basis. Each PWM generator configures the necessary conditions to indicate a fault condition exists. This method allows the development of applications with dependent and independent control.

Four fault input pins (MnFAULTn) are available. These inputs may be used with circuits that generate an active High or active Low signal to indicate an error condition. A MnFAULTn pins may be individually programmed for the appropriate logic sense using the **PWMnFLTSEN** register.

The PWM generator's mode control, including fault condition handling, is provided in the **PWMnCTL** register. This register determines whether the input or a combination of MnFAULTn input signals and/or digital comparator triggers (as configured by the **PWMnFLTSRC0** and **PWMnFLTSRC1** registers) is used to generate a fault condition. The **PWMnCTL** register also selects whether the fault condition is maintained as long as the external condition lasts or if it is latched until the fault condition until cleared by software. Finally, this register also enables a counter that may be used to extend the period of a fault condition for external events to assure that the duration is a minimum length. The minimum fault period count is specified in the **PWMnMINFLTPER** register.

**Note:** When using an ADC digital comparator as a fault source, the LATCH and MINFLTPER bits in the **PWMnCTL** register should be set to 1 to ensure trigger assertions are captured.

Status regarding the specific fault cause is provided in the **PWMnFLTSTAT0** and **PWMnFLTSTAT1** registers. Note that the fault status registers, **PWMnFLTSTAT0** and **PWMnFLTSTAT1**, reflect the status of all fault sources, regardless of what fault sources are enabled for that particular generator.

PWM generator fault conditions may be promoted to a controller interrupt using the **PWMINTEN** register.

### 27.3.9 Output Control Block

The output control block takes care of the final conditioning of the pwmA' and pwmB' signals before they go to the pins as the MnPWMn signals. Via a single register, the **PWM Output Enable (PWENABLE)** register, the set of PWM signals that are actually enabled to the pins can be modified. This function can be used, for example, to perform commutation of a brushless DC motor with a single register write (and without modifying the individual PWM generators, which are modified by the feedback control loop). In addition, the updating of the bits in the **PWENABLE** register can be configured to be immediate or locally or globally synchronized to the next synchronous update using the **PWM Enable Update (PWMENUPE)** register.

During fault conditions, the PWM output signals, MnPWMn, usually must be driven to safe values so that external equipment may be safely controlled. The **PWMFAULT** register specifies whether during a fault condition, the generated signal continues to be passed driven or to an encoding specified in the **PWMFAULTVAL** register.

A final inversion can be applied to any of the MnPWMn signals, making them active Low instead of the default active High using the **PWM Output Inversion (PWMINVERT)**. The inversion is applied even if a value has been enabled in the **PWMFAULT** register and specified in the **PWMFAULTVAL** register. In other words, if a bit is set in the **PWMFAULT**, **PWMFAULTVAL**, and **PWMINVERT** registers, the output on the MnPWMn signal is 0, not 1 as specified in the **PWMFAULTVAL** register.

## 27.4 Initialization and Configuration

The following example shows how to initialize PWM Generator 0 with a 25-kHz frequency, a 25% duty cycle on the MnPWM0 pin, and a 75% duty cycle on the MnPWM1 pin. This example assumes the system clock is 20 MHz.

1. Enable the PWM clock by setting its corresponding bit in the **RCGCPWM** register in the System Control module (see page 412).
2. Enable the clock to the appropriate GPIO module via the **RCGCGPIO** register in the System Control module (see page 396).
3. In the GPIO module, enable the appropriate pins for their alternate function using the **GPIOAFSEL** register. To determine which GPIOs to configure, see Table 30-4 on page 2022.
4. Configure the PMcN fields in the **GPIOCTL** register to assign the PWM signals to the appropriate pins (see page 813 and Table 30-5 on page 2037).
5. Configure the **PWM Clock Configuration (PWMCC)** register to use the PWM divide (USEPWMDIV) and set the divider (PWMDIV) to divide by 2 (0x0).
6. Configure the PWM generator for countdown mode with immediate updates to the parameters.
  - Write the **PWM0CTL** register with a value of 0x0000.0000.
  - Write the **PWM0GENA** register with a value of 0x0000.008C.
  - Write the **PWM0GENB** register with a value of 0x0000.080C.
7. Set the period. For a 25-KHz frequency, the period = 1/25,000, or 40 microseconds. The PWM clock source is 10 MHz; the system clock divided by 2. Thus there are 400 clock ticks per period. Use this value to set the **PWM0LOAD** register. In Count-Down mode, set the LOAD field in the **PWM0LOAD** register to the requested period minus one.

- Write the **PWM0LOAD** register with a value of 0x0000.018F.
- 8. Set the pulse width of the MnPWM0 pin for a 25% duty cycle.
  - Write the **PWM0CMPA** register with a value of 0x0000.012B.
- 9. Set the pulse width of the MnPWM1 pin for a 75% duty cycle.
  - Write the **PWM0CMPB** register with a value of 0x0000.0063.
- 10. Start the timers in PWM generator 0.
  - Write the **PWM0CTL** register with a value of 0x0000.0001.
- 11. Enable PWM outputs.
  - Write the **PWMENABLE** register with a value of 0x0000.0003.

## 27.5 Register Map

Table 27-2 on page 1893 lists the PWM registers. The offset listed is a hexadecimal increment to the register's address, relative to the PWM module's base address:

- PWM0: 0x4002.8000

Note that the PWM module clock must be enabled before the registers can be programmed. There must be a delay of 3 system clocks after the PWM module clock is enabled before any PWM module registers are accessed.

**Table 27-2. PWM Register Map**

| Offset | Name        | Type | Reset       | Description                       | See page |

## 27.6 Register Descriptions

The remainder of this section lists and describes the PWM registers, in numerical order by address offset.

**Register 1: PWM Master Control (PWMCTL), offset 0x000**

This register provides master control over the PWM generation blocks.

**PWM Master Control (PWMCTL)**

PWM0 base: 0x4002.8000

Offset 0x000

Type RW, reset 0x0000.0000

**Register 2: PWM Time Base Sync (PWMSYNC), offset 0x004**

This register provides a method to perform synchronization of the counters in the PWM generation blocks. Setting a bit in this register causes the specified counter to reset back to 0; setting multiple bits resets multiple counters simultaneously. The bits auto-clear after the reset has occurred; reading them back as zero indicates that the synchronization has completed.

**PWM Time Base Sync (PWMSYNC)**

PWM0 base: 0x4002.8000

Offset 0x004

Type RW, reset 0x0000.0000

**Register 3: PWM Output Enable (PWMENABLE), offset 0x008**

This register provides a master control of which generated pwmA' and pwmB' signals are output to the MnPWMn pins. By disabling a PWM output, the generation process can continue (for example, when the time bases are synchronized) without driving PWM signals to the pins. When bits in this register are set, the corresponding pwmA' or pwmB' signal is passed through to the output stage. When bits are clear, the pwmA' or pwmB' signal is replaced by a zero value which is also passed to the output stage. The **PWMINVERT** register controls the output stage, so if the corresponding bit is set in that register, the value seen on the MnPWMn signal is inverted from what is configured by the bits in this register. Updates to the bits in this register can be immediate or locally or globally synchronized to the next synchronous update as controlled by the ENUPDn fields in the **PWMENUPD** register.

**PWM Output Enable (PWMENABLE)**

PWM0 base: 0x4002.8000

**Register 4: PWM Output Inversion (PWMINVERT), offset 0x00C**

This register provides a master control of the polarity of the MnPWMn signals on the device pins. The pwmA' and pwmB' signals generated by the PWM generator are active High; but can be made active Low via this register. Disabled PWM channels are also passed through the output inverter (if so configured) so that inactive signals can be High. In addition, if the **PWMFAULT** register enables a specific value to be placed on the MnPWMn signals during a fault condition, that value is inverted if the corresponding bit in this register is set.

**PWM Output Inversion (PWMINVERT)**

**Register 5: PWM Output Fault (PWMFAULT), offset 0x010**

This register controls the behavior of the MnPWMn outputs in the presence of fault conditions. Both the fault inputs (MnFAULTn pins and digital comparator outputs) and debug events are considered fault conditions. On a fault condition, each pwmA' or pwmB' signal can be passed through unmodified or driven to the value specified by the corresponding bit in the **PWMFAULTVAL** register. For outputs that are configured for pass-through, the debug event handling on the corresponding PWM generator also determines if the pwmA' or pwmB' signal continues to be generated.

Fault condition control occurs before the output inverter, so PWM signals driven to a specified value on fault are inverted if the channel is configured for inversion (therefore, the pin is driven to the logical complement of the specified value on a fault condition).

**Register 6: PWM Interrupt Enable (PWMINTEN), offset 0x014**

This register controls the global interrupt generation capabilities of the PWM module. The events that can cause an interrupt are the fault input and the individual interrupts from the PWM generators.

**Note:** The "n" in the INTFAULTn and INTPWMn bits in this register correspond to the PWM generators, not to the FAULTn signals.

**PWM Interrupt Enable (PWMINTEN)**

PWM0 base: 0x4002.8000

Offset 0x014

Type RW, reset 0x0000.0000

## Register 7: PWM Raw Interrupt Status (PWMRIS), offset 0x018

This register provides the current set of interrupt sources that are asserted, regardless of whether they are enabled to cause an interrupt to be asserted to the interrupt controller. The fault interrupt is asserted based on the fault condition source that is specified by the **PWMnCTL**, **PWMnFLTSRC0** and **PWMnFLTSRC1** registers. The fault interrupt is latched on detection and must be cleared through the **PWM Interrupt Status and Clear (PWMISC)** register. The actual value of the MnFAULTn signals can be observed using the **PWMSTATUS** register.

The PWM generator interrupts simply reflect the status of the PWM generators and are cleared via the interrupt status register in the PWM generator blocks. If a bit is set, the event is active; if a bit is clear the event is not active.

### PWM Raw Interrupt Status (PWMRIS)

| 0         | INTPWM0 | RO   | 0     | PWM0 Interrupt Asserted |

Value Description

0 The PWM generator 0 block interrupt has not been asserted.

1 The PWM generator 0 block interrupt is asserted.

The **PWM0RIS** register shows the source of this interrupt. This bit is cleared by writing a 1 to the corresponding bit in the **PWM0ISC** register.

## Register 8: PWM Interrupt Status and Clear (PWMISC), offset 0x01C

This register provides a summary of the interrupt status of the individual PWM generator blocks. If a fault interrupt is set, the corresponding MnFAULTn input has caused an interrupt. For the fault interrupt, a write of 1 to that bit position clears the latched interrupt status. If an block interrupt bit is set, the corresponding generator block is asserting an interrupt. The individual interrupt status registers, **PWMnISC**, in each block must be consulted to determine the reason for the interrupt and used to clear the interrupt.

**Register 9: PWM Status (PWMSTATUS), offset 0x020**

This register provides the unlatched status of the PWM generator fault condition.

**PWM Status (PWMSTATUS)**

PWM0 base: 0x4002.8000

Offset 0x020

Type RO, reset 0x0000.0000

|           |        |      |       | If the FLTSRC bit in the <b>PWM0CTL</b> register is clear, the input is the source of the fault condition, and is therefore asserted. |

**Register 10: PWM Fault Condition Value (PWMFAULTVAL), offset 0x024**

This register specifies the output value driven on the MnPWMn signals during a fault condition if enabled by the corresponding bit in the **PWMFAULT** register. Note that if the corresponding bit in the **PWMINVERT** register is set, the output value is driven to the logical NOT of the bit value in this register.

**PWM Fault Condition Value (PWMFAULTVAL)**

PWM0 base: 0x4002.8000

Offset 0x024

Type RW, reset 0x0000.0000

**Register 11: PWM Enable Update (PWMENUPD), offset 0x028**

This register specifies when updates to the PWMnEN bit in the **PWMENABLE** register are performed. The PWMnEN bit enables the pwmA' or pwmB' output to be passed to the microcontroller's pin. Updates can be immediate or locally or globally synchronized to the next synchronous update.

**PWM Enable Update (PWMENUPD)**

PWM0 base: 0x4002.8000

Offset 0x028

Type RW, reset 0x0000.0000

**Register 12: PWM0 Control (PWM0CTL), offset 0x040****Register 13: PWM1 Control (PWM1CTL), offset 0x080****Register 14: PWM2 Control (PWM2CTL), offset 0x0C0****Register 15: PWM3 Control (PWM3CTL), offset 0x100**

These registers configure the PWM signal generation blocks (PWM0CTL controls the PWM generator 0 block, and so on). The Register Update mode, Debug mode, Counting mode, and Block Enable mode are all controlled via these registers. The blocks produce the PWM signals, which can be either two independent PWM signals (from the same counter), or a paired set of PWM signals with dead-band delays added.

The PWM0 block produces the MnPWM0 and MnPWM1 outputs, the PWM1 block produces the MnPWM2 and MnPWM3 outputs, the PWM2 block produces the MnPWM4 and MnPWM5 outputs, and the PWM3 block produces the MnPWM6 and MnPWM7 outputs.

**PWMn Control (PWMnCTL)**

PWM0 base: 0x4002.8000

Offset 0x040

Type RW, reset 0x0000.0000

|              |          |      |       | A fault condition is set as the result of the assertion of the faulting source and is held (latched) while the <b>PWMISC</b> INTFAULTn bit is set. Clearing the INTFAULTn bit clears the fault condition. |
| <b>Note:</b> |          |      |       | When using an ADC digital comparator as a fault source, the LATCH and MINFLTPER bits in the <b>PWMnCTL</b> register should be set to 1 to ensure trigger assertions are captured.                         |

|-----------|-----------|------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 17        | MINFLTPER | RW   | 0     | <p>Minimum Fault Period</p> <p>This bit specifies that the PWM generator enables a one-shot counter to provide a minimum fault condition period.</p> <p>The timer begins counting on the rising edge of the fault condition to extend the condition for a minimum duration of the count value. The timer ignores the state of the fault condition while counting.</p> <p>The minimum fault delay is in effect only when the MINFLTPER bit is set. If a detected fault is in the process of being extended when the MINFLTPER bit is cleared, the fault condition extension is aborted.</p> <p>The delay time is specified by the <b>PWMnMINFLTPER</b> register MFP field value. The effect of this is to pulse stretch the fault condition input.</p> <p>The delay value is defined by the PWM clock period. Because the fault input is not synchronized to the PWM clock, the period of the time is <math>PWMClock * (MFP \text{ value} + 1)</math> or <math>PWMClock * (MFP \text{ value} + 2)</math>.</p> <p>The delay function makes sense only if the fault source is unlatched. A latched fault source makes the fault condition appear asserted until cleared by software and negates the utility of the extend feature. It applies to all fault condition sources as specified in the FLTSRC field.</p> <p>Value Description</p> <p>0 The FAULT input deassertion is unaffected.</p> <p>1 The <b>PWMnMINFLTPER</b> one-shot counter is active and extends the period of the fault condition to a minimum period.</p> <p><b>Note:</b> When using an ADC digital comparator as a fault source, the LATCH and MINFLTPER bits in the <b>PWMnCTL</b> register should be set to 1 to ensure trigger assertions are captured.</p> |
| 16        | FLTSRC    | RW   | 0     | <p>Fault Condition Source</p> <p>Value Description</p> <p>0 The Fault condition is determined by the Fault0 input.</p> <p>1 The Fault condition is determined by the configuration of the <b>PWMnFLTSRC0</b> and <b>PWMnFLTSRC1</b> registers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| 0         | ENABLE | RW   | 0     | <p>PWM Block Enable</p> <p><b>Note:</b> Disabling the PWM by clearing the ENABLE bit does not clear the COUNT field of the <b>PWMnCOUNT</b> register. Before re-enabling the PWM (ENABLE = 0x1), the COUNT field should be cleared by resetting the PWM registers through the <b>SRPWM</b> register in the System Control Module.</p> <p>Value Description</p> <p>0 The entire PWM generation block is disabled and not clocked.</p> <p>1 The PWM generation block is enabled and produces PWM signals.</p> |

**Register 16: PWM0 Interrupt and Trigger Enable (PWM0INTEN), offset 0x044**

**Register 17: PWM1 Interrupt and Trigger Enable (PWM1INTEN), offset 0x084**

**Register 18: PWM2 Interrupt and Trigger Enable (PWM2INTEN), offset 0x0C4**

**Register 19: PWM3 Interrupt and Trigger Enable (PWM3INTEN), offset 0x104**

These registers control the interrupt and ADC trigger generation capabilities of the PWM generators (**PWM0INTEN** controls the PWM generator 0 block, and so on). The events that can cause an interrupt, or an ADC trigger are:

- The counter being equal to the load register
- The counter being equal to zero
- The counter being equal to the **PWMnCMPA** register while counting up
- The counter being equal to the **PWMnCMPA** register while counting down
- The counter being equal to the **PWMnCMB** register while counting up
- The counter being equal to the **PWMnCMB** register while counting down

Any combination of these events can generate either an interrupt or an ADC trigger, though no determination can be made as to the actual event that caused an ADC trigger if more than one is specified. The **PWMnRIS** register provides information about which events have caused raw interrupts.

#### PWMn Interrupt and Trigger Enable (PWMnINTEN)

PWM0 base: 0x4002.8000  
Offset 0x044  
Type RW, reset 0x0000.0000

**Register 20: PWM0 Raw Interrupt Status (PWM0RIS), offset 0x048****Register 21: PWM1 Raw Interrupt Status (PWM1RIS), offset 0x088****Register 22: PWM2 Raw Interrupt Status (PWM2RIS), offset 0x0C8****Register 23: PWM3 Raw Interrupt Status (PWM3RIS), offset 0x108**

These registers provide the current set of interrupt sources that are asserted, regardless of whether they cause an interrupt to be asserted to the controller (**PWM0RIS** controls the PWM generator 0 block, and so on). If a bit is set, the event has occurred; if a bit is clear, the event has not occurred. Bits in this register are cleared by writing a 1 to the corresponding bit in the **PWMnISC** register.

**Register 24: PWM0 Interrupt Status and Clear (PWM0ISC), offset 0x04C****Register 25: PWM1 Interrupt Status and Clear (PWM1ISC), offset 0x08C****Register 26: PWM2 Interrupt Status and Clear (PWM2ISC), offset 0x0CC****Register 27: PWM3 Interrupt Status and Clear (PWM3ISC), offset 0x10C**

These registers provide the current set of interrupt sources that are asserted to the interrupt controller (**PWM0ISC** controls the PWM generator 0 block, and so on). A bit is set if the event has occurred and is enabled in the **PWMnINTEN** register; if a bit is clear, the event has not occurred or is not enabled. These are RW1C registers; writing a 1 to a bit position clears the corresponding interrupt reason.

**Note:** The interrupt status can only be cleared one PWM Clock cycle after the interrupt occurs. The larger the PWM Clock Divider (PWMDIV) value in **PWMCC** register, the longer the system delay is to clear the interrupt.

**Register 28: PWM0 Load (PWM0LOAD), offset 0x050****Register 29: PWM1 Load (PWM1LOAD), offset 0x090****Register 30: PWM2 Load (PWM2LOAD), offset 0x0D0****Register 31: PWM3 Load (PWM3LOAD), offset 0x110**

These registers contain the load value for the PWM counter (**PWM0LOAD** controls the PWM generator 0 block, and so on). Based on the counter mode configured by the **MODE** bit in the **PWMnCTL** register, this value is either loaded into the counter after it reaches zero or is the limit of up-counting after which the counter decrements back to zero. When this value matches the counter, a pulse is output which can be configured to drive the generation of the pwmA and/or pwmB signal (via the **PWMnGENA/PWMnGENB** register) or drive an interruptor ADC trigger (via the **PWMnINTEN** register).

If the Load Value Update mode is locally synchronized (based on the **LOADUPD** field encoding in the **PWMnCTL** register), the 16-bit **LOAD** value is used the next time the counter reaches zero. If the update mode is globally synchronized, it is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1897). If this register is re-written before the actual update occurs, the previous value is never used and is lost.

**PWMn Load (PWMnLOAD)**

| 31:16     | reserved | RO   | 0x0000 | Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation. |
| 15:0      | LOAD     | RW   | 0x0000 | Counter Load Value<br>The counter load value.                                                                                                                                                 |

**Register 32: PWM0 Counter (PWM0COUNT), offset 0x054****Register 33: PWM1 Counter (PWM1COUNT), offset 0x094****Register 34: PWM2 Counter (PWM2COUNT), offset 0x0D4****Register 35: PWM3 Counter (PWM3COUNT), offset 0x114**

These registers contain the current value of the PWM counter (**PWM0COUNT** is the value of the PWM generator 0 block, and so on). When this value matches zero or the value in the **PWMnLOAD**, **PWMnCMPA**, or **PWMnCMPB** registers, a pulse is output which can be configured to drive the generation of a PWM signal or drive an interrupt or ADC trigger.

**Note:** Disabling the PWM by clearing the ENABLE bit does not clear the COUNT field of the **PWMnCOUNT** register. Before re-enabling the PWM (ENABLE = 0x1), the COUNT field should be cleared by resetting the PWM registers through the **SRPWM** register in the System Control Module.

**Register 44: PWM0 Generator A Control (PWM0GENA), offset 0x060****Register 45: PWM1 Generator A Control (PWM1GENA), offset 0x0A0****Register 46: PWM2 Generator A Control (PWM2GENA), offset 0x0E0****Register 47: PWM3 Generator A Control (PWM3GENA), offset 0x120**

These registers control the generation of the pwmA signal based on the load and zero output pulses from the counter, as well as the compare A and compare B pulses from the comparators (**PWM0GENA** controls the PWM generator 0 block, and so on). When the counter is running in Count-Down mode, only four of these events occur; when running in Count-Up/Down mode, all six occur. These events provide great flexibility in the positioning and duty cycle of the resulting PWM signal.

The **PWM0GENA** register controls generation of the pwm0A signal; **PWM1GENA**, the pwm1A signal; **PWM2GENA**, the pwm2A signal; and **PWM3GENA**, the pwm3A signal.

If a zero or load event coincides with a compare A or compare B event, the zero or load action is taken and the compare A or compare B action is ignored. If a compare A event coincides with a compare B event, the compare A action is taken and the compare B action is ignored.

If the Generator A update mode is immediate (based on the GENAUPD field encoding in the **PWMnCTL** register), the ACTCMPBD, ACTCMPBU, ACTCMPAD, ACTCMPAU, ACTLOAD, and ACTZERO values are used immediately. If the update mode is locally synchronized, these values are used the next time the counter reaches zero. If the update mode is globally synchronized, these values are used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1897). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**Register 48: PWM0 Generator B Control (PWM0GENB), offset 0x064****Register 49: PWM1 Generator B Control (PWM1GENB), offset 0x0A4****Register 50: PWM2 Generator B Control (PWM2GENB), offset 0x0E4****Register 51: PWM3 Generator B Control (PWM3GENB), offset 0x124**

These registers control the generation of the pwmB signal based on the load and zero output pulses from the counter, as well as the compare A and compare B pulses from the comparators (**PWM0GENB** controls the PWM generator 0 block, and so on). When the counter is running in Count-Down mode, only four of these events occur; when running in Count-Up/Down mode, all six occur. These events provide great flexibility in the positioning and duty cycle of the resulting PWM signal.

The **PWM0GENB** register controls generation of the pwm0B signal; **PWM1GENB**, the pwm1B signal; **PWM2GENB**, the pwm2B signal; and **PWM3GENB**, the pwm3B signal.

If a zero or load event coincides with a compare A or compare B event, the zero or load action is taken and the compare A or compare B action is ignored. If a compare A event coincides with a compare B event, the compare B action is taken and the compare A action is ignored.

If the Generator B update mode is immediate (based on the GENBUPD field encoding in the **PWMnCTL** register), the ACTCMPBD, ACTCMPBU, ACTCMPAD, ACTCMPAU, ACTLOAD, and ACTZERO values are used immediately. If the update mode is locally synchronized, these values are used the next time the counter reaches zero. If the update mode is globally synchronized, these values are used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1897). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**PWMn Generator B Control (PWMnGENB), offset 0x064**

PWM0 base: 0x4002.8000

Offset 0x064

| 0x3       | Drive pwmB High. |      |       |                                                                                                                                                                                                                                                                                                                                                                     |       |             |     |             |     |              |     |                 |     |                  |

**Register 52: PWM0 Dead-Band Control (PWM0DBCTL), offset 0x068****Register 53: PWM1 Dead-Band Control (PWM1DBCTL), offset 0x0A8****Register 54: PWM2 Dead-Band Control (PWM2DBCTL), offset 0x0E8****Register 55: PWM3 Dead-Band Control (PWM3DBCTL), offset 0x128**

The **PWMnDBCTL** register controls the dead-band generator, which produces the MnPWMn signals based on the pwmA and pwmB signals. When disabled, the pwmA signal passes through to the pwmA' signal and the pwmB signal passes through to the pwmB' signal. When dead-band control is enabled, the pwmB signal is ignored, the pwmA' signal is generated by delaying the rising edge(s) of the pwmA signal by the value in the **PWMnDBRISE** register (see page 1945), and the pwmB' signal is generated by inverting the pwmA signal and delaying the falling edge(s) of the pwmA signal by the value in the **PWMnDBFALL** register (see page 1946). The Output Control block outputs the pwm0A' signal on the MnPWM0 signal and the pwm0B' signal on the MnPWM1 signal. In a similar manner, MnPWM2 and MnPWM3 are produced from the pwm1A' and pwm1B' signals, MnPWM4 and MnPWM5 are produced from the pwm2A' and pwm2B' signals, and MnPWM6 and MnPWM7 are produced from the pwm3A' and pwm3B' signals.

If the Dead-Band Control mode is immediate (based on the DBCTLUPD field encoding in the **PWMnCTL** register), the ENABLE bit value is used immediately. If the update mode is locally synchronized, this value is used the next time the counter reaches zero. If the update mode is globally synchronized, this value is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1897). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**Register 56: PWM0 Dead-Band Rising-Edge Delay (PWM0DBRISE), offset 0x06C**

**Register 57: PWM1 Dead-Band Rising-Edge Delay (PWM1DBRISE), offset 0x0AC**

**Register 58: PWM2 Dead-Band Rising-Edge Delay (PWM2DBRISE), offset 0x0EC**

**Register 59: PWM3 Dead-Band Rising-Edge Delay (PWM3DBRISE), offset 0x12C**

The **PWMnDBRISE** register contains the number of clock cycles to delay the rising edge of the pwmA signal when generating the pwmA' signal. If the dead-band generator is disabled through the **PWMnDBCTL** register, this register is ignored. If the value of this register is larger than the width of a High pulse on the pwmA signal, the rising-edge delay consumes the entire High time of the signal, resulting in no High time on the output. Care must be taken to ensure that the pwmA High time always exceeds the rising-edge delay.

If the Dead-Band Rising-Edge Delay mode is immediate (based on the DBRISEUPD field encoding in the **PWMnCTL** register), the 12-bit RISEDELAY value is used immediately. If the update mode is locally synchronized, this value is used the next time the counter reaches zero. If the update mode is globally synchronized, this value is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1897). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

| 11:0      | RISEDELAY | RW   | 0x000    | Dead-Band Rise Delay<br>The number of clock cycles to delay the rising edge of pwmA' after the rising edge of pwmA.                                                                           |

**Register 60: PWM0 Dead-Band Falling-Edge-Delay (PWM0DBFALL), offset 0x070**

**Register 61: PWM1 Dead-Band Falling-Edge-Delay (PWM1DBFALL), offset 0x0B0**

**Register 62: PWM2 Dead-Band Falling-Edge-Delay (PWM2DBFALL), offset 0x0F0**

**Register 63: PWM3 Dead-Band Falling-Edge-Delay (PWM3DBFALL), offset 0x130**

The **PWMnDBFALL** register contains the number of clock cycles to delay the rising edge of the pwmB' signal from the falling edge of the pwmA signal. If the dead-band generator is disabled through the **PWMnDBCTL** register, this register is ignored. If the value of this register is larger than the width of a Low pulse on the pwmA signal, the falling-edge delay consumes the entire Low time of the signal, resulting in no Low time on the output. Care must be taken to ensure that the pwmA Low time always exceeds the falling-edge delay.

If the Dead-Band Falling-Edge-Delay mode is immediate (based on the DBFALLUP field encoding in the **PWMnCTL** register), the 12-bit FALLDELAY value is used immediately. If the update mode is locally synchronized, this value is used the next time the counter reaches zero. If the update mode is globally synchronized, this value is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1897). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**Register 64: PWM0 Fault Source 0 (PWM0FLTSRC0), offset 0x074****Register 65: PWM1 Fault Source 0 (PWM1FLTSRC0), offset 0x0B4****Register 66: PWM2 Fault Source 0 (PWM2FLTSRC0), offset 0x0F4****Register 67: PWM3 Fault Source 0 (PWM3FLTSRC0), offset 0x134**

This register specifies which fault pin inputs are used to generate a fault condition. Each bit in the following register indicates whether the corresponding fault pin is included in the fault condition. All enabled fault pins are ORed together to form the **PWMnFLTSRC0** portion of the fault condition. The **PWMnFLTSRC0** fault condition is then ORed with the **PWMnFLTSRC1** fault condition to generate the final fault condition for the PWM generator.

If the FLTSRC bit in the **PWMnCTL** register (see page 1922) is clear, only the Fault0 signal affects the fault condition generated. Otherwise, sources defined in **PWMnFLTSRC0** and **PWMnFLTSRC1** affect the fault condition generated.

**PWMn Fault Source 0 (PWMnFLTSRC0)**

**Register 72: PWM0 Minimum Fault Period (PWM0MINFLTPER), offset 0x07C**

**Register 73: PWM1 Minimum Fault Period (PWM1MINFLTPER), offset 0x0BC**

**Register 74: PWM2 Minimum Fault Period (PWM2MINFLTPER), offset 0x0FC**

**Register 75: PWM3 Minimum Fault Period (PWM3MINFLTPER), offset 0x13C**

If the MINFLTPER bit in the **PWMnCTL** register is set, this register specifies the 16-bit time-extension value to be used in extending the fault condition. The value is loaded into a 16-bit down counter, and the counter value is used to extend the fault condition. The fault condition is released in the clock immediately after the counter value reaches 0. The fault condition is asynchronous to the PWM clock; and the delay value is the product of the PWM clock period and the (MFP field value + 1) or (MFP field value + 2) depending on when the fault condition asserts with respect to the PWM clock. The counter decrements at the PWM clock rate, without pause or condition.

**Register 80: PWM0 Fault Status 0 (PWM0FLTSTAT0), offset 0x804****Register 81: PWM1 Fault Status 0 (PWM1FLTSTAT0), offset 0x884****Register 82: PWM2 Fault Status 0 (PWM2FLTSTAT0), offset 0x904****Register 83: PWM3 Fault Status 0 (PWM3FLTSTAT0), offset 0x984**

Along with the **PWMnFLTSTAT1** register, this register provides status regarding the fault condition inputs.

If the LATCH bit in the **PWMnCTL** register is clear, the contents of the **PWMnFLTSTAT0** register are read-only (RO) and provide the current state of the MnFAULTn inputs.

If the LATCH bit in the **PWMnCTL** register is set, the contents of the **PWMnFLTSTAT0** register are read / write 1 to clear (RW1C) and provide a latched version of the MnFAULTn inputs. In this mode, the register bits are cleared by writing a 1 to a set bit. The MnFAULTn inputs are recorded after their sense is adjusted in the generator.

The contents of this register can only be written if the fault source extensions are enabled (the FLTSRC bit in the **PWMnCTL** register is set).

**Note:** The fault status registers, **PWMnFLTSTAT0** and **PWMnFLTSTAT1**, reflect the status of all fault sources, regardless of what fault sources are enabled for that particular generator.

**PWMn Fault Status 0 (PWMnFLTSTAT0)**

**Register 88: PWM Peripheral Properties (PWMPP), offset 0xFC0**

The **PWMPP** register provides information regarding the properties of the PWM module.

**PWM Peripheral Properties (PWMPP)**

PWM0 base: 0x4002.8000

Offset 0xFC0

Type RO, reset 0x0000.0344

**Register 89: PWM Clock Configuration (PWMCC), offset 0xFC8**

The **PWMCC** register controls the clock source for the PWM module.

**PWM Clock Configuration (PWMCC)**

PWM0 base: 0x4002.8000

Offset 0xFC8

Type RW, reset 0x0000.0005

## 28 Quadrature Encoder Interface (QEI)

A quadrature encoder, also known as a 2-channel incremental encoder, converts linear displacement into a pulse signal. By monitoring both the number of pulses and the relative phase of the two signals, you can track the position, direction of rotation, and speed. In addition, a third channel, or index signal, can be used to reset the position counter.

The TM4C129LNCZAD quadrature encoder interface (QEI) module interprets the code produced by a quadrature encoder wheel to integrate position over time and determine direction of rotation. In addition, it can capture a running estimate of the velocity of the encoder wheel.

The TM4C129LNCZAD microcontroller includes one QEI module with the following features:

- Position integrator that tracks the encoder position
- Programmable noise filter on the inputs
- Velocity capture using built-in timer
- The input frequency of the QEI inputs may be as high as 1/4 of the processor frequency (for example, 12.5 MHz for a 50-MHz system)
- Interrupt generation on:
  - Index pulse
  - Velocity-timer expiration
  - Direction change
  - Quadrature error detection

### 28.1 Block Diagram

Figure 28-1 on page 1963 provides an internal block diagram of a TM4C129LNCZAD QEI module. The PhA and PhB inputs shown in this diagram are the internal signals that enter the Quadrature Encoder after the external signals, PhAn and PhBn, have passed through inversion and swapping logic shown in Figure 28-2 on page 1964. The QEI module has the option of inverting and/or swapping the incoming signals.

**Note:** Any references in this chapter to PhA and PhB refer to the internal PhA and PhB inputs that enter the Quadrature Encoder after the external signals, PhAn and PhBn, have passed through inversion and swapping logic that is enabled through the **QEI Control (QEICTL)** register.

Figure 28-1. QEI Block Diagram

Figure 28-2 on page 1964 shows the logic that is provided to allow the PhAn and PhBn signals to be inverted and/or swapped.

Figure 28-2. QEI Input Signal Logic

## 28.2 Signal Description

The following table lists the external signals of the QEI module and describes the function of each. The QEI signals are alternate functions for some GPIO signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for these QEI signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 796) should be set to choose the QEI function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOCTL)** register (page 813) to assign the QEI signal to the specified GPIO port pin. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 765.

Table 28-1. QEI Signals (212BGA)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type | Description           |

## 28.3 Functional Description

The QEI module interprets the two-bit gray code produced by a quadrature encoder wheel to integrate position over time and determine direction of rotation. In addition, it can capture a running estimate of the velocity of the encoder wheel.

The position integrator and velocity capture can be independently enabled, though the position integrator must be enabled before the velocity capture can be enabled. The two phase signals,

PhAn and PhBn, can be swapped before being interpreted by the QEI module to change the meaning of forward and backward and to correct for miswiring of the system. Alternatively, the phase signals can be interpreted as a clock and direction signal as output by some encoders.

The QEI module input signals have a digital noise filter on them that can be enabled to prevent spurious operation. The noise filter requires that the inputs be stable for a specified number of consecutive clock cycles before updating the edge detector. The filter is enabled by the **FILTEN** bit in the **QEI Control (QEICTL)** register. The frequency of the input update is programmable using the **FILTCNT** bit field in the **QEICTL** register.

The QEI module supports two modes of signal operation: quadrature phase mode and clock/direction mode. In quadrature phase mode, the encoder produces two clocks that are 90 degrees out of phase; the edge relationship is used to determine the direction of rotation. In clock/direction mode, the encoder produces a clock signal to indicate steps and a direction signal to indicate the direction of rotation. This mode is determined by the **SIGMODE** bit of the **QEICTL** register (see page 1969).

When the QEI module is set to use the quadrature phase mode (**SIGMODE** bit is clear), the capture mode for the position integrator can be set to update the position counter on every edge of the PhA signal or to update on every edge of both PhA and PhB. Updating the position counter on every PhA and PhB edge provides more positional resolution at the cost of less range in the positional counter.

When edges on PhA lead edges on PhB, the position counter is incremented. When edges on PhB lead edges on PhA, the position counter is decremented. When a rising and falling edge pair is seen on one of the phases without any edges on the other, the direction of rotation has changed.

The positional counter is automatically reset on one of two conditions: sensing the index pulse or reaching the maximum position value. The reset mode is determined by the **RESMODE** bit of the **QEICTL** register.

When **RESMODE** is set, the positional counter is reset when the index pulse is sensed. This mode limits the positional counter to the values [0:N-1], where N is the number of phase edges in a full revolution of the encoder wheel. The **QEI Maximum Position (QEIMAXPOS)** register must be programmed with N-1 so that the reverse direction from position 0 can move the position counter to N-1. In this mode, the position register contains the absolute position of the encoder relative to the index (or home) position once an index pulse has been seen.

When **RESMODE** is clear, the positional counter is constrained to the range [0:M], where M is the programmable maximum value. The index pulse is ignored by the positional counter in this mode.

Velocity capture uses a configurable timer and a count register. The timer counts the number of phase edges (using the same configuration as for the position integrator) in a given time period. The edge count from the previous time period is available to the controller via the **QEI Velocity (QEISPEED)** register, while the edge count for the current time period is being accumulated in the **QEI Velocity Counter (QEICOUNT)** register. As soon as the current time period is complete, the total number of edges counted in that time period is made available in the **QEISPEED** register (overwriting the previous value), the **QEICOUNT** register is cleared, and counting commences on a new time period. The number of edges counted in a given time period is directly proportional to the velocity of the encoder.

Figure 28-3 on page 1966 shows how the TM4C129LNCZAD quadrature encoder converts the phase input signals into clock pulses, the direction signal, and how the velocity predivider operates (in Divide by 4 mode).

Figure 28-3. Quadrature Encoder and Velocity Predivider Operation

The period of the timer is configurable by specifying the load value for the timer in the **QEI Timer Load (QEILOAD)** register. When the timer reaches zero, an interrupt can be triggered, and the hardware reloads the timer with the **QEILOAD** value and continues to count down. At lower encoder speeds, a longer timer period is required to be able to capture enough edges to have a meaningful result. At higher encoder speeds, both a shorter timer period and/or the velocity predivider can be used.

The following equation converts the velocity counter value into an rpm value:

$$\text{rpm} = (\text{clock} * (2 \wedge \text{VELDIV}) * \text{SPEED} * 60) \div (\text{LOAD} * \text{ppr} * \text{edges})$$

where:

clock is the controller clock rate

ppr is the number of pulses per revolution of the physical encoder

edges is 2 or 4, based on the capture mode set in the **QEICTL** register (2 for CAPMODE clear and 4 for CAPMODE set)

For example, consider a motor running at 600 rpm. A 2048 pulse per revolution quadrature encoder is attached to the motor, producing 8192 phase edges per revolution. With a velocity predivider of  $\div 1$  (VELDIV is clear) and clocking on both PhA and PhB edges, this results in 81,920 pulses per second (the motor turns 10 times per second). If the timer were clocked at 10,000 Hz, and the load value was 2,500 ( $\frac{1}{4}$  of a second), it would count 20,480 pulses per update. Using the above equation:

$$\text{rpm} = (10000 * 1 * 20480 * 60) \div (2500 * 2048 * 4) = 600 \text{ rpm}$$

Now, consider that the motor is sped up to 3000 rpm. This results in 409,600 pulses per second, or 102,400 every  $\frac{1}{4}$  of a second. Again, the above equation gives:

$$\text{rpm} = (10000 * 1 * 102400 * 60) \div (2500 * 2048 * 4) = 3000 \text{ rpm}$$

Care must be taken when evaluating this equation because intermediate values may exceed the capacity of a 32-bit integer. In the above examples, the clock is 10,000 and the divider is 2,500; both could be predivided by 100 (at compile time if they are constants) and therefore be 100 and 25. In fact, if they were compile-time constants, they could also be reduced to a simple multiply by 4, cancelled by the  $\div 4$  for the edge-count factor.

**Important:** Reducing constant factors at compile time is the best way to control the intermediate values of this equation and reduce the processing requirement of computing this equation.

The division can be avoided by selecting a timer load value such that the divisor is a power of 2; a simple shift can therefore be done in place of the division. For encoders with a power of 2 pulses per revolution, the load value can be a power of 2. For other encoders, a load value must be selected such that the product is very close to a power of 2. For example, a 100 pulse-per-revolution encoder

could use a load value of 82, resulting in 32,800 as the divisor, which is 0.09% above  $2^{14}$ . In this case a shift by 15 would be an adequate approximation of the divide in most cases. If absolute accuracy were required, the microcontroller's divide instruction could be used.

The QEI module can produce a controller interrupt on several events: phase error, direction change, reception of the index pulse, and expiration of the velocity timer. Standard masking, raw interrupt status, interrupt status, and interrupt clear capabilities are provided.

## 28.4 Initialization and Configuration

The following example shows how to configure the Quadrature Encoder module to read back an absolute position:

1. Enable the QEI clock using the **RCGCQEI** register in the System Control module (see page 413).
2. Enable the clock to the appropriate GPIO module via the **RCGCGPIO** register in the System Control module (see page 396).
3. In the GPIO module, enable the appropriate pins for their alternate function using the **GPIOAFSEL** register. To determine which GPIOs to configure, see Table 30-4 on page 2022.
4. Configure the PMCN fields in the **GPIOPCTL** register to assign the QEI signals to the appropriate pins (see page 813 and Table 30-5 on page 2037).
5. Configure the quadrature encoder to capture edges on both signals and maintain an absolute position by resetting on index pulses. A 1000-line encoder with four edges per line, results in 4000 pulses per revolution; therefore, set the maximum position to 3999 (0xF9F) as the count is zero-based.
  - Write the **QEICTL** register with the value of 0x0000.0018.
  - Write the **QEIMAXPOS** register with the value of 0x0000.0F9F.
6. Enable the quadrature encoder by setting bit 0 of the **QEICTL** register.
 

**Note:** Once the QEI module has been enabled by setting the ENABLE bit in the **QEICTL** register, it cannot be disabled. The only way to clear the ENABLE bit is to reset the module using the **Quadrature Encoder Interface Software Reset (SRQEI)** register.
7. Delay until the encoder position is required.
8. Read the encoder position by reading the **QEI Position (QEIPOS)** register value.

**Note:** If the application requires the quadrature encoder to have a specific initial position, this value must be programmed in the **QEIPOS** register after the quadrature encoder has been enabled by setting the ENABLE bit in the **QEICTL** register.

## 28.5 Register Map

Table 28-2 on page 1968 lists the QEI registers. The offset listed is a hexadecimal increment to the register's address, relative to the module's base address:

- QEIO: 0x4002.C000

Note that the QEI module clock must be enabled before the registers can be programmed (see page 413). There must be a delay of 3 system clocks after the QEI module clock is enabled before any QEI module registers are accessed.

**Table 28-2. QEI Register Map**

| Offset | Name      | Type | Reset       | Description                    | See page |
|--------|-----------|------|-------------|--------------------------------|----------|
| 0x000  | QEICTL    | RW   | 0x0000.0000 | QEI Control                    | 1969     |
| 0x004  | QEISTAT   | RO   | 0x0000.0000 | QEI Status                     | 1972     |

## 28.6 Register Descriptions

The remainder of this section lists and describes the QEI registers, in numerical order by address offset.

## Register 1: QEI Control (QEICTL), offset 0x000

This register contains the configuration of the QEI module. Separate enables are provided for the quadrature encoder and the velocity capture blocks; the quadrature encoder must be enabled in order to capture the velocity, but the velocity does not need to be captured in applications that do not need it. The phase signal interpretation, phase swap, Position Update mode, Position Reset mode, and velocity predivider are all set via this register.

### QEI Control (QEICTL)

QEIO base: 0x4002.C000

Offset 0x000

Type RW, reset 0x0000.0000

| 31:0      | POSITION | RW   | 0x0000.0000 | Current Position Integrator Value<br>The current value of the position integrator. |

Register 4: QEI Maximum Position (QEIMAXPOS), offset 0x00C

This register contains the maximum value of the position integrator. When moving forward, the position register resets to zero when it increments past this value. When moving in reverse, the position register resets to this value when it decrements from zero.

QEI Maximum Position (QEIMAXPOS)

QEIO base: 0x4002.C000  
Offset 0x00C  
Type RW, reset 0x0000.0000

| Bit/Field | Name   | Type | Reset       | Description                                                                        |
|-----------|--------|------|-------------|------------------------------------------------------------------------------------|
| 31:0      | MAXPOS | RW   | 0x0000.0000 | Maximum Position Integrator Value<br>The maximum value of the position integrator. |

**Register 5: QEI Timer Load (QEILOAD), offset 0x010**

This register contains the load value for the velocity timer. Because this value is loaded into the timer on the clock cycle after the timer is zero, this value should be one less than the number of clocks in the desired period. So, for example, to have 2000 decimal clocks per timer period, this register should contain 1999 decimal.

**QEI Timer Load (QEILOAD)**

QEIO base: 0x4002.C000

Offset 0x010

Type RW, reset 0x0000.0000

| Bit/Field | Name | Type | Reset       | Description                                                         |
|-----------|------|------|-------------|---------------------------------------------------------------------|
| 31:0      | LOAD | RW   | 0x0000.0000 | Velocity Timer Load Value<br>The load value for the velocity timer. |

Register 6: QEI Timer (QEITIME), offset 0x014

This register contains the current value of the velocity timer. This counter does not increment when the VELEN bit in the **QEICTL** register is clear.

QEI Timer (QEITIME)

QEIO base: 0x4002.C000  
Offset 0x014  
Type RO, reset 0x0000.0000

| Bit/Field | Name | Type | Reset       | Description                                                              |
|-----------|------|------|-------------|--------------------------------------------------------------------------|
| 31:0      | TIME | RO   | 0x0000.0000 | Velocity Timer Current Value<br>The current value of the velocity timer. |

**Register 7: QEI Velocity Counter (QEICOUNT), offset 0x018**

This register contains the running count of velocity pulses for the current time period. Because this count is a running total, the time period to which it applies cannot be known with precision (that is, a read of this register does not necessarily correspond to the time returned by the **QEITIME** register because there is a small window of time between the two reads, during which either value may have changed). The **QEISPEED** register should be used to determine the actual encoder velocity; this register is provided for information purposes only. This counter does not increment when the VELEN bit in the **QEICTL** register is clear.

**QEI Velocity Counter (QEICOUNT)**

QEI0 base: 0x4002.C000

Offset 0x018

## Register 10: QEI Raw Interrupt Status (QEIRIS), offset 0x024

This register provides the current set of interrupt sources that are asserted, regardless of whether they cause an interrupt to be asserted to the controller (configured through the **QEINTEN** register). If a bit is set, the latched event has occurred; if a bit is clear, the event in question has not occurred.

### QEI Raw Interrupt Status (QEIRIS)

QEIO base: 0x4002.C000

Offset 0x024

## Register 11: QEI Interrupt Status and Clear (QEIIISC), offset 0x028

This register provides the current set of interrupt sources that are asserted to the controller. If a bit is set, the latched event has occurred and is enabled to generate an interrupt; if a bit is clear the event in question has not occurred or is not enabled to generate an interrupt. This register is RW1C; writing a 1 to a bit position clears the bit and the corresponding interrupt reason.

### QEI Interrupt Status and Clear (QEIIISC)

QEIO base: 0x4002.C000

Offset 0x028

Type RW1C, reset 0x0000.0000

## 29 Pin Diagram

The TM4C129LNCZAD microcontroller pin diagram is shown below.

Each GPIO signal is identified by its GPIO port unless it defaults to an alternate function on reset. In this case, the GPIO port name is followed by the default alternate function. To see a complete list of possible functions for each pin, see Table 30-5 on page 2037.

**Figure 29-1. 212-Ball BGA Package Pin Diagram (Top View)**

## 30 Signal Tables

The following tables list the signals available for each pin. Signals are configured as GPIOs on reset, except for those noted below. Use the **GPIOAMSEL** register (see page 812) to select analog mode. For a GPIO pin to be used for an alternate digital function, the corresponding bit in the **GPIOAFSEL** register (see page 796) must be set. Further pin muxing options are provided through the PMCx bit field in the **GPIOPCTL** register (see page 813), which selects one of several available peripheral functions for that GPIO.

**Important:** Table 10-1 on page 766 shows special consideration GPIO pins. Most GPIO pins are configured as GPIOs and tri-stated by default (**GPIOAFSEL**=0, **GIODEN**=0, **GPIOPDR**=0, **GPIOPUR**=0, and **GPIOPCTL**=0). Special consideration pins may be programmed to a non-GPIO function or may have special commit controls out of reset. In addition, a Power-On-Reset (POR) returns these GPIO to their original special consideration state.

**Table 30-1. GPIO Pins With Special Considerations**

| GPIO Pins | Default Reset State | GPIOAFSEL | GIODEN | GPIOPDR | GPIOPUR | GPIOPCTL | GPIOCR |
|-----------|---------------------|-----------|--------|---------|---------|----------|--------|
| PC[3:0]   | JTAG/SWD            | 1         | 1      | 0       | 1       | 0x1      | 0      |
| PD[7]     | GPIO <sup>a</sup>   | 0         | 0      | 0       | 0       | 0x0      | 0      |
| PE[7]     | GPIO <sup>a</sup>   | 0         | 0      | 0       | 0       | 0x0      | 0      |

a. This pin is configured as a GPIO by default but is locked and can only be reprogrammed by unlocking the pin in the **GPIOLOCK** register and uncommitting it by setting the **GPIOCR** register.

Table 30-2 on page 1987 shows the pin-to-signal-name mapping, including functional characteristics of the signals. Each possible alternate analog and digital function is listed for each pin.

Table 30-3 on page 2005 lists the signals in alphabetical order by signal name. If it is possible for a signal to be on multiple pins, each possible pin assignment is listed. The "Pin Mux" column indicates the GPIO and the encoding needed in the PMCx bit field in the **GPIOPCTL** register.

Table 30-4 on page 2022 groups the signals by functionality, except for GPIOs. If it is possible for a signal to be on multiple pins, each possible pin assignment is listed.

Table 30-5 on page 2037 lists the GPIO pins and their analog and digital alternate functions. The AINx analog signals go through an isolation circuit before reaching their circuitry. These signals are configured by clearing the corresponding DEN bit in the **GPIO Digital Enable (GIODEN)** register and setting the corresponding AMSEL bit in the **GPIO Analog Mode Select (GPIOAMSEL)** register. Other analog signals are 3.3-V tolerant and are connected directly to their circuitry (C0-, C0+, C1-, C1+, C2-, C2+, USB0VBUS, USB0ID). These signals are configured by clearing the DEN bit in the **GPIO Digital Enable (GIODEN)** register. The digital signals are enabled by setting the appropriate bit in the **GPIO Alternate Function Select (GPIOAFSEL)** and **GIODEN** registers and configuring the PMCx bit field in the **GPIO Port Control (GPIOPCTL)** register to the numeric encoding shown in the table below. Table entries that are shaded gray are the default values for the corresponding GPIO pin.

Table 30-6 on page 2042 lists the signals based on number of possible pin assignments. This table can be used to plan how to configure the pins for a particular functionality. Application Note AN01274 Configuring Tiva™ C Series Microcontrollers with Pin Multiplexing provides an overview of the pin muxing implementation, an explanation of how a system designer defines a pin configuration, and examples of the pin configuration process.

**Note:** All digital inputs are Schmitt triggered.

## 30.1 Signals by Pin Number

**Table 30-2. Signals by Pin Number**

| Pin Number | Pin Name  | Pin Type | Buffer Type | Description                                                                                                                                      |
|------------|-----------|----------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| A1         | GND       | -        | Power       | Ground reference for logic and I/O pins.                                                                                                         |
| A2         | GND       | -        | Power       | Ground reference for logic and I/O pins.                                                                                                         |
| A4         | PD4       | I/O      | TTL         | GPIO port D bit 4.                                                                                                                               |
|            | AIN7      | I        | Analog      | Analog-to-digital converter input 7.                                                                                                             |
|            | SSI1XDAT2 | I/O      | TTL         | SSI Module 1 Bi-directional Data Pin 2.                                                                                                          |
|            | T3CCP0    | I/O      | TTL         | 16/32-Bit Timer 3 Capture/Compare/PWM 0.                                                                                                         |
|            | U2Rx      | I        | TTL         | UART module 2 receive.                                                                                                                           |
| A5         | PE4       | I/O      | TTL         | GPIO port E bit 4.                                                                                                                               |
|            | AIN9      | I        | Analog      | Analog-to-digital converter input 9.                                                                                                             |
|            | SSI1XDAT0 | I/O      | TTL         | SSI Module 1 Bi-directional Data Pin 0 (SSI1TX in Legacy SSI Mode).                                                                              |
|            | U1RI      | I        | TTL         | UART module 1 Ring Indicator modem status input signal.                                                                                          |
| A7         | PE6       | I/O      | TTL         | GPIO port E bit 6.                                                                                                                               |
|            | AIN20     | I        | Analog      | Analog-to-digital converter input 20.                                                                                                            |
|            | I2C9SCL   | I/O      | OD          | I <sup>2</sup> C module 9 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|            | U0CTS     | I        | TTL         | UART module 0 Clear To Send modem flow control input signal.                                                                                     |
| A8         | PP7       | I/O      | TTL         | GPIO port P bit 7.                                                                                                                               |
|            | AIN22     | I        | Analog      | Analog-to-digital converter input 22.                                                                                                            |
| A10        | PN4       | I/O      | TTL         | GPIO port N bit 4.                                                                                                                               |
|            | EPI0S34   | I/O      | TTL         | EPI module 0 signal 34.                                                                                                                          |
|            | I2C2SDA   | I/O      | OD          | I <sup>2</sup> C module 2 data.                                                                                                                  |
|            | U1DTR     | O        | TTL         | UART module 1 Data Terminal Ready modem status input signal.                                                                                     |
|            | U3RTS     | O        | TTL         | UART module 3 Request to Send modem flow control output line.                                                                                    |
| A11        | PN2       | I/O      | TTL         | GPIO port N bit 2.                                                                                                                               |
|            | EPI0S29   | I/O      | TTL         | EPI module 0 signal 29.                                                                                                                          |
|            | U1DCD     | I        | TTL         | UART module 1 Data Carrier Detect modem status input signal.                                                                                     |
|            | U2RTS     | O        | TTL         | UART module 2 Request to Send modem flow control output line.                                                                                    |
| A13        | PQ4       | I/O      | TTL         | GPIO port Q bit 4.                                                                                                                               |
|            | DIVSCLK   | O        | TTL         | An optionally divided reference clock output based on a selected clock source. Note that this signal is not synchronized to the System Clock.    |
|            | U1Rx      | I        | TTL         | UART module 1 receive.                                                                                                                           |
| A14        | PS3       | I/O      | TTL         | GPIO port S bit 3.                                                                                                                               |
|            | LCDDATA23 | O        | TTL         | LCD Data Pin 23 output.                                                                                                                          |
|            | M0FAULT3  | I        | TTL         | Motion Control Module 0 PWM Fault 3.                                                                                                             |
|            | T3CCP1    | I/O      | TTL         | 16/32-Bit Timer 3 Capture/Compare/PWM 1.                                                                                                         |

Table 30-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type | Description                                                                                                                                                                                                                                                   |
|------------|-----------|----------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A16        | PB0       | I/O      | TTL         | GPIO port B bit 0.                                                                                                                                                                                                                                            |
|            | CAN1Rx    | I        | TTL         | CAN module 1 receive.                                                                                                                                                                                                                                         |
|            | I2C5SCL   | I/O      | OD          | I <sup>2</sup> C module 5 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain.                                                                                                              |
|            | T4CCP0    | I/O      | TTL         | 16/32-Bit Timer 4 Capture/Compare/PWM 0.                                                                                                                                                                                                                      |
|            | U1Rx      | I        | TTL         | UART module 1 receive.                                                                                                                                                                                                                                        |
|            | USB0ID    | I        | Analog      | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
| A17        | PB2       | I/O      | TTL         | GPIO port B bit 2.                                                                                                                                                                                                                                            |
|            | EPI0S27   | I/O      | TTL         | EPI module 0 signal 27.                                                                                                                                                                                                                                       |
|            | I2C0SCL   | I/O      | OD          | I <sup>2</sup> C module 0 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain.                                                                                                              |

Table 30-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type | Description                                                                                                                                                                        |
|------------|-----------|----------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| B15        | PC0       | I/O      | TTL         | GPIO port C bit 0.                                                                                                                                                                 |
|            | SWCLK     | I        | TTL         | JTAG/SWD CLK.                                                                                                                                                                      |
|            | TCK       | I        | TTL         | JTAG/SWD CLK.                                                                                                                                                                      |
| B16        | PB1       | I/O      | TTL         | GPIO port B bit 1.                                                                                                                                                                 |
|            | CAN1Tx    | O        | TTL         | CAN module 1 transmit.                                                                                                                                                             |
|            | I2C5SDA   | I/O      | OD          | I <sup>2</sup> C module 5 data.                                                                                                                                                    |
|            | T4CCP1    | I/O      | TTL         | 16/32-Bit Timer 4 Capture/Compare/PWM 1.                                                                                                                                           |
|            | U1Tx      | O        | TTL         | UART module 1 transmit.                                                                                                                                                            |
|            | USB0VBUS  | I/O      | Analog      | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing. |
| B17        | PB3       | I/O      | TTL         | GPIO port B bit 3.                                                                                                                                                                 |
|            | EPI0S28   | I/O      | TTL         | EPI module 0 signal 28.                                                                                                                                                            |
|            | I2C0SDA   | I/O      | OD          | I <sup>2</sup> C module 0 data.                                                                                                                                                    |
|            | T5CCP1    | I/O      | TTL         | 16/32-Bit Timer 5 Capture/Compare/PWM 1.                                                                                                                                           |
|            | USB0CLK   | O        | TTL         | 60-MHz clock to the external PHY.                                                                                                                                                  |
| B18        | PL7       | I/O      | TTL         | GPIO port L bit 7.                                                                                                                                                                 |
|            | T1CCP1    | I/O      | TTL         | 16/32-Bit Timer 1 Capture/Compare/PWM 1.                                                                                                                                           |
|            | USB0DM    | I/O      | Analog      | Bidirectional differential data pin (D- per USB specification) for USB0.                                                                                                           |
| B19        | GND       | -        | Power       | Ground reference for logic and I/O pins.                                                                                                                                           |
| C1         | PD1       | I/O      | TTL         | GPIO port D bit 1.                                                                                                                                                                 |
|            | AIN14     | I        | Analog      | Analog-to-digital converter input 14.                                                                                                                                              |
|            | C10       | O        | TTL         | Analog comparator 1 output.                                                                                                                                                        |
|            | I2C7SDA   | I/O      | OD          | I <sup>2</sup> C module 7 data.                                                                                                                                                    |

|            | T0CCP1    | I/O      | TTL         | 16/32-Bit Timer 0 Capture/Compare/PWM 1.                                                                                                                                           |
| C2         | PD0       | I/O      | TTL         | GPIO port D bit 0.                                                                                                                                                                 |
|            | AIN15     | I        | Analog      | Analog-to-digital converter input 15.                                                                                                                                              |
|            | C00       | O        | TTL         | Analog comparator 0 output.                                                                                                                                                        |
|            | I2C7SCL   | I/O      | OD          | I <sup>2</sup> C module 7 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain.                                   |
|            | SSI2XDAT1 | I/O      | TTL         | SSI Module 2 Bi-directional Data Pin 1 (SSI2RX in Legacy SSI Mode).                                                                                                                |
|            | T0CCP0    | I/O      | TTL         | 16/32-Bit Timer 0 Capture/Compare/PWM 0.                                                                                                                                           |
| C5         | NC        | -        | -           | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                       |
| C6         | PB4       | I/O      | TTL         | GPIO port B bit 4.                                                                                                                                                                 |
|            | AIN10     | I        | Analog      | Analog-to-digital converter input 10.                                                                                                                                              |
|            | I2C5SCL   | I/O      | OD          | I <sup>2</sup> C module 5 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain.                                   |
|            | SSI1Fss   | I/O      | TTL         | SSI module 1 frame signal.                                                                                                                                                         |
|            | U0CTS     | I        | TTL         | UART module 0 Clear To Send modem flow control input signal.                                                                                                                       |

Table 30-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type | Description                                                                                                                                                                   |
|------------|-----------|----------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| C8         | PJ0       | I/O      | TTL         | GPIO port J bit 0.                                                                                                                                                            |
|            | EN0PPS    | O        | TTL         | Ethernet 0 Pulse-Per-Second (PPS) Output.                                                                                                                                     |
|            | U3Rx      | I        | TTL         | UART module 3 receive.                                                                                                                                                        |
| C10        | PN0       | I/O      | TTL         | GPIO port N bit 0.                                                                                                                                                            |
|            | U1RTS     | O        | TTL         | UART module 1 Request to Send modem flow control output line.                                                                                                                 |
| C12        | PP3       | I/O      | TTL         | GPIO port P bit 3.                                                                                                                                                            |
|            | EPI0S30   | I/O      | TTL         | EPI module 0 signal 30.                                                                                                                                                       |
|            | RTCCLK    | O        | TTL         | Buffered version of the Hibernation module's 32.768-kHz clock. This signal is not output when the part is in Hibernate mode and before being configured after power-on reset. |
|            | U0DCD     | I        | TTL         | UART module 0 Data Carrier Detect modem status input signal.                                                                                                                  |
|            | U1CTS     | I        | TTL         | UART module 1 Clear To Send modem flow control input signal.                                                                                                                  |
|            | USB0DIR   | O        | TTL         | Indicates that the external PHY is able to accept data from the USB controller.                                                                                               |
| C14        | PC3       | I/O      | TTL         | GPIO port C bit 3.                                                                                                                                                            |
|            | SW0       | O        | TTL         | JTAG TDO and SWO.                                                                                                                                                             |
|            | TD0       | O        | TTL         | JTAG TDO and SWO.                                                                                                                                                             |
| C15        | PC1       | I/O      | TTL         | GPIO port C bit 1.                                                                                                                                                            |

|            | U3CTS     | I        | TTL         | UART module 3 Clear To Send modem flow control input signal.                                                                                                                                                                                                                                      |

Table 30-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type | Description                                                                                                                                                                                                                                                                                                                                                           |
|------------|-----------|----------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E18        | PT2       | I/O      | TTL         | GPIO port T bit 2.                                                                                                                                                                                                                                                                                                                                                    |
|            | CAN1RX    | I        | TTL         | CAN module 1 receive.                                                                                                                                                                                                                                                                                                                                                 |
|            | LCDDATA18 | O        | TTL         | LCD Data Pin 18 output.                                                                                                                                                                                                                                                                                                                                               |
|            | T7CCP0    | I/O      | TTL         | 16/32-Bit Timer 7 Capture/Compare/PWM 0.                                                                                                                                                                                                                                                                                                                              |
| E19        | OSC0      | I        | Analog      | Main oscillator crystal input or an external clock reference input.                                                                                                                                                                                                                                                                                                   |
| F1         | PB7       | I/O      | TTL         | GPIO port B bit 7.                                                                                                                                                                                                                                                                                                                                                    |
|            | I2C6SDA   | I/O      | OD          | I <sup>2</sup> C module 6 data.                                                                                                                                                                                                                                                                                                                                       |
|            | T6CCP1    | I/O      | TTL         | 16/32-Bit Timer 6 Capture/Compare/PWM 1.                                                                                                                                                                                                                                                                                                                              |
| F2         | PB6       | I/O      | TTL         | GPIO port B bit 6.                                                                                                                                                                                                                                                                                                                                                    |
|            | I2C6SCL   | I/O      | OD          | I <sup>2</sup> C module 6 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain.                                                                                                                                                                                                                      |
|            | T6CCP0    | I/O      | TTL         | 16/32-Bit Timer 6 Capture/Compare/PWM 0.                                                                                                                                                                                                                                                                                                                              |
| F3         | VDDA      | -        | Power       | The positive supply for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be supplied with a voltage that meets the specification in , regardless of system implementation.                                                     |
| F4         | VREFA+    | -        | Analog      | A reference voltage used to specify the voltage at which the ADC converts to a maximum value. This pin is used in conjunction with VREFA-, which specifies the minimum value . The voltage that is applied to VREFA+ is the voltage with which an AINn signal is converted to 4095. The VREFA+ voltage is limited to the range specified in Table 31-44 on page 2094. |
| F10        | GND       | -        | Power       | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                                                                              |
| F16        | PJ3       | I/O      | TTL         | GPIO port J bit 3.                                                                                                                                                                                                                                                                                                                                                    |
|            | LCDDATA15 | I/O      | TTL         | LCD Data Pin 15 input/output.                                                                                                                                                                                                                                                                                                                                         |
|            | U2CTS     | I        | TTL         | UART module 2 Clear To Send modem flow control input signal.                                                                                                                                                                                                                                                                                                          |
| F17        | PT3       | I/O      | TTL         | GPIO port T bit 3.                                                                                                                                                                                                                                                                                                                                                    |
|            | CAN1Tx    | O        | TTL         | CAN module 1 transmit.                                                                                                                                                                                                                                                                                                                                                |

| G4         | GNDA      | -        | Power       | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                                                                                     |

Table 30-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|-----------|----------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| G5         | VREFA-    | -        | Analog      | A reference voltage used to specify the input voltage at which the ADC converts to a minimum value. This pin is used in conjunction with VREFA+, which specifies the maximum value. In other words, the voltage that is applied to VREFA- is the voltage with which an AINn signal is converted to 0, while the voltage that is applied to VREFA+ is the voltage with which an AINn signal is converted to 4095. The VREFA- voltage is limited to the range specified in Table 31-44 on page 2094. |
| G10        | VDD       | -        | Power       | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| G15        | PM5       | I/O      | TTL         | GPIO port M bit 5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Table 30-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type | Description                                                                                                                                                                                                                                                                                      |
|------------|-----------|----------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| H16        | VDDC      | -        | Power       | Positive supply for most of the logic function, including the processor core and most peripherals. The voltage on this pin is 1.2 V and is supplied by the on-chip LDO. The VDDC pins should only be connected to each other and an external capacitor as specified in Table 31-15 on page 2067. |

Table 30-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type | Description                                                                                                                                                                   |
|------------|-----------|----------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| L10        | VDD       | -        | Power       | Positive supply for I/O and some logic.                                                                                                                                       |
| L11        | VDD       | -        | Power       | Positive supply for I/O and some logic.                                                                                                                                       |
| L12        | VDD       | -        | Power       | Positive supply for I/O and some logic.                                                                                                                                       |
| L18        | PM2       | I/O      | TTL         | GPIO port M bit 2.                                                                                                                                                            |
|            | EPI0S13   | I/O      | TTL         | EPI module 0 signal 13.                                                                                                                                                       |
|            | T3CCP0    | I/O      | TTL         | 16/32-Bit Timer 3 Capture/Compare/PWM 0.                                                                                                                                      |
| L19        | PM3       | I/O      | TTL         | GPIO port M bit 3.                                                                                                                                                            |
|            | EPI0S12   | I/O      | TTL         | EPI module 0 signal 12.                                                                                                                                                       |
|            | T3CCP1    | I/O      | TTL         | 16/32-Bit Timer 3 Capture/Compare/PWM 1.                                                                                                                                      |
| M1         | PC5       | I/O      | TTL         | GPIO port C bit 5.                                                                                                                                                            |
|            | C1+       | I        | Analog      | Analog comparator 1 positive input.                                                                                                                                           |
|            | EPI0S6    | I/O      | TTL         | EPI module 0 signal 6.                                                                                                                                                        |
|            | RTCCLK    | O        | TTL         | Buffered version of the Hibernation module's 32.768-kHz clock. This signal is not output when the part is in Hibernate mode and before being configured after power-on reset. |
|            | T7CCP1    | I/O      | TTL         | 16/32-Bit Timer 7 Capture/Compare/PWM 1.                                                                                                                                      |
|            | U7Tx      | O        | TTL         | UART module 7 transmit.                                                                                                                                                       |
| M2         | PC4       | I/O      | TTL         | GPIO port C bit 4.                                                                                                                                                            |
|            | C1-       | I        | Analog      | Analog comparator 1 negative input.                                                                                                                                           |
|            | EPI0S7    | I/O      | TTL         | EPI module 0 signal 7.                                                                                                                                                        |
|            | T7CCP0    | I/O      | TTL         | 16/32-Bit Timer 7 Capture/Compare/PWM 0.                                                                                                                                      |
|            | U7Rx      | I        | TTL         | UART module 7 receive.                                                                                                                                                        |
| M3         | PQ7       | I/O      | TTL         | GPIO port Q bit 7.                                                                                                                                                            |
|            | U1RI      | I        | TTL         | UART module 1 Ring Indicator modem status input signal.                                                                                                                       |
| M4         | PQ3       | I/O      | TTL         | GPIO port Q bit 3.                                                                                                                                                            |
|            | EPI0S23   | I/O      | TTL         | EPI module 0 signal 23.                                                                                                                                                       |
|            | SSI3XDAT1 | I/O      | TTL         | SSI Module 3 Bi-directional Data Pin 1 (SSI3RX in Legacy SSI Mode).                                                                                                           |
|            | T7CCP1    | I/O      | TTL         | 16/32-Bit Timer 7 Capture/Compare/PWM 1.                                                                                                                                      |
| M8         | GND       | -        | Power       | Ground reference for logic and I/O pins.                                                                                                                                      |
| M9         | GND       | -        | Power       | Ground reference for logic and I/O pins.                                                                                                                                      |
| M10        | GND       | -        | Power       | Ground reference for logic and I/O pins.                                                                                                                                      |
| M11        | VDD       | -        | Power       | Positive supply for I/O and some logic.                                                                                                                                       |
| M12        | VDD       | -        | Power       | Positive supply for I/O and some logic.                                                                                                                                       |
| M16        | PG3       | I/O      | TTL         | GPIO port G bit 3.                                                                                                                                                            |
|            | I2C2SDA   | I/O      | OD          | I <sup>2</sup> C module 2 data.                                                                                                                                               |
|            | SSI2XDAT2 | I/O      | TTL         | SSI Module 2 Bi-directional Data Pin 2.                                                                                                                                       |
| M17        | HIB       | O        | TTL         | An output that indicates the processor is in Hibernate mode.                                                                                                                  |
| M18        | PM4       | I/O      | TTL         | GPIO port M bit 4.                                                                                                                                                            |
|            | T4CCP0    | I/O      | TTL         | 16/32-Bit Timer 4 Capture/Compare/PWM 0.                                                                                                                                      |
|            | TMPR3     | I/O      | TTL         | Tamper signal 3.                                                                                                                                                              |
|            | U0CTS     | I        | TTL         | UART module 0 Clear To Send modem flow control input signal.                                                                                                                  |

Table 30-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name | Pin Type | Buffer Type | Description                                                                                                                                      |
|------------|----------|----------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| N1         | PJ6      | I/O      | TTL         | GPIO port J bit 6.                                                                                                                               |
|            | LCDAC    | O        | TTL         | LCD AC bias or latch enable in Raster mode; Primary chip select (CS0)/Primary Enable (E0) in LIDD MPU/Hitachi mode                               |
|            | U4RTS    | O        | TTL         | UART module 4 Request to Send modem flow control output line.                                                                                    |
| N2         | PR2      | I/O      | TTL         | GPIO port R bit 2.                                                                                                                               |
|            | I2C2SCL  | I/O      | OD          | I <sup>2</sup> C module 2 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|            | LCDLP    | O        | TTL         | LCD Line Clock or HSYNC in Raster mode; Write Strobe or Direction bit in LIDD mode                                                               |
|            | M0PWM2   | O        | TTL         | Motion Control Module 0 PWM 2. This signal is controlled by Module 0 PWM Generator 1.                                                            |
| N4         | PR1      | I/O      | TTL         | GPIO port R bit 1.                                                                                                                               |
|            | I2C1SDA  | I/O      | OD          | I <sup>2</sup> C module 1 data.                                                                                                                  |
|            | LCDFP    | O        | TTL         | LCD Frame Clock or VSYNC in Raster mode; Address Latch Enable in LIDD mode                                                                       |
|            | M0PWM1   | O        | TTL         | Motion Control Module 0 PWM 1. This signal is controlled by Module 0 PWM Generator 0.                                                            |
|            | U4Rx     | I        | TTL         | UART module 4 receive.                                                                                                                           |
| N5         | PR0      | I/O      | TTL         | GPIO port R bit 0.                                                                                                                               |
|            | I2C1SCL  | I/O      | OD          | I <sup>2</sup> C module 1 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|            | LCDCP    | O        | TTL         | LCD Pixel Clock in Raster mode; read strobe or read/write strobe in LIDD mode                                                                    |
|            | M0PWM0   | O        | TTL         | Motion Control Module 0 PWM 0. This signal is controlled by Module 0 PWM Generator 0.                                                            |
|            | U4Tx     | O        | TTL         | UART module 4 transmit.                                                                                                                          |
| N10        | GND      | -        | Power       | Ground reference for logic and I/O pins.                                                                                                         |
| N15        | PG0      | I/O      | TTL         | GPIO port G bit 0.                                                                                                                               |
|            | EN0PPS   | O        | TTL         | Ethernet 0 Pulse-Per-Second (PPS) Output.                                                                                                        |
|            | EPI0S11  | I/O      | TTL         | EPI module 0 signal 11.                                                                                                                          |
|            | I2C1SCL  | I/O      | OD          | I <sup>2</sup> C module 1 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|            | M0PWM4   | O        | TTL         | Motion Control Module 0 PWM 4. This signal is controlled by Module 0 PWM Generator 2.                                                            |
| N16        | VDD      | -        | Power       | Positive supply for I/O and some logic.                                                                                                          |
| N18        | PM7      | I/O      | TTL         | GPIO port M bit 7.                                                                                                                               |
|            | T5CCP1   | I/O      | TTL         | 16/32-Bit Timer 5 Capture/Compare/PWM 1.                                                                                                         |
|            | TMPR0    | I/O      | TTL         | Tamper signal 0.                                                                                                                                 |
|            | U0RI     | I        | TTL         | UART module 0 Ring Indicator modem status input signal.                                                                                          |
| N19        | PM6      | I/O      | TTL         | GPIO port M bit 6.                                                                                                                               |
|            | T5CCP0   | I/O      | TTL         | 16/32-Bit Timer 5 Capture/Compare/PWM 0.                                                                                                         |
|            | TMPR1    | I/O      | TTL         | Tamper signal 1.                                                                                                                                 |
|            | U0DSR    | I        | TTL         | UART module 0 Data Set Ready modem output control line.                                                                                          |

Table 30-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type | Description                                                                                                                                                                      |
|------------|-----------|----------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| P2         | PR5       | I/O      | TTL         | GPIO port R bit 5.                                                                                                                                                               |
|            | I2C3SDA   | I/O      | OD          | I <sup>2</sup> C module 3 data.                                                                                                                                                  |
|            | LCDDATA01 | I/O      | TTL         | LCD Data Pin 1 input/output.                                                                                                                                                     |
|            | M0PWM5    | O        | TTL         | Motion Control Module 0 PWM 5. This signal is controlled by Module 0 PWM Generator 2.                                                                                            |
|            | T0CCP1    | I/O      | TTL         | 16/32-Bit Timer 0 Capture/Compare/PWM 1.                                                                                                                                         |
|            | U1Rx      | I        | TTL         | UART module 1 receive.                                                                                                                                                           |
| P3         | PR4       | I/O      | TTL         | GPIO port R bit 4.                                                                                                                                                               |

| V5         | PA6       | I/O      | TTL         | GPIO port A bit 6.                                                                                                                               |
|            | EPI0S8    | I/O      | TTL         | EPI module 0 signal 8.                                                                                                                           |
|            | I2C6SCL   | I/O      | OD          | I <sup>2</sup> C module 6 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|            | SSI0XDAT2 | I/O      | TTL         | SSI Module 0 Bi-directional Data Pin 2.                                                                                                          |
|            | T3CCP0    | I/O      | TTL         | 16/32-Bit Timer 3 Capture/Compare/PWM 0.                                                                                                         |
|            | U2Rx      | I        | TTL         | UART module 2 receive.                                                                                                                           |
|            | USB0EPEN  | O        | TTL         | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                 |
| V6         | PF1       | I/O      | TTL         | GPIO port F bit 1.                                                                                                                               |
|            | EN0LED2   | O        | TTL         | Ethernet 0 LED 2.                                                                                                                                |
|            | M0PWM1    | O        | TTL         | Motion Control Module 0 PWM 1. This signal is controlled by Module 0 PWM Generator 0.                                                            |
|            | SSI3XDAT0 | I/O      | TTL         | SSI Module 3 Bi-directional Data Pin 0 (SSI3TX in Legacy SSI Mode).                                                                              |
|            | TRD1      | O        | TTL         | Trace data 1.                                                                                                                                    |

Table 30-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type | Description                                                                                                                                      |
|------------|-----------|----------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| V7         | PF4       | I/O      | TTL         | GPIO port F bit 4.                                                                                                                               |
|            | EN0LED1   | O        | TTL         | Ethernet 0 LED 1.                                                                                                                                |
|            | M0FAULT0  | I        | TTL         | Motion Control Module 0 PWM Fault 0.                                                                                                             |
|            | SSI3XDAT2 | I/O      | TTL         | SSI Module 3 Bi-directional Data Pin 2.                                                                                                          |
|            | TRD3      | O        | TTL         | Trace data 3.                                                                                                                                    |
| V8         | PR3       | I/O      | TTL         | GPIO port R bit 3.                                                                                                                               |
|            | I2C2SDA   | I/O      | OD          | I <sup>2</sup> C module 2 data.                                                                                                                  |
|            | LCDDATA03 | I/O      | TTL         | LCD Data Pin 3 input/output.                                                                                                                     |
|            | M0PWM3    | O        | TTL         | Motion Control Module 0 PWM 3. This signal is controlled by Module 0 PWM Generator 1.                                                            |
| V9         | PS4       | I/O      | TTL         | GPIO port S bit 4.                                                                                                                               |
|            | LCDDATA06 | I/O      | TTL         | LCD Data Pin 6 input/output.                                                                                                                     |
|            | PhA0      | I        | TTL         | QEI module 0 phase A.                                                                                                                            |
|            | T4CCP0    | I/O      | TTL         | 16/32-Bit Timer 4 Capture/Compare/PWM 0.                                                                                                         |
| V10        | PT1       | I/O      | TTL         | GPIO port T bit 1.                                                                                                                               |
|            | CAN0Tx    | O        | TTL         | CAN module 0 transmit.                                                                                                                           |
|            | LCDDATA11 | I/O      | TTL         | LCD Data Pin 11 input/output.                                                                                                                    |
|            | T6CCP1    | I/O      | TTL         | 16/32-Bit Timer 6 Capture/Compare/PWM 1.                                                                                                         |
| V11        | PG2       | I/O      | TTL         | GPIO port G bit 2.                                                                                                                               |
|            | I2C2SCL   | I/O      | OD          | I <sup>2</sup> C module 2 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|            | SSI2XDAT3 | I/O      | TTL         | SSI Module 2 Bi-directional Data Pin 3.                                                                                                          |
| V12        | PG6       | I/O      | TTL         | GPIO port G bit 6.                                                                                                                               |
|            | I2C4SCL   | I/O      | OD          | I <sup>2</sup> C module 4 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|            | SSI2Fss   | I/O      | TTL         | SSI module 2 frame signal.                                                                                                                       |
| V13        | EN0RXIN   | I/O      | TTL         | Ethernet PHY negative receive differential input.                                                                                                |
| V14        | EN0TX0N   | I/O      | TTL         | Ethernet PHY negative transmit differential output.                                                                                              |
| V15        | EN0TX0P   | I/O      | TTL         | Ethernet PHY positive transmit differential output.                                                                                              |
| V16        | PK6       | I/O      | TTL         | GPIO port K bit 6.                                                                                                                               |
|            | EN0LED1   | O        | TTL         | Ethernet 0 LED 1.                                                                                                                                |
|            | EPI0S25   | I/O      | TTL         | EPI module 0 signal 25.                                                                                                                          |
|            | I2C4SCL   | I/O      | OD          | I <sup>2</sup> C module 4 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|            | M0FAULT1  | I        | TTL         | Motion Control Module 0 PWM Fault 1.                                                                                                             |
| V17        | PK5       | I/O      | TTL         | GPIO port K bit 5.                                                                                                                               |
|            | EN0LED2   | O        | TTL         | Ethernet 0 LED 2.                                                                                                                                |

Table 30-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type | Description                                                                                                                                      |
|------------|-----------|----------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| W1         | GND       | -        | Power       | Ground reference for logic and I/O pins.                                                                                                         |
| W2         | GND       | -        | Power       | Ground reference for logic and I/O pins.                                                                                                         |
| W3         | PA1       | I/O      | TTL         | GPIO port A bit 1.                                                                                                                               |
|            | CAN0Tx    | O        | TTL         | CAN module 0 transmit.                                                                                                                           |
|            | I2C9SDA   | I/O      | OD          | I <sup>2</sup> C module 9 data.                                                                                                                  |
|            | T0CCP1    | I/O      | TTL         | 16/32-Bit Timer 0 Capture/Compare/PWM 1.                                                                                                         |
|            | U0Tx      | O        | TTL         | UART module 0 transmit.                                                                                                                          |
| W4         | PA5       | I/O      | TTL         | GPIO port A bit 5.                                                                                                                               |
|            | I2C7SDA   | I/O      | OD          | I <sup>2</sup> C module 7 data.                                                                                                                  |
|            | SSI0XDAT1 | I/O      | TTL         | SSI Module 0 Bi-directional Data Pin 1 (SSI0RX in Legacy SSI Mode).                                                                              |
|            | T2CCP1    | I/O      | TTL         | 16/32-Bit Timer 2 Capture/Compare/PWM 1.                                                                                                         |
|            | U3Tx      | O        | TTL         | UART module 3 transmit.                                                                                                                          |
| W6         | PF2       | I/O      | TTL         | GPIO port F bit 2.                                                                                                                               |
|            | M0PWM2    | O        | TTL         | Motion Control Module 0 PWM 2. This signal is controlled by Module 0 PWM Generator 1.                                                            |
|            | SSI3Fss   | I/O      | TTL         | SSI module 3 frame signal.                                                                                                                       |
|            | TRD0      | O        | TTL         | Trace data 0.                                                                                                                                    |
| W7         | PF5       | I/O      | TTL         | GPIO port F bit 5.                                                                                                                               |
|            | SSI3XDAT3 | I/O      | TTL         | SSI Module 3 Bi-directional Data Pin 3.                                                                                                          |
| W9         | PR6       | I/O      | TTL         | GPIO port R bit 6.                                                                                                                               |
|            | I2C4SCL   | I/O      | OD          | I <sup>2</sup> C module 4 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|            | LCDDATA04 | I/O      | TTL         | LCD Data Pin 4 input/output.                                                                                                                     |
|            | M0PWM6    | O        | TTL         | Motion Control Module 0 PWM 6. This signal is controlled by Module 0 PWM Generator 3.                                                            |
|            | T1CCP0    | I/O      | TTL         | 16/32-Bit Timer 1 Capture/Compare/PWM 0.                                                                                                         |
|            | U1Tx      | O        | TTL         | UART module 1 transmit.                                                                                                                          |
| W10        | PT0       | I/O      | TTL         | GPIO port T bit 0.                                                                                                                               |
|            | CAN0Rx    | I        | TTL         | CAN module 0 receive.                                                                                                                            |
|            | LCDDATA10 | I/O      | TTL         | LCD Data Pin 10 input/output.                                                                                                                    |
|            | T6CCP0    | I/O      | TTL         | 16/32-Bit Timer 6 Capture/Compare/PWM 0.                                                                                                         |
| W12        | PQ5       | I/O      | TTL         | GPIO port Q bit 5.                                                                                                                               |
|            | U1Tx      | O        | TTL         | UART module 1 transmit.                                                                                                                          |
| W13        | EN0RXIP   | I/O      | TTL         | Ethernet PHY positive receive differential input.                                                                                                |
| W15        | RBIAS     | O        | Analog      | 4.87-k $\Omega$ resistor (1% precision) for Ethernet PHY.                                                                                        |

Table 30-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type | Description                                                                                                                                                                   |
|------------|----------|----------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| W16        | PK7      | I/O      | TTL         | GPIO port K bit 7.                                                                                                                                                            |
|            | EPI0S24  | I/O      | TTL         | EPI module 0 signal 24.                                                                                                                                                       |
|            | I2C4SDA  | I/O      | OD          | I <sup>2</sup> C module 4 data.                                                                                                                                               |
|            | M0FAULT2 | I        | TTL         | Motion Control Module 0 PWM Fault 2.                                                                                                                                          |
|            | RTCCLK   | O        | TTL         | Buffered version of the Hibernation module's 32.768-kHz clock. This signal is not output when the part is in Hibernate mode and before being configured after power-on reset. |
|            | U0RI     | I        | TTL         | UART module 0 Ring Indicator modem status input signal.                                                                                                                       |
| W18        | NC       | -        | -           | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                  |

Table 30-3. Signals by Signal Name (continued)

| Pin Name  | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type | Description                                                                                                        |
|-----------|------------|--------------------------|----------|-------------|--------------------------------------------------------------------------------------------------------------------|
| LCDAC     | N1         | PJ6 (15)                 | O        | TTL         | LCD AC bias or latch enable in Raster mode; Primary chip select (CS0)/Primary Enable (E0) in LIDD MPU/Hitachi mode |
| LDCDP     | N5         | PR0 (15)                 | O        | TTL         | LCD Pixel Clock in Raster mode; read strobe or read/write strobe in LIDD mode                                      |
| LCDDATA00 | P3         | PR4 (15)                 | I/O      | TTL         | LCD Data Pin 0 input/output.                                                                                       |
| LCDDATA01 | P2         | PR5 (15)                 | I/O      | TTL         | LCD Data Pin 1 input/output.                                                                                       |
| LCDDATA02 | U8         | PF7 (15)                 | I/O      | TTL         | LCD Data Pin 2 input/output.                                                                                       |
| LCDDATA03 | V8         | PR3 (15)                 | I/O      | TTL         | LCD Data Pin 3 input/output.                                                                                       |
| LCDDATA04 | W9         | PR6 (15)                 | I/O      | TTL         | LCD Data Pin 4 input/output.                                                                                       |
| LCDDATA05 | R10        | PR7 (15)                 | I/O      | TTL         | LCD Data Pin 5 input/output.                                                                                       |
| LCDDATA06 | V9         | PS4 (15)                 | I/O      | TTL         | LCD Data Pin 6 input/output.                                                                                       |
| LCDDATA07 | T13        | PS5 (15)                 | I/O      | TTL         | LCD Data Pin 7 input/output.                                                                                       |
| LCDDATA08 | U10        | PS6 (15)                 | I/O      | TTL         | LCD Data Pin 8 input/output.                                                                                       |
| LCDDATA09 | R13        | PS7 (15)                 | I/O      | TTL         | LCD Data Pin 9 input/output.                                                                                       |
| LCDDATA10 | W10        | PT0 (15)                 | I/O      | TTL         | LCD Data Pin 10 input/output.                                                                                      |
| LCDDATA11 | V10        | PT1 (15)                 | I/O      | TTL         | LCD Data Pin 11 input/output.                                                                                      |
| LCDDATA12 | U12        | PN7 (15)                 | I/O      | TTL         | LCD Data Pin 12 input/output.                                                                                      |
| LCDDATA13 | T12        | PN6 (15)                 | I/O      | TTL         | LCD Data Pin 13 input/output.                                                                                      |
| LCDDATA14 | H17        | PJ2 (15)                 | I/O      | TTL         | LCD Data Pin 14 input/output.                                                                                      |
| LCDDATA15 | F16        | PJ3 (15)                 | I/O      | TTL         | LCD Data Pin 15 input/output.                                                                                      |
| LCDDATA16 | F18        | PJ4 (15)                 | O        | TTL         | LCD Data Pin 16 output.                                                                                            |
| LCDDATA17 | E17        | PJ5 (15)                 | O        | TTL         | LCD Data Pin 17 output.                                                                                            |
| LCDDATA18 | E18        | PT2 (15)                 | O        | TTL         | LCD Data Pin 18 output.                                                                                            |
| LCDDATA19 | F17        | PT3 (15)                 | O        | TTL         | LCD Data Pin 19 output.                                                                                            |
| LCDDATA20 | D12        | PS0 (15)                 | O        | TTL         | LCD Data Pin 20 output.                                                                                            |
| LCDDATA21 | D13        | PS1 (15)                 | O        | TTL         | LCD Data Pin 21 output.                                                                                            |
| LCDDATA22 | B14        | PS2 (15)                 | O        | TTL         | LCD Data Pin 22 output.                                                                                            |
| LCDDATA23 | A14        | PS3 (15)                 | O        | TTL         | LCD Data Pin 23 output.                                                                                            |
| LCDFP     | N4         | PR1 (15)                 | O        | TTL         | LCD Frame Clock or VSYNC in Raster mode; Address Latch Enable in LIDD mode                                         |
| LCDLP     | N2         | PR2 (15)                 | O        | TTL         | LCD Line Clock or HSYNC in Raster mode; Write Strobe or Direction bit in LIDD mode                                 |
| LCDMCLK   | T8         | PF6 (15)                 | O        | TTL         | LCD Memory Clock/Secondary chip Select (CS1)/Secondary Enable (E1) in LIDD Synchronous/Async MPU/Hitachi mode      |
| M0FAULT0  | V7<br>D12  | PF4 (6)<br>PS0 (6)       | I        | TTL         | Motion Control Module 0 PWM Fault 0.                                                                               |
| M0FAULT1  | V16<br>D13 | PK6 (6)<br>PS1 (6)       | I        | TTL         | Motion Control Module 0 PWM Fault 1.                                                                               |
| M0FAULT2  | W16<br>B14 | PK7 (6)<br>PS2 (6)       | I        | TTL         | Motion Control Module 0 PWM Fault 2.                                                                               |
| M0FAULT3  | G16<br>A14 | PL0 (6)<br>PS3 (6)       | I        | TTL         | Motion Control Module 0 PWM Fault 3.                                                                               |

Table 30-3. Signals by Signal Name (continued)

| Pin Name | Pin Number                            | Pin Mux / Pin Assignment | Pin Type | Buffer Type | Description                                                                               |
|----------|---------------------------------------|--------------------------|----------|-------------|-------------------------------------------------------------------------------------------|
| M0PWM0   | U6<br>N5                              | PF0 (6)<br>PR0 (6)       | O        | TTL         | Motion Control Module 0 PWM 0. This signal is controlled by Module 0 PWM Generator 0.     |
| M0PWM1   | V6<br>N4                              | PF1 (6)<br>PR1 (6)       | O        | TTL         | Motion Control Module 0 PWM 1. This signal is controlled by Module 0 PWM Generator 0.     |
| M0PWM2   | W6<br>N2                              | PF2 (6)<br>PR2 (6)       | O        | TTL         | Motion Control Module 0 PWM 2. This signal is controlled by Module 0 PWM Generator 1.     |
| M0PWM3   | T7<br>V8                              | PF3 (6)<br>PR3 (6)       | O        | TTL         | Motion Control Module 0 PWM 3. This signal is controlled by Module 0 PWM Generator 1.     |
| M0PWM4   | N15<br>P3                             | PG0 (6)<br>PR4 (6)       | O        | TTL         | Motion Control Module 0 PWM 4. This signal is controlled by Module 0 PWM Generator 2.     |
| M0PWM5   | T14<br>P2                             | PG1 (6)<br>PR5 (6)       | O        | TTL         | Motion Control Module 0 PWM 5. This signal is controlled by Module 0 PWM Generator 2.     |
| M0PWM6   | U19<br>W9                             | PK4 (6)<br>PR6 (6)       | O        | TTL         | Motion Control Module 0 PWM 6. This signal is controlled by Module 0 PWM Generator 3.     |
| M0PWM7   | V17<br>R10                            | PK5 (6)<br>PR7 (6)       | O        | TTL         | Motion Control Module 0 PWM 7. This signal is controlled by Module 0 PWM Generator 3.     |

| USB0DM   | B18            | PL7                            | I/O      | Analog      | Bidirectional differential data pin (D- per USB specification) for USB0.                                                                                                                                                                                      |
| USB0DP   | C18            | PL6                            | I/O      | Analog      | Bidirectional differential data pin (D+ per USB specification) for USB0.                                                                                                                                                                                      |
| USB0EPEN | V5<br>R7<br>B3 | PA6 (5)<br>PA7 (11)<br>PD6 (5) | O        | TTL         | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                                                                                              |
| USB0ID   | A16            | PB0                            | I        | Analog      | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
| USB0NXT  | B13            | PP2 (14)                       | O        | TTL         | Asserted by the external PHY to throttle all data types.                                                                                                                                                                                                      |
| USB0PFLT | R7<br>B2       | PA7 (5)<br>PD7 (5)             | I        | TTL         | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |
| USB0STP  | A17            | PB2 (14)                       | O        | TTL         | Asserted by the USB controller to signal the end of a USB transmit packet or register write operation.                                                                                                                                                        |

Table 30-3. Signals by Signal Name (continued)

| Pin Name | Pin Number                                                                                                     | Pin Mux / Pin Assignment | Pin Type | Buffer Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------|----------------------------------------------------------------------------------------------------------------|--------------------------|----------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USB0VBUS | B16                                                                                                            | PB1                      | I/O      | Analog      | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                                                                                                                                                                                                                                                                  |
| VBAT     | P19                                                                                                            | fixed                    | -        | Power       | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.                                                                                                                                                                                                                                                                                                                    |
| VDD      | G10<br>H9<br>J8<br>J9<br>J10<br>K7<br>K8<br>K11<br>N16<br>P17<br>K12<br>L10<br>L11<br>L12<br>M11<br>M12<br>P10 | fixed                    | -        | Power       | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| VDDA     | F3                                                                                                             | fixed                    | -        | Power       | The positive supply for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be supplied with a voltage that meets the specification in , regardless of system implementation.                                                                                                                                                                                   |
| VDDC     | H16<br>E10                                                                                                     | fixed                    | -        | Power       | Positive supply for most of the logic function, including the processor core and most peripherals. The voltage on this pin is 1.2 V and is supplied by the on-chip LDO. The VDDC pins should only be connected to each other and an external capacitor as specified in Table 31-15 on page 2067 .                                                                                                                                                                                                   |
| VREFA+   | F4                                                                                                             | fixed                    | -        | Analog      | A reference voltage used to specify the voltage at which the ADC converts to a maximum value. This pin is used in conjunction with VREFA- , which specifies the minimum value . The voltage that is applied to VREFA+ is the voltage with which an AINn signal is converted to 4095. The VREFA+ voltage is limited to the range specified in Table 31-44 on page 2094.                                                                                                                              |
| VREFA-   | G5                                                                                                             | fixed                    | -        | Analog      | A reference voltage used to specify the input voltage at which the ADC converts to a minimum value. This pin is used in conjunction with VREFA+ , which specifies the maximum value. In other words, the voltage that is applied to VREFA- is the voltage with which an AINn signal is converted to 0, while the voltage that is applied to VREFA+ is the voltage with which an AINn signal is converted to 4095. The VREFA- voltage is limited to the range specified in Table 31-44 on page 2094. |

**Table 30-3. Signals by Signal Name (continued)**

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type | Description                                                                                                                                                                     |
|----------|------------|--------------------------|----------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WAKE     | U18        | fixed                    | I        | TTL         | An external input that brings the processor out of Hibernate mode when asserted.                                                                                                |
| XOSC0    | T18        | fixed                    | I        | Analog      | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a crystal or a 32.768-kHz oscillator for the Hibernation module RTC. |
| XOSC1    | T19        | fixed                    | O        | Analog      | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                         |

### 30.3 Signals by Function, Except for GPIO

Table 30-4. Signals by Function, Except for GPIO

| Function | Pin Name | Pin Number | Pin Type | Buffer Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|          | VREFA+   | F4         | -        | Analog      | A reference voltage used to specify the voltage at which the ADC converts to a maximum value. This pin is used in conjunction with VREFA-, which specifies the minimum value. The voltage that is applied to VREFA+ is the voltage with which an AINn signal is converted to 4095. The VREFA+ voltage is limited to the range specified in Table 31-44 on page 2094.                                                                                                                               |
|          | VREFA-   | G5         | -        | Analog      | A reference voltage used to specify the input voltage at which the ADC converts to a minimum value. This pin is used in conjunction with VREFA+, which specifies the maximum value. In other words, the voltage that is applied to VREFA- is the voltage with which an AINn signal is converted to 0, while the voltage that is applied to VREFA+ is the voltage with which an AINn signal is converted to 4095. The VREFA- voltage is limited to the range specified in Table 31-44 on page 2094. |

Table 30-4. Signals by Function, Except for GPIO (continued)

| Function                | Pin Name | Pin Number      | Pin Type | Buffer Type | Description                                         |
|-------------------------|----------|-----------------|----------|-------------|-----------------------------------------------------|

|           | T7CCP1   | M1<br>M4<br>F17  | I/O      | TTL         | 16/32-Bit Timer 7 Capture/Compare/PWM 1.                                                                                                                                                                                                         |
| Hibernate | GNDX     | R18              | -        | Power       | GND for the Hibernation oscillator. When using a crystal clock source, this pin should be connected to digital ground along with the crystal load capacitors. When using an external oscillator, this pin should be connected to digital ground. |
|           | HIB      | M17              | O        | TTL         | An output that indicates the processor is in Hibernate mode.                                                                                                                                                                                     |
|           | RTCCLK   | M1<br>W16<br>C12 | O        | TTL         | Buffered version of the Hibernation module's 32.768-kHz clock. This signal is not output when the part is in Hibernate mode and before being configured after power-on reset.                                                                    |
|           | TMPR0    | N18              | I/O      | TTL         | Tamper signal 0.                                                                                                                                                                                                                                 |
|           | TMPR1    | N19              | I/O      | TTL         | Tamper signal 1.                                                                                                                                                                                                                                 |
|           | TMPR2    | G15              | I/O      | TTL         | Tamper signal 2.                                                                                                                                                                                                                                 |
|           | TMPR3    | M18              | I/O      | TTL         | Tamper signal 3.                                                                                                                                                                                                                                 |
|           | VBAT     | P19              | -        | Power       | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.                                                                 |
|           | WAKE     | U18              | I        | TTL         | An external input that brings the processor out of Hibernate mode when asserted.                                                                                                                                                                 |
|           | XOSC0    | T18              | I        | Analog      | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a crystal or a 32.768-kHz oscillator for the Hibernation module RTC.                                                                  |
|           | XOSC1    | T19              | O        | Analog      | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                          |

Table 30-4. Signals by Function, Except for GPIO (*continued*)

| Function | Pin Name | Pin Number                    | Pin Type | Buffer Type | Description                                                                                                                                      |
|----------|----------|-------------------------------|----------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| I2C      | I2C0SCL  | A17                           | I/O      | OD          | I <sup>2</sup> C module 0 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|          | I2C0SDA  | B17                           | I/O      | OD          | I <sup>2</sup> C module 0 data.                                                                                                                  |
|          | I2C1SCL  | N15<br>N5                     | I/O      | OD          | I <sup>2</sup> C module 1 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|          | I2C1SDA  | T14<br>N4                     | I/O      | OD          | I <sup>2</sup> C module 1 data.                                                                                                                  |
|          | I2C2SCL  | V11<br>H19<br>B9<br>B12<br>N2 | I/O      | OD          | I <sup>2</sup> C module 2 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|          | I2C2SDA  | M16<br>G16<br>A10<br>B8<br>V8 | I/O      | OD          | I <sup>2</sup> C module 2 data.                                                                                                                  |
|          | I2C3SCL  | K17<br>U19<br>P3              | I/O      | OD          | I <sup>2</sup> C module 3 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|          | I2C3SDA  | K15<br>V17<br>P2              | I/O      | OD          | I <sup>2</sup> C module 3 data.                                                                                                                  |
|          | I2C4SCL  | V12<br>V16<br>W9              | I/O      | OD          | I <sup>2</sup> C module 4 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|          | I2C4SDA  | U14<br>W16<br>R10             | I/O      | OD          | I <sup>2</sup> C module 4 data.                                                                                                                  |
|          | I2C5SCL  | A16<br>C6                     | I/O      | OD          | I <sup>2</sup> C module 5 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|          | I2C5SDA  | B16<br>B6                     | I/O      | OD          | I <sup>2</sup> C module 5 data.                                                                                                                  |
|          | I2C6SCL  | V5<br>F2                      | I/O      | OD          | I <sup>2</sup> C module 6 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|          | I2C6SDA  | R7<br>F1                      | I/O      | OD          | I <sup>2</sup> C module 6 data.                                                                                                                  |
|          | I2C7SCL  | V4<br>C2                      | I/O      | OD          | I <sup>2</sup> C module 7 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |

|          | USB0DP   | C18            | I/O      | Analog      | Bidirectional differential data pin (D+ per USB specification) for USB0.                                                                                                                                                                                      |
|          | USB0EPEN | V5<br>R7<br>B3 | O        | TTL         | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                                                                                              |
|          | USB0ID   | A16            | I        | Analog      | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
|          | USB0NXT  | B13            | O        | TTL         | Asserted by the external PHY to throttle all data types.                                                                                                                                                                                                      |
|          | USB0PFLT | R7<br>B2       | I        | TTL         | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |
|          | USB0STP  | A17            | O        | TTL         | Asserted by the USB controller to signal the end of a USB transmit packet or register write operation.                                                                                                                                                        |
|          | USB0VBUS | B16            | I/O      | Analog      | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                            |

## 30.4 GPIO Pins and Alternate Functions

a. The TMPRn signals are digital signals enabled and configured by the Hibernation module. All other signals listed in this column are analog signals.

b. The digital signals that are shaded gray are the power-on default values for the corresponding GPIO pin. Encodings 9, 10, and 12 are not used on this device.

## 30.5 Possible Pin Assignments for Alternate Functions

Table 30-6. Possible Pin Assignments for Alternate Functions

| # of Possible Assignments | Alternate Function | GPIO Function |
|---------------------------|--------------------|---------------|
| one                       | AIN0               | PE3           |
|                           | AIN1               | PE2           |
|                           | AIN10              | PB4           |
|                           | AIN11              | PB5           |
|                           | AIN12              | PD3           |
|                           | AIN13              | PD2           |
|                           | AIN14              | PD1           |

## 30.6 Connections for Unused Signals

Table 30-7 on page 2049 show how to handle signals for functions that are not used in a particular system implementation for devices that are in a 212-ball BGA package. Two options are shown in the table: an acceptable practice and a preferred practice for reduced power consumption and improved EMC characteristics. If a module is not used in a system, and its inputs are grounded, it is important that the clock to the module is never enabled by setting the corresponding bit in the **RCGCx** register.

Table 30-7. Connections for Unused Signals (212-Ball BGA)

| Function  | Signal Name      | Pin Number | Acceptable Practice                      | Preferred Practice |
|-----------|------------------|------------|------------------------------------------|--------------------|
| ADC       | VREFA+           | F4         | VDDA                                     | VDDA               |
|           | VREFA-           | G5         | GND                                      | GND                |

|                | USB0DP / PL6 | C18                                           | NC                  | Pull-down to GND with 1K resistor <sup>d</sup> |

- a. The internal Ethernet PHY should not be enabled when RBIAS is not connected. The ROM boot loader will enable the internal Ethernet PHY if no code is present in the flash and a 24-25 Mhz crystal is attached to the OSC0/OSC1 pins.
- b. PA1 (UART0TX) may be enabled as an output by the ROM boot loader if no code is present in the flash and PA0 (UART0RX) receives a valid boot signature. Ensure that this condition will not occur if PA1 is to be connected directly to GND.
- c. PA4 (SSI0XDAT0) may be enabled as an output by the ROM boot loader if no code is present in the flash and the SSI0X (PA2, PA3, PA5) receives a valid boot signature. Ensure that this condition will not occur if PA4 is to be connected directly to GND.
- d. The ROM boot loader may configure these pins as USB pins if no code is present in the flash therefore they should not be directly connected to ground.

## 31 Electrical Characteristics

### 31.1 Maximum Ratings

The maximum ratings are the limits to which the device can be subjected without permanently damaging the device. Device reliability may be adversely affected by exposure to absolute-maximum ratings for extended periods.

**Note:** The device is not guaranteed to operate properly at the maximum ratings.

**Table 31-1. Absolute Maximum Ratings**

| Parameter             | Parameter Name <sup>a</sup>                       | Value |     | Unit |
|-----------------------|---------------------------------------------------|-------|-----|------|
|                       |                                                   | Min   | Max |      |
| V <sub>DD</sub>       | V <sub>DD</sub> supply voltage                    | 0     | 4   | V    |
| V <sub>DDA</sub>      | V <sub>DDA</sub> supply voltage                   | 0     | 4   | V    |
| V <sub>BAT</sub>      | V <sub>BAT</sub> battery supply voltage           | 0     | 4   | V    |
| V <sub>BATRMP</sub>   | V <sub>BAT</sub> battery supply voltage ramp time | 0     | 0.7 | V/μs |
| V <sub>IN_GPIO</sub>  | Input voltage <sup>b</sup>                        | -0.3  | 4   | V    |
| I <sub>GPIO MAX</sub> | Maximum current per output pin                    | -     | 64  | mA   |
| T <sub>S</sub>        | Unpowered storage temperature range               | -65   | 150 | °C   |
| T <sub>JMAX</sub>     | Maximum junction temperature                      | -     | 125 | °C   |

a. Voltages are measured with respect to GND.

b. Applies to static and dynamic signals including overshoot.

**Important:** This device contains circuitry to protect the I/Os against damage due to high-static voltages; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are connected to an appropriate logic voltage level (see “Connections for Unused Signals” on page 2049).

**Table 31-2. ESD Absolute Maximum Ratings**

| Parameter                                       | Parameter Name                   | Min | Nom | Max | Unit |
|-------------------------------------------------|----------------------------------|-----|-----|-----|------|
| Component-Level ESD Stress Voltage <sup>a</sup> | V <sub>ESDHBM</sub> <sup>b</sup> | -   | -   | 2.0 | kV   |
|                                                 | V <sub>ESDCDM</sub> <sup>c</sup> | -   | -   | 500 | V    |

a. Electrostatic discharge (ESD) is used to measure device sensitivity/immunity to damage caused by electrostatic discharges in device.

b. All pins are HBM compliant to 2 kV for all combinations as per JESD22-A114F, except for the following stress combinations:

- The Ethernet EN0RXIN, EN0TX0N, EN0RXIP, and EN0TXOP pins to each other.
- The GPIO pins PM4, PM5, PM6, and PM7 to other pins.

These exceptions are compliant to 500 V and do not require any special handling beyond typical ESD control procedures during assembly operations per JEDEC publication JEP155. Note that these pins do meet the 500 V CDM specification.

c. Level listed is the passing level per EIA-JEDEC JESD22-C101E. JEDEC document JEP157 states that 250 V CDM allows safe manufacturing with a standard ESD control process.

## 31.2 Operating Characteristics

**Table 31-3. Temperature Characteristics**

| Characteristic                       | Symbol | Value                                                                              | Unit |
|--------------------------------------|--------|------------------------------------------------------------------------------------|------|
| Ambient operating temperature range  | $T_A$  | -40 to 85 (industrial temperature part)<br>-40 to 105 (extended temperature part)  | °C   |
| Junction operating temperature range | $T_J$  | -40 to 105 (industrial temperature part)<br>-40 to 125 (extended temperature part) | °C   |

**Table 31-4. 212 BGA Power Dissipation<sup>ab</sup>**

| Parameter | Parameter Name                                  | $T_A$                               | $T_J$                                | Min | Max  | Unit |
|-----------|-------------------------------------------------|-------------------------------------|--------------------------------------|-----|------|------|
| $P_{DI}$  | Industrial temperature device power dissipation | 85 °C (industrial temperature part) | 125 °C (industrial temperature part) | -   | 1018 | mW   |
| $P_{DE}$  | Extended temperature device power dissipation   | 105 °C (extended temperature part)  | 125 °C (extended temperature part)   | -   | 509  | mW   |

a. If the device exceeds the power dissipation value shown, then modifications such as heat sinks or fans must be used to conform to the limits shown.

b. A larger power dissipation allowance can be achieved by lowering  $T_A$  as long as  $T_{JMAX}$  shown in Table 31-1 on page 2051 is not exceeded.

**Table 31-5. Thermal Characteristics<sup>a</sup>**

| Characteristic                                        | Symbol        | Value                                                                                                                                       | Unit |
|-------------------------------------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------|------|
| Thermal resistance (junction to ambient) <sup>b</sup> | $\Theta_{JA}$ | 39.3                                                                                                                                        | °C/W |
| Thermal resistance (junction to board) <sup>b</sup>   | $\Theta_{JB}$ | 18.6                                                                                                                                        | °C/W |
| Thermal resistance (junction to case) <sup>b</sup>    | $\Theta_{JC}$ | 12.9                                                                                                                                        | °C/W |
| Thermal metric (junction to top of package)           | $\Psi_{JT}$   | 0.2                                                                                                                                         | °C/W |
| Thermal metric (junction to board)                    | $\Psi_{JB}$   | 18.4                                                                                                                                        | °C/W |
| Junction temperature formula                          | $T_J$         | $T_C + (P \cdot \Psi_{JT})^c$<br>$T_{PCB} + (P \cdot \Psi_{JB})^d$<br>$T_A + (P \cdot \Theta_{JA})^e$<br>$T_B + (P \cdot \Theta_{JB})^{fg}$ | °C   |

a. For more details about thermal metrics and definitions, see the *Semiconductor and IC Package Thermal Metrics Application Report* (literature number [SPRA953](#)).

b. Junction to ambient thermal resistance ( $\Theta_{JA}$ ), junction to board thermal resistance ( $\Theta_{JB}$ ), and junction to case thermal resistance ( $\Theta_{JC}$ ) numbers are determined by a package simulator.

c.  $T_C$  is the case temperature and P is the device power consumption.

d.  $T_{PCB}$  is the temperature of the board acquired by following the steps listed in the EAI/JESD 51-8 standard summarized in the *Semiconductor and IC Package Thermal Metrics Application Report* (literature number [SPRA953](#)). P is the device power consumption.

e. Because  $\Theta_{JA}$  is highly variable and based on factors such as board design, chip/pad size, altitude, and external ambient temperature, it is recommended that equations containing  $\Psi_{JT}$  and  $\Psi_{JB}$  be used for best results.

f.  $T_B$  is temperature of the board.

g.  $\Theta_{JB}$  is not a pure reflection of the internal resistance of the package because it includes the resistance of the testing board and environment. It is recommended that equations containing  $\Psi_{JT}$  and  $\Psi_{JB}$  be used for best results.

## 31.3 Recommended Operating Conditions

The following sections describe the recommended DC operating conditions and GPIO operating characteristics for the device.

### 31.3.1 DC Operating Conditions

**Table 31-6. Recommended DC Operating Conditions**

| Parameter                     | Parameter Name                                   | Min  | Nom | Max  | Unit |
|-------------------------------|--------------------------------------------------|------|-----|------|------|
| V <sub>DD</sub>               | V <sub>DD</sub> supply voltage                   | 2.97 | 3.3 | 3.63 | V    |
| V <sub>DDA</sub> <sup>a</sup> | V <sub>DDA</sub> supply voltage                  | 2.97 | 3.3 | 3.63 | V    |
| V <sub>DDC</sub>              | V <sub>DDC</sub> supply voltage, Run mode        | 1.14 | 1.2 | 1.32 | V    |
| V <sub>DDCDS</sub>            | V <sub>DDC</sub> supply voltage, Deep-Sleep mode | 0.85 | -   | 0.95 | V    |

a. To ensure proper operation, V<sub>DDA</sub> must be powered up before V<sub>DD</sub> if sourced from different supplies, or connected to the same supply as V<sub>DD</sub>. There is not a restriction on order for powering off.

### 31.3.2 Recommended GPIO Operating Characteristics

Two types of pads are provided on the device:

- Fast GPIO pads: These pads provide variable, programmable drive strength and optimized voltage output levels.
- Slow GPIO pads: These pads provide 2-mA drive strength and are designed to be sensitive to voltage inputs. The following GPIOs port pins are designed with Slow GPIO Pads:
  - PJ1

All other GPIOs have a fast GPIO pad-type.

**Note:** Port pins PL6 and PL7 operate as Fast GPIO pads, but have 4-mA drive capability only. GPIO register controls for drive strength, slew rate and open drain have no effect on these pins. The registers which have no effect are as follows: **GPIO2R2R**, **GPIO4R**, **GPIO8R**, **GPIO12R**, **GPIOSLR**, and **GPIOODR**.

**Note:** Port pins PM[7:4] operate as Fast GPIO pads but support only 2-, 4-, 6-, and 8-mA drive capability. 10- and 12-mA drive are not supported. All standard GPIO register controls, except for the **GPIO12R** register, apply to these port pins.

Table 31-7 on page 2053 detail the GPIO operating conditions for these two different pad types.

**Table 31-7. Recommended FAST GPIO Pad Operating Conditions**

| Parameter        | Parameter Name                                  | Min                    | Nom | Max                    | Unit |
|------------------|-------------------------------------------------|------------------------|-----|------------------------|------|
| V <sub>IH</sub>  | Fast GPIO high-level input voltage              | 0.65 * V <sub>DD</sub> | -   | 4                      | V    |
| I <sub>IH</sub>  | Fast GPIO high-level input current <sup>a</sup> | -                      | -   | 300                    | nA   |
| V <sub>IL</sub>  | Fast GPIO low-level input voltage               | 0                      | -   | 0.35 * V <sub>DD</sub> | V    |
| I <sub>IL</sub>  | Fast GPIO low-level input current <sup>a</sup>  | -                      | -   | -200                   | nA   |
| V <sub>HYS</sub> | Fast GPIO Input Hysteresis                      | 0.49                   | -   | -                      | V    |
| V <sub>OH</sub>  | Fast GPIO High-level output voltage             | 2.4                    | -   | -                      | V    |
| V <sub>OL</sub>  | Fast GPIO Low-level output voltage              | -                      | -   | 0.40                   | V    |

**Table 31-7. Recommended FAST GPIO Pad Operating Conditions (continued)**

| Parameter | Parameter Name                                               | Min  | Nom | Max | Unit |
|-----------|--------------------------------------------------------------|------|-----|-----|------|
| $I_{OH}$  | Fast GPIO High-level source current, $V_{OH}=2.4\text{ V}^b$ |      |     |     |      |
|           | 2-mA Drive                                                   | 2.0  | -   | -   | mA   |
|           | 4-mA Drive                                                   | 4.0  | -   | -   | mA   |
|           | 8-mA Drive                                                   | 8.0  | -   | -   | mA   |
|           | 10-mA Drive                                                  | 10.0 | -   | -   | mA   |
|           | 12-mA Drive                                                  | 12.0 | -   | -   | mA   |
| $I_{OL}$  | Fast GPIO Low-level sink current, $V_{OL}=0.4\text{ V}^b$    |      |     |     |      |
|           | 2-mA Drive                                                   | 2.0  | -   | -   | mA   |
|           | 4-mA Drive                                                   | 4.0  | -   | -   | mA   |
|           | 8-mA Drive                                                   | 8.0  | -   | -   | mA   |
|           | 10-mA Drive                                                  | 10.0 | -   | -   | mA   |
|           | 12-mA Drive                                                  | 12.0 | -   | -   | mA   |
|           | 12-mA Drive overdriven to 18-mA                              | 18.0 | -   | -   | mA   |

a. Output/pull-up/pull-down disabled; only input enabled

b.  $I_O$  specifications reflect the maximum current where the corresponding output voltage meets the  $V_{OH}/V_{OL}$  thresholds.  $I_O$  current can exceed these limits (subject to absolute maximum ratings).

**Table 31-8. Recommended Slow GPIO Pad Operating Conditions**

| Parameter | Parameter Name                                     | Min             | Nom | Max             | Unit |
|-----------|----------------------------------------------------|-----------------|-----|-----------------|------|
| $V_{IH}$  | Slow GPIO high-level input voltage                 | $0.65 * V_{DD}$ | -   | 4               | V    |
| $I_{IH}$  | Slow GPIO high-level input current <sup>a</sup>    | -               | -   | 4.1             | nA   |
| $V_{IL}$  | Slow GPIO low-level input voltage                  | 0               | -   | $0.35 * V_{DD}$ | V    |
| $I_{IL}$  | Slow GPIO low-level input current <sup>a</sup>     | -               | -   | -1              | nA   |
| $V_{HYS}$ | Slow GPIO Input Hysteresis                         | 0.49            | -   | -               | V    |
| $V_{OH}$  | Slow GPIO High-level output voltage                | 2.4             | -   | -               | V    |
| $V_{OL}$  | Slow GPIO Low-level output voltage                 | -               | -   | 0.4             | V    |
| $I_{OH}$  | High-level source current, $V_{OH}=2.4\text{ V}^b$ |                 |     |                 |      |
|           | 2-mA Drive                                         | 2.0             | -   | -               | mA   |
| $I_{OL}$  | Low-level sink current, $V_{OL}=0.4\text{ V}^b$    |                 |     |                 |      |
|           | 2-mA Drive                                         | 2.0             | -   | -               | mA   |

a. Output/pull-up/pull-down disabled; only input enabled.

b.  $I_O$  specifications reflect the maximum current where the corresponding output voltage meets the  $V_{OH}/V_{OL}$  thresholds.  $I_O$  current can exceed these limits (subject to absolute maximum ratings).

### 31.3.2.1 GPIO Current Restrictions

**Table 31-9. GPIO Current Restrictions<sup>a</sup>**

| Parameter  | Parameter Name                                                | Min | Nom | Max | Unit |
|------------|---------------------------------------------------------------|-----|-----|-----|------|
| $I_{MAXL}$ | Cumulative maximum GPIO current per side, left <sup>b</sup>   | -   | -   | 110 | mA   |
| $I_{MAXB}$ | Cumulative maximum GPIO current per side, bottom <sup>b</sup> | -   | -   | 116 | mA   |
| $I_{MAXR}$ | Cumulative maximum GPIO current per side, right <sup>b</sup>  | -   | -   | 110 | mA   |

**Table 31-9. GPIO Current Restrictions (continued)**

| Parameter  | Parameter Name                                             | Min | Nom | Max | Unit |
|------------|------------------------------------------------------------|-----|-----|-----|------|
| $I_{MAXT}$ | Cumulative maximum GPIO current per side, top <sup>b</sup> | -   | -   | 88  | mA   |

a. Based on design simulations, not tested in production.

b. Sum of sink and source current for GPIOs as shown in Table 31-10 on page 2055.

**Table 31-10. Maximum GPIO Package Side Assignments**

| Side   | GPIOs                                                                             |
|--------|-----------------------------------------------------------------------------------|
| Left   | PB[6-7], PC[4-7], PD[0-3], PE[0-3], PH[0-7], PJ[6-7], PK[0-3], PQ[0-3,7], PR[0-5] |
| Bottom | PA[0-7], PF[0-7], PG[0-7], PK[4-7], PN[6-7], PR[3,6-7], PQ[5-6], PS[4-7], PT[0-1] |
| Right  | PB[0-3], PJ[2-5], PL[0-5,6-7], PM[0-7], PT[2-3]                                   |
| Top    | PB[4-5], PC[0-3], PD[4-7], PE[4-7], PJ[0-1], PN[0-5], PP[0-7], PQ[4], PS[0-3],    |

**I/O Reliability**

For typical continuous drive applications, I/O pins configured between 2 mA and 12 mA and operating at -40 to 85°C, meet the standard 10-year lifetime reliability. If a continuous current sink of 18 mA is required, then operation is limited to 0 to 75°C in order to meet the standard 10-year reliability.

At 105°C, I/O configured for continuous drive meet the standard 2.5 year lifetime reliability.

In typical switching applications (40% switch rate) operating at -40 to 85°C, all I/O configurations except 2 mA meet the standard 10-year lifetime reliability with 50-pF loading. By limiting the capacitive loading to 20 pF for an I/O configured to 2 mA, the 10-year lifetime reliability can be met at -40 to 85°C.

In typical switching applications (40% switch rate) operating at 105°C, all I/O configurations except 2 mA meet the standard 2.5-year lifetime reliability. By reducing the capacitive loading to 20 pF with a typical switching rate at 105°C, a 2-mA I/O configuration meets a 2.5 year lifetime reliability.

### 31.4 Load Conditions

Table 31-11 on page 2056 contains the load conditions used for timing measurements.

Figure 31-1. Load Conditions

Table 31-11. Load Conditions

| Signals                               | Load Value ( $C_L$ ) |
|---------------------------------------|----------------------|
| LCDDATA[23:0]                         | 25 pF                |
| EPIOS[35:0] SDRAM interface           | 30 pF                |
| EPIOS[35:0] General-Purpose interface |                      |
| EPIOS[35:0] Host-Bus interface        |                      |
| EPIOS[35:0] PSRAM interface           | 40 pF                |
| All other digital I/O signals         | 50 pF                |

## 31.5 JTAG and Boundary Scan

Table 31-12. JTAG Characteristics

| Parameter No. | Parameter       | Parameter Name                                                            | Min | Nom         | Max | Unit |
|---------------|-----------------|---------------------------------------------------------------------------|-----|-------------|-----|------|
| J1            | $F_{TCK}$       | TCK operational clock frequency <sup>a</sup>                              | 0   | -           | 10  | MHz  |
| J2            | $T_{TCK}$       | TCK operational clock period                                              | 100 | -           | -   | ns   |
| J3            | $T_{TCK\_LOW}$  | TCK clock Low time                                                        | -   | $t_{TCK}/2$ | -   | ns   |
| J4            | $T_{TCK\_HIGH}$ | TCK clock High time                                                       | -   | $t_{TCK}/2$ | -   | ns   |
| J5            | $T_{TCK\_R}$    | TCK rise time                                                             | 0   | -           | 10  | ns   |
| J6            | $T_{TCK\_F}$    | TCK fall time                                                             | 0   | -           | 10  | ns   |
| J7            | $T_{TMS\_SU}$   | TMS setup time to TCK rise                                                | 8   | -           | -   | ns   |
| J8            | $T_{TMS\_HLD}$  | TMS hold time from TCK rise                                               | 4   | -           | -   | ns   |
| J9            | $T_{TDI\_SU}$   | TDI setup time to TCK rise                                                | 18  | -           | -   | ns   |
| J10           | $T_{TDI\_HLD}$  | TDI hold time from TCK rise                                               | 4   | -           | -   | ns   |
| J11           | $T_{TDO\_ZDV}$  | TCK fall to Data Valid from High-Z, 2-mA drive                            | -   | 13          | 35  | ns   |
|               |                 | TCK fall to Data Valid from High-Z, 4-mA drive                            |     | 9           | 26  | ns   |
|               |                 | TCK fall to Data Valid from High-Z, 8-mA drive                            |     | 8           | 26  | ns   |
|               |                 | TCK fall to Data Valid from High-Z, 8-mA drive with slew rate control     |     | 10          | 29  | ns   |
|               |                 | TCK fall to Data Valid from High-Z, 10-mA drive                           |     | 11          | 13  | ns   |
|               |                 | TCK fall to Data Valid from High-Z, 12-mA drive                           |     | 11          | 14  | ns   |
| J12           | $T_{TDO\_DV}$   | TCK fall to Data Valid from Data Valid, 2-mA drive                        | -   | 14          | 20  | ns   |
|               |                 | TCK fall to Data Valid from Data Valid, 4-mA drive                        |     | 10          | 26  | ns   |
|               |                 | TCK fall to Data Valid from Data Valid, 8-mA drive                        |     | 8           | 21  | ns   |
|               |                 | TCK fall to Data Valid from Data Valid, 8-mA drive with slew rate control |     | 10          | 26  | ns   |
|               |                 | TCK fall to Data Valid from Data Valid, 10-mA drive                       |     | 12          | 14  | ns   |
|               |                 | TCK fall to Data Valid from Data Valid, 12-mA drive                       |     | 12          | 15  | ns   |
| J13           | $T_{TDO\_DVZ}$  | TCK fall to High-Z from Data Valid, 2-mA drive                            | -   | 7           | 16  | ns   |
|               |                 | TCK fall to High-Z from Data Valid, 4-mA drive                            |     | 7           | 16  | ns   |
|               |                 | TCK fall to High-Z from Data Valid, 8-mA drive                            |     | 7           | 16  | ns   |
|               |                 | TCK fall to High-Z from Data Valid, 8-mA drive with slew rate control     |     | 8           | 19  | ns   |
|               |                 | TCK fall to High-Z from Data Valid, 10-mA drive                           |     | 20          | 22  | ns   |
|               |                 | TCK fall to High-Z from Data Valid, 12-mA drive                           |     | 20          | 25  | ns   |

a. A ratio of at least 8:1 must be kept between the system clock and TCK.

## 31.6 Power and Brown-Out

Table 31-13. Power and Brown-Out Levels

| Parameter No. | Parameter          | Parameter Name                                | Min  | Nom  | Max      | Unit    |
|---------------|--------------------|-----------------------------------------------|------|------|----------|---------|
| P1            | $T_{VDDA\_RISE}$   | Analog Supply voltage ( $V_{DDA}$ ) rise time | -    | -    | $\infty$ | $\mu s$ |
| P2            | $T_{VDD\_RISE}$    | I/O Supply voltage ( $V_{DD}$ ) rise time     | -    | -    | $\infty$ | $\mu s$ |
| P3            | $T_{VDDC\_RISE}^a$ | Core Supply Voltage ( $V_{DDC}$ ) rise time   | 10   | -    | 150      | $\mu s$ |
| P4            | $V_{POR}$          | Power-On Reset Threshold (Rising Edge)        | 1.98 | 2.35 | 2.72     | V       |
|               |                    | Power-On Reset Threshold (Falling Edge)       | 1.84 | 2.20 | 2.56     | V       |
|               |                    | Power-On Reset Hysteresis                     | 0.06 | 0.15 | 0.24     | V       |
| P5            | $V_{DDA\_POK}$     | $V_{DDA}$ Power-OK Threshold (Rising Edge)    | 2.67 | 2.82 | 2.97     | V       |
| P6            | $V_{DDA\_BOR0}$    | $V_{DDA}$ Brown-Out Reset Threshold           | 2.71 | 2.80 | 2.89     | V       |
| P7            | $V_{DD\_POK}$      | $V_{DD}$ Power-OK Threshold (Rising Edge)     | 2.65 | 2.80 | 2.90     | V       |
|               |                    | $V_{DD}$ Power-OK Threshold (Falling Edge)    | 2.67 | 2.76 | 2.85     | V       |
| P8            | $V_{DD\_BOR0}$     | $V_{DD}$ Brown-Out Reset Threshold            | 2.77 | 2.86 | 2.95     | V       |
| P9            | $V_{DDC\_POK}$     | $V_{DDC}$ Power-OK Threshold (Rising Edge)    | 0.85 | 0.95 | 1.10     | V       |
|               |                    | $V_{DDC}$ Power-OK Threshold (Falling Edge)   | 0.71 | 0.80 | 0.85     | V       |

a. The MIN and MAX values are based on an external filter capacitor load within the range of  $C_{LDO}$ . Please refer to "On-Chip Low Drop-Out (LDO) Regulator" on page 2067 for the  $C_{LDO}$  value.

### 31.6.1 $V_{DDA}$ Levels

The  $V_{DDA}$  supply has three monitors:

- Power-On Reset (POR)
- Power-OK (POK)
- Brown Out Reset (BOR)

The POR monitor is used to keep the analog circuitry in reset until the  $V_{DDA}$  supply has reached the correct range for the analog circuitry to begin operating. The POK monitor is used to keep the digital circuitry in reset until the  $V_{DDA}$  power supply is at an acceptable operational level. The digital reset is only released when the Power-On Reset has deasserted and all of the Power-OK monitors for each of the supplies indicate that power levels are in operational ranges. The BOR monitor is used to generate a reset to the device or assert an interrupt if the  $V_{DDA}$  supply drops below its operational range.

**Note:**  $V_{DDA}$  BOR and  $V_{DD}$  BOR events are a combined BOR to the system logic, such that if either BOR event occurs, the following bits are affected:

- BORRIS bit in the **Raw Interrupt Status (RIS)** register, System Control offset 0x050. See page 271.
- BORMIS bit in the **Masked Interrupt Status and Clear (MISC)** register, System Control offset 0x058. This bit is set only if the BORIM bit in the **Interrupt Mask Control (IMC)** register has been set. See page 273 and page 275.

- BOR bit in the **Reset Cause (RESC)** register, System Control offset 0x05C. This bit is set only if either of the BOR events have been configured to initiate a reset. See page 277.

In addition, the following bits control both BOR events:

- BORIM bit in the **Interrupt Mask Control (IMC)** register, System Control offset 0x054.
- VDDA\_UBOR0 and VDD\_LBOR0 bits in the **Power-Temperature Cause (PWRTC)** register.

Please refer to “System Control” on page 230 for more information on how to configure these registers.

Figure 31-4 on page 2060 shows the relationship between  $V_{DDA}$ , POK, POR and a BOR event.

**Figure 31-4. Power and Brown-Out Assertions vs  $V_{DDA}$  Levels**

### 31.6.2 $V_{DD}$ Levels

The  $V_{DD}$  supply has two monitors:

- Power-OK (POK)
- Brown Out Reset (BOR)

The POK monitor is used to keep the digital circuitry in reset until the  $V_{DD}$  power supply is at an acceptable operational level. The digital reset is only released when the Power-On Reset has deasserted and all of the Power-OK monitors for each of the supplies indicate that power levels are

in operational ranges. The BOR monitor is used to generate a reset to the device or assert an interrupt if the  $V_{DD}$  supply drops below its operational range.

**Note:**  $V_{DDA}$  BOR and  $V_{DD}$  BOR events are a combined BOR to the system logic, such that if either BOR event occurs, the following bits are affected:

- BORRIS bit in the **Raw Interrupt Status (RIS)** register, System Control offset 0x050. See page 271.
- BORMIS bit in the **Masked Interrupt Status and Clear (MISC)** register, System Control offset 0x058. This bit is set only if the BORIM bit in the **Interrupt Mask Control (IMC)** register has been set. See page 273 and page 275.
- BOR bit in the **Reset Cause (RESC)** register, System Control offset 0x05C. This bit is set only if either of the BOR events have been configured to initiate a reset. See page 277.

In addition, the following bits control both BOR events:

- BORIM bit in the **Interrupt Mask Control (IMC)** register, System Control offset 0x054.
- $V_{DDA\_UBOR0}$  and  $V_{DD\_UBOR0}$  bits in the **Power-Temperature Cause (PWRTC)** register.

Please refer to “System Control” on page 230 for more information on how to configure these registers.

Figure 31-5 on page 2061 shows the relationship between  $V_{DD}$ , POK, POR and a BOR event.

**Figure 31-5. Power and Brown-Out Assertions vs  $V_{DD}$  Levels**

### 31.6.3 $V_{DDC}$ Levels

The  $V_{DDC}$  supply has one monitor, the Power-OK (POK). The POK monitor is used to keep the digital circuitry in reset until the  $V_{DDC}$  power supply is at an acceptable operational level. The digital reset is only released when the Power-On Reset has deasserted and all of the Power-OK monitors for each of the supplies indicate that power levels are in operational ranges. Figure 31-6 on page 2062 shows the relationship between POK and  $V_{DDC}$ .

Figure 31-6. POK Assertion vs  $V_{DDC}$ 

### 31.6.4 Response

#### 31.6.4.1 $V_{DD}$ Glitch Response

Figure 31-7 on page 2062 shows the response of the BOR and the POR circuit to glitches on the VDD supply.

Figure 31-7. POR-BOR  $V_{DD}$  Glitch Response

#### 31.6.4.2 $V_{DD}$ Droop Response

Figure 31-8 on page 2063 shows the response of the BOR and the POR monitors to a drop on the VDD supply.

Figure 31-8. POR-BOR  $V_{DD}$  Droop Response

## 31.7 Reset

**Table 31-14. Reset Characteristics<sup>a</sup>**

| Parameter No. | Parameter         | Parameter Name                                                                | Min  | Nom                                 | Max               | Unit    |
|---------------|-------------------|-------------------------------------------------------------------------------|------|-------------------------------------|-------------------|---------|
| R1            | $T_{DPODLY}^b$    | Digital POR to Internal Reset assertion delay <sup>c</sup>                    | 0.44 | -                                   | 126               | $\mu s$ |
| R2            | $T_{IRTOUD}^{bd}$ | Standard Internal Reset time                                                  | -    | 14                                  | 16                | ms      |
|               |                   | Internal Reset time with recovery code repair (program or erase) <sup>e</sup> | 24.4 | -                                   | 6400 <sup>f</sup> | ms      |
| R3            | $T_{BOR0DLY}^b$   | BOR0 to Internal Reset assertion delay <sup>c</sup>                           | 0.44 | -                                   | 125               | $\mu s$ |
| R4            | $T_{RSTMIN}$      | Minimum RST pulse width                                                       | -    | 0.25 <sup>g</sup> /100 <sup>h</sup> | -                 | $\mu s$ |
| R5            | $T_{IRHWDLY}$     | RST to Internal Reset assertion delay                                         | -    | 0.85                                | -                 | $\mu s$ |

| R7            | $T_{IRWDR}^b$     | Internal reset timeout after Watchdog reset                                   | -    | 2.44                                | -                 | $\mu s$ |
| R8            | $T_{IRMFR}^b$     | Internal reset timeout after MOSC failure reset                               | -    | 2.44                                | -                 | $\mu s$ |

a. Minimum timings are for reset assertion using PIOSC as a clock source. Maximum timings are for reset assertion using LFIOSC in Deep-Sleep Operation.

b. These values are based on simulation.

c. Timing values are dependent on the  $V_{DD}$  power-down ramp rate.

d. This is the delay from the time POR is released until the reset vector is fetched.

e. This parameter applies only in situations where a power-loss or brown-out event occurs during an EEPROM program or erase operation, and EEPROM needs to be repaired (which is a rare case). For all other sequences, there is no impact to normal Power-On Reset (POR) timing. This delay is in addition to other POR delays.

f. This value represents the maximum internal reset time when the EEPROM reaches its endurance limit.

g. Standard operation.

h. Deep-Sleep operation with PIOSC powered down.

**Figure 31-9. Digital Power-On Reset Timing**

The digital Power-On Reset is only released when the analog Power-On Reset has deasserted and all of the Power-OK monitors for each of the supplies indicate that power levels are in operational ranges.

**Figure 31-10. Brown-Out Reset Timing****Figure 31-11. External Reset Timing ( $\overline{RST}$ )****Figure 31-12. Software Reset Timing****Figure 31-13. Watchdog Reset Timing**

**Figure 31-14. MOSC Failure Reset Timing**

## 31.8 On-Chip Low Drop-Out (LDO) Regulator

Table 31-15. LDO Regulator Characteristics

| Parameter           | Parameter Name                                                        | Min  | Nom | Max  | Unit |
|---------------------|-----------------------------------------------------------------------|------|-----|------|------|
| C <sub>LDO</sub>    | External filter capacitor size for internal power supply <sup>a</sup> | 2.5  | -   | 4.0  | μF   |
| ESR                 | Filter capacitor equivalent series resistance                         | 0    | -   | 100  | mΩ   |
| ESL                 | Filter capacitor equivalent series inductance                         | -    | -   | 0.5  | nH   |
| V <sub>LDO</sub>    | LDO output voltage, Run mode                                          | 1.13 | 1.2 | 1.27 | V    |
| I <sub>INRUSH</sub> | Inrush current                                                        | 50   | -   | 250  | mA   |

a. The capacitor should be connected as close as possible to pin E10.

## 31.9 Clocks

The following sections provide specifications on the various clock sources and mode.

### 31.9.1 PLL Specifications

The following tables provide specifications for using the PLL.

**Note:** If the integrated Ethernet PHY is used in this device, then  $F_{REF\_XTAL}$  and  $F_{REF\_EXT}$  are required to be 25 MHz.

**Table 31-16. Phase Locked Loop (PLL) Characteristics**

| Parameter       | Parameter Name                                                                         | Min | Nom | Max                            | Unit |
|-----------------|----------------------------------------------------------------------------------------|-----|-----|--------------------------------|------|
| $F_{REF\_XTAL}$ | Crystal reference                                                                      | 5   | -   | 25                             | MHz  |
| $F_{REF\_EXT}$  | External clock reference                                                               | 5   | -   | 25                             | MHz  |
| $F_{PLL}$       | PLL VCO frequency at 1.2V <sup>a</sup>                                                 | -   | -   | 480                            | MHz  |
| $F_{PLLS}$      | PLL VCO frequency at 0.9V <sup>b</sup>                                                 | -   | -   | 480                            | MHz  |
| $T_{READY}$     | PLL lock time (enabling the PLL) when PLL is transitioning from power down to power up | -   | -   | 512 * (reference clock period) | μs   |
|                 | PLL lock time when the PLL VCO frequency is changed (PLL is already enabled)           | -   | -   | 128 * (reference clock period) | μs   |
|                 | PLL lock time, changing the OSCSRC between MOSC and PIOSC                              | -   | -   | 128 * (reference clock period) | μs   |

a. PLL frequency is manually calculated using the values in the PLLFREQ0 and PLLFREQ1 registers.

b. If the LDO is dropped to 0.9V, the system must be run 1/4 of the maximum frequency at most. The Q value in the **PLLFREQ1** register must be set to 0x3 rather than using the PSYSDIV field in the **RSCLKCFG** register for the divisor.

#### 31.9.1.1 PLL Configuration

The PLL is disabled by default during power-on reset and is enabled later by software if required. Software specifies the output divisor to set the system clock frequency and enables the PLL to drive the output. The PLL is controlled using the **PLLFREQ0**, **PLLFREQ1** and **PLLSTAT** registers. Changes made to these registers do not become active until after the NEWFREQ bit in the **RSCLKCFG** register is enabled.

The clock source for the main PLL is selected by configuring the PLLSRC field in the **Run and Sleep Clock Configuration (RSCLKCFG)** register.

The PLL allows for the generation of system clock frequencies in excess of the reference clock provided. The reference clocks for the PLL are the PIOSC and the MOSC. The PLL is controlled by two registers, **PLLFREQ0** and **PLLFREQ1**. The PLL VCO frequency ( $f_{VCO}$ ) is determined through the following calculation:

$$f_{VCO} = f_{IN} * MDIV$$

where

$$f_{IN} = f_{XTAL} / ((Q+1)(N+1)) \text{ or } f_{PIOSC} / ((Q+1)(N+1))$$

$$MDIV = MINT + (MFRAC / 1024)$$

The Q and N values are programmed in the **PLLFREQ1** register. Note that to reduce jitter, MFRAC should be programmed to 0x0.

When the PLL is active, the system clock frequency (SysClk) is calculated using the following equation:

$$\text{SysClk} = f_{\text{VCO}} / (\text{PSYSDIV} + 1)$$

The PLL system divisor factor (PSYSDIV) determines the value of the system clock. Table 5-6 on page 247 shows how the system divisor encodings affect the system clock frequency when the  $f_{\text{VCO}} = 480$  MHz.

**Table 31-17. System Divisor Factors for  $f_{\text{VCO}}=480$  MHz**

| System Clock (SYSCLK) (MHz) | $f_{\text{VCO}}$ (MHz)= 480 MHz           |
|-----------------------------|-------------------------------------------|
|                             | System Divisors (PSYSDIV +1) <sup>a</sup> |
| 120                         | 4                                         |
| 60                          | 8                                         |
| 48                          | 10                                        |
| 30                          | 16                                        |
| 24                          | 20                                        |
| 12                          | 40                                        |
| 6                           | 80                                        |

a. The use of non-integer divisors introduce additional jitter which may affect interface performance.

If the main oscillator provides the clock reference to the PLL, the translation provided by hardware and used to program the PLL is available for software in the **PLL Frequency n (PLLREQn)** registers (see page 302). The internal translation provides a translation within  $\pm 1\%$  of the targeted PLL VCO frequency. Table 5-7 on page 248 shows the actual PLL frequency and error for a given crystal choice.

Table 5-7 on page 248 provides examples of the programming expected for the **PLLREQ0** and **PLLREQ1** registers. The first column specifies the input crystal frequency and the last column displays the PLL frequency given the values of MINT and N, when Q=0.

**Table 31-18. Actual PLL Frequency<sup>a</sup>**

| Crystal Frequency (MHz) | MINT (Decimal Value) | MINT (Hexadecimal Value) | N   | Reference Frequency (MHz) <sup>b</sup> | PLL Frequency (MHz) |
|-------------------------|----------------------|--------------------------|-----|----------------------------------------|---------------------|
| 5                       | 64                   | 0x40                     | 0x0 | 5                                      | 320                 |
| 6                       | 160                  | 0x35                     | 0x2 | 2                                      | 320                 |
| 8                       | 40                   | 0x28                     | 0x0 | 8                                      | 320                 |
| 10                      | 32                   | 0x20                     | 0x0 | 10                                     | 320                 |
| 12                      | 80                   | 0x50                     | 0x2 | 4                                      | 320                 |
| 16                      | 20                   | 0x14                     | 0x0 | 16                                     | 320                 |
| 18                      | 160                  | 0xA0                     | 0x8 | 2                                      | 320                 |
| 20                      | 16                   | 0x10                     | 0x0 | 20                                     | 320                 |
| 24                      | 40                   | 0x28                     | 0x2 | 8                                      | 320                 |
| 25                      | 64                   | 0x40                     | 0x4 | 5                                      | 320                 |
| 5                       | 96                   | 0x60                     | 0x0 | 5                                      | 480                 |
| 6                       | 80                   | 0x50                     | 0x0 | 6                                      | 480                 |
| 8                       | 60                   | 0x3C                     | 0x0 | 8                                      | 480                 |

Table 31-18. Actual PLL Frequency (*continued*)

| Crystal Frequency (MHz) | MINT (Decimal Value) | MINT (Hexadecimal Value) | N   | Reference Frequency (MHz) <sup>b</sup> | PLL Frequency (MHz) |
|-------------------------|----------------------|--------------------------|-----|----------------------------------------|---------------------|
| 10                      | 48                   | 0x30                     | 0x0 | 10                                     | 480                 |
| 12                      | 40                   | 0x28                     | 0x0 | 12                                     | 480                 |
| 16                      | 30                   | 0x1E                     | 0x0 | 16                                     | 480                 |
| 18                      | 80                   | 0x50                     | 0x2 | 6                                      | 480                 |
| 20                      | 24                   | 0x18                     | 0x0 | 20                                     | 480                 |
| 24                      | 20                   | 0x14                     | 0x0 | 24                                     | 480                 |
| 25                      | 96                   | 0x60                     | 0x4 | 5                                      | 480                 |

a. For all examples listed, Q=0

b. For a given crystal frequency, N should be chosen such that the reference frequency is within 4 to 30 MHz.

## 31.9.2 PIOSC Specifications

Table 31-19. PIOSC Clock Characteristics

| Parameter          | Parameter Name                                                                                                                                                     | Min | Nom | Max   | Unit |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|-----|-------|------|
| F <sub>PIOSC</sub> | Factory calibration, 0 to +105°C:<br>Internal 16-MHz precision oscillator frequency variance across voltage and temperature range when factory calibration is used | -   | -   | ±4.5% | -    |
|                    | Factory calibration, -40°C to <0°C                                                                                                                                 | -   | -   | ±10%  | -    |
|                    | Recalibration:<br>Internal 16-MHz precision oscillator frequency variance when recalibration is used at a specific temperature                                     | -   | -   | ±1%   | -    |
| T <sub>START</sub> | PIOSC startup time <sup>a</sup>                                                                                                                                    | -   | -   | 1     | μs   |

a. PIOSC startup time is part of reset and is included in the internal reset timeout value (T<sub>IRTOU</sub>) given in Table 31-14 on page 2064. Note that the T<sub>START</sub> value is based on simulation.

## 31.9.3 Low-Frequency Internal Oscillator Specifications

Table 31-20. Low-Frequency Oscillator Characteristics

| Parameter           | Parameter Name                              | Min | Nom | Max | Unit |
|---------------------|---------------------------------------------|-----|-----|-----|------|
| F <sub>LFIOSC</sub> | Internal low-frequency oscillator frequency | 10  | 33  | 75  | KHz  |

## 31.9.4 Hibernation Clock Source Specifications

Table 31-21. Hibernation Internal Low Frequency Oscillator Clock Characteristics

| Parameter              | Parameter Name                                          | Min | Nom | Max | Unit |
|------------------------|---------------------------------------------------------|-----|-----|-----|------|
| F <sub>HIBLFIOSC</sub> | Internal Low Frequency Hibernation oscillator frequency | 10  | 33  | 90  | KHz  |

Table 31-22. Hibernation External Oscillator (XOSC) Input Characteristics

| Parameter                         | Parameter Name                                              | Min | Nom    | Max | Unit |
|-----------------------------------|-------------------------------------------------------------|-----|--------|-----|------|
| F <sub>HIBXOSC</sub> <sup>a</sup> | Parallel resonance frequency                                | -   | 32.768 | -   | KHz  |
| C <sub>1</sub> , C <sub>2</sub>   | External load capacitance on XOSC0, XOSC1 pins <sup>b</sup> | 12  | -      | 24  | pF   |
| C <sub>PKG</sub>                  | Device package stray shunt capacitance <sup>b</sup>         | -   | 0.5    | -   | pF   |

**Table 31-22. Hibernation External Oscillator (XOSC) Input Characteristics (continued)**

| Parameter                | Parameter Name                                                                               | Min          | Nom | Max               | Unit |
|--------------------------|----------------------------------------------------------------------------------------------|--------------|-----|-------------------|------|
| $C_{PCB}$                | PCB stray shunt capacitance <sup>b</sup>                                                     | -            | 0.5 | -                 | pF   |
| $C_{SHUNT}$              | Total shunt capacitance <sup>b</sup>                                                         | -            | -   | 4                 | pF   |
| ESR                      | Crystal effective series resistance, OSCDRV = 0 <sup>c</sup>                                 | -            | -   | 50                | kΩ   |
|                          | Crystal effective series resistance, OSCDRV = 1 <sup>c</sup>                                 | -            | -   | 75                | kΩ   |
| DL                       | Oscillator output drive level                                                                | -            | -   | 0.25              | μW   |
| $T_{START}$              | Oscillator startup time, when using a crystal <sup>d</sup>                                   | -            | 600 | 1500 <sup>e</sup> | ms   |
| $V_{IH}^f$               | CMOS input high level, when using an external oscillator with Supply > 3.3 V                 | 2.64         | -   | -                 | V    |
|                          | CMOS input high level, when using an external oscillator with 1.8 V ≤ Supply ≤ 3.3 V         | 0.8 * Supply | -   | -                 | V    |
| $V_{IL}^f$               | CMOS input low level, when using an external oscillator with 1.8 V ≤ Supply ≤ 3.63 V         | -            | -   | 0.2 * Supply      | V    |
| $V_{HYS}^f$              | CMOS input buffer hysteresis, when using an external oscillator with 1.8 V ≤ Supply ≤ 3.63 V | 360          | 960 | 1390              | mV   |
| DC <sub>HIBOSC_EXT</sub> | External single-Ended (Bypass) reference duty cycle                                          | 30           | -   | 70                | %    |

a. The HIB XOSC pins are non-failsafe and must follow the limits detailed in “Non-Power I/O Pins” on page 2084.

b. See information below table.

c. Crystal ESR specified by crystal manufacturer.

d. Oscillator startup time is specified from the time the oscillator is enabled to when it reaches a stable point of oscillation such that the internal clock is valid.

e. Only valid for recommended supply conditions. Measured with OSCDRV bit set (high drive strength enabled, 24 pF).

f. Specification is relative to the larger of  $V_{DD}$  or  $V_{BAT}$ .

The load capacitors added on the board,  $C_1$  and  $C_2$ , should be chosen such that the following equation is satisfied (see Table 31-22 on page 2070 for typical values).

- $C_L$  = load capacitance specified by crystal manufacturer
- $C_L = (C_1 * C_2) / (C_1 + C_2) + C_{PKG} + C_{PCB}$
- $C_{SHUNT} = C_{PKG} + C_{PCB} + C_0$  (total shunt capacitance seen across XOSC0, XOSC1)
- $C_{PKG}$ ,  $C_{PCB}$  as measured across the XOSC0, XOSC1 pins excluding the crystal
- Clear the OSCDRV bit in the **Hibernation Control (HIBCTL)** register for  $C_{1,2} \leq 18$  pF; set the OSCDRV bit for  $C_{1,2} > 18$  pF.
- $C_0$  = Shunt capacitance of crystal specified by the crystal manufacturer

### 31.9.5 Main Oscillator Specifications

**Table 31-23. Main Oscillator Input Characteristics<sup>a</sup>**

| Parameter               | Parameter Name                                            | Min            | Nom | Max | Unit |
|-------------------------|-----------------------------------------------------------|----------------|-----|-----|------|
| $F_{MOSC}$              | Parallel resonance frequency                              | 4 <sup>b</sup> | -   | 25  | MHz  |
| $F_{REF\_XTAL\_BYPASS}$ | External clock reference (PLL in BYPASS mode)             | 0              | -   | 120 | MHz  |
| $C_1, C_2$              | External load capacitance on OSC0, OSC1 pins <sup>c</sup> | 12             | -   | 24  | pF   |
| $C_{PKG}$               | Device package stray shunt capacitance <sup>c</sup>       | -              | 0.5 | -   | pF   |

**Table 31-23. Main Oscillator Input Characteristics (continued)**

| Parameter             | Parameter Name                                                  | Min                    | Nom                | Max                    | Unit |
|-----------------------|-----------------------------------------------------------------|------------------------|--------------------|------------------------|------|
| C <sub>PCB</sub>      | PCB stray shunt capacitance <sup>c</sup>                        | -                      | 0.5                | -                      | pF   |
| C <sub>SHUNT</sub>    | Total shunt capacitance <sup>c</sup>                            | -                      | -                  | 4                      | pF   |
| ESR                   | Crystal effective series resistance, 4 MHz <sup>de</sup>        | -                      | -                  | 300                    | Ω    |
|                       | Crystal effective series resistance, 6 MHz <sup>de</sup>        | -                      | -                  | 200                    | Ω    |
|                       | Crystal effective series resistance, 8 MHz <sup>de</sup>        | -                      | -                  | 130                    | Ω    |
|                       | Crystal effective series resistance, 12 MHz <sup>de</sup>       | -                      | -                  | 120                    | Ω    |
|                       | Crystal effective series resistance, 16 MHz <sup>de</sup>       | -                      | -                  | 100                    | Ω    |
|                       | Crystal effective series resistance, 25 MHz <sup>de</sup>       | -                      | -                  | 50                     | Ω    |
| DL                    | Oscillator output drive level <sup>f</sup>                      | -                      | OSC <sub>PWR</sub> | -                      | mW   |
| T <sub>START</sub>    | Oscillator startup time, when using a crystal <sup>g</sup>      | -                      | -                  | 18                     | ms   |
| V <sub>IH</sub>       | CMOS input high level, when using an external oscillator        | 0.65 * V <sub>DD</sub> | -                  | V <sub>DD</sub>        | V    |
| V <sub>IL</sub>       | CMOS input low level, when using an external oscillator         | GND                    | -                  | 0.35 * V <sub>DD</sub> | V    |
| V <sub>HYS</sub>      | CMOS input buffer hysteresis, when using an external oscillator | 150                    | -                  | -                      | mV   |
| DC <sub>OSC_EXT</sub> | External clock reference duty cycle                             | 45                     | -                  | 55                     | %    |

a. Refer to Table 31-50 on page 2104 and Table 31-51 on page 2104 for additional Ethernet crystal requirements.

b. 5 MHz is the minimum when using the PLL.

c. See information below table.

d. Crystal ESR specified by crystal manufacturer.

e. Crystal vendors can be contacted to confirm these specifications are met for a specific crystal part number if the vendors generic crystal datasheet show limits outside of these specifications.

f.  $OSC_{PWR} = (2 * \pi * F_P * C_L * 2.5)^2 * ESR / 2$ . An estimation of the typical power delivered to the crystal is based on the C<sub>L</sub>, F<sub>P</sub> and ESR parameters of the crystal in the circuit as calculated by the OSC<sub>PWR</sub> equation. Ensure that the value calculated for OSC<sub>PWR</sub> does not exceed the crystal's drive-level maximum.

g. Oscillator startup time is specified from the time the oscillator is enabled to when it reaches a stable point of oscillation such that the internal clock is valid.

The load capacitors added on the board, C<sub>1</sub> and C<sub>2</sub>, should be chosen such that the following equation is satisfied (see Table 31-23 on page 2071 for typical values and Table 31-24 on page 2073 for detailed crystal parameter information).

- C<sub>L</sub> = load capacitance specified by crystal manufacturer
- $C_L = (C_1 * C_2) / (C_1 + C_2) + C_{SHUNT}$
- $C_{SHUNT} = C_0 + C_{PKG} + C_{PCB}$  (total shunt capacitance seen across OSC0, OSC1 crystal inputs)
- C<sub>PKG</sub>, C<sub>PCB</sub> = the mutual caps as measured across the OSC0, OSC1 pins excluding the crystal.
- C<sub>0</sub> = Shunt capacitance of crystal specified by the crystal manufacturer

Table 31-24 on page 2073 lists part numbers of crystals that have been simulated and confirmed to operate within the specifications in Table 31-23 on page 2071. Other crystals that have nearly identical crystal parameters can be expected to work as well.

In the table below, the crystal parameters labeled C0, C1 and L1 are values that are obtained from the crystal manufacturer. These numbers are usually a result of testing a relevant batch of crystals

on a network analyzer. The parameters labeled ESR, DL and  $C_L$  are maximum numbers usually available in the data sheet for a crystal.

The table also includes three columns of Recommended Component Values. These values apply to system board components.  $C_1$  and  $C_2$  are the values in pico Farads of the load capacitors that should be put on each leg of the crystal pins to ensure oscillation at the correct frequency.  $R_s$  is the value in k $\Omega$  of a resistor that is placed in series with the crystal between the OSC1 pin and the crystal pin.  $R_s$  dissipates some of the power so the Max DI crystal parameter is not exceeded. Only use the recommended  $C_1$ ,  $C_2$ , and  $R_s$  values with the associated crystal part. The values in the table were used in the simulation to ensure crystal startup and to determine the worst case drive level (WC DI). The value in the WC DI column should not be greater than the Max DI Crystal parameter. The WC DI value can be used to determine if a crystal with similar parameter values but a lower Max DI value is acceptable.

**Table 31-24. Crystal Parameters**

| MFG     | MFG Part#                    | Holder   | PKG Size<br>(mm x mm) | Freq (MHz) | Crystal Spec<br>(Tolerance /<br>Stability) | Crystal Parameters |         |         |            |             |                     | Recommended<br>Component<br>Values |                     |                  | WC DI (μW) |
|---------|------------------------------|----------|-----------------------|------------|--------------------------------------------|--------------------|---------|---------|------------|-------------|---------------------|------------------------------------|---------------------|------------------|------------|
|         |                              |          |                       |            |                                            | Typical Values     |         |         | Max Values |             |                     |                                    |                     |                  |            |

a. R<sub>S</sub> values as low as 0 Ohms can be used. Using a lower R<sub>S</sub> value will result in the WC DL to increase towards the Max DL of the crystal.

b. Although this ESR value is outside of the recommended crystal ESR maximum for this frequency, this crystal has been simulated to confirm proper operation and is valid for use with this device.

c. R<sub>S</sub> values as low as 500 Ohms can be used. Using a lower R<sub>S</sub> value will result in the WC DL to increase towards the Max DL of the crystal.

### 31.9.6 System Clock Specification with ADC Operation

Table 31-25. System Clock Characteristics with ADC Operation

| Parameter           | Parameter Name                                                                  | Min | Nom | Max | Unit |
|---------------------|---------------------------------------------------------------------------------|-----|-----|-----|------|
| F <sub>sysadc</sub> | System clock frequency when the ADC module is operating (when PLL is bypassed). | -   | 16  | -   | MHz  |

### 31.9.7 System Clock Specification with USB Operation

Table 31-26. System Clock Characteristics with USB Operation

| Parameter           | Parameter Name                                                                                                                          | Min | Nom | Max | Unit |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------|-----|-----|-----|------|
| F <sub>sysusb</sub> | System clock frequency when the USB module is operating (note that MOSC must be the clock source, either with or without using the PLL) | 30  | -   | -   | MHz  |

## 31.10 Sleep Modes

The following tables can be used to calculate the maximum wake time from Sleep or Deep Sleep depending on the specific application. Depending on the application configuration, each of the parameters, except for  $T_{FLASH}$ , add sequential latency to the wake time. Flash restoration happens in parallel to the other wake processes and its wake time is normally absorbed by the other latencies. As an example, the wake time for a device in Deep Sleep, with the PIOSC and PLL turned off and the Flash and SRAM in low power mode is calculated as follows:

$$\text{Wake Time} = T_{PIOSCDS} + T_{PLLDS} + T_{SRAML PDS}$$

$T_{FLASH}$  does not contribute to this equation since all other parameters are greater in value.

Note that in Sleep mode the wake time due to a clock source is zero because the device uses the same clock configuration in Run mode; thus, there is no latency involved with respect to the clocks.

**Table 31-27. Wake from Sleep Characteristics**

| Parameter No | Parameter      | Parameter Name                                                           | Min | Nom | Max              | Unit |
|--------------|----------------|--------------------------------------------------------------------------|-----|-----|------------------|------|
| D1           | $T_{PIOSC}$    | Time to restore PIOSC as System Clock in Sleep mode                      | -   | -   | N/A <sup>a</sup> | μs   |
| D2           | $T_{MOSC}$     | Time to restore MOSC as System Clock in Sleep mode                       | -   | -   | N/A <sup>b</sup> | μs   |
| D3           | $T_{PLL}$      | Time to restore PLL as System Clock in Sleep mode                        | -   | -   | N/A <sup>c</sup> | μs   |
| D4           | $T_{LDO}$      | Time to restore LDO to 1.2 V in Sleep mode                               | -   | -   | 39               | μs   |
| D5           | $T_{FLASH}$    | Time to restore Flash to active state from low power state in Sleep mode | -   | -   | 5                | μs   |
| D6           | $T_{SRAML P}$  | Time to restore SRAM to active state from low power state in Sleep mode  | -   | -   | 15               | μs   |
| D7           | $T_{SRAMSTBY}$ | Time to restore SRAM to active state from standby state in Sleep mode    | -   | -   | 15               | μs   |

a. Because the PIOSC is enabled in both Run and Sleep Mode for this configuration, no restoration time is required.

b. Because the MOSC is enabled in both Run and Sleep Mode for this configuration, no restoration time is required.

c. Because the PLL is enabled in both Run and Sleep Mode for this configuration, no restoration time is required.

**Table 31-28. Wake from Deep Sleep Characteristics**

| Parameter No | Parameter       | Parameter Name                                             | Min | Nom | Max                                                                          | Unit                                 |
|--------------|-----------------|------------------------------------------------------------|-----|-----|------------------------------------------------------------------------------|--------------------------------------|
| D8           | $T_{PIOSCDS}$   | Time to restore PIOSC as System Clock in Deep Sleep Mode   | -   | -   | 14                                                                           | Deep Sleep Clock Cycles <sup>a</sup> |
| D9           | $T_{MOSCDS}$    | Time to restore MOSC as System Clock in Deep Sleep Mode    | -   | -   | 18                                                                           | ms                                   |
| D10          | $T_{PLLDS}$     | Time to restore PLL as System Clock in Deep Sleep Mode     | -   | -   | 1 cycle of Deep Sleep Clock + 512 cycles of PLL reference Clock <sup>a</sup> | clocks                               |
| D11          | $T_{LDODS}$     | Time to restore LDO to 1.2 V in Deep Sleep Mode            | -   | -   | 39                                                                           | μs                                   |
| D12          | $T_{FLASHLPDS}$ | Time to restore Flash to active state from low power state | -   | -   | 5                                                                            | μs                                   |
| D13          | $T_{SRAML PDS}$ | Time to restore SRAM to active state from low power state  | -   | -   | 15                                                                           | μs                                   |

**Table 31-28. Wake from Deep Sleep Characteristics (continued)**

| Parameter No | Parameter               | Parameter Name                                          | Min | Nom | Max | Unit |
|--------------|-------------------------|---------------------------------------------------------|-----|-----|-----|------|
| D14          | T <sub>SRAMSTBYDS</sub> | Time to restore SRAM to active state from standby state | -   | -   | 15  | μs   |

a. Deep Sleep Clock can vary. See page 291 for the Deep Sleep Clock options.

## 31.11 Hibernation Module

The Hibernation module requires special system implementation considerations because it is intended to power down all other sections of its host device, refer to “Hibernation Module” on page 554.

**Table 31-29. Hibernation Module Battery Characteristics**

| Parameter                        | Parameter Name                                    | Min | Nominal | Max              | Unit |
|----------------------------------|---------------------------------------------------|-----|---------|------------------|------|
| V <sub>BAT</sub>                 | Battery supply voltage                            | 1.8 | 3.0     | 3.6 <sup>a</sup> | V    |
| V <sub>BATRMP</sub> <sup>b</sup> | V <sub>BAT</sub> battery supply voltage ramp time | 0   | -       | 0.7              | V/μs |
| V <sub>LOWBAT</sub>              | Low battery detect voltage, VBATSEL=0x0           | 1.8 | 1.9     | 2.0              | V    |
|                                  | Low battery detect voltage, VBATSEL=0x1           | 2.0 | 2.1     | 2.2              | V    |
|                                  | Low battery detect voltage, VBATSEL=0x2           | 2.2 | 2.3     | 2.4              | V    |
|                                  | Low battery detect voltage, VBATSEL=0x3           | 2.4 | 2.5     | 2.6              | V    |

a. To ensure proper functionality, any voltage input higher than V<sub>BAT</sub> Max, must be connected through a diode.

b. For recommended V<sub>BAT</sub> RC circuit values, refer to the diagrams located in “Hibernation Clock Source” on page 558.

**Table 31-30. Hibernation Module Characteristics**

| Parameter No | Parameter                | Parameter Name                                                                                           | Min | Nom                                        | Max | Unit                     |
|--------------|--------------------------|----------------------------------------------------------------------------------------------------------|-----|--------------------------------------------|-----|--------------------------|
| H1           | T <sub>WAKE</sub>        | WAKE assertion time                                                                                      | 100 | -                                          | -   | ns                       |
| H2           | T <sub>WAKE_TO_HIB</sub> | WAKE assert to HIB desassert (wake up time)                                                              | -   | -                                          | 1   | Hibernation clock period |
| H3           | T <sub>VDD_RAMP</sub>    | V <sub>DD</sub> ramp to 3.0 V                                                                            | -   | Depends on characteristics of power supply | -   | μs                       |
| H4           | T <sub>VDD_CODE</sub>    | V <sub>DD</sub> at 3.0 V to internal POR deassert; first instruction executes                            | -   | -                                          | 500 | μs                       |
| H5           | DC <sub>RTCCLK</sub>     | Duty cycle for RTCCLK output signal, when using a 32.768-kHz crystal                                     | 40  | -                                          | 60  | %                        |
|              |                          | Duty cycle for RTCCLK output signal, when using a 32.768-kHz external single-ended (bypass) clock source | 30  | -                                          | 70  | %                        |

**Table 31-31. Hibernation Module Tamper I/O Characteristics**

| Parameter         | Parameter Name                                          | Min                   | Nominal | Max      | Unit |
|-------------------|---------------------------------------------------------|-----------------------|---------|----------|------|
| R <sub>TPU</sub>  | TMPRn pull-up resistor                                  | 3.5<br>-              | 4.4     | 5.2<br>- | MΩ   |
| T <sub>SP</sub>   | TMPRn pulse width with short glitch filter              | 62                    | -       | -        | μs   |
| T <sub>LP</sub>   | TMPRn pulse width with long glitch filter               | 94                    | -       | -        | ms   |
| T <sub>NMIS</sub> | TMPRn assertion to NMI (short glitch filter)            | -                     | -       | 95       | μs   |
| T <sub>NMIL</sub> | TMPRn assertion to NMI (long glitch filter)             | -                     | -       | 94       | ms   |
| V <sub>IH</sub>   | TMPRn high-level input voltage when operating from VBAT | V <sub>BAT</sub> *0.8 | -       | -        | V    |

**Figure 31-15. Hibernation Module Timing**

## 31.12 Flash Memory

**Table 31-32. Flash Memory Characteristics**

| Parameter            | Parameter Name                                                                                                  | Min     | Nom | Max  | Unit   |
|----------------------|-----------------------------------------------------------------------------------------------------------------|---------|-----|------|--------|
| PE <sub>CYC</sub>    | Number of program/erase cycles <sup>a</sup>                                                                     | 100,000 | -   | -    | cycles |
| T <sub>RET</sub>     | Data retention with 100% power-on hours at T <sub>J</sub> =85°C                                                 | 20      | -   | -    | years  |
| T <sub>RET_EXT</sub> | Data retention with 10% power-on hours at T <sub>J</sub> =125°C and 90% power-on hours at T <sub>J</sub> =100°C | 11      | -   | -    | years  |
| T <sub>PROG64</sub>  | Program time for double-word-aligned (64 bits) data <sup>b</sup>                                                | 30      | 100 | 300  | μs     |
| T <sub>ERASE</sub>   | Page erase time, <1k cycles                                                                                     | -       | 8   | 15   | ms     |
|                      | Page erase time, 10k cycles                                                                                     | -       | 15  | 40   | ms     |
|                      | Page erase time, 100k cycles                                                                                    | -       | 75  | 500  | ms     |
| T <sub>ME</sub>      | Mass erase time, <1k cycles                                                                                     | -       | 10  | 25   | ms     |
|                      | Mass erase time, 10k cycles                                                                                     | -       | 20  | 70   | ms     |
|                      | Mass erase time, 100k cycles                                                                                    | -       | 300 | 2500 | ms     |

a. A program/erase cycle is defined as switching the bits from 1-> 0 -> 1.

b. If programming fewer than 64 bits of data, the programming time is the same. For example, if only 32 bits of data need to be programmed, the other 32 bits are masked off.

## 31.13 EEPROM

**Table 31-33. EEPROM Characteristics<sup>a</sup>**

| Parameter                       | Parameter Name                                                                                                                                                | Min     | Nom           | Max       | Unit          |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------|-----------|---------------|
| EPE <sub>CYC</sub> <sup>b</sup> | Number of mass program/erase cycles of a single word <sup>c</sup>                                                                                             | 500,000 | -             | -         | cycles        |
| ET <sub>RET</sub>               | Data retention with 100% power-on hours at T <sub>J</sub> =85°C                                                                                               | 20      | -             | -         | years         |
| ET <sub>RET_EXTEMP</sub>        | Data retention with 10% power-on hours at T <sub>J</sub> =125°C and 90% power-on hours at T <sub>J</sub> =100°C                                               | 11      | -             | -         | years         |
| ET <sub>PROG</sub>              | Program time for 32 bits of data with memory space available                                                                                                  | -       | 110           | 600       | μs            |
|                                 | Program time for 32 bits of data in which a copy to the copy buffer is required, the copy buffer has space and less than 10% of EEPROM endurance used         | -       | 30            | -         | ms            |
|                                 | Program time for 32 bits of data in which a copy to the copy buffer is required, the copy buffer has space and greater than 90% of EEPROM endurance used      | -       | -             | 900       | ms            |
|                                 | Program time for 32 bits of data in which a copy of the copy buffer is required, the copy buffer requires an erase and less than 10% of EEPROM endurance used | -       | 60            | -         | ms            |
|                                 | Program time for 32 bits of data a copy to the copy buffer is required, the copy buffer requires an erase and greater than 90% of EEPROM endurance used       | -       | -             | 1800      | ms            |
| ET <sub>READ</sub>              | Read access time <sup>d</sup>                                                                                                                                 | -       | 7+<br>2*(EWS) | 9+4*(EWS) | system clocks |
| ET <sub>ME</sub>                | Mass erase time, <1k cycles                                                                                                                                   | -       | 8             | 15        | ms            |
|                                 | Mass erase time, 10k cycles                                                                                                                                   | -       | 15            | 40        | ms            |
|                                 | Mass erase time, 100k cycles                                                                                                                                  | -       | 75            | 500       | ms            |

a. Because the EEPROM operates as a background task and does not prevent the CPU from executing from Flash memory, the operation will complete within the maximum time specified provided the EEPROM operation is not stalled by a Flash memory program or erase operation.

b. One word can be written more than 500K times, but these writes impact the endurance of the words in the meta-block that the word is within. Different words can be written such that any or all words can be written more than 500K times when write counts per word stay about the same. See the section called "Endurance" on page 643 for more information.

c. A program/erase cycle is defined as switching the bits from 1-> 0 -> 1.

d. The EWS field is programmed in the **MEMTIM0** register at Sysctl Offset 0x0C0.

## 31.14 Input/Output Pin Characteristics

**Note:** All GPIO signals are 3.3-V tolerant, except for PB1 (USB0VBUS) which is 5-V tolerant. See “Signal Description” on page 766 for more information on GPIO configuration.

Two types of pads are provided on the device:

- Fast GPIO pads: These pads provide variable, programmable drive strength and optimized voltage output levels.
- Slow GPIO pads: These pads provide 2-mA drive strength and are designed to be sensitive to voltage inputs. The following GPIOs port pins are designed with Slow GPIO Pads:
  - PJ1

**Note:** Port pins PL6 and PL7 operate as Fast GPIO pads, but have 4-mA drive capability only. GPIO register controls for drive strength, slew rate and open drain have no effect on these pins. The registers which have no effect are as follows: **GPIODR2R**, **GPIODR4R**, **GPIODR8R**, **GPIODR12R**, **GPIOSLR**, and **GPIODR**.

**Note:** Port pins PM[7:4] operate as Fast GPIO pads but support only 2-, 4-, 6-, and 8-mA drive capability. 10- and 12-mA drive are not supported. All standard GPIO register controls, except for the **GPIODR12R** register, apply to these port pins.

**Table 31-34. Fast GPIO Module Characteristics**<sup>abcd</sup>

| Parameter      | Parameter Name                                                                                                                    | Min  | Nom  | Max   | Unit          |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------|------|------|-------|---------------|
| $C_{LGPIO}$    | Capacitive loading for measurements given in this table <sup>e</sup>                                                              | -    | -    | 50    | pF            |
| $R_{GPIOU}$    | Fast GPIO internal pull-up resistor <sup>f</sup>                                                                                  | 12.1 | 16.0 | 20.2  | k $\Omega$    |
| $R_{GPIOU4MA}$ | Fast GPIO PL6 and PL7 (4-mA only) pull-up resistor                                                                                | 25   | -    | 40    | k $\Omega$    |
| $R_{GIOPD}$    | Fast GPIO internal pull-down resistor <sup>f</sup>                                                                                | 13.0 | 20.5 | 35.5  | k $\Omega$    |
| $R_{GIOPD4MA}$ | Fast GPIO PL6 and PL7 (4-mA only) pull-down resistor                                                                              | 10   | 14.3 | 17    | k $\Omega$    |
| $I_{LKG+}$     | Fast GPIO input leakage current, $0\text{ V} \leq V_{IN} \leq V_{DD}$ GPIO pins <sup>g</sup>                                      | -    | -    | 400   | nA            |
|                | Fast GPIO input leakage current, $0\text{ V} < V_{IN} \leq V_{DD}$ , Fast GPIO pins configured as ADC or analog comparator inputs | -    | -    | 400   | nA            |
| $I_{INJ-}$     | DC injection current, $V_{IN} \leq 0\text{ V}$                                                                                    | -    | -    | 60    | $\mu\text{A}$ |
| $I_{MAXINJ-}$  | Max negative injection if not voltage protected <sup>d</sup>                                                                      | -    | -    | -0.5  | mA            |
| $T_{GPOR}$     | Fast GPIO rise time, 2-mA drive <sup>h</sup>                                                                                      | -    | 7.85 | 11.73 | ns            |
|                | Fast GPIO rise time, 4-mA drive <sup>h</sup>                                                                                      |      | 4.15 | 6.35  | ns            |
|                | Fast GPIO rise time, 8-mA drive <sup>h</sup>                                                                                      |      | 2.33 | 3.73  | ns            |
|                | Fast GPIO rise time, 8-mA drive with slew rate control <sup>h</sup>                                                               |      | 3.77 | 5.76  | ns            |
|                | Fast GPIO rise time, 10-mA drive <sup>h</sup>                                                                                     |      | 1.98 | 3.22  | ns            |
|                | Fast GPIO rise time, 12-mA drive <sup>h</sup>                                                                                     |      | 1.75 | 2.9   | ns            |

**Table 31-34. Fast GPIO Module Characteristics (continued)**

| Parameter   | Parameter Name                                                      | Min | Nom  | Max  | Unit |
|-------------|---------------------------------------------------------------------|-----|------|------|------|
| $T_{GPIOF}$ | Fast GPIO fall time, 2-mA drive <sup>i</sup>                        | -   | 10.3 | 16.5 | ns   |
|             | Fast GPIO fall time, 4-mA drive <sup>i</sup>                        |     | 5.15 | 8.29 | ns   |
|             | Fast GPIO fall time, 8-mA drive <sup>i</sup>                        |     | 2.58 | 4.16 | ns   |
|             | Fast GPIO fall time, 8-mA drive with slew rate control <sup>i</sup> |     | 3.54 | 5.55 | ns   |
|             | Fast GPIO fall time, 10-mA drive <sup>i</sup>                       |     | 2.07 | 3.34 | ns   |
|             | Fast GPIO fall time, 12-mA drive <sup>i</sup>                       |     | 1.73 | 2.78 | ns   |

- a.  $V_{DD}$  must be within the range specified in Table 31-6 on page 2053.
- b. Leakage and Injection current characteristics specified in this table also apply to XOSC0 and XOSC1 inputs.
- c. Note that for the ADC's external reference inputs, care must be taken to avoid a current limiting resistor (refer to  $I_{VREF}$  spec in Table 31-44 on page 2094)
- d. I/O pads should be protected if at any point the IO voltage has a possibility of going outside the limits shown in the table. If the part is unpowered, the IO pad Voltage or Current must be limited (as shown in this table) to avoid powering the part through the IO pad, causing potential irreversible damage.
- e. Refer to individual peripheral sections for specific loading information.
- f. This value includes all GPIO except for port pins PL6 and PL7.
- g. The leakage current is measured with  $V_{IN}$  applied to the corresponding pin(s). The leakage of digital port pins is measured individually. The port pin is configured as an input and the pull-up/pull-down resistor is disabled.
- h. Time measured from 20% to 80% of  $V_{DD}$ .
- i. Time measured from 80% to 20% of  $V_{DD}$ .

**Table 31-35. Slow GPIO Module Characteristics<sup>abc</sup>**

| Parameter    | Parameter Name                                                                                                               | Min  | Nom  | Max  | Unit          |
|--------------|------------------------------------------------------------------------------------------------------------------------------|------|------|------|---------------|
| $C_{LGPIO}$  | Capacitive loading for measurements given in this table <sup>d</sup>                                                         | -    | -    | 50   | pF            |
| $R_{GPIOPU}$ | Slow GPIO internal pull-up resistor                                                                                          | 13.8 | 20.0 | 31.4 | k $\Omega$    |
| $R_{GPIOPD}$ | Slow GPIO internal pull-down resistor                                                                                        | 13.0 | 20.5 | 35.5 | k $\Omega$    |
| $I_{LKG+}$   | Slow GPIO input leakage current, $0\text{ V} \leq V_{IN} \leq V_{DD}$ , GPIO pins <sup>e</sup>                               | -    | -    | 3.25 | nA            |
|              | Slow GPIO input leakage current, $0\text{ V} < V_{IN} \leq V_{DD}$ , GPIO pins configured as ADC or analog comparator inputs | -    | -    | 3.25 | nA            |
| $I_{INJ-}$   | DC injection current, $V_{IN} \leq 0\text{ V}$                                                                               | -    | -    | 3.42 | $\mu\text{A}$ |
| $T_{GPIOR}$  | Slow GPIO rise time, 2-mA drive <sup>f</sup>                                                                                 | -    | 19.3 | 29.8 | ns            |
| $T_{GPIOF}$  | Slow GPIO fall time, 2-mA drive <sup>g</sup>                                                                                 | -    | 12.8 | 21.1 | ns            |

- a.  $V_{DD}$  must be within the range specified in Table 31-6 on page 2053.
- b.  $V_{IN}$  must be within the range specified in Table 31-1 on page 2051. Leakage current outside of this maximum voltage is not guaranteed and can result in permanent damage of the device.
- c. To avoid potential damage to the part, either the voltage or current on the non-Power, non-WAKE input/outputs should be limited externally as shown in this table.
- d. Refer to individual peripheral sections for specific loading information.
- e. The leakage current is measured with  $V_{IN}$  applied to the corresponding pin(s). The leakage of digital port pins is measured individually. The port pin is configured as an input and the pull-up/pull-down resistor is disabled.
- f. Time measured from 20% to 80% of  $V_{DD}$ .
- g. Time measured from 80% to 20% of  $V_{DD}$ .

### 31.14.1 Types of I/O Pins and ESD Protection

**Caution** – All device I/Os pins, except for PB1, are NOT 5V tolerant; voltages in excess of the limits shown in Table 31-6 on page 2053 can permanently damage the device. PB1 is used for the USB's USB0VBUS signal, which requires a 5-V input.

#### 31.14.1.1 Hibernate $\overline{\text{WAKE}}$ pin

The Hibernate  $\overline{\text{WAKE}}$  pin uses ESD protection, similar to the one shown in Figure 31-16 on page 2084. This ESD protection prevents a direct path between this pad and any power supply rails in the device. The  $\overline{\text{WAKE}}$  pad input voltage should be kept inside the maximum ratings specified in Table 31-1 on page 2051 to ensure current leakage and current injections are within acceptable range. Current leakages and current injection for these pins are specified in Table 31-36 on page 2084.

**Figure 31-16. ESD Protection**

**Table 31-36. Pad Voltage/Current Characteristics for Hibernate  $\overline{\text{WAKE}}$  Pin<sup>ab</sup>**

| Parameter         | Parameter Name                                                                               | Min | Nom | Max  | Unit          |
|-------------------|----------------------------------------------------------------------------------------------|-----|-----|------|---------------|
| $I_{\text{LKG+}}$ | Positive IO leakage for $V_{\text{DD}} \leq V_{\text{IN}} \leq V_{\text{BAT}} + 0.3\text{V}$ | -   | -   | 300  | nA            |
| $I_{\text{LKG-}}$ | Negative IO leakage for $-0.3\text{V} \leq V_{\text{IN}} \leq 0\text{V}^{\text{c}}$          | -   | -   | 43.3 | $\mu\text{A}$ |
| $I_{\text{INJ+}}$ | Max positive injection if not voltage protected <sup>d</sup>                                 | -   | -   | 2    | mA            |
| $I_{\text{INJ-}}$ | Max negative injection if not voltage protected <sup>d</sup>                                 | -   | -   | -0.5 | mA            |

a.  $V_{\text{IN}}$  must be within the range specified in Table 31-1 on page 2051. Leakage current outside of this maximum voltage is not guaranteed and can result in permanent damage of the device.

b.  $V_{\text{DD}}$  must be within the range specified in Table 31-6 on page 2053.

c. Leakage outside the minimum range ( $-0.3\text{V}$ ) is unbounded and must be limited to  $I_{\text{INJ-}}$  using an external resistor.

d. If the I/O pad is not voltage limited, it should be current limited (to  $I_{\text{INJ+}}$  and  $I_{\text{INJ-}}$ ) if there is any possibility of the pad voltage exceeding the  $V_{\text{IO}}$  limits (including transient behavior during supply ramp up, or at any time when the part is unpowered).

#### 31.14.1.2 Non-Power I/O Pins

Most non-power I/Os (with the exception of the I/O pad for Hibernate  $\overline{\text{WAKE}}$  input) have ESD protection as shown in Figure 31-17 on page 2085.

These I/Os have an ESD clamp to ground and a diode connection to the corresponding power supply rail. The voltage and current of these I/Os should follow the specifications in Table 31-37 on page 2085 to prevent potential damage to the device. In addition, it is recommended that the ADC external reference specifications in Table 31-44 on page 2094 be adhered to prevent any gain error.

**Figure 31-17. ESD Protection for Non-Power Pins (Except  $\overline{\text{WAKE}}$  Signal)****Table 31-37. Non-Power I/O Pad Voltage/Current Characteristics<sup>abc</sup>**

| Parameter  | Parameter Name                                                         | Min  | Nom      | Max          | Unit          |
|------------|------------------------------------------------------------------------|------|----------|--------------|---------------|
| $V_{IO}^d$ | IO pad voltage limits if voltage protected                             | -0.3 | $V_{DD}$ | $V_{DD}+0.3$ | V             |
| $I_{LKG+}$ | Positive IO leakage for $V_{DD} \leq V_{IN} \leq V_{IO} \text{ MAX}^e$ | -    | -        | 400          | nA            |
| $I_{LKG-}$ | Negative IO leakage for $V_{IO} \text{ MIN} \leq V_{IN} \leq 0V^e$     | -    | -        | 60           | $\mu\text{A}$ |
| $I_{INJ+}$ | Max positive injection if not voltage protected <sup>f</sup>           | -    | -        | 2            | mA            |
| $I_{INJ-}$ | Max negative injection if not voltage protected <sup>f</sup>           | -    | -        | -0.5         | mA            |

- a. To avoid potential damage to the part, either the voltage or current on the non-Power, non- $\overline{\text{WAKE}}$  input/outputs should be limited externally as shown in this table.
- b. Note that for the ADC's external reference inputs, care must be taken to avoid a current limiting resistor (refer to IVREF spec in Table 31-44 on page 2094)
- c. I/O pads should be protected if at any point the IO voltage has a possibility of going outside the limits shown in the table. If the part is unpowered, the IO pad Voltage or Current must be limited (as shown in this table) to avoid powering the part through the IO pad, causing potential irreversible damage.
- d. The Hibernate XOSC pins are non-failsafe and should follow the limits for  $V_{IO}$  with respect to both  $V_{DD}$  and  $V_{BAT}$ . Thus  $V_{IO}$  for the HIB XOSC pins should also fall within a MIN of -0.3 and a MAX of  $V_{BAT} + 0.3$ .
- e. MIN and MAX leakage current for the case when the I/O is voltage protected to  $V_{IO} \text{ Min}$  or  $V_{IO} \text{ Max}$ .
- f. If the I/O pad is not voltage limited, it should be current limited (to  $I_{INJ+}$  and  $I_{INJ-}$ ) if there is any possibility of the pad voltage exceeding the  $V_{IO}$  limits (including transient behavior during supply ramp up, or at any time when the part is unpowered).

## 31.15 External Peripheral Interface (EPI)

**Table 31-38. EPI Interface Load Conditions**

| Signals                               | Load Value ( $C_L$ ) |
|---------------------------------------|----------------------|
| EPI0S[35:0] SDRAM interface           | 30 pF                |
| EPI0S[35:0] General-Purpose interface |                      |
| EPI0S[35:0] Host-Bus interface        |                      |
| EPI0S[35:0] PSRAM interface           | 40 pF                |

When the EPI module is in SDRAM mode, EPI CLK must be configured to 12 mA. The EPI data bus can be configured to 8 mA. Table 31-39 on page 2086 shows the rise and fall times in SDRAM mode. When the EPI module is in Host-Bus or General-Purpose mode, the values in “Input/Output Pin Characteristics” on page 2082 should be used.

**Table 31-39. EPI SDRAM Characteristics**

| Parameter    | Parameter Name                               | Condition                  | Min | Nom | Max | Unit |
|--------------|----------------------------------------------|----------------------------|-----|-----|-----|------|
| $T_{SDRAMR}$ | EPI Rise Time (from 20% to 80% of $V_{DD}$ ) | 12-mA drive, $C_L = 30$ pF | -   | 2   | 3   | ns   |
| $T_{SDRAMF}$ | EPI Fall Time (from 80% to 20% of $V_{DD}$ ) | 12-mA drive, $C_L = 30$ pF | -   | 2   | 3   | ns   |

**Table 31-40. EPI SDRAM Interface Characteristics<sup>a</sup>**

| Parameter No | Parameter | Parameter Name         | Min   | Nom | Max | Unit    |
|--------------|-----------|------------------------|-------|-----|-----|---------|
| E1           | $T_{CK}$  | SDRAM Clock period     | 16.67 | -   | -   | ns      |
| E2           | $T_{CH}$  | SDRAM Clock high time  | 8.33  | -   | -   | ns      |
| E3           | $T_{CL}$  | SDRAM Clock low time   | 8.33  | -   | -   | ns      |
| E4           | $T_{COV}$ | CLK to output valid    | -     | -   | 4   | ns      |
| E5           | $T_{COI}$ | CLK to output invalid  | -     | -   | 4   | ns      |
| E6           | $T_{COT}$ | CLK to output tristate | -     | -   | 4   | ns      |
| E7           | $T_S$     | Input set up to CLK    | 8.5   | -   | -   | ns      |
| E8           | $T_H$     | CLK to input hold      | 0     | -   | -   | ns      |
| E9           | $T_{PU}$  | Power-up time          | 100   | -   | -   | μs      |
| E10          | $T_{RP}$  | Precharge all banks    | 20    | -   | -   | ns      |
| E11          | $T_{RFC}$ | Auto refresh           | 66    | -   | -   | ns      |
| E12          | $T_{MRD}$ | Program mode register  | 2     | -   | -   | EPI CLK |

a. The EPI SDRAM interface must use 12-mA drive.

Figure 31-18. SDRAM Initialization and Load Mode Register Timing

## Notes:

1. If CS is high at clock high time, all applied commands are NOP.
2. The **Mode** register may be loaded prior to the auto refresh cycles if desired.
3. JEDEC and PC100 specify three clocks.
4. Outputs are guaranteed High-Z after command is issued.

a. Values are at  $V_{REF+} = 3.3V$ ,  $F_{ADC} = 16$  MHz unless otherwise noted.

b. Best design practices suggest that static or quiet digital I/O signals be configured adjacent to sensitive analog inputs to reduce capacitive coupling and cross talk. Unexpected results can occur if a switching digital I/O is placed adjacent to an ADC input channel or voltage reference input. In addition, analog signals configured adjacent to ADC input channels or reference inputs must meet the  $R_{ADC}$  equivalent input resistance given in this table and must be band-limited to 100 kHz or lower.

c. Two capacitors in parallel. Note that these capacitors should be as close to the die as possible.

d. Assumes external filtering network between VREF+ and VREF- as shown in Figure 31-28 on page 2099. External reference noise level must be under 12bit (-74 dB) of Full Scale input, over input bandwidth, measured at VREF+ - VREF-.

e. Internal reference is connected directly between  $V_{DDA}$  and GNDA ( $V_{REFi} = V_{DDA} - GNDA$ ). In this mode,  $E_O$ ,  $E_G$ ,  $E_T$ , and dynamic specifications are adversely affected due to internal voltage drop and noise on  $V_{DDA}$  and GNDA. Internal reference voltage is selected when VREF field in the **ADCCTL** register is 0x0.

- f.  $V_{ADCIN} = V_{INP} - V_{INN}$
- g. With signal common mode as  $V_{DDA}/2$ .
- h. With signal common mode as  $(V_{REF+} + V_{REF-})/2$ .
- i. This parameter is defined as the average of the differential inputs.
- j. As shown in Figure 31-29 on page 2099,  $R_{ADC}$  is the total equivalent resistance in the input line all the way up to the sampling node at the input of the ADC.
- k. See "System Clock Specification with ADC Operation" on page 2075 for full ADC clock frequency specification.
- l. ADC conversion time ( $T_c$ ) includes the ADC sample time ( $T_s$ ).
- m. Low noise environment is assumed in order to obtain values close to spec. Board must have good ground isolation between analog and digital grounds, a clean reference voltage is assumed, and input signal must be bandlimited to Nyquist bandwidth. No anti-aliasing filter is provided internally.
- n. ADC static measurements taken by averaging over several samples. At least 20-sample averaging is assumed to obtain expected typical or maximum spec values.
- o. 12-bit DNL
- p. Gain error is measured at max code after compensating for offset. Gain error is equivalent to "Full Scale Error." It can be given in % of slope error, or in LSB, as done here.
- q. Total Unadjusted Error is the maximum error at any one code versus the ideal ADC curve. It includes all other errors (offset error, gain error and INL) at any given ADC code.
- r. A low noise environment is assumed in order to obtain values close to spec. The board must have good ground isolation between analog and digital grounds and a clean reference voltage. The input signal must be band-limited to Nyquist bandwidth. No anti-aliasing filter is provided internally.
- s. ADC dynamic characteristics are measured using low-noise board design, with low-noise reference voltage ( $< -74$ dB noise level in signal BW) and low-noise analog supply voltage. Board noise and ground bouncing couple into the ADC and affect dynamic characteristics. Clean external reference must be used to achieve shown specs.
- t. Differential signal with correct common mode, applied between two ADC inputs.
- u. SDR = -THD in dB.
- v. For higher frequency inputs, degradation in SDR should be expected.
- w.  $SNDR = S/(N+D) = SINAD$  (in dB)
- x. Effective number of bits (ENOB) can be calculated from SNDR:  $ENOB = (SNDR - 1.76) / 6.02$ .
- y. Single ended inputs are more sensitive to board and trace noise than differential inputs; SNR and SNDR measurements on single-ended inputs are highly dependent on how clean the test set-up is. If the input signal is not well-isolated on the board, higher noise than specified could potentially be seen at the ADC output.
- z. Note that this parameter does not include ADC error.

**Table 31-45. ADC Electrical Characteristics for ADC at 2 Msps (continued)**

| Parameter         | Parameter Name                                                                                          | Min | Nom | Max | Unit |
|-------------------|---------------------------------------------------------------------------------------------------------|-----|-----|-----|------|
| SNDR <sub>D</sub> | Signal-to-Noise+Distortion ratio, Differential input, V <sub>ADCIN</sub> : -3dB FS, 1KHz <sup>twx</sup> | 65  | 70  | -   | dB   |
| SNR <sub>S</sub>  | Signal-to-noise-ratio, Single-ended input, V <sub>ADCIN</sub> : -20dB FS, 1KHz <sup>y</sup>             | 58  | 65  | -   | dB   |
| SDR <sub>S</sub>  | Signal-to-distortion ratio, Single-ended input, V <sub>ADCIN</sub> : -3dB FS, 1KHz <sup>uv</sup>        | 68  | 72  | -   | dB   |
| SNDR <sub>S</sub> | Signal-to-Noise+Distortion ratio, Single-ended input, V <sub>ADCIN</sub> : -3dB FS, 1KHz <sup>ywx</sup> | 58  | 63  | -   | dB   |

a. Values are at V<sub>REF+</sub> = 3.3V, F<sub>ADC</sub> = 32 MHz unless otherwise noted.

b. Best design practices suggest that static or quiet digital I/O signals be configured adjacent to sensitive analog inputs to reduce capacitive coupling and cross talk. Unexpected results can occur if a switching digital I/O is placed adjacent to an ADC input channel or voltage reference input. In addition, analog signals configured adjacent to ADC input channels or reference inputs must meet the R<sub>ADC</sub> equivalent input resistance given in this table and must be band-limited to 100 kHz or lower.

c. Two capacitors in parallel. Note that these capacitors should be as close to the die as possible.

d. Assumes external filtering network between VREFA+ and VREFA- as shown in Figure 31-28 on page 2099. External reference noise level must be under 12bit (-74 dB) of Full Scale input, over input bandwidth, measured at VREFA+ - VREFA-.

e. Internal reference is connected directly between V<sub>DDA</sub> and GNDA (VREFi = V<sub>DDA</sub> - GNDA). In this mode, E<sub>O</sub>, E<sub>G</sub>, E<sub>T</sub>, and dynamic specifications are adversely affected due to internal voltage drop and noise on V<sub>DDA</sub> and GNDA. Internal reference voltage is selected when VREF field in the **ADCCTL** register is 0x0.

f. V<sub>ADCIN</sub> = V<sub>INP</sub> - V<sub>INN</sub>

g. With signal common mode as V<sub>DDA</sub>/2.

h. With signal common mode as (V<sub>REF+</sub> + V<sub>REF-</sub>)/2.

i. This parameter is defined as the average of the differential inputs.

j. As shown in Figure 31-29 on page 2099, R<sub>ADC</sub> is the total equivalent resistance in the input line all the way up to the sampling node at the input of the ADC.

k. See "System Clock Specification with ADC Operation" on page 2075 for full ADC clock frequency specification.

l. ADC conversion time (T<sub>c</sub>) includes the ADC sample time (T<sub>s</sub>).

m. Low noise environment is assumed in order to obtain values close to spec. Board must have good ground isolation between analog and digital grounds, a clean reference voltage is assumed, and input signal must be bandlimited to Nyquist bandwidth. No anti-aliasing filter is provided internally.

n. ADC static measurements taken by averaging over several samples. At least 20-sample averaging is assumed to obtain expected typical or maximum spec values.

o. 12-bit DNL

p. Gain error is measured at max code after compensating for offset. Gain error is equivalent to "Full Scale Error." It can be given in % of slope error, or in LSB, as done here.

q. Total Unadjusted Error is the maximum error at any one code versus the ideal ADC curve. It includes all other errors (offset error, gain error and INL) at any given ADC code.

r. A low noise environment is assumed in order to obtain values close to spec. The board must have good ground isolation between analog and digital grounds and a clean reference voltage. The input signal must be band-limited to Nyquist bandwidth. No anti-aliasing filter is provided internally.

s. ADC dynamic characteristics are measured using low-noise board design, with low-noise reference voltage (< -74dB noise level in signal BW) and low-noise analog supply voltage. Board noise and ground bouncing couple into the ADC and affect dynamic characteristics. Clean external reference must be used to achieve shown specs.

t. Differential signal with correct common mode, applied between two ADC inputs.

u. SDR = -THD in dB.

v. For higher frequency inputs, degradation in SDR should be expected.

w. SNDR = S/(N+D) = SINAD (in dB)

x. Effective number of bits (ENOB) can be calculated from SNDR: ENOB = (SNDR - 1.76) / 6.02.

y. Single ended inputs are more sensitive to board and trace noise than differential inputs; SNR and SNDR measurements on single-ended inputs are highly dependent on how clean the test set-up is. If the input signal is not well-isolated on the board, higher noise than specified could potentially be seen at the ADC output.

| S13           | $T_{RXDSSU}$    | Slave Mode: Rx Data In (from master) setup time                                 | 0                  | -   | -                  | ns   |
| S14           | $T_{RXDSH}$     | Slave Mode: Rx Data In (from master) hold time                                  | 37.03 <sup>f</sup> | -   | -                  | ns   |

a. In master mode, the system clock must be at least twice as fast as the SSIClk.

b. In slave mode, the system clock must be at least 12 times faster than the SSIClk.

c. Note that the delays shown are using 12-mA drive strength.

d. This MAX value is for the minimum slave mode  $T_{SYSCLK}$  period (8.33 ns). To find the MAX  $T_{TXDSOV}$  value for a larger  $T_{SYSCLK}$ , use the equation:  $4 * T_{SYSCLK} + 14.25$ .

e. This MIN value is for the minimum slave mode  $T_{SYSCLK}$  (8.33 ns). To find the MIN  $T_{TXDSOH}$  value for a larger  $T_{SYSCLK}$ , use the equation:  $4 * T_{SYSCLK} + 4.08$ .

f. This MIN value is for the minimum slave mode  $T_{SYSCLK}$  (8.33 ns). To find the MIN  $T_{TXDSH}$  value for a larger  $T_{SYSCLK}$ , use the equation:  $4 * T_{SYSCLK} + 3.70$ .

| I1 <sup>a</sup> | T <sub>SCH</sub>  | Start condition hold time                                                    | 36  | -                   | -            | system clocks |
| I2 <sup>a</sup> | T <sub>LP</sub>   | Clock Low period                                                             | 36  | -                   | -            | system clocks |
| I3 <sup>b</sup> | T <sub>SRT</sub>  | I2CSCL/I2CSDA rise time (V <sub>IL</sub> = 0.5 V to V <sub>IH</sub> = 2.4 V) | -   | -                   | (see note b) | ns            |
| I4              | T <sub>DH</sub>   | Data hold time (slave)                                                       | -   | 2                   | -            | system clocks |
|                 |                   | Data hold time (master)                                                      | -   | 7                   | -            | system clocks |
| I5 <sup>c</sup> | T <sub>SFT</sub>  | I2CSCL/I2CSDA fall time (V <sub>IH</sub> = 2.4 V to V <sub>IL</sub> = 0.5 V) | -   | 9                   | 10           | ns            |
| I6 <sup>a</sup> | T <sub>HT</sub>   | Clock High time                                                              | 24  | -                   | -            | system clocks |
| I7              | T <sub>DS</sub>   | Data setup time                                                              | 18  | -                   | -            | system clocks |
| I8 <sup>a</sup> | T <sub>SCSR</sub> | Start condition setup time (for repeated start condition only)               | 36  | -                   | -            | system clocks |
| I9 <sup>a</sup> | T <sub>SCS</sub>  | Stop condition setup time                                                    | 24  | -                   | -            | system clocks |
| I10             | T <sub>DV</sub>   | Data Valid (slave)                                                           | -   | 2                   | -            | system clocks |
|                 |                   | Data Valid (master)                                                          | -   | (6 * (1 + TPR)) + 1 | -            | system clocks |

- a. Values depend on the value programmed into the TPR bit in the **I<sup>2</sup>C Master Timer Period (I2CMTPR)** register; a TPR programmed for the maximum I2CSCL frequency (TPR=0x2) results in a minimum output timing as shown in the table above. The I<sup>2</sup>C interface is designed to scale the actual data transition time to move it to the middle of the I2CSCL Low period. The actual position is affected by the value programmed into the TPR; however, the numbers given in the above values are minimum values.
- b. Because I2CSCL and I2CSDA operate as open-drain-type signals, which the controller can only actively drive low, the time I2CSCL or I2CSDA takes to reach a high level depends on external signal capacitance and pull-up resistor values.
- c. Specified at a nominal 50 pF load.

Figure 31-33. I<sup>2</sup>C Timing

## 31.19 Ethernet Controller

### 31.19.1 DC Characteristics

The parameters listed in Table 31-49 on page 2104, with the exception of  $R_{BIAS}$ , apply to transmit pins of the Ethernet PHY, which are generally the EN0TX0P and EN0TX0N signals during standard operation but can also be the EN0RXIN EN0RXIP signals if Auto-MDIX is enabled.

**Table 31-49. Ethernet PHY DC Characteristics**

| Parameter       | Parameter Name                                   | Min  | Nom  | Max  | Unit       |
|-----------------|--------------------------------------------------|------|------|------|------------|
| $R_{BIAS}$      | Value of the pull-down resistor on the RBIAS pin | 4.82 | 4.87 | 4.92 | k $\Omega$ |
| $V_{TPTD\_100}$ | 100M transmit voltage                            | 0.95 | 1    | 1.05 | V          |
| $V_{TPTDSYM}$   | 100M transmit voltage symmetry                   | -2   | -    | 2    | %          |
| $V_{OVRSH}$     | Output overshoot                                 | -    | -    | 5    | %          |
| $V_{TPTD\_10}$  | 10M transmit voltage                             | 2.2  | 2.5  | 2.8  | V          |
| $V_{TH1}$       | 10Base-T Receive threshold                       | -    | 200  | -    | mV         |

### 31.19.2 Clock Characteristics

**Table 31-50. MOSC 25-MHz Crystal Specification<sup>a</sup>**

| Parameter No. | Parameter    | Parameter Name                                 | Min | Nom | Max      | Unit |
|---------------|--------------|------------------------------------------------|-----|-----|----------|------|
| N1            | $F_{MOSC25}$ | Frequency                                      | -   | 25  | -        | MHz  |
| -             | $F_{TOL}$    | Frequency tolerance at operational temperature | 0   | -   | $\pm 50$ | ppm  |
| -             | $T_{STA}$    | Frequency stability at 1-year aging            | -   | -   | $\pm 5$  | ppm  |

a. Refer to Table 31-23 on page 2071 for additional MOSC requirements.

**Figure 31-34. MOSC Crystal Characteristics for Ethernet**

## 31.20 Universal Serial Bus (USB) Controller

The Tiva™ C Series USB controller electrical specifications are compliant with the *Universal Serial Bus Specification Rev. 2.0* (full-speed and low-speed support) and the *On-The-Go Supplement to the USB 2.0 Specification Rev. 1.0*. Some components of the USB system are integrated within the TM4C129LNCZAD microcontroller and specific to the Tiva™ C Series microcontroller design.

**Note:** GPIO pin, PB1, which can be configured as the USB0VBUS signal, is the only pin which is 5-V tolerant on the device.

**Table 31-57. ULPI Interface Timing**

| Parameter No.                                                  | Parameter        | Parameter Name                           | Min | Nom | Max  | Unit |
|----------------------------------------------------------------|------------------|------------------------------------------|-----|-----|------|------|
| Timings with respect to external clock source input to USB0CLK |                  |                                          |     |     |      |      |

**Figure 31-41. ULPI Interface Timing Diagram**

## 31.21 LCD Controller

The LCD controller consists of two independent controllers, the raster controller and the LCD interface display driver (LIDD) controller. Each controller operates independently from the other and only one of them is active at any given time.

- The LIDD controller supports an asynchronous LCD interface. It provides full-timing programmability of control signals (CS, WE, OE, ALE) and output data. It also supports synchronous interface in Motorola 6800 mode and Intel 8080 mode through the use of the external LCDMCLK output.
- The raster controller handles the synchronous LCD interface. It provides timing and data for constant graphics refresh to a passive display. It supports a wide variety of monochrome and full-color display types and sizes by use of programmable timing controls, a built-in palette, and a gray-scale and serializer. Graphics data is processed and stored in frame buffers. A frame buffer is a contiguous memory block in the system. The  $\mu$ DMA supplies the graphics data to the raster engine which, in turn, outputs to the external LCD device.

The maximum resolution for the LCD controller is 2048 x 2048 pixels. The maximum frame rate is determined by the image size in combination with the pixel clock rate.

The LCD signals must be configured with a drive strength of 8 mA with slew rate control.

**Table 31-58. LCD Controller Load Capacitance Limits**

| Parameter  | Parameter Name              | Condition   | Min | Nom | Max | Unit |
|------------|-----------------------------|-------------|-----|-----|-----|------|
| $C_{LOAD}$ | LCD Output Load Capacitance | LIDD mode   | 5   | -   | 50  | pF   |
|            |                             | Raster mode | 3   | -   | 30  | pF   |

**Note:** A 25-pF load is assumed for LCD timings.

### 31.21.1 LCD Interface Display Driver (LIDD Mode)

In LIDD mode, the **LIDDCS0CFG** register allows for full programmability of the read and write strobes, data and enables. In the **LCDCS0CFG** register, the following parameters can be configured with respect to the internal MCLK:

- WRSU (bits[31:27]): Number of MCLK cycles that the LCDDATA bus, output enable, ADE, DIR and CS0 signals have to be ready before the write strobe. The minimum value is 0x0.
- WRDUR (bits[26:21]): Number of MCLK cycles for which the write strobe is held active when performing a write access. The minimum value is 0x1.
- WRHOLD (bits[20:17]): Number of MCLK cycles for which the LCDDATA bus, output enable, ALE, DIR and CS0 signals are held after the write strobe is deasserted when performing a write access. The minimum value is 0x1.
- RDSU (bits[16:12]): When performing a read access, this field defines the number of MCLK cycles that the LCDDATA bus, output enable, ALE, DIR and CS0 signals have to be ready before the read strobe is asserted.
- RDDUR (bits[11:6]): Number of MCLK cycles for which the read strobe is held active when performing a read access. The minimum value is 0x1.

- RDHOLD (bits[5:2]): Number of MCLK cycles for which the LCDDATA bus, output enable, ALE, DIR and CS0 signals are held after the read strobe is deasserted when performing a read access. The minimum value is 0x1.
- GAP (bits[1:0]): Number of MCLK cycles (GAP + 1) between the end of one CS0 device access and the start of another CS0 devices access unless the two accesses are both reads. In this case, this delay is not incurred. The minimum value is 0x0.

Essentially, output valid/hold and input setup/hold times in LIDD mode are programmed by these fields. In addition, the inherent clock delay from the internal MCLK transition to the signal output adds or subtracts to these programmed times as indicated in the following tables and figures.

**Table 31-59. LCD Switching Characteristics**

| Parameter No. | Parameter             | Parameter Name                                                          | Min | Nom | Max   | Unit |
|---------------|-----------------------|-------------------------------------------------------------------------|-----|-----|-------|------|
| L1            | T <sub>CYC</sub>      | Internal MCLK cycle time                                                | -   | 50  | -     | ns   |

### 31.21.1.1 Hitachi Mode

Hitachi mode is an asynchronous mode which does not use an external LCDMCLK and allows for full programmability of the read and write strobes, data and enables through the **LIDDCS0CFG** register. Note that in addition to the parameter delays configured in the **LIDDCS0CFG** register, the delay times in the associated figures shown below that are from the internal MCLK to the signal output must be added to the programmed delays for full timing information. All of the parameter values associated with the following figures can be found in Table 31-59 on page 2111 and Table 31-60 on page 2111.

In Figure 31-42 on page 2112, Figure 31-43 on page 2113, and Figure 31-44 on page 2113 the second LCDMCLK is shown as E1 and can be used as the enable strobe for a second display in Hitachi mode. The primary enable strobe is the LCDAC signal.

**Note:** The acronyms WRSU, WRDUR, WRHOLD and GAP in the following figures correspond to the bitfields of the **LIDDCS0CFG** register described in “LCD Interface Display Driver (LIDD Mode)” on page 2110.

Figure 31-45. Data Read in Hitachi Mode

### 31.21.1.2 Motorola 6800 Mode

Motorola 6800 mode can be configured to perform asynchronous operations or synchronous operations. When configured in asynchronous mode, LCDMCLK is not required, so it performs the CS1 function. When configured in asynchronous mode, LCDMCLK is not required, so it performs the CS1 function. When configured in synchronous mode, MCLK is available externally through the signal LCDMCLK. Note that in asynchronous mode the internal MCLK shown represents the internal clock that sequences the other signals. All of the parameter values associated with the following figures can be found in Table 31-59 on page 2111 and Table 31-60 on page 2111.

**Note:** In asynchronous Motorola 6800 mode, LCDCP functions as the read and write strobe. In synchronous mode

**Note:** The acronyms WRSU, WRDUR, WRHOLD and GAP in the following figures correspond to the bitfields of the **LIDDCS0CFG** register described in "LCD Interface Display Driver (LIDD Mode)" on page 2110.

**Figure 31-46. Motorola 6800 Graphic Display Mode Write (Synchronous & Asynchronous Operation)**

**Figure 31-47. Motorola 6800 Graphic Display Mode Read (Synchronous & Asynchronous Operation)**

**Figure 31-48. Motorola 6800 Graphic Display Mode Status (Synchronous & Asynchronous Operation)**

### 31.21.1.3 Intel 8080 Mode

Intel mode can be configured to perform asynchronous operations or synchronous operations. When configured in asynchronous mode, LCDMCLK is not required, so it performs the CS1 function. When configured in synchronous mode, MCLK is available externally through the signal LCDMCLK. Note that in asynchronous mode the internal MCLK shown represents the internal clock that sequences the other signals. All of the parameter values associated with the following figures can be found in Table 31-59 on page 2111 and Table 31-60 on page 2111.

**Note:** The acronyms WRSU, WRDUR, WRHOLD and GAP in the following figures correspond to the bitfields of the **LIDDCS0CFG** register described in “LCD Interface Display Driver (LIDD Mode)” on page 2110.

### 31.21.2 LCD Raster Mode

The following table depicts the LCD Raster Mode Characteristics.

**Table 31-61. Switching Characteristics Over Recommended Operating Characteristics for LCD Raster Mode**

| Parameter No. | Parameter    | Parameter Name                                       | Min   | Nom | Max | Unit |
|---------------|--------------|------------------------------------------------------|-------|-----|-----|------|
| L21           | $T_{CYC}$    | LCDCP cycle time                                     | 16.67 | -   | -   | ns   |
| L22           | $T_{PH}$     | LCDCP pulse width high                               | 8.33  | -   | -   | ns   |
| L23           | $T_{PL}$     | LCDCP pulse width low                                | 8.33  | -   | -   | ns   |
| L24           | $T_{DLYVAL}$ | Delay time from LCDCP to LCDDATA[23:0] valid (write) | 2.0   | -   | 7.3 | ns   |

**Table 31-61. Switching Characteristics Over Recommended Operating Characteristics for LCD Raster Mode (continued)**

| Parameter No. | Parameter      | Parameter Name                                         | Min | Nom | Max | Unit |
|---------------|----------------|--------------------------------------------------------|-----|-----|-----|------|
| L25           | $T_{DLYINV}$   | Delay time from LCDCP to LCDDATA[23:0] invalid (write) | 2.0 | -   | 7.3 | ns   |
| L26           | $T_{DLYHAC}$   | Delay time, LCDCP to LCDAC                             | 1.9 | -   | 7.0 | ns   |
| L27           | $T_{TRANAC}$   | LCDAC transition time                                  | 0.5 | -   | 3.3 | ns   |
| L28           | $T_{DLYFP}$    | Delay time from LCDCP high to LCDFP                    | 1.7 | -   | 6.5 | ns   |
| L29           | $T_{TRANFP}$   | LCDFP transition time                                  | 0.5 | -   | 3.3 | ns   |
| L30           | $T_{DLYLP}$    | Delay time from LCDCP high to LCDLP                    | 2.0 | -   | 6.8 | ns   |
| L31           | $T_{TRANLP}$   | LCDLP transition time                                  | 0.5 | -   | 3.3 | ns   |
| L32           | $T_{TRANC}$    | LCDCP transition time                                  | 0.5 | -   | 3.3 | ns   |
| L33           | $T_{TRANDATA}$ | LCDDATA transition time                                | 0.5 | -   | 3.3 | ns   |

Frame-to-frame timing is derived through the following parameters in the **LCD Raster Timing 1 (LCDRASTRIM1)** register:

- Vertical front porch (VFP)
- Vertical sync pulse width (VSW)
- Vertical back porch (VBP)
- Lines per panel (MSBLPP + LPP)

Line-to-line timing is derived through the following parameters in the **LCD Raster Timing 0 (LCDRASTRIM0)** register:

- Horizontal front porch (HFP)
- Horizontal sync pulse width (HSW)
- Horizontal back porch (HBP)
- Pixels per panel (PPLMSB + PPLLSB)

LCDAC timing is derived through the following parameter in the **LCD Raster Timing 2 (LCDRASTRIM2)** register:

- AC bias frequency (ACBF)

The display format produced in raster mode is shown in Figure 31-52 on page 2122. An entire frame is delivered one line at a time. The first line delivered starts at data pixel (1, 1) and ends at data pixel (P, 1). The last line delivered starts at data pixel (1, L) and ends at data pixel (P, L). The beginning of each new frame is denoted by the activation of IO signal LCDFP (VSYNC). The beginning of each new line is denoted by the activation of IO signal LCDLP (HSYNC).

## 31.22 Analog Comparator

**Table 31-62. Analog Comparator Characteristics<sup>ab</sup>**

| Parameter            | Parameter Name                                | Min  | Nom      | Max              | Unit    |
|----------------------|-----------------------------------------------|------|----------|------------------|---------|
| $V_{INP}, V_{INN}^c$ | Input voltage range                           | GNDA | -        | $V_{DDA}$        | V       |
| $V_{CM}$             | Input common mode voltage range               | GNDA | -        | $V_{DDA}$        | V       |
| $V_{OS}$             | Input offset voltage                          | -    | $\pm 10$ | $\pm 50^d$       | mV      |
| $I_{INP}, I_{INN}$   | Input leakage current over full voltage range | -    | -        | 2.0              | $\mu A$ |
| $C_{MRR}$            | Common mode rejection ratio                   | -    | 50       | -                | dB      |
| $T_{RT}$             | Response time                                 | -    | -        | 1.0 <sup>e</sup> | $\mu s$ |
| $T_{MC}$             | Comparator mode change to Output Valid        | -    | -        | 10               | $\mu s$ |

a. Best design practices suggest that static or quiet digital I/O signals be configured adjacent to sensitive analog inputs to reduce capacitive coupling and cross talk.

b. To achieve best analog results, the source resistance driving the analog inputs,  $V_{INP}$  and  $V_{INN}$ , should be kept low.

c. The external voltage inputs to the Analog Comparator are designed to be highly sensitive and can be affected by external noise on the board. For this reason,  $V_{INP}$  and  $V_{INN}$  must be set to different voltage levels during idle states to ensure the analog comparator triggers are not enabled. If an internal voltage reference is used, it should be set to a mid-supply level. When operating in Sleep/Deep-Sleep modes, the Analog Comparator module should be disabled or the external voltage inputs set to different levels (greater than the input offset voltage) to achieve minimum current draw.

d. Measured at  $V_{REF}=100$  mV.

e. Measured at external  $V_{REF}=100$  mV, input signal switching from 75 mV to 125 mV.

**Table 31-63. Analog Comparator Voltage Reference Characteristics**

| Parameter | Parameter Name               | Min | Nom             | Max            | Unit |
|-----------|------------------------------|-----|-----------------|----------------|------|
| $R_{HR}$  | Resolution in high range     | -   | $V_{DDA}/29.4$  | -              | V    |
| $R_{LR}$  | Resolution in low range      | -   | $V_{DDA}/22.12$ | -              | V    |
| $A_{HR}$  | Absolute accuracy high range | -   | -               | $\pm R_{HR}/2$ | V    |
| $A_{LR}$  | Absolute accuracy low range  | -   | -               | $\pm R_{LR}/2$ | V    |

## 31.23 Pulse-Width Modulator (PWM)

**Table 31-66. PWM Timing Characteristics**

| Parameter           | Parameter Name                                   | Min | Nom | Max                | Unit              |
|---------------------|--------------------------------------------------|-----|-----|--------------------|-------------------|
| T <sub>FLTW</sub>   | Minimum Fault Pulse Width                        | 2   | -   | -                  | PWM clock periods |
| T <sub>FLTMAX</sub> | MnFAULTn Assertion to PWM Inactive <sup>a</sup>  | -   | -   | 24 + (1 PWM clock) | ns                |
| T <sub>FLTMIN</sub> | MnFAULTn De-Assertion to PWM Active <sup>b</sup> | 5   | -   | -                  | ns                |

a. This parameter value can vary depending on the PWM clock frequency which is controlled by the System Clock and a programmable divider field in the **PWMCC** register.

b. The latch and minimum fault period functions that can be enabled in the **PWMnCTL** register can change the timing of this parameter.

## 31.24 Current Consumption

Table 31-68 on page 2134 shows the amount of current consumption that specific peripherals contribute to the Run mode current consumption numbers shown in Table 31-67 on page 2130. If these peripherals are not powered, then the peripheral current consumption values can be subtracted from the Run mode numbers displayed in Table 31-67 on page 2130.

**Table 31-67. Current Consumption<sup>ab</sup>**

| Parameter     | Parameter Name        | Conditions                                                                                            | System Clock |               | Nom   |       |       |                    | Max   |                    | Unit |

a. Total current in RUN, SLEEP and DEEPSLEEP modes is the sum of I<sub>DD</sub> and I<sub>DDA</sub>.

b. For Peripherals = All OFF, the clocks to all peripherals are turned off and the peripherals are powered down, if capable (see the section called "Peripheral Power Control" on page 253).

c. Applicable to extended temperature devices only.

- d. Note that if the MOSC is the source of the Run-mode system clock and is powered down in Sleep mode, wake time is increased by  $T_{\text{MOSC\_SETTLE}}$ .
- e. To achieve the lowest possible Deep-Sleep current, one or more wait states must be configured in the **MEMTIMO** register. If there are no wait states applied in Run mode, then lowest possible Deep-Sleep current is not achieved.
- f. See the section called “LDO Power Control” on page 254 for information on lowering the LDO voltage to 0.9 V.

**Table 31-68. Peripheral Current Consumption**

| Parameter              | Parameter Name                           | Conditions                                                          | System Clock            | Nom | Units |
|------------------------|------------------------------------------|---------------------------------------------------------------------|-------------------------|-----|-------|
| $I_{\text{DDUSB}}$     | USB (including USB PHY) run mode current | $V_{\text{DD}} = 3.3 \text{ V}$<br>$V_{\text{DDA}} = 3.3 \text{ V}$ | 120 MHz (MOSC with PLL) | 4.0 | mA    |
| $I_{\text{DDEMACPHY}}$ | Ethernet MAC and PHY run mode current    | $V_{\text{DD}} = 3.3 \text{ V}$<br>$V_{\text{DDA}} = 3.3 \text{ V}$ | 120 MHz (MOSC with PLL) | 30  | mA    |

## A Package Information

### A.1 Orderable Devices

The figure below defines the full set of orderable part numbers for the TM4C129x Series. See the Package Option Addendum for the complete list of valid orderable part numbers for the TM4C129LNCZAD microcontroller.

**Figure A-1. Key to Part Numbers**

### A.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microcontroller (MCU) devices. Each Tiva™ C Series family member has one of two prefixes: XM4C or TM4C. These prefixes represent evolutionary stages of product development from engineering prototypes (XM4C) through fully qualified production devices (TM4C).

Device development evolutionary flow:

- XM4C — Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- TM4C — Production version of the silicon die that is fully qualified.

XM4C devices are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TM4C devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (XM4C) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

### A.3 Device Markings

The figure below shows an example of the Tiva™ microcontroller package symbolization.

This identifying number contains the following information:

- **Lines 1 and 5:** Internal tracking numbers
- **Lines 2 and 3:** Part number

For example, TM4C129X on the second line followed by NCZADI3 on the third line indicates orderable part number TM4C129XNCZADI3. Note that the first letter in the part number indicates the product status. A T indicates the part is fully qualified and released to production; an X indicates the part is experimental (pre-production) and requires a waiver. The silicon revision number is the last number in the part number, in this example, 3. The **DID0** register identifies the version of the microcontroller, as shown in the table below. Combined, the MAJOR and MINOR bit fields indicate the die revision and part revision numbers.

| MAJOR Bitfield Value | MINOR Bitfield Value | Die Revision | Part Revision |
|----------------------|----------------------|--------------|---------------|
| 0x0                  | 0x0                  | A0           | 1             |
| 0x0                  | 0x1                  | A1           | 2             |
| 0x0                  | 0x2                  | A2           | 3             |

- **Line 4:** Date code

The first two characters on the fourth line indicate the date code, followed by internal tracking numbers. The two-digit date code YM indicates the last digit of the year, then the month. For example, a 34 for the first two digits of the fourth line indicates a date code of April 2013.

## PACKAGING INFORMATION

| Orderable Device | Status<br>(1) | Package Type | Package<br>Drawing | Pins | Package<br>Qty | Eco Plan<br>(2)            | Lead/Ball Finish<br>(6) | MSL Peak Temp<br>(3) | Op Temp (°C) | Device Marking<br>(4/5) | Samples                 |

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
